1. The report which the Member States are required to forward to the Commission pursuant to Article 14 of Directive 78/176/EEC shall contain details of the surveillance and monitoring operations carried out by the bodies appointed in accordance with Article 7 (2) of that Directive. These details shall, in respect of each environment affected, include the following information:

— a description of the sampling point, including its permanent features, which may be coded, and other administrative and geographical information. This information shall be provided only once when the sampling point is designated,

— a description of the sampling methods used,

— the results of the measurements of the parameters whose determination is mandatory and, where Member States consider it useful, also those of parameters whose determination is optional,

— the methods of measurement and analysis used and, where appropriate, their limit of detection, accuracy and precision,

— changes, adopted in accordance with Article 4 (3), in the frequency of sampling and analysis.

2. The first set of data to be communicated pursuant to paragraph 1 shall be that gathered during the third year following notification of this Directive.

3. The Commission shall, with the prior agreement of the Member State concerned, publish a summary of the information supplied to it.

4. The Commission shall assess the effectiveness of the procedure for the surveillance and monitoring of the environments affected and shall — no later than six years after notification of this Directive — place before the Council, if appropriate, proposals to improve this procedure and, if necessary, to harmonize the methods of measurement including their limit of detection, accuracy and precision and the sampling methods.

▼B

Article 8

Member States may derogate from this Directive in the event of flooding or natural disaster or on account of exceptional weather conditions.

▼M2

Article 9

The Commission shall adopt the requisite amendments to adapt to scientific and technical progress the contents of the Annexes as regards parameters listed in the 'optional determination' column and reference methods of measurement.

Those measures, designed to amend non-essential elements of this Directive, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 11(2).

▼B

Article 10

1. A committee on adaptation to technical progress (hereinafter referred to as 'the committee'), consisting of representatives of the Member States and chaired by a Commission representative, is hereby set up.

▼M1

_____

▼M2

Article 11

1. The Commission shall be assisted by the committee.

2. Where reference is made to this paragraph, Article 5a(1) to (4) and Article 7 of Decision 1999/468/EC shall apply, having regard to the provisions of Article 8 thereof.

▼B

Article 12

Point (c) of Article 8 (1) of Directive 78/176/EEC is hereby replaced by the following:

'(c) if the results of the monitoring which the Member States are obliged to carry out on the environment concerned reveal a deterioration in the area under consideration, or'.

Article 13

Where waste elimination requires that, in accordance with Article 4 (1) of Directive 78/176/EEC, the competent authorities of more than one Member State should issue prior authorizations, the Member States involved shall consult each other on the content and the implementation of the monitoring programme.

Article 14

1. The Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with this Directive within two years following its notification. They shall forthwith inform the Commission thereof.

2. Member States shall communicate to the Commission the texts of the main provisions of national law which they adopt in the field governed by this Directive.

▼B

Article 15

This Directive is addressed to the Member States.

ANNEX I

METHOD OF WASTE DISPOSAL: DISCHARGE INTO AIR

Components	Parameters to be determined		Minimum annual sampling and analysis frequency	Comments
	mandatorily	optionally		
Air	Sulphur dioxide (SO_2) (1) Chlorine (2)	Dust	Continuously	1. Region with surveillance by an existing air pollution surveillance network with at least one station near the production site giving representative readings for pollution emanating from the site
			12 (3)	2. Region with no surveillance network. Measurement of total amounts of gaseous discharges emitted by the production site. Where a site has a number of discharge sources, sequential measurements may be made. The reference method of measurement for sulphur dioxide is that given in Annex III to Council Directive 80/779/EEC of 15 July 1980 on air quality limit values and guide values for sulphur dioxide and suspended particulates (OJ No L 229, 30.8.1980, p. 30)

(1) If the production process used is the sulphate process.
(2) To be used once measuring technology allows continuous measurements to be carried out and where the chlorine process is used.
(3) The figures must be sufficiently representative and significant.

ANNEX II

METHOD OF WASTE DISPOSAL: DISCHARGE INTO OR IMMERSION IN SALT WATER

(estuarine, coastal, open sea)

Components	Parameters to be determined		Minimum annual sampling and analysis frequency	Reference method of measurement
	mandatorily	optionally		
Water column Non-filtered sea water (1)	Temperature (°C)		3	Thermometry. Measurement is to be carried out on the spot at the time of sampling
	Salinity (‰)		3	Conductimetry
	pH (pH unit)		3	Electrometry. Measurement is to be carried out on the spot at the time of sampling
	Dissolved O_2 (mg/O_2 dissolved/l)		3	— Winkler method — Electrochemical method
	Turbidity (mg solids/l) or suspended matter (mg/l)		3	For turbidity: turbidimetry For suspended matter: gravimetry — Weighing after filtration through 0·45 μm pore size membrane filter and drying at 105 °C — Weighing after centrifugation (minimum time five minutes, average acceleration 2 800 to 3 200 g) and drying at 105° C
	Fe (dissolved and in suspension) (mg/l)		3	After the sample has been appropriately prepared, determination by atomic absorption spectrophotometry or by molecular absorption spectrophotometry
		Cr, total Cd, total Hg (mg/l)	3	— Atomic absorption spectrophotometry — Molecular absorption spectrophotometry

▼B

Components	Parameters to be determined		Minimum annual sampling and analysis frequency	Reference method of measurement
	mandatorily	optionally		
	Ti (mg/l)	V, Mn, Ni, Zn (mg/l)	3	Atomic absorption spectrophotometry
		Cu, Pb (mg/l)	3	— Atomic absorption spectrophotometry — Polarography
Sea water filtered through 0·45 µm pore size membrane filter ([1])	Dissolved Fe (mg/l)		3	Determination by atomic absorption spectrophotometry or by molecular absorption spectrophotometry
		Cr, Cd, Hg (mg/l)	3	— Atomic absorption spectrophotometry — Molecular absorption spectrophotometry
		Ti, V, Mn, Ni, Zn (mg/l)	3	Atomic absorption spectrophotometry
		Cu, Pb (mg/l)	3	— Atomic absorption spectrophotometry — Polarography
Suspended solids remaining in 0·45 µm pore size membrane filter	Total Fe (mg/l)	Cr, Cd, Hg (mg/l)	3	— Atomic absorption spectrophotometry — Molecular absorption spectrophotometry
		Ti, V, Mn, Ni, Zn (mg/l)	3	Atomic absorption spectrophotometry
		Cu, Pb (mg/l)	3	— Atomic absorption spectrophotometry — Polarography
	Hydrated oxides and hydroxides of iron (mg Fe/l)		3	Extraction of the sample under appropriate acid conditions; measurement by atomic absorption spectrophotometry or by molecular absorption spectrophotometry. The same method of acid extraction must be used for all samples coming from the same site

▼B

Components	Parameters to be determined		Minimum annual sampling and analysis frequency	Reference method of measurement
	mandatorily	optionally		
Sediments In the top layer of sediment as near the surface as possible	Total Ti, Fe (mg/kg dry matter)	V, Cr, Mn, Ni, Cu, Zn, Cd, Hg, Pb (mg/kg dry matter)	1	Identical methods to those for measurements in the water column. After appropriate preparation of the sample (wet or dry mineralization and purification). The quantities of metals must be measured for a specific range of particle sizes
	Hydrated oxides and hydroxides of iron (mg Fe/kg)		1	Identical methods to those for measurements in the water column
Living organisms Species representative of the site: benthic fish and invertebrates or other appropriate species (2)	Ti, Cr, Fe, Ni, Zn, Pb (mg/kg wet and dry weight)	V, Mn, Cu, Cd, Hg (mg/kg wet and dry weight)	1	Atomic absorption spectrophotometry after appropriate preparation of the composite sample of ground flesh (wet or dry mineralization and purification) — For fish, the metals must be measured in muscle or other appropriate tissue; the sample must consist of at least 10 specimens — For molluscs and crustaceans, the metals must be measured in the flesh. The sample must consist of at least 50 specimens
Benthic fauna	Diversity and relative abundance		1	Qualitative and quantitative classification of representative species, indicating the specimen count per species, density, dominance
Planktonic fauna		Diversity and relative abundance	1	Qualitative and quantitative classification of representative species, indicating the specimen count per species, density, dominance
Flora		Diversity and relative abundance	1	Qualitative and quantitative classification of representative species, indicating the specimen count per species, density, dominance
Fish in particular	Presence of morbid anatomical lesions in fish		1	Visual inspection of samples of the representative species taken for chemical analysis

(1) Member States may choose whether to analyse non-filtered or filtered water for substances under 'Parameters'.
(2) Species representative of the site of discharge in particular in terms of their sensitivity to bioaccumulation, e.g. Mytilus edulis, crangon crangon, flounder, plaice, cod, mackerel, red mullet, herring, sole (or other appropriate benthic species).

ANNEX III

METHOD OF WASTE DISPOSAL: DISCHARGE INTO FRESH SURFACE WATER

Components	Parameters to be determined		Minimum annual sampling and analysis frequency	Reference method of measurement
	mandatorily	optionally		
Water column (1) Non-filtered fresh water	Temperature (°C)		3	Thermometry. Measurement is to be carried out on the spot at the time of sampling
	Conductivity at 20 °C (μS cm^{-1})		3	Electrometric measurement
	pH (pH unit)		3	Electrometry. Measurement is to be carried out on the spot at the time of sampling
	Dissolved O_2 (dissolved mg O_2/l)		3	— Winkler method — Electrochemical method
	Turbidity (mg solids/l or suspended matter (mg/l)		3	For turbidity: turbidimetry For suspended matter: gravimetry — Weighing after filtration through 0·45 μm membrane filter and drying at 105 °C — Weighing after centrifugation (minimum time five minutes, and average acceleration 2 800 to 3 200 g) and drying at 105 °C
Non-filtered fresh water (2)	Fe (dissolved and in suspension) (mg/l)		3	After the sample has been appropriatelyprepared, determination by atomic absorption spectrophotometry or by molecular absorption spectrophotometry
		Cr, total Cd, total Hg (mg/l)	3	— Atomic absorption spectrophotometry — Molecular absorption spectrophotometry
	Ti (mg/l)	V, Mn, Ni, Zn (mg/l)	3	Atomic absorption spectrophotometry

Benthic fauna	Diversity and relative abundance		1	Qualitative and quantitative classification of representative species, indicating the specimen count per species, density, dominance
Planktonic fauna		Diversity and relative abundance	1	Qualitative and quantitative classification of representative species, indicating the specimen count per species, density, dominance
Flora		Diversity and relative abundance	1	Qualitative and quantitative classification of representative species, indicating the specimen count per species, density, dominance
Fish in particular		Presence of morbid anatomical lesions in fish	1	Visual inspection of samples of the representative species taken for chemical analysis

(1) Samples must be taken at the same time of the year and if possible at a depth of 50 cm below the surface.
(2) Member States may choose whether to analyse non-filtered or filtered water for substances under 'Parameters'.

ANNEX IV

METHOD OF WASTE DISPOSAL: STORAGE AND DUMPING ON LAND

Components	Parameters to be determined		Minimum annual sampling and analysis frequency	Reference method of analysis
	mandatorily	optionally		
1. *Unfiltered surface water*around the site in the area affected by the storage and at a point outside this area (1) (2) (3) 2. *Unfiltered groundwater*around the site including, where necessary, outflow points (1) (2)	pH (pH unit)		1	Electrometry. Measurement is to be carried out at the time of sampling
	SO_4 (4) (mg/l)		1	— Gravimetry — Complexometric titration with EDTA — Molecular absorption spectrophotometry
	Ti (5) (mg/l)	V, Mn, Ni, Zn (mg/l)	1	Atomic absorption spectrophotometry
	Fe (6) (mg/l)	Cr (mg/l)	1	— Atomic absorption spectrophotometry — Molecular absorption spectrophotometry
	Ca (mg/l)		1	— Atomic absorption spectrophotometry — Complexometric titration
		Cu, Pb (mg/l)	1	— Atomic absorption spectrophotometry — Polarography
	Cl (5) (mg/l)		1	Titrimetry (Mohr method)
Environment of the storage and dumping site	Visual inspection of: — topography and site management — effect on subsoil		1	Methods to be chosen by Member States

▼B

Components	Parameters to be determined		Minimum annual sampling and analysis frequency	Reference method of analysis
	mandatorily	optionally		
	— ecology of the site			

([1]) Sampling must be carried out at the same time of year.
([2]) When monitoring surface water and groundwater, particular attention is to be paid to any matter carried by running water from the waste storage area.
([3]) Sampling must be carried out 50 cm beneath the surface of the water, if possible.
([4]) Mandatory determination where storage or dumping contains waste from the sulphate process.
([5]) Mandatory determination where storage or dumping contains waste from the chlorine process.
([6]) Also includes the measurement of Fe in the filtrate (suspended solids).

ANNEX V

METHOD OF WASTE DISPOSAL: INJECTION INTO SOIL

Components	Parameters to be determined		Minimum annual sampling frequency and analysis	Reference method of analysis
	mandatorily	optionally		
1. *Unfiltered surface water* around the site in the zone affected by the injection 2. *Unfiltered groundwater* around the site including out-flow points	pH (pH unit)		1	Electrometry. Measurement is to be carried out at the time of sampling
	SO_4 (1) (mg/l)		1	— Gravimetry — Complexometric titration with EDTA — Molecular absorption spectrophotometry
	Ti (2) (mg/l)	V, Mn, Ni, Zn (mg/l)	1	Atomic absorption spectrophotometry
	Fe (3) (mg/l)	Cr (mg/l)	1	— Atomic absorption spectrophotometry — Molecular absorption spectrophotometry
	Ca (mg/l)		1	— Atomic absorption spectrophotometry — Complexometric titration
		Cu, Pb (mg/l)	1	— Atomic absorption spectrophotometry — Polarography
	Cl (2) (mg/l)		1	Titrimetry (Mohr method)
Environment Topography	Ground stability		1	Photographic and topographic survey
	Permeability Porosity		1	Pumping tests Well-logging

(1) Mandatory determination where waste from the sulphate process is injected into soil.
(2) Mandatory determination where waste from the chlorine process is injected into soil.
(3) Also includes the measurement of Fe in the filtrate (suspended solids).

COUNCIL DIRECTIVE

of 20 February 1978

on waste from the titanium dioxide industry

(78/176/EEC)

THE COUNCIL OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Economic Community, and in particular Articles 100 and 235 thereof,

Having regard to the proposal from the Commission,

Having regard to the opinion of the European Parliament [1],

Having regard to the opinion of the Economic and Social Committee [2],

Whereas waste from the titanium dioxide industry is liable to be harmful to human health and the environment; whereas it is therefore necessary to prevent and gradually reduce pollution caused by such waste with a view to eliminating it;

Whereas the 1973 [3] and 1977 [4] European Communities' Programmes of Action on the Environment refer to the need to undertake Community action against waste from the titanium dioxide industry;

Whereas any disparity between the provisions on waste from the titanium dioxide industry already applicable or in preparation in the various Member States may create unequal conditions of competition and thus directly affect the functioning of the common market; whereas it is therefore necessary to approximate laws in this field, as provided for in Article 100 of the Treaty;

Whereas it seems necessary for this approximation of laws to be accompanied by Community action so that one of the aims of the Community in the sphere of protection of the environment and improvement of the quality of life can be achieved by more extensive rules; whereas certain specific provisions to this effect should therefore be laid down; whereas Article 235 of the Treaty should be invoked as the powers required for this purpose have not been provided for by the Treaty;

Whereas Directive 75/442/EEC [5], concerns waste disposal in general; whereas for waste from the titanium dioxide industry it is advisable to lay down a special system which will ensure that human health and the environment are protected against the harmful effects caused by the uncontrolled discharge, dumping or tipping of such waste;

Whereas in order to attain these objectives there should be a system of prior authorization as regards the discharge, dumping, storage, tipping or injecting of waste; whereas the issue of this authorization should be made subject to specific conditions;

Whereas discharge, dumping, storage, tipping and injecting of waste must be accompanied both by monitoring of the waste and monitoring and surveillance of the environment concerned;

Whereas for existing industrial establishments Member States must, by 1 July 1980, draw up programmes for the progressive reduction of pollution caused by such waste with a view to its elimination; whereas these programmes must fix the general reduction targets to be attained by 1 July 1987 at the latest and indicate the measures to be taken for each establishment;

---

[5] OJ No L 194, 25. 7. 1975, p. 39.

▼B

Whereas for new industrial establishments Member States must issue a prior authorization; whereas such authorization must be preceded by an environmental impact study and may be granted only to firms which undertake to use only those materials, processes and techniques available on the market that are least damaging to the environment,

HAS ADOPTED THIS DIRECTIVE:

Article 1

1. The aim of this Directive is the prevention and progressive reduction, with a view to its elimination, of pollution caused by waste from the titanium dioxide industry.

2. For the purpose of this Directive:

(a) 'pollution' means the discharge by man, directly or indirectly, of any residue from the titanium dioxide manufacturing process into the environment, the results of which are such as to cause hazards to human health, harm to living resources and to ecosystems, damage to amenities or interference with other legitimate uses of the environment concerned;

(b) 'waste' means:

— any residue from the titanium dioxide manufacturing process of which the holder disposes or is obliged to dispose under current national legislation;

— any residue from a treatment process of a residue referred to in the first indent;

(c) 'disposal' means:

— the collection, sorting, transport and treatment of waste as well as its storage and tipping above ground or underground and its injection into the ground;

— the discharge thereof into surface water, ground water and the sea, and dumping at sea;

— the transformation operations necessary for its re-use, recovery or recycling;

(d) 'existing industrial establishments' means those industrial establishments already set up on the date of notification of this Directive;

(e) 'new industrial establishments' means those industrial establishments which are in the process of being set up on the date of entry into force of this Directive or which are set up after that date. Extensions to existing industrial establishments leading to an increase of 15 000 tonnes per year or more in the titanium dioxide on-site production capacity of the establishment concerned shall be treated as new industrial establishments.

Article 2

Member States shall take the necessary measures to ensure that waste is disposed of without endangering human health and without harming the environment, and in particular:

— without risk to water, air, soil and plants and animals;

— without deleteriously affecting beauty-spots or the countryside.

Article 3

Member States shall take appropriate measures to encourage the prevention, recycling and processing of waste, the extraction of raw materials and any other process for the re-use of waste.

Article 4

1. The discharge, dumping, storage, tipping and injection of waste are prohibited unless prior authorization is issued by the competent authority of the Member State in whose territory the waste is produced.

▼B

Prior authorization must also be issued by the competent authority of the Member State

— in whose territory the waste is discharged, stored, tipped or injected;

— from whose territory it is discharged or dumped.

2. Authorization may be granted for a limited period only. It may be renewed.

Article 5

In the case of discharge or dumping, the competent authority may, in accordance with Article 2 and on the basis of the information supplied in accordance with Annex I, grant the authorization referred to in Article 4 provided that:

(a) the waste cannot be disposed of by more appropriate means;

(b) an assessment carried out in the light of available scientific and technical knowledge shows that there will be no deleterious effect, either immediate or delayed, on the aquatic environment;

(c) there is no deleterious effect on boating, fishing, leisure activities, the extraction of raw materials, desalination, fish and shellfish breeding, on regions of special scientifc importance or on other legitimate uses of the waters in question.

Article 6

In the case of storage, tipping or injection, the competent authority may, in accordance with Article 2, and on the basis of the information supplied in accordance with Annex I, grant the authorization referred to in Article 4, provided that:

(a) the waste cannot be disposed of by more appropriate means;

(b) an assessment carried out in the light of available scientific and technical knowledge shows that there will be no detrimental effect, either immediate or delayed, on underground waters, the soil or the atmosphere;

(c) there is no deleterious effect on leisure activities, the extraction of raw materials, plants, animals, on regions of special scientific importance or on other legitimate uses of the environment in question.

Article 7

1. Irrespective of the method and extent of treatment of the waste in question, its discharge, dumping, storage, tipping and injection shall be accompanied by the monitoring referred to in Annex II of the waste and of the environment concerned having regard to its physical, chemical, biological and ecological aspects.

2. The monitoring operations shall be carried out periodically by one or more bodies appointed by the Member State the competent authority of which has issued the authorization provided for in Article 4. In the case of cross-frontier pollution between Member States, the body in question shall be appointed jointly by the parties concerned.

3. Within one year of notification of this Directive, the Commission shall submit to the Council a proposal on the procedures for the surveillance and monitoring of the environments concerned. The Council shall act on this proposal within six months of the publication of the opinion of the European Parliament and that of the Economic and Social Committee in the *Official Journal of the European Communities*.

Article 8

1. The competent authority in the Member State concerned shall take all appropriate steps to remedy one of the following situations

▼B

and, if necessary, shall require the suspension of discharge, dumping, storage, tipping or injection operations:

(a) if the results of the monitoring provided for in Annex II (A) (1) show that the conditions for the prior authorization referred to in Articles 4, 5 and 6 have not been fulfilled, or

(b) if the results of the acute toxicity tests referred to in Annex II (A) (2) show that the limits laid down therein have been exceeded, or

▼M1

(c) if the results of the monitoring which the Member States are obliged to carry out on the environment concerned reveal a deterioration in the area under consideration, or

▼B

(d) if discharge or dumping produces a deleterious effect on boating, fishing, leisure activities, the extraction of raw materials, desalination, fish and shellfish breeding, on regions of special scientific importance or on other legitimate uses of the waters in question, or

(e) if storage, tipping or injection produces a deleterious effect on leisure activities, the extraction of raw materials, plants, animals, on regions of special scientific importance or on other legitimate uses of the environments in question.

2. If several Member States are concerned, the measures shall be taken after consultation.

Article 9

1. Member States shall draw up programmes for the progressive reduction and eventual elimination of pollution caused by waste from existing industrial establishments.

2. The programmes mentioned in paragraph 1 shall set general targets for the reduction of pollution from liquid, solid and gaseous waste, to be achieved by 1 July 1987 at the latest. The programmes shall also contain intermediate objectives. They shall, moreover, contain information on the state of the environment concerned, on measures for reducing pollution and on methods for treating waste that is directly caused by the manufacturing processes.

3. ►M2 By 1 July 1980 at the latest the programmes referred to in paragraph 1 shall be sent to the Commission, which, before 15 March 1983, shall submit suitable proposals to the Council ◄ for the harmonization of these programmes in regard to the reduction and eventual elimination of pollution and the improvement of the conditions of competition in the titanium dioxide industry. The Council shall act on these proposals within six months of the publication of the opinion of the European Parliament and that of the Economic and Social Committee in the *Official Journal of the European Communities*.

4. Member States shall introduce a programme by 1 January 1982 at the latest.

Article 10

1. The programmes referred to in Article 9 (1) must cover all existing industrial establishments and must set out the measures to be taken in respect of each of them.

2. Where, in particular circumstances, a Member State considers that, in the case of an individual establishment, no additional measures are necessary to fulfil the requirements of this Directive, it shall, within six months of notification of this Directive, provide the Commission with the evidence which has led it to that conclusion.

3. After conducting any independent verification of the evidence that may be necessary, the Commission may agree with the Member State that it is not neccessary to take additional measures in respect of the individual establishment concerned. The Commission must give its agreement, with reasons, within six months.

▼B

4. If the Commission does not agree with the Member State, additional measures in respect of that establishment shall be included in the programme of the Member State concerned.

5. If the Commission does agree, its agreement will be periodically reviewed in the light of the results of the monitoring carried out pursuant to this Directive and in the light of any significant change in the manufacturing processes or in environmental policy objectives.

Article 11

New industrial establishments shall be subject to applications for prior authorization made to the competent authorities of the Member State on whose territory it is proposed to build the establishments. Such authorizations must be preceded by environmental impact surveys. They may be granted only to firms which give an undertaking to use only such of the materials, processes and techniques available on the market as are least damaging to the environment.

Article 12

Without prejudice to this Directive, Member States may adopt more stringent regulations.

Article 13

1. For the purposes of this Directive, Member States shall supply the Commission with all the necessary information relating to:

— the authorizations issued pursuant to Articles 4, 5 and 6,

— the results of the monitoring of the environment concerned carried out pursuant to Article 7,

— the measures taken pursuant to Article 8.

They shall also supply the Commission with general information concerning the materials, processes and techniques notified to them pursuant to Article 11.

2. Information acquired as a result of the application of this Article may be used only for the purposes of this Directive.

3. The Commission and the competent authorities of the Member States, their officials and other servants shall not disclose information acquired by them pursuant to this Directive and of a kind covered by the obligation of professional secrecy.

4. Paragraphs 2 and 3 shall not prevent publication of general information or surveys which do not contain information relating to particular undertakings or associations of undertakings.

Article 14

▼M3

At intervals of three years the Member States shall send information to the Commission on the implementation of this Directive, in the form of a sectoral report which shall also cover other pertinent Community Directives. This report shall be drawn up on the basis of a questionnaire or outline drafted by the Commission in accordance with the procedure laid down in Article 6 of Directive 91/692/EEC [1]. The questionaire or outline shall be sent to the Member States six months before the start of the period covered by the report. The report shall be sent to the Commission within nine months of the end of the three-year period covered by it.

The first report shall cover the period from 1993 to 1995 inclusive.

The Commission shall publish a Community report on the implementation of the Directive within nine months of receiving the reports from the Member States.

[1] OJ No L 377, 31. 12. 1991, p. 48.

▼B

Article 15

1. Member States shall bring into force the measures needed to comply with this Directive within 12 months, of its notification and shall forthwith inform the Commission thereof.

2. Member States shall communicate to the Commission the texts of the national laws which they adopt in the field covered by this Directive.

Article 16

This Directive is addressed to the Member States.

▼B

ANNEX I

PARTICULARS WHICH MUST BE SUPPLIED IN ORDER TO OBTAIN THE PRIOR AUTHORIZATION REFERRED TO IN ARTICLES 4, 5 AND 6

A. **Characteristics and composition of the matter:**

1. total amount and average compositions of matter dumped (e.g. per year);
2. form (e.g. solid, sludge, liquid or gaseous);
3. properties: physical (e.g. solubility and density), chemical and biochemical (e.g. oxygen demand) and biological;
4. toxicity;
5. persistence: physical, chemical and biological;
6. accumulation and biotransformation in biological materials or sediments;
7. susceptibility to physical, chemical and biochemical changes and interaction in the environment concerned with other organic and inorganic materials;
8. probability of production of taints or other changes reducing marketability of resources (fish, shellfish, etc.).

B. **Characteristics of dumping or discharge site and methods of disposal:**

1. location (e.g. coordinates of the dumping or discharge area, depth and distance from the coast), location in relation to other areas (e.g. amenity areas, spawning, nursery and fishing areas and exploitable resources);
2. rate of disposal per specific period (e.g. quantity per day, per week, per month);
3. methods of packaging and containment, if any;
4. initial dilution achieved by proposed method of release, particularly the speed of the ship;
5. dispersal characteristics (e.g. effects of currents, tides, and wind on horizontal transport and vertical mixing);
6. water characteristics (e.g. temperature, pH, salinity, stratification, oxygen indices of pollution — dissolved oxygen (DO), chemical oxygen demand (COD), biochemical oxygen demand (BOD), nitrogen present in organic and inorganic form, including ammonia, suspended matter, other nutrients and productivity);
7. bottom characteristics (e.g. topography, geochemical and geological characteristics and biological productivity);
8. existence and effects of other dumpings or discharges which have been made in the area concerned (e.g. heavy metal background reading and organic carbon content).

C. **Characteristics of the tipping, storage or injection area and disposal methods:**

1. geographical siuation;
2. characteristics of adjacent areas;
3. methods of packaging and containment, if any;
4. characteristics of the methods of tipping, storage and injection, including an assessment of precautions taken to avoid the pollution of waters, the soil and the atmosphere.

▼B

ANNEX II

SURVEILLANCE AND MONITORING OF DISPOSAL

A. **Monitoring of waste**

Disposal operations shall be accompanied by:

1. checks on the quantity, composition and toxicity of the waste to ensure that the conditions for prior authorization referred to in Articles 4, 5 and 6 are fulfilled;

2. tests for acute toxicity on certain species of molluscs, crustaceans, fish and plankton, preferably species commonly found in the discharge areas. In addition, tests shall be carried out on samples of the brine shrimp species (Artemia salina).

   Over a period of 36 hours and at an effluent dilution of 1/5 000, these tests must not reveal:

   — more than 20 % mortality for adult forms of the species tested,

   — and for larval forms, mortality exceeding that of a control group.

B. **Surveillance and monitoring of the environment concerned**

I. In The case of discharge into fresh water or into the sea or in the case of dumping, such checks shall relate to the three following items: water column, living matter and sediments. Periodic checks on the state of the area affected by the discharges will make it possible to follow the development of the environments concerned.

   Monitoring shall include the determination of:

   1. pH;

   2. dissolved oxygen;

   3. turbidity;

   4. hydrated iron oxides and hydroxides in suspension;

   5. toxic metals in water, suspended solids, sediments and in accumulation in selected benthic and pelagic organisms;

   6. the diversity and the relative and absolute abundance of flora and fauna.

II. In the case of storage, tipping or injection the monitoring shall include:

   1. tests to ensure that surface waters and ground waters are not contaminated. These tests shall include the measurement of:

      — acidity,

      — iron content (soluble and particulate),

      — calcium content,

      — toxic metal content (soluble and particulate) if any;

   2. where necessary, tests to determine any adverse effects on the structure of the subsoils;

   3. a general assessment of the ecology of the area in the vicinity of the tipping, storage or injection point.

COMMISSION DECISION

of 16 May 2011

establishing a forum for the exchange of information pursuant to Article 13 of the Directive 2010/75/EU on industrial emissions

(2011/C 146/03)

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Having regard to Directive 2010/75/EU on industrial emissions (integrated pollution prevention and control) (Recast) [1] (the Directive), and in particular Article 13(3) thereof,

Whereas:

(1) Article 13(1) of the Directive requires the Commission to organise an exchange of information between Member States, the industries concerned, non-governmental organisations promoting environmental protection and the Commission.

(2) Article 13(3) of the Directive requires the Commission to establish and regularly convene a forum composed of representatives of Member States, the industries concerned and non-governmental organisations promoting environmental protection and to obtain the opinion of the forum on the practical arrangements for the exchange of information foreseen under that Article.

(3) Article 13(4) of the Directive requires the Commission to obtain and make publicly available the opinion of the forum on the proposed content of BAT reference documents.

(4) It is therefore necessary to establish a forum and to define its tasks and its structure.

(5) The forum should provide its opinion on the practical arrangements for the exchange of information and on the proposed content of BAT reference documents.

(6) The forum should be composed of Member States, international organisations representing industries concerned by the activities covered by Annex I of the Directive and non-governmental organisations promoting environmental protection.

(7) Rules on disclosure of information by members of the forum should be laid down.

(8) Personal data should be processed in accordance with Regulation (EC) No 45/2001 of the European Parliament and of the Council of 18 December 2000 on the protection of individuals with regard to the processing of personal data by the Community institutions and bodies and on the free movement of such data [2],

HAS DECIDED AS FOLLOWS:

Article 1

Subject matter

A forum to promote the exchange of information pursuant to Article 13(3) of the Directive is hereby established.

Article 2

Task

The forum's task shall be:

(a) to provide its opinion on the practical arrangements for the exchange of information in accordance with the second subparagraph of Article 13(3) of the Directive;

(b) to provide its opinion on the proposed content of BAT reference documents in accordance with Article 13(4) of the Directive.

Article 3

Consultation

The Commission may consult the forum on any matter relating to Article 13 of the Directive or on any matter relating to BAT as defined in Article 3(10) of the Directive.

Article 4

Membership — Appointment

1. Members shall be Member States, international organisations representing industries concerned by the activities covered by Annex I of the Directive and non-governmental organisations promoting environmental protection. Those organisations shall have an acceptable degree of European representation.

2. Members of the Commission Expert Group 'Information Exchange Forum on Best Available Techniques under legislation on industrial emissions' (E00466) shall automatically be considered as members of the forum.

3. New members who are not Member States shall be appointed by the Director General of DG Environment.

4. Members who are no longer capable of contributing effectively to the forum's deliberations, who resign or who do not comply with Article 339 of the Treaty, may be replaced.

[1] OJ L 334, 17.12.2010, p. 17.

[2] OJ L 8, 12.1.2001, p. 1.

5. The names of member organisations shall be published in the Register. The names of Member States' representatives may be published in the Register.

6. Personal data shall be collected, processed and published in accordance with Regulation (EC) No 45/2001.

Article 5

Operation

1. The forum shall be chaired by the Commission.

2. In agreement with the Commission, the forum may establish sub-groups to examine specific questions on the basis of terms of reference defined by the forum. Such sub-groups shall cease to exist as soon as their mandate is fulfilled. The sub-groups shall be chaired by the Commission. The chair of the sub-group shall report back to the forum.

3. The representatives of EEA countries shall be invited to attend meetings of the forum, in accordance with the EEA Protocol.

4. Representatives of acceding countries shall be invited to attend the meetings of the forum as from the date of signature of the Treaty of accession.

5. The Chair may invite experts from outside the forum with specific competence in a subject on the agenda to participate in the work of the forum or sub-group on an ad hoc basis. In addition, the Chair may give observer status to individuals, organisations as defined in Rule 8(3) of the horizontal rules on expert groups ([1]) and candidate countries.

6. Members of the forum and their representatives, as well as invited experts and observers, shall comply with the obligations of professional secrecy laid down by the Treaties and their implementing rules, as well as with the Commission's rules on security regarding the protection of EU classified information, laid down in the Annex to Commission Decision 2001/844/EC, ECSC, Euratom ([2]). Should they fail to respect these obligations, the Commission may take all appropriate measures.

7. The meetings of the forum and its sub-groups shall be held on Commission premises. The Commission shall provide secretarial services.

8. The forum shall adopt, by simple majority of its members, its rules of procedure on the basis of the standard rules of procedure for expert groups.

9. The Commission publishes relevant information on the activities carried out by the forum either by including it in the Register or via a link from the Register to a dedicated website.

Article 6

Meeting expenses

1. Participants in the activities of the forum shall not be remunerated for the services they render.

2. Travel expenses incurred by participants in the activities of the forum may be reimbursed by the Commission. Reimbursement shall be made in accordance with the provisions in force within the Commission and within the limits of the available appropriations allocated to the Commission services under the annual procedure for the allocation of resources.

Done at Brussels, 16 May 2011.

For the Commission

Janez POTOČNIK

Member of the Commission

([1]) C(2010) 7649 final.

I

(Legislative acts)

DIRECTIVES

DIRECTIVE 2012/18/EU OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 4 July 2012

on the control of major-accident hazards involving dangerous substances, amending and subsequently repealing Council Directive 96/82/EC

(Text with EEA relevance)

THE EUROPEAN PARLIAMENT AND THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty on the Functioning of the European Union, and in particular Article 192(1) thereof,

Having regard to the proposal from the European Commission,

After transmission of the draft legislative act to the national parliaments,

Having regard to the opinion of the European Economic and Social Committee [1],

After consulting the Committee of the Regions,

Acting in accordance with the ordinary legislative procedure [2],

Whereas:

(1) Council Directive 96/82/EC of 9 December 1996 on the control of major-accident hazards involving dangerous substances [3] lays down rules for the prevention of major accidents which might result from certain industrial activities and the limitation of their consequences for human health and the environment.

(2) Major accidents often have serious consequences, as evidenced by accidents like Seveso, Bhopal, Schweizerhalle, Enschede, Toulouse and Buncefield. Moreover the impact can extend beyond national borders. This underlines the need to ensure that appropriate precautionary action is taken to ensure a high level of protection throughout the Union for citizens, communities and the environment. There is therefore a need to ensure that the existing high level of protection remains at least the same or increases.

(3) Directive 96/82/EC has been instrumental in reducing the likelihood and consequences of such accidents thereby leading to a better level of protection throughout the Union. A review of that Directive has confirmed that the rate of major accidents has remained stable. While overall the existing provisions are fit for purpose, some changes are required in order to further strengthen the level of protection, in particular with regard to the prevention of major accidents. At the same time the system established by Directive 96/82/EC should be adapted to changes to the Union system of classification of substances and mixtures to which that Directive refers. In addition, a number of other provisions should be clarified and updated.

(4) It is therefore appropriate to replace Directive 96/82/EC in order to ensure that the existing level of protection is maintained and further improved, by making the provisions more effective and efficient, and where possible by reducing unnecessary administrative burdens by streamlining or simplification, provided that safety and environmental and human health protection are not compromised. At the same time, the new provisions should be clear, coherent and easy to understand to help improve implementation and enforceability, while the level of protection of human health and the environment remains at least the same or increases. The Commission should cooperate with the Member States on the practical implementation of this Directive. That cooperation should, inter alia, address the issue of self-classification of substances and mixtures. As appropriate, stakeholders such as representatives of industry, workers and non-governmental organisations promoting the protection of human health or the environment should be involved in the implementation of this Directive.

[1] OJ C 248, 25.8.2011, p. 138.
[2] Position of the European Parliament of 14 June 2012 and decision of the Council of 26 June 2012.
[3] OJ L 10, 14.1.1997, p. 13.

(5) The Convention of the United Nations Economic Commission for Europe on the Transboundary Effects of Industrial Accidents, which was approved on behalf of the Union by Council Decision 98/685/EC of 23 March 1998 concerning the conclusion of the Convention on the Transboundary Effects of Industrial Accidents ([1]), provides for measures regarding the prevention of, preparedness for, and response to industrial accidents capable of causing transboundary effects as well as for international cooperation in this field. Directive 96/82/EC implements the Convention within Union law.

(6) Major accidents can have consequences beyond frontiers, and the ecological and economic costs of an accident are borne not only by the establishment affected, but also by the Member States concerned. It is therefore necessary to establish and apply safety and risk-reduction measures to prevent possible accidents, to reduce the risk of accidents occurring and to minimise the effects if they do occur, thereby making it possible to ensure a high level of protection throughout the Union.

(7) The provisions of this Directive should apply without prejudice to the provisions of Union law relating to health and safety at work and the working environment, and, in particular, without prejudice to Council Directive 89/391/EEC of 12 June 1989 on the introduction of measures to encourage improvements in the safety and health of workers at work ([2]).

(8) Certain industrial activities should be excluded from the scope of this Directive provided they are subject to other legislation at Union or national level providing for an equivalent level of safety. The Commission should continue to examine whether there are significant gaps in the existing regulatory framework, in particular as regards new and emerging risks from other activities as well as from specific dangerous substances and, if appropriate, present a legislative proposal to address those gaps.

(9) Annex I to Directive 96/82/EC lists the dangerous substances falling within its scope, inter alia, by reference to certain provisions of Council Directive 67/548/EEC of 27 June 1967 on the approximation of the laws, regulations and administrative provisions relating to the classification, packaging and labelling of dangerous substances ([3]) as well as Directive 1999/45/EC of the European Parliament and of the Council of 31 May 1999 concerning the approximation of the laws, regulations and administrative provisions of the Member States relating to the classification, packaging and labelling of dangerous preparations ([4]). Directives 67/548/EEC and 1999/45/EC have been replaced by Regulation (EC) No 1272/2008 of the European Parliament and of the Council of 16 December 2008 on classification, labelling and packaging of substances and mixtures ([5]), which implements within the Union the Globally Harmonised System of Classification and Labelling of Chemicals that has been adopted at international level, within the structure of the United Nations (UN). That Regulation introduces new hazard classes and categories only partially corresponding to those used under those repealed Directives. Certain substances or mixtures would, however, not be classified under that system due to an absence of criteria within that framework. Annex I to Directive 96/82/EC therefore needs to be amended to align it to that Regulation while maintaining the existing level, or further increasing the level, of protection provided for in that Directive.

(10) For the purpose of classifying upgraded biogas, any developments on standards under the European Committee for Standardisation (CEN) should be taken into account.

(11) Unwanted effects from the alignment to Regulation (EC) No 1272/2008 and subsequent adaptations to that Regulation having an impact on the classification of substances and mixtures may occur. On the basis of criteria included in this Directive, the Commission should assess whether, notwithstanding their hazard classification, there are dangerous substances which do not present a major-accident hazard and, where appropriate, submit a legislative proposal to exclude the dangerous substance concerned from the scope of this Directive. The assessment should start swiftly, in particular after the change of classification of a substance or mixture, in order to avoid unnecessary burdens for operators and competent authorities in the Member States. Exclusions from the scope of this Directive should not prevent any Member State from maintaining or introducing more stringent protective measures.

(12) Operators should have a general obligation to take all necessary measures to prevent major accidents, to mitigate their consequences and to take recovery measures. Where dangerous substances are present in establishments above certain quantities the operator should provide the competent authority with sufficient information to enable it to identify the establishment, the dangerous substances present and the potential dangers. The operator should also draw up and, where required by national law, send to the competent authority a major-accident prevention policy (MAPP) setting out the operator's overall approach and measures, including appropriate safety management systems, for controlling major-accident hazards. When the operators identify and evaluate the major-accident hazards, consideration should also be given to the dangerous substances which may be generated during a severe accident within the establishment.

([1]) OJ L 326, 3.12.1998, p. 1.
([2]) OJ L 183, 29.6.1989, p. 1.
([3]) OJ 196, 16.8.1967, p. 1.
([4]) OJ L 200, 30.7.1999, p. 1.
([5]) OJ L 353, 31.12.2008, p. 1.

(13) Directive 2004/35/EC of the European Parliament and of the Council of 21 April 2004 on environmental liability with regard to the prevention and remedying of environmental damage [1] is normally relevant for environmental damage caused by a major accident.

(14) In order to reduce the risk of domino effects, where establishments are sited in such a way or so close together as to increase the likelihood of major accidents, or aggravate their consequences, operators should cooperate in the exchange of appropriate information and in informing the public, including neighbouring establishments that could be affected.

(15) In order to demonstrate that all that is necessary has been done to prevent major accidents, and to prepare emergency plans and response measures, the operator should, in the case of establishments where dangerous substances are present in significant quantities, provide the competent authority with information in the form of a safety report. That safety report should contain details of the establishment, the dangerous substances present, the installation or storage facilities, possible major-accident scenarios and risk analysis, prevention and intervention measures and the management systems available, in order to prevent and reduce the risk of major accidents and to enable the necessary steps to be taken to limit the consequences thereof. The risk of a major accident could be increased by the probability of natural disasters associated with the location of the establishment. This should be considered during the preparation of major-accident scenarios.

(16) To prepare for emergencies, in the case of establishments where dangerous substances are present in significant quantities, it is necessary to establish internal and external emergency plans and to establish procedures to ensure that those plans are tested and revised as necessary and implemented in the event of a major accident or the likelihood thereof. The staff of an establishment should be consulted on the internal emergency plan and the public concerned should have the opportunity to give its opinion on the external emergency plan. Sub-contracting may have an impact on the safety of an establishment. Member States should require operators to take this into account when drafting a MAPP, a safety report or an internal emergency plan.

(17) When considering the choice of appropriate operating methods, including those for monitoring and control, operators should take into account available information on best practices.

(18) In order to provide greater protection for residential areas, areas of substantial public use and the environment, including areas of particular natural interest or sensitivity, it is necessary for land-use or other relevant policies applied in the Member States to ensure appropriate distances between such areas and establishments presenting such hazards and, where existing establishments are concerned, to implement, if necessary, additional technical measures so that the risk to persons or the environment is maintained at an acceptable level. Sufficient information about the risks and technical advice on these risks should be taken into account when decisions are taken. Where possible, to reduce administrative burdens, especially for small and medium-sized enterprises, procedures and measures should be integrated with those under other relevant Union legislation.

(19) In order to promote access to environmental information under the Convention of the United Nations Economic Commission for Europe on access to information, public participation in decision-making and access to justice in environmental matters (the Aarhus Convention), which was approved on behalf of the Union by Council Decision 2005/370/EC of 17 February 2005 on the conclusion, on behalf of the European Community, of the Convention on access to information, public participation in decision-making and access to justice in environmental matters [2], the level and quality of information to the public should be improved. In particular, persons likely to be affected by a major accident should be given sufficient information on the correct action to be taken in that event. Member States should make information available on where to find information on the rights of persons affected by a major accident. Information disseminated to the public should be worded clearly and intelligibly. In addition to providing information in an active way, without the public having to submit a request, and without precluding other forms of dissemination, it should also be made available permanently and kept up to date electronically. At the same time there should be appropriate confidentiality safeguards, to address security-related concerns, among others.

(20) The way information is managed should be in line with the Shared Environmental Information System (SEIS) initiative introduced by the Commission Communication of 1 February 2008 entitled 'Towards a Shared Environmental Information System (SEIS)'. It should also be in line with Directive 2007/2/EC of the European Parliament and of the Council of 14 March 2007 establishing an Infrastructure for Spatial Information in the European Community (INSPIRE) [3] and its implementing rules, aimed at enabling the sharing of environmental spatial information among public sector organisations and better facilitating public access to spatial information across the Union. Information should be held on a publicly available database at Union level, which will also facilitate monitoring and reporting on implementation.

[1] OJ L 143, 30.4.2004, p. 56.

[2] OJ L 124, 17.5.2005, p. 1.

[3] OJ L 108, 25.4.2007, p. 1.

(21) In line with the Aarhus Convention, effective public participation in decision-making is necessary to enable the public concerned to express, and the decision-maker to take account of, opinions and concerns that may be relevant to those decisions, thereby increasing the accountability and transparency of the decision-making process and contributing to public awareness of environmental issues and support for the decisions taken.

(22) In order to ensure that adequate response measures are taken if a major accident occurs, the operator should immediately inform the competent authority and communicate the information necessary to enable it to assess the effects of that accident on human health and on the environment.

(23) Local authorities have an interest in the prevention of major accidents and mitigation of their consequences and can have an important role to play. This should be taken into account by the Member States in the implementation of this Directive.

(24) In order to facilitate the exchange of information and to prevent future accidents of a similar nature, Member States should forward information to the Commission regarding major accidents occurring on their territory, so that the Commission can analyse the hazards involved, and operate a system for the distribution of information concerning, in particular, major accidents and lessons learned from them. That exchange of information should also cover 'near misses' which Member States regard as being of particular technical interest for preventing major accidents and limiting their consequences. Member States and the Commission should strive to ensure the completeness of the information held on information systems established to facilitate the exchange of information on major accidents.

(25) Member States should determine the competent authorities responsible for ensuring that operators fulfil their obligations. The competent authorities and the Commission should cooperate in activities in support of implementation such as the development of appropriate guidance and exchanges of best practice. To avoid unnecessary administrative burden, information obligations should be integrated, where appropriate, with those under other relevant Union legislation.

(26) Member States should ensure that competent authorities take the necessary measures in the event of non-compliance with this Directive. In order to ensure effective implementation and enforcement, there should be a system of inspections, including a programme of routine inspections at regular intervals and non-routine inspections. Where possible, inspections should be coordinated with those under other Union legislation, including Directive 2010/75/EU of the European Parliament and of the Council of 24 November 2010 on industrial emissions (integrated pollution prevention and control) [1], where appropriate. Member States should ensure that sufficient staff is available with the skills and qualifications needed to carry out inspections effectively. Competent authorities should provide appropriate support using tools and mechanisms for exchanging experience and consolidating knowledge, including at Union level.

(27) In order to take into account technical developments, the power to adopt acts in accordance with Article 290 of the Treaty on the Functioning of the European Union should be delegated to the Commission in respect of amending Annexes II to VI to adapt them to technical progress. It is of particular importance that the Commission carry out appropriate consultations during its preparatory work, including at expert level. The Commission, when preparing and drawing up delegated acts, should ensure a simultaneous, timely and appropriate transmission of relevant documents to the European Parliament and to the Council.

(28) In order to ensure uniform conditions for the implementation of this Directive, implementing powers should be conferred on the Commission. Those powers should be exercised in accordance with Regulation (EU) No 182/2011 of the European Parliament and of the Council of 16 February 2011 laying down the rules and general principles concerning mechanisms for control by the Member States of the Commission's exercise of implementing powers [2].

(29) Member States should lay down rules on penalties applicable to infringements of the national provisions adopted pursuant to this Directive and ensure that they are implemented. Those penalties should be effective, proportionate and dissuasive.

(30) Since the objective of this Directive, namely to ensure a high level of protection of human health and the environment, cannot be sufficiently achieved by Member States and can, therefore, be better achieved at Union level, the Union may adopt measures in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty on European Union. In accordance with the principle of proportionality, as set out in that Article, this Directive does not go beyond what is necessary in order to achieve that objective.

[1] OJ L 334, 17.12.2010, p. 17.
[2] OJ L 55, 28.2.2011, p. 13.

(31) In accordance with the Joint Political Declaration of Member States and the Commission of 28 September 2011 on explanatory documents [1], Member States have undertaken to accompany, in justified cases, the notification of their transposition measures with one or more documents explaining the relationship between the components of a directive and the corresponding parts of national transposition instruments. With regard to this Directive, the legislator considers the transmission of such documents to be justified.

(32) Directive 96/82/EC should therefore be amended and subsequently repealed,

HAVE ADOPTED THIS DIRECTIVE:

Article 1

Subject matter

This Directive lays down rules for the prevention of major accidents which involve dangerous substances, and the limitation of their consequences for human health and the environment, with a view to ensuring a high level of protection throughout the Union in a consistent and effective manner.

Article 2

Scope

1. This Directive shall apply to establishments as defined in Article 3(1).

2. This Directive shall not apply to any of the following:

(a) military establishments, installations or storage facilities;

(b) hazards created by ionising radiation originating from substances;

(c) the transport of dangerous substances and directly related intermediate temporary storage by road, rail, internal waterways, sea or air, outside the establishments covered by this Directive, including loading and unloading and transport to and from another means of transport at docks, wharves or marshalling yards;

(d) the transport of dangerous substances in pipelines, including pumping stations, outside establishments covered by this Directive;

(e) the exploitation, namely the exploration, extraction and processing, of minerals in mines and quarries, including by means of boreholes;

(f) the offshore exploration and exploitation of minerals, including hydrocarbons;

(g) the storage of gas at underground offshore sites including both dedicated storage sites and sites where exploration and exploitation of minerals, including hydrocarbons are also carried out;

(h) waste land-fill sites, including underground waste storage.

Notwithstanding points (e) and (h) of the first subparagraph, onshore underground gas storage in natural strata, aquifers, salt cavities and disused mines and chemical and thermal processing operations and storage related to those operations which involve dangerous substances, as well as operational tailings disposal facilities, including tailing ponds or dams, containing dangerous substances shall be included within the scope of this Directive.

Article 3

Definitions

For the purposes of this Directive the following definitions shall apply:

1. 'establishment' means the whole location under the control of an operator where dangerous substances are present in one or more installations, including common or related infrastructures or activities; establishments are either lower-tier establishments or upper-tier establishments;

2. 'lower-tier establishment' means an establishment where dangerous substances are present in quantities equal to or in excess of the quantities listed in Column 2 of Part 1 or in Column 2 of Part 2 of Annex I, but less than the quantities listed in Column 3 of Part 1 or in Column 3 of Part 2 of Annex I, where applicable using the summation rule laid down in note 4 to Annex I;

3. 'upper-tier establishment' means an establishment where dangerous substances are present in quantities equal to or in excess of the quantities listed in Column 3 of Part 1 or in Column 3 of Part 2 of Annex I, where applicable using the summation rule laid down in note 4 to Annex I;

4. 'neighbouring establishment' means an establishment that is located in such proximity to another establishment so as to increase the risk or consequences of a major accident;

5. 'new establishment' means

   (a) an establishment that enters into operation or is constructed, on or after 1 June 2015; or

[1] OJ C 369, 17.12.2011, p. 14.

(b) a site of operation that falls within the scope of this Directive, or a lower-tier establishment that becomes an upper-tier establishment or vice versa, on or after 1 June 2015 due to modifications to its installations or activities resulting in a change in its inventory of dangerous substances;

6. 'existing establishment' means an establishment that on 31 May 2015 falls within the scope of Directive 96/82/EC and from 1 June 2015 falls within the scope of this Directive without changing its classification as a lower-tier establishment or upper-tier establishment;

7. 'other establishment' means a site of operation that falls within the scope of this Directive, or a lower-tier establishment that becomes an upper-tier establishment or vice versa, on or after 1 June 2015 for reasons other than those referred to in point 5;

8. 'installation' means a technical unit within an establishment and whether at or below ground level, in which dangerous substances are produced, used, handled or stored; it includes all the equipment, structures, pipework, machinery, tools, private railway sidings, docks, unloading quays serving the installation, jetties, warehouses or similar structures, floating or otherwise, necessary for the operation of that installation;

9. 'operator' means any natural or legal person who operates or controls an establishment or installation or, where provided for by national legislation, to whom the decisive economic or decision-making power over the technical functioning of the establishment or installation has been delegated;

10. 'dangerous substance' means a substance or mixture covered by Part 1 or listed in Part 2 of Annex I, including in the form of a raw material, product, by-product, residue or intermediate;

11. 'mixture' means a mixture or solution composed of two or more substances;

12. 'presence of dangerous substances' means the actual or anticipated presence of dangerous substances in the establishment, or of dangerous substances which it is reasonable to foresee may be generated during loss of control of the processes, including storage activities, in any installation within the establishment, in quantities equal to or exceeding the qualifying quantities set out in Part 1 or Part 2 of Annex I;

13. 'major accident' means an occurrence such as a major emission, fire, or explosion resulting from uncontrolled developments in the course of the operation of any establishment covered by this Directive, and leading to serious danger to human health or the environment, immediate or delayed, inside or outside the establishment, and involving one or more dangerous substances;

14. 'hazard' means the intrinsic property of a dangerous substance or physical situation, with a potential for creating damage to human health or the environment;

15. 'risk' means the likelihood of a specific effect occurring within a specified period or in specified circumstances;

16. 'storage' means the presence of a quantity of dangerous substances for the purposes of warehousing, depositing in safe custody or keeping in stock;

17. 'the public' means one or more natural or legal persons and, in accordance with national law or practice, their associations, organisations or groups;

18. 'the public concerned' means the public affected or likely to be affected by, or having an interest in, the taking of a decision on any of the matters covered by Article 15(1); for the purposes of this definition, non-governmental organisations promoting environmental protection and meeting any applicable requirements under national law shall be deemed to have an interest;

19. 'inspection' means all actions, including site visits, checks of internal measures, systems and reports and follow-up documents, and any necessary follow-up, undertaken by or on behalf of the competent authority to check and promote compliance of establishments with the requirements of this Directive.

Article 4

Assessment of major-accident hazards for a particular dangerous substance

1. The Commission shall assess, where appropriate or in any event on the basis of a notification by a Member State in accordance with paragraph 2, whether it is impossible in practice for a particular dangerous substance covered by Part 1 or listed in Part 2 of Annex I, to cause a release of matter or energy that could create a major accident under both normal and abnormal conditions which can reasonably be foreseen. That assessment shall take into account the information referred to in paragraph 3, and shall be based on one or more of the following characteristics:

(a) the physical form of the dangerous substance under normal processing or handling conditions or in an unplanned loss of containment;

(b) the inherent properties of the dangerous substance, in particular those related to dispersive behaviour in a major-accident scenario, such as molecular mass and saturated vapour pressure;

(c) the maximum concentration of the substances in the case of mixtures.

For the purposes of the first subparagraph, the containment and generic packing of the dangerous substance should, where appropriate, also be taken into account, including in particular where covered under specific Union legislation.

2. Where a Member State considers that a dangerous substance does not present a major-accident hazard in accordance with paragraph 1, it shall notify the Commission together with supporting justification, including the information referred to in paragraph 3.

3. For the purposes of paragraphs 1 and 2, information necessary for assessing the health, physical and environmental hazard properties of the dangerous substance concerned shall include:

(a) a comprehensive list of properties necessary to assess the dangerous substance's potential for causing physical, health or environmental harm;

(b) physical and chemical properties (for instance molecular mass, saturated vapour pressure, inherent toxicity, boiling point, reactivity, viscosity, solubility and other relevant properties);

(c) health and physical hazard properties (for instance reactivity, flammability, toxicity together with additional factors such as mode of attack on the body, injury to fatality ratio, and long-term effects, and other properties as relevant);

(d) environmental hazard properties (for instance ecotoxicity, persistence, bio-accumulation, potential for long-range environmental transport, and other properties as relevant);

(e) where available, the Union classification of the substance or mixture;

(f) information about substance-specific operating conditions (for instance temperature, pressure and other conditions as relevant) under which the dangerous substance is stored, used and/or may be present in the event of foreseeable abnormal operations or an accident such as fire.

4. Following the assessment referred to in paragraph 1, the Commission shall, if appropriate, present a legislative proposal to the European Parliament and to the Council to exclude the dangerous substance concerned from the scope of this Directive.

Article 5

General obligations of the operator

1. Member States shall ensure that the operator is obliged to take all necessary measures to prevent major accidents and to limit their consequences for human health and the environment.

2. Member States shall ensure that the operator is required to prove to the competent authority referred to in Article 6, at any time, in particular for the purposes of inspections and controls referred to in Article 20, that the operator has taken all necessary measures as specified in this Directive.

Article 6

Competent authority

1. Without prejudice to the operator's responsibilities, Member States shall set up or appoint the competent authority or authorities responsible for carrying out the duties laid down in this Directive ('the competent authority') and, if necessary, bodies to assist the competent authority at technical level. Member States which set up or appoint more than one competent authority shall ensure that the procedures for carrying out their duties are fully coordinated.

2. The competent authorities and the Commission shall cooperate in activities in support of implementation of this Directive, involving stakeholders as appropriate.

3. Member States shall ensure that competent authorities accept equivalent information submitted by operators in accordance with other relevant Union legislation, which fulfils any of the requirements of this Directive, for the purposes of this Directive. In such cases the competent authorities shall ensure that the requirements of this Directive are complied with.

Article 7

Notification

1. Member States shall require the operator to send a notification to the competent authority containing the following information:

(a) the name and/or trade name of the operator and the full address of the establishment concerned;

(b) the registered place of business of the operator, with the full address;

(c) the name and position of the person in charge of the establishment, if different from point (a);

(d) information sufficient to identify the dangerous substances and category of substances involved or likely to be present;

(e) the quantity and physical form of the dangerous substance or substances concerned;

(f) the activity or proposed activity of the installation or storage facility;

(g) the immediate environment of the establishment, and factors likely to cause a major accident or to aggravate the consequences thereof including, where available, details of neighbouring establishments, of sites that fall outside the scope of this Directive, areas and developments that could be the source of or increase the risk or consequences of a major accident and of domino effects.

2. The notification or its update shall be sent to the competent authority within the following time-limits:

(a) for new establishments, a reasonable period of time prior to the start of construction or operation, or prior to the modifications leading to a change in the inventory of dangerous substances;

(b) for all other cases, one year from the date from which this Directive applies to the establishment concerned.

3. Paragraphs 1 and 2 shall not apply if the operator has already sent a notification to the competent authority under the requirements of national legislation before 1 June 2015, and the information contained therein complies with paragraph 1 and has remained unchanged.

4. The operator shall inform the competent authority in advance of the following events:

(a) any significant increase or decrease in the quantity or significant change in the nature or physical form of the dangerous substance present, as indicated in the notification provided by the operator pursuant to paragraph 1, or a significant change in the processes employing it;

(b) modification of an establishment or an installation which could have significant consequences in terms of major-accident hazards;

(c) the permanent closure of the establishment or its decommissioning; or

(d) changes in the information referred to in points (a), (b) or (c) of paragraph 1.

Article 8

Major-accident prevention policy

1. Member States shall require the operator to draw up a document in writing setting out the major-accident prevention policy (MAPP) and to ensure that it is properly implemented. The MAPP shall be designed to ensure a high level of protection of human health and the environment. It shall be proportionate to the major-accident hazards. It shall include the operator's overall aims and principles of action, the role and responsibility of management, as well as the commitment towards continuously improving the control of major-accident hazards, and ensuring a high level of protection.

2. The MAPP shall be drawn up and, where required by national law, sent to the competent authority within the following time-limits:

(a) for new establishments, a reasonable period of time prior to the start of construction or operation, or prior to the modifications leading to a change in the inventory of dangerous substances;

(b) for all other cases, one year from the date from which this Directive applies to the establishment concerned.

3. Paragraphs 1 and 2 shall not apply if the operator has already established the MAPP and, where required by national law, sent it to the competent authority before 1 June 2015, and the information contained therein complies with paragraph 1 and has remained unchanged.

4. Without prejudice to Article 11, the operator shall periodically review and where necessary update the MAPP, at least every five years. Where required by national law the updated MAPP shall be sent to the competent authority without delay.

5. The MAPP shall be implemented by appropriate means, structures and by a safety management system, in accordance with Annex III, proportionate to the major-accident hazards, and the complexity of the organisation or the activities of the establishment. For lower-tier establishments, the obligation to implement the MAPP may be fulfilled by other appropriate means, structures and management systems, proportionate to major-accident hazards, taking into account the principles set out in Annex III.

Article 9

Domino effects

1. Member States shall ensure that the competent authority, using the information received from the operators in accordance with Articles 7 and 10, or following a request for additional information from the competent authority, or through inspections pursuant to Article 20, identifies all lower-tier and upper-tier establishments or groups of establishments where the risk or consequences of a major accident may be increased because of the geographical position and the proximity of such establishments, and their inventories of dangerous substances.

2. Where the competent authority has additional information to that provided by the operator pursuant to point (g) of Article 7(1), it shall make this information available to that operator, if it is necessary for the application of this Article.

3. Member States shall ensure that operators of the establishments identified in accordance with paragraph 1:

(a) exchange suitable information to enable those establishments to take account of the nature and extent of the overall hazard of a major accident in their MAPP, safety management systems, safety reports and internal emergency plans, as appropriate;

(b) cooperate in informing the public and neighbouring sites that fall outside the scope of this Directive, and in supplying information to the authority responsible for the preparation of external emergency plans.

Article 10

Safety report

1. Member States shall require the operator of an upper-tier establishment to produce a safety report for the purposes of:

(a) demonstrating that a MAPP and a safety management system for implementing it have been put into effect in accordance with the information set out in Annex III;

(b) demonstrating that major-accident hazards and possible major-accident scenarios have been identified and that the necessary measures have been taken to prevent such accidents and to limit their consequences for human health and the environment;

(c) demonstrating that adequate safety and reliability have been taken into account in the design, construction, operation and maintenance of any installation, storage facility, equipment and infrastructure connected with its operation which are linked to major-accident hazards inside the establishment;

(d) demonstrating that internal emergency plans have been drawn up and supplying information to enable the external emergency plan to be drawn up;

(e) providing sufficient information to the competent authority to enable decisions to be made regarding the siting of new activities or developments around existing establishments.

2. The safety report shall contain at least the data and information listed in Annex II. It shall name the relevant organisations involved in the drawing up of the report.

3. The safety report shall be sent to the competent authority within the following time-limits:

(a) for new establishments, a reasonable period of time prior to the start of construction or operation, or prior to the modifications leading to a change in the inventory of dangerous substances;

(b) for existing upper-tier establishments, 1 June 2016;

(c) for other establishments, two years from the date from which this Directive applies to the establishment concerned.

4. Paragraphs 1, 2 and 3 shall not apply if the operator has already sent the safety report to the competent authority under the requirements of national law before 1 June 2015, and the information contained therein complies with paragraphs 1 and 2 and has remained unchanged. In order to comply with paragraphs 1 and 2, the operator shall submit any changed parts of the safety report in the format agreed by the competent authority, subject to the time-limits referred to in paragraph 3.

5. Without prejudice to Article 11, the operator shall periodically review and where necessary update the safety report at least every five years.

The operator shall also review and where necessary update the safety report following a major accident at its establishment, and at any other time at the initiative of the operator or at the request of the competent authority, where justified by new facts or by new technological knowledge about safety matters, including knowledge arising from analysis of accidents or, as far as possible, 'near misses', and by developments in knowledge concerning the assessment of hazards.

The updated safety report or updated parts thereof shall be sent to the competent authority without delay.

6. Before the operator commences construction or operation, or in the cases referred to in points (b) and (c) of paragraph 3 and in paragraph 5 of this Article, the competent authority shall within a reasonable period of receipt of the report communicate the conclusions of its examination of the safety report to the operator and, where appropriate, in accordance with Article 19, prohibit the bringing into use, or the continued use, of the establishment concerned.

Article 11

Modification of an installation, an establishment or a storage facility

In the event of the modification of an installation, establishment, storage facility, or process or of the nature or physical form or quantity of dangerous substances which could have significant consequences for major-accident hazards, or could result in a lower-tier establishment becoming an upper-tier establishment or vice versa, Member States shall ensure that the operator reviews, and where necessary updates the notification, the MAPP, the safety management system and the safety report and informs the competent authority of the details of those updates in advance of that modification.

Article 12

Emergency plans

1. Member States shall ensure that, for all upper-tier establishments:

(a) the operator draws up an internal emergency plan for the measures to be taken inside the establishment;

(b) the operator supplies the necessary information to the competent authority, to enable the latter to draw up external emergency plans;

(c) the authorities designated for that purpose by the Member State draw up an external emergency plan for the measures to be taken outside the establishment within two years following receipt of the necessary information from the operator pursuant to point (b).

2. Operators shall comply with the obligations set out in points (a) and (b) of paragraph 1 within the following time-limits:

(a) for new establishments, a reasonable period of time prior to the start of operation, or prior to the modifications leading to a change in the inventory of dangerous substances;

(b) for existing upper-tier establishments, by 1 June 2016 unless the internal emergency plan drawn up under the requirements of national law before that date, and the information contained therein, and the information referred to in point (b) of paragraph 1, complies with this Article and has remained unchanged;

(c) for other establishments, two years from the date from which this Directive applies to the establishment concerned.

3. The emergency plans shall be established with the following objectives:

(a) containing and controlling incidents so as to minimise the effects, and to limit damage to human health, the environment and property;

(b) implementing the necessary measures to protect human health and the environment from the effects of major accidents;

(c) communicating the necessary information to the public and to the services or authorities concerned in the area;

(d) providing for the restoration and clean-up of the environment following a major accident.

Emergency plans shall contain the information set out in Annex IV.

4. Member States shall ensure that the internal emergency plans provided for in this Directive are drawn up in consultation with the personnel working inside the establishment, including long-term relevant subcontracted personnel.

5. Member States shall ensure that the public concerned is given early opportunity to give its opinion on external emergency plans when they are being established or substantially modified.

6. Member States shall ensure that internal and external emergency plans are reviewed, tested, and where necessary updated by the operators and designated authorities respectively at suitable intervals of no longer than three years. The review shall take into account changes occurring in the establishments concerned or within the emergency services concerned, new technical knowledge, and knowledge concerning the response to major accidents.

With regard to external emergency plans, Member States shall take into account the need to facilitate enhanced cooperation in civil protection assistance in major emergencies.

7. Member States shall ensure that emergency plans are put into effect without delay by the operator and, if necessary, by the competent authority designated for this purpose when a major accident occurs, or when an uncontrolled event occurs which by its nature could reasonably be expected to lead to a major accident.

8. The competent authority may decide, giving reasons for their decision, in view of the information contained in the safety report, that the requirement to produce an external emergency plan under paragraph 1 shall not apply.

Article 13

Land-use planning

1. Member States shall ensure that the objectives of preventing major accidents and limiting the consequences of such accidents for human health and the environment are taken into account in their land-use policies or other relevant policies. They shall pursue those objectives through controls on:

(a) the siting of new establishments;

(b) modifications to establishments covered by Article 11;

(c) new developments including transport routes, locations of public use and residential areas in the vicinity of establishments, where the siting or developments may be the source of or increase the risk or consequences of a major accident.

2. Member States shall ensure that their land-use or other relevant policies and the procedures for implementing those policies take account of the need, in the long term:

(a) to maintain appropriate safety distances between establishments covered by this Directive and residential areas, buildings and areas of public use, recreational areas, and, as far as possible, major transport routes;

(b) to protect areas of particular natural sensitivity or interest in the vicinity of establishments, where appropriate through appropriate safety distances or other relevant measures;

(c) in the case of existing establishments, to take additional technical measures in accordance with Article 5 so as not to increase the risks to human health and the environment.

3. Member States shall ensure that all competent authorities and planning authorities responsible for decisions in this area set up appropriate consultation procedures to facilitate implementation of the policies established under paragraph 1. The procedures shall be designed to ensure that operators provide sufficient information on the risks arising from the establishment and that technical advice on those risks is available, either on a case-by-case or on a generic basis, when decisions are taken.

Member States shall ensure that operators of lower-tier establishments provide, at the request of the competent authority, sufficient information on the risks arising from the establishment necessary for land-use planning purposes.

4. The requirements of paragraphs 1, 2 and 3 of this Article shall apply without prejudice to the provisions of Directive 2011/92/EU of the European Parliament and of the Council of 13 December 2011 on the assessment of the effects of certain public and private projects on the environment [1], Directive 2001/42/EC of the European Parliament and of the Council of 27 June 2001 on the assessment of the effects of certain plans and programmes on the environment [2] and other relevant Union legislation. Member States may provide for coordinated or joint procedures in order to fulfil the requirements of this Article and the requirements of that legislation, inter alia, to avoid duplication of assessment or consultations.

Article 14

Information to the public

1. Member States shall ensure that the information referred to in Annex V is permanently available to the public, including electronically. The information shall be kept updated, where necessary, including in the event of modifications covered by Article 11.

2. For upper-tier establishments, Member States shall also ensure that:

(a) all persons likely to be affected by a major accident receive regularly and in the most appropriate form, without having to request it, clear and intelligible information on safety measures and requisite behaviour in the event of a major accident;

(b) the safety report is made available to the public upon request subject to Article 22(3); where Article 22(3) applies, an amended report, for instance in the form of a non-technical summary, which shall include at least general information on major-accident hazards and on potential effects on human health and the environment in the event of a major accident, shall be made available;

(c) the inventory of dangerous substances is made available to the public upon request subject to Article 22(3).

The information to be supplied under point (a) of the first subparagraph of this paragraph shall include at least the information referred to in Annex V. That information shall likewise be supplied to all buildings and areas of public use, including schools and hospitals, and to all neighbouring establishments in the case of establishments covered by Article 9. Member States shall ensure that the information is supplied at least every five years and periodically reviewed and where necessary, updated, including in the event of modifications covered by Article 11.

3. Member States shall, with respect to the possibility of a major accident with transboundary effects originating in an upper-tier establishment, provide sufficient information to the

[1] OJ L 26, 28.1.2012, p. 1.
[2] OJ L 197, 21.7.2001, p. 30.

potentially affected Member States so that all relevant provisions contained in Articles 12 and 13 and in this Article can be applied, where applicable, by the potentially affected Member States.

4. Where the Member State concerned has decided that an establishment close to the territory of another Member State is incapable of creating a major-accident hazard beyond its boundary for the purposes of Article 12(8) and is not therefore required to produce an external emergency plan under Article 12(1), it shall inform the other Member State of its reasoned decision.

Article 15

Public consultation and participation in decision-making

1. Member States shall ensure that the public concerned is given an early opportunity to give its opinion on specific individual projects relating to:

(a) planning for new establishments pursuant to Article 13;

(b) significant modifications to establishments under Article 11, where such modifications are subject to obligations provided for in Article 13;

(c) new developments around establishments where the siting or developments may increase the risk or consequences of a major accident pursuant to Article 13.

2. With regard to the specific individual projects referred to in paragraph 1, the public shall be informed by public notices or other appropriate means, including electronic media where available, of the following matters early in the procedure for the taking of a decision or, at the latest, as soon as the information can reasonably be provided:

(a) the subject of the specific project;

(b) where applicable, the fact that a project is subject to a national or transboundary environmental impact assessment or to consultations between Member States in accordance with Article 14(3);

(c) details of the competent authority responsible for taking the decision, from which relevant information can be obtained and to which comments or questions can be submitted, and details of the time schedule for transmitting comments or questions;

(d) the nature of possible decisions or, where there is one, the draft decision;

(e) an indication of the times and places where, or means by which, the relevant information will be made available;

(f) details of the arrangements for public participation and consultation made pursuant to paragraph 7 of this Article.

3. With regard to the specific individual projects referred to in paragraph 1, Member States shall ensure that, within appropriate time-frames, the following is made available to the public concerned:

(a) in accordance with national legislation, the main reports and advice issued to the competent authority at the time when the public concerned was informed pursuant to paragraph 2;

(b) in accordance with the provisions of Directive 2003/4/EC of the European Parliament and of the Council of 28 January 2003 on public access to environmental information [1], information other than that referred to in paragraph 2 of this Article which is relevant for the decision in question and which only becomes available after the public concerned was informed in accordance with that paragraph.

4. Member States shall ensure that the public concerned is entitled to express comments and opinions to the competent authority before a decision is taken on a specific individual project as referred to in paragraph 1, and that the results of the consultations held pursuant to paragraph 1 are duly taken into account in the taking of a decision.

5. Member States shall ensure that when the relevant decisions are taken, the competent authority shall make available to the public:

(a) the content of the decision and the reasons on which it is based, including any subsequent updates;

(b) the results of the consultations held before the decision was taken and an explanation of how they were taken into account in that decision.

6. Where general plans or programmes are being established relating to the matters referred to in points (a) or (c) of paragraph 1, Member States shall ensure that the public is given early and effective opportunities to participate in their preparation and modification or review using the procedures set out in Article 2(2) of Directive 2003/35/EC of the European Parliament and of the Council of 26 May 2003 providing for public participation in respect of the drawing up of certain plans and programmes relating to the environment [2].

Member States shall identify the public entitled to participate for the purposes of this paragraph, including relevant non-governmental organisations meeting any relevant requirements imposed under national law, such as those promoting environmental protection.

[1] OJ L 41, 14.2.2003, p. 26.
[2] OJ L 156, 25.6.2003, p. 17.

This paragraph shall not apply to plans and programmes for which a public participation procedure is carried out under Directive 2001/42/EC.

7. The detailed arrangements for informing the public and consulting the public concerned shall be determined by the Member States.

Reasonable time-frames for the different phases shall be provided, allowing sufficient time for informing the public and for the public concerned to prepare and participate effectively in environmental decision-making subject to the provisions of this Article.

Article 16

Information to be supplied by the operator and actions to be taken following a major accident

Member States shall ensure that, as soon as practicable following a major accident, the operator shall be required, using the most appropriate means to:

(a) inform the competent authority;

(b) provide the competent authority with the following information as soon as it becomes available:

(i) the circumstances of the accident;

(ii) the dangerous substances involved;

(iii) the data available for assessing the effects of the accident on human health, the environment and property;

(iv) the emergency measures taken;

(c) inform the competent authority of the steps envisaged to:

(i) mitigate the medium-term and long-term effects of the accident;

(ii) prevent any recurrence of such an accident;

(d) update the information provided if further investigation reveals additional facts which alter that information or the conclusions drawn.

Article 17

Action to be taken by the competent authority following a major accident

Following a major accident, Member States shall require the competent authority to:

(a) ensure that any urgent, medium-term and long-term measures which may prove necessary are taken;

(b) collect, by inspection, investigation or other appropriate means, the information necessary for a full analysis of the technical, organisational and managerial aspects of the accident;

(c) take appropriate action to ensure that the operator takes any necessary remedial measures;

(d) make recommendations on future preventive measures; and

(e) inform the persons likely to be affected, of the accident which has occurred and, where relevant, of the measures undertaken to mitigate its consequences.

Article 18

Information to be supplied by the Member States following a major accident

1. For the purpose of prevention and mitigation of major accidents, Member States shall inform the Commission of major accidents meeting the criteria of Annex VI which have occurred within their territory. They shall provide it with the following details:

(a) the Member State, the name and address of the authority responsible for the report;

(b) the date, time and place of the accident, including the full name of the operator and the address of the establishment involved;

(c) a brief description of the circumstances of the accident, including the dangerous substances involved, and the immediate effects on human health and the environment;

(d) a brief description of the emergency measures taken and of the immediate precautions necessary to prevent recurrence;

(e) the results of their analysis and recommendations.

2. The information referred to in paragraph 1 of this Article shall be provided as soon as practicable and at the latest within one year of the date of the accident, using the database referred to in Article 21(4). Where only preliminary information under point (e) of paragraph 1 can be provided within this time-limit for inclusion in the database, the information shall be updated once the results of further analysis and recommendations are available.

Reporting of the information referred to in point (e) of paragraph 1 by Member States may be delayed to allow for the completion of judicial proceedings where such reporting may affect those proceedings.

3. For the purposes of providing the information referred to in paragraph 1 of this Article by Member States, a report form shall be established in the form of implementing acts. Those implementing acts shall be adopted in accordance with the examination procedure referred to in Article 27(2).

4. Member States shall inform the Commission of the name and address of any body which might have relevant information on major accidents and which is able to advise the competent authorities of other Member States which have to intervene in the event of such an accident.

Article 19

Prohibition of use

1. Member States shall prohibit the use or bringing into use of any establishment, installation or storage facility, or any part thereof where the measures taken by the operator for the prevention and mitigation of major accidents are seriously deficient. To this end, Member States shall, inter alia, take into account serious failures to take the necessary actions identified in the inspection report.

Member States may prohibit the use or bringing into use of any establishment, installation or storage facility, or any part thereof if the operator has not submitted the notification, reports or other information required by this Directive within the specified period.

2. Member States shall ensure that operators may appeal against a prohibition order by a competent authority under paragraph 1 to an appropriate body determined by national law and procedures.

Article 20

Inspections

1. Member States shall ensure that the competent authorities organise a system of inspections.

2. Inspections shall be appropriate to the type of establishment concerned. They shall not be dependent upon receipt of the safety report or any other report submitted. They shall be sufficient for a planned and systematic examination of the systems being employed at the establishment, whether of a technical, organisational or managerial nature, so as to ensure in particular that:

(a) the operator can demonstrate that he has taken appropriate measures, in connection with the various activities of the establishment, to prevent major accidents;

(b) the operator can demonstrate that he has provided appropriate means for limiting the consequences of major accidents, on-site and off-site;

(c) the data and information contained in the safety report, or any other report submitted, adequately reflects the conditions in the establishment;

(d) information has been supplied to the public pursuant to Article 14.

3. Member States shall ensure that all establishments are covered by an inspection plan at national, regional or local level and shall ensure that this plan is regularly reviewed and, where appropriate, updated.

Each inspection plan shall include the following:

(a) a general assessment of relevant safety issues;

(b) the geographical area covered by the inspection plan;

(c) a list of the establishments covered by the plan;

(d) a list of groups of establishments with possible domino effects pursuant to Article 9;

(e) a list of establishments where particular external risks or hazard sources could increase the risk or consequences of a major accident;

(f) procedures for routine inspections, including the programmes for such inspections pursuant to paragraph 4;

(g) procedures for non-routine inspections pursuant to paragraph 6;

(h) provisions on the co-operation between different inspection authorities.

4. Based on the inspection plans referred to in paragraph 3, the competent authority shall regularly draw up programmes for routine inspections for all establishments including the frequency of site visits for different types of establishments.

The period between two consecutive site visits shall not exceed one year for upper-tier establishments and three years for lower-tier establishments, unless the competent authority has drawn up an inspection programme based on a systematic appraisal of major-accident hazards of the establishments concerned.

5. The systematic appraisal of the hazards of the establishments concerned shall be based on at least the following criteria:

(a) the potential impacts of the establishments concerned on human health and the environment;

(b) the record of compliance with the requirements of this Directive.

Where appropriate, relevant findings of inspections carried out under other Union legislation shall also be taken into account.

6. Non-routine inspections shall be carried out to investigate serious complaints, serious accidents and 'near misses', incidents and occurrences of non-compliance as soon as possible.

7. Within four months after each inspection, the competent authority shall communicate the conclusions of the inspection and all the necessary actions identified to the operator. The competent authority shall ensure that the operator takes all those necessary actions within a reasonable period after receipt of the communication.

8. If an inspection has identified an important case of non-compliance with this Directive, an additional inspection shall be carried out within six months.

9. Inspections shall, where possible, be coordinated with inspections under other Union legislation and combined, where appropriate.

10. Member States shall encourage the competent authorities to provide mechanisms and tools for exchanging experience and consolidating knowledge, and to participate in such mechanisms at Union level where appropriate.

11. Member States shall ensure that operators provide the competent authorities with all necessary assistance to enable those authorities to carry out any inspection and to gather any information necessary for the performance of their duties for the purposes of this Directive, in particular to allow the authorities to fully assess the possibility of a major accident and to determine the scope of possible increased probability or aggravation of major accidents, to prepare an external emergency plan and to take into account substances which, due to their physical form, particular conditions or location, may require additional consideration.

Article 21

Information system and exchanges

1. Member States and the Commission shall exchange information on the experience acquired with regard to the prevention of major accidents and the limitation of their consequences. This information shall concern, in particular, the functioning of the measures provided for in this Directive.

2. By 30 September 2019, and every four years thereafter, Member States shall provide the Commission with a report on the implementation of this Directive.

3. For establishments covered by this Directive, Member States shall supply the Commission with at least the following information:

(a) the name or trade name of the operator and the full address of the establishment concerned;

(b) the activity or activities of the establishment.

The Commission shall set up and keep up to date a database containing the information supplied by the Member States. Access to the database shall be restricted to persons authorised by the Commission or the competent authorities of the Member States.

4. The Commission shall set up and keep at the disposal of Member States a database containing, in particular, details of the major accidents which have occurred within the territory of Member States, for the purpose of:

(a) the rapid dissemination of the information supplied by Member States pursuant to Article 18(1) and (2) among all competent authorities;

(b) distribution to competent authorities of an analysis of the causes of major accidents and the lessons learned from them;

(c) supply of information to competent authorities on preventive measures;

(d) provision of information on organisations able to provide advice or relevant information on the occurrence, prevention and mitigation of major accidents.

5. The Commission shall, by 1 January 2015, adopt implementing acts to establish the formats for communicating the information referred to in paragraphs 2 and 3 of this Article from Member States and the relevant databases referred to in paragraphs 3 and 4. Those implementing acts shall be adopted in accordance with the examination procedure referred to in Article 27(2).

6. The databases referred to in paragraph 4 shall contain, at least:

(a) the information supplied by Member States in accordance with Article 18(1) and (2);

(b) an analysis of the causes of the accidents;

(c) the lessons learned from the accidents;

(d) the preventive measures necessary to prevent a recurrence.

7. The Commission shall make publicly available the non-confidential part of the data.

Article 22

Access to information and confidentiality

1. Member States shall ensure, in the interests of transparency, that the competent authority is required to make any information held pursuant to this Directive available to any natural or legal person who so requests in accordance with Directive 2003/4/EC.

2. Disclosure of any information required under this Directive, including under Article 14, may be refused or restricted by the competent authority where the conditions laid down in Article 4 of Directive 2003/4/EC are fulfilled.

3. Disclosure of the complete information referred to in points (b) and (c) of Article 14(2) held by the competent authority may be refused by that competent authority, without prejudice to paragraph 2 of this Article, if the operator has requested not to disclose certain parts of the safety report or the inventory of dangerous substances for the reasons provided for in Article 4 of Directive 2003/4/EC.

The competent authority may also decide for the same reasons that certain parts of the report or inventory shall not be disclosed. In such cases, and on approval of that authority, the operator shall supply to the competent authority an amended report or inventory excluding those parts.

Article 23

Access to justice

Member States shall ensure that:

(a) any applicant requesting information pursuant to points (b) or (c) of Article 14(2) or Article 22(1) of this Directive is able to seek a review in accordance with Article 6 of Directive 2003/4/EC of the acts or omissions of a competent authority in relation to such a request;

(b) in their respective national legal system, members of the public concerned have access to the review procedures set up in Article 11 of Directive 2011/92/EU for cases subject to Article 15(1) of this Directive.

Article 24

Guidance

The Commission may develop guidance on safety distance and domino effects.

Article 25

Amendment of Annexes

The Commission shall be empowered to adopt delegated acts in accordance with Article 26 in order to adapt Annexes II to VI to technical progress. Such adaptations shall not result in substantial changes in the obligations of the Member States and the operators as laid down in this Directive.

Article 26

Exercise of the delegation

1. The power to adopt delegated acts is conferred on the Commission subject to the conditions laid down in this Article.

2. The power to adopt delegated acts referred to in Article 25 shall be conferred on the Commission for a period of five years from 13 August 2012. The Commission shall draw up a report in respect of the delegation of power no later than nine months before the end of the five-year period. The delegation of power shall be tacitly extended for periods of an identical duration, unless the European Parliament or the Council opposes such extension not later than four months before the end of each period.

3. The delegation of power referred to in Article 25 may be revoked at any time by the European Parliament or by the Council. A decision to revoke shall put an end to the delegation of the power specified in that decision. It shall take effect the day following the publication of the decision in the *Official Journal of the European Union* or at a later date specified therein. It shall not affect the validity of any delegated acts already in force.

4. As soon as it adopts a delegated act, the Commission shall notify it simultaneously to the European Parliament and to the Council.

5. A delegated act adopted pursuant to Article 25 shall enter into force only if no objection has been expressed either by the European Parliament or the Council within a period of two months of notification of that act to the European Parliament and the Council or if, before the expiry of that period, the European Parliament and the Council have both informed the Commission that they will not object. That period shall be extended by two months at the initiative of the European Parliament or of the Council.

Article 27

Committee procedure

1. The Commission shall be assisted by the Committee established by Directive 96/82/EC. That Committee is a committee within the meaning of Regulation (EU) No 182/2011.

2. Where reference is made to this paragraph, Article 5 of Regulation (EU) No 182/2011 shall apply.

Article 28

Penalties

Member States shall determine penalties applicable to infringements of the national provisions adopted pursuant to this Directive. The penalties thus provided for shall be effective, proportionate and dissuasive. Member States shall notify those provisions to the Commission by 1 June 2015 and shall notify it without delay of any subsequent amendment affecting them.

Article 29

Reporting and review

1. By 30 September 2020, and every four years thereafter, the Commission, on the basis of information submitted by Member States in accordance with Article 18 and Article 21(2) and of information held in databases, as referred to in Article 21(3) and (4), and taking into account the implementation of Article 4, shall submit to the European Parliament and to the Council a report on the implementation and efficient functioning of this Directive, including information on major accidents that have occurred within the Union and their potential impact upon the implementation of this Directive. The Commission shall include in the first of those reports an assessment of the need to amend the scope of this Directive. Any report may, where appropriate, be accompanied by a legislative proposal.

2. In the context of relevant Union legislation, the Commission may examine the need to address the issue of financial responsibilities of the operator in relation to major accidents, including issues related to insurance.

Article 30

Amendment of Directive 96/82/EC

In Directive 96/82/EC, the words '(d) heavy fuel oils' are added to the heading 'Petroleum products' in Part 1 of Annex I.

Article 31

Transposition

1. Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with this Directive by 31 May 2015. They shall apply those measures from 1 June 2015.

Notwithstanding the first subparagraph, Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with Article 30 of this Directive by 14 February 2014. They shall apply those measures from 15 February 2014.

They shall forthwith communicate to the Commission the text of those provisions.

When Member States adopt those provisions, they shall contain a reference to this Directive or be accompanied by such a reference on the occasion of their official publication. Member States shall determine how such reference is to be made.

2. Member States shall communicate to the Commission the text of the main provisions of national law which they adopt in the field covered by this Directive.

Article 32

Repeal

1. Directive 96/82/EC is repealed with effect from 1 June 2015.

2. References to the repealed Directive shall be construed as references to this Directive and shall be read in accordance with the correlation table set out in Annex VII.

Article 33

Entry into force

This Directive shall enter into force on the twentieth day following that of its publication in the *Official Journal of the European Union*.

Article 34

Addressees

This Directive is addressed to the Member States.

Done at Strasbourg, 4 July 2012.

For the European Parliament	*For the Council*
The President	*The President*

LIST OF ANNEXES

ANNEX I

DANGEROUS SUBSTANCES

Dangerous substances covered by the hazard categories listed in Column 1 of Part 1 of this Annex are subject to the qualifying quantities set out in Columns 2 and 3 of Part 1.

Where a dangerous substance is covered by Part 1 of this Annex and is also listed in Part 2, the qualifying quantities set out in Columns 2 and 3 of Part 2 apply.

PART 1

Categories of dangerous substances

This Part covers all dangerous substances falling under the hazard categories listed in Column 1:

Column 1	Column 2	Column 3
Hazard categories in accordance with Regulation (EC) No 1272/2008	Qualifying quantity (tonnes) of dangerous substances as referred to in Article 3(10) for the application of	
	Lower-tier requirements	Upper-tier requirements
Section 'H' – HEALTH HAZARDS		
H1 ACUTE TOXIC Category 1, all exposure routes	5	20
H2 ACUTE TOXIC — Category 2, all exposure routes — Category 3, inhalation exposure *route* (see note 7)	50	200
H3 STOT SPECIFIC TARGET ORGAN TOXICITY – SINGLE EXPOSURE STOT SE Category 1	50	200
Section 'P' – PHYSICAL HAZARDS		
P1a EXPLOSIVES (see note 8) — Unstable explosives or — Explosives, Division 1.1, 1.2, 1.3, 1.5 or 1.6, or — Substances or mixtures having explosive properties according to method A.14 of Regulation (EC) No 440/2008 (see note 9) and do not belong to the hazard classes Organic peroxides or Self-reactive substances and mixtures	10	50
P1b EXPLOSIVES (see note 8) Explosives, Division 1.4 (see note 10)	50	200
P2 FLAMMABLE GASES Flammable gases, Category 1 or 2	10	50
P3a FLAMMABLE AEROSOLS (see note 11.1) 'Flammable' aerosols *Category 1 or 2*, containing flammable gases Category 1 or 2 or flammable liquids Category 1	150 *(net)*	500 *(net)*
P3b FLAMMABLE AEROSOLS (see note 11.1) 'Flammable' aerosols *Category 1 or 2*, not containing flammable gases Category 1 or 2 nor flammable liquids category 1 (see note 11.2)	5 000 *(net)*	50 000 *(net)*

Column 1	Column 2	Column 3
Hazard categories in accordance with Regulation (EC) No 1272/2008	Qualifying quantity (tonnes) of dangerous substances as referred to in Article 3(10) for the application of	
	Lower-tier requirements	Upper-tier requirements
P4 OXIDISING GASES Oxidising gases, Category 1	50	200
P5a FLAMMABLE LIQUIDS — Flammable liquids, Category 1, or — Flammable liquids Category 2 or 3 maintained at a temperature above their boiling point, or — Other liquids with a flash point ≤ 60 °C, maintained at a temperature above their boiling point (see note 12)	10	50
P5b FLAMMABLE LIQUIDS — Flammable liquids Category 2 or 3 where particular processing conditions, such as high pressure or high temperature, may create major-accident hazards, or — Other liquids with a flash point ≤ 60 °C where particular processing conditions, such as high pressure or high temperature, may create major-accident hazards (see note 12)	50	200
P5c FLAMMABLE LIQUIDS Flammable liquids, Categories 2 or 3 not covered by P5a and P5b	5 000	50 000
P6a SELF-REACTIVE SUBSTANCES AND MIXTURES and ORGANIC PEROXIDES Self-reactive substances and mixtures, Type A or B or organic peroxides, Type A or B	10	50
P6b SELF-REACTIVE SUBSTANCES AND MIXTURES and ORGANIC PEROXIDES Self-reactive substances and mixtures, Type C, D, E or F or organic peroxides, Type C, D, E, or F	50	200
P7 PYROPHORIC LIQUIDS AND SOLIDS Pyrophoric liquids, Category 1 Pyrophoric solids, Category 1	50	200
P8 OXIDISING LIQUIDS AND SOLIDS Oxidising Liquids, Category 1, 2 or 3, or Oxidising Solids, Category 1, 2 or 3	50	200
Section 'E' – ENVIRONMENTAL HAZARDS		
E1 Hazardous to the Aquatic Environment in Category Acute 1 or Chronic 1	100	200
E2 Hazardous to the Aquatic Environment in Category Chronic 2	200	500
Section 'O' – OTHER HAZARDS		
O1 Substances or mixtures with hazard statement EUH014	100	500
O2 Substances and mixtures which in contact with water emit flammable gases, Category 1	100	500
O3 Substances or mixtures with hazard statement EUH029	50	200

PART 2

Named dangerous substances

Column 1 Dangerous substances	CAS number (1)	Column 2	Column 3
		Qualifying quantity (tonnes) for the application of	
		Lower-tier requirements	Upper-tier requirements
1. Ammonium nitrate (see note 13)	—	5 000	10 000
2. Ammonium nitrate (see note 14)	—	1 250	5 000
3. Ammonium nitrate (see note 15)	—	350	2 500
4. Ammonium nitrate (see note 16)	—	10	50
5. Potassium nitrate (see note 17)	—	5 000	10 000
6. Potassium nitrate (see note 18)	—	1 250	5 000
7. Arsenic pentoxide, arsenic (V) acid and/or salts	1303-28-2	1	2
8. Arsenic trioxide, arsenious (III) acid and/or salts	1327-53-3		0,1
9. Bromine	7726-95-6	20	100
10. Chlorine	7782-50-5	10	25
11. Nickel compounds in inhalable powder form: nickel monoxide, nickel dioxide, nickel sulphide, trinickel disulphide, dinickel trioxide	—		1
12. Ethyleneimine	151-56-4	10	20
13. Fluorine	7782-41-4	10	20
14. Formaldehyde (concentration ≥ 90 %)	50-00-0	5	50
15. Hydrogen	1333-74-0	5	50
16. Hydrogen chloride (liquefied gas)	7647-01-0	25	250
17. Lead alkyls	—	5	50
18. Liquefied flammable gases, Category 1 or 2 (including LPG) and natural gas (see note 19)	—	50	200
19. Acetylene	74-86-2	5	50
20. Ethylene oxide	75-21-8	5	50
21. Propylene oxide	75-56-9	5	50
22. Methanol	67-56-1	500	5 000
23. 4, 4′-Methylene bis (2-chloraniline) and/or salts, in powder form	101-14-4		0,01
24. Methylisocyanate	624-83-9		0,15
25. Oxygen	7782-44-7	200	2 000
26. 2,4 -Toluene diisocyanate 2,6 -Toluene diisocyanate	584-84-9 91-08-7	10	100

Column 1 Dangerous substances	CAS number (1)	Column 2 Qualifying quantity (tonnes) for the application of Lower-tier requirements	Column 3 Upper-tier requirements
27. Carbonyl dichloride (phosgene)	75-44-5	0,3	0,75
28. Arsine (arsenic trihydride)	7784-42-1	0,2	1
29. Phosphine (phosphorus trihydride)	7803-51-2	0,2	1
30. Sulphur dichloride	10545-99-0		1
31. Sulphur trioxide	7446-11-9	15	75
32. Polychlorodibenzofurans and polychlorodibenzodioxins (including TCDD), calculated in TCDD equivalent (see note 20)	—		0,001
33. The following CARCINOGENS or the mixtures containing the following carcinogens at concentrations above 5 % by weight: 4-Aminobiphenyl and/or its salts, Benzotrichloride, Benzidine and/or salts, Bis (chloromethyl) ether, Chloromethyl methyl ether, 1,2-Dibromoethane, Diethyl sulphate, Dimethyl sulphate, Dimethylcarbamoyl chloride, 1,2-Dibromo-3-chloropropane, 1,2-Dimethylhydrazine, Dimethylnitrosamine, Hexamethylphosphoric triamide, Hydrazine, 2- Naphthylamine and/or salts, 4-Nitrodiphenyl, and 1,3 Propanesultone	—	0,5	2
34. Petroleum products and alternative fuels (a) gasolines and naphthas, (b) kerosenes (including jet fuels), (c) gas oils (including diesel fuels, home heating oils and gas oil blending streams) (d) heavy fuel oils (e) alternative fuels serving the same purposes and with similar properties as regards flammability and environmental hazards as the products referred to in points (a) to (d)	—	2 500	25 000
35. Anhydrous Ammonia	7664-41-7	50	200
36. Boron trifluoride	7637-07-2	5	20
37. Hydrogen sulphide	7783-06-4	5	20
38. Piperidine	110-89-4	50	200
39. Bis(2-dimethylaminoethyl) (methyl)amin	3030-47-5	50	200
40. 3-(2-Ethylhexyloxy)propylamin	5397-31-9	50	200
41. Mixtures (*) of sodium hypochlorite classified as Aquatic Acute Category 1 [H400] containing less than 5 % active chlorine and not classified under any of the other hazard categories in Part 1 of Annex I.		200	500

(*) Provided that the mixture in the absence of sodium hypochlorite would not be classified as Aquatic Acute Category 1 [H400].

Column 1 Dangerous substances	CAS number (1)	Column 2 Qualifying quantity (tonnes) for the application of Lower-tier requirements	Column 3 Upper-tier requirements
42. Propylamine (see note 21)	107-10-8	500	2 000
43. Tert-butyl acrylate (see note 21)	1663-39-4	200	500
44. 2-Methyl-3-butenenitrile (see note 21)	16529-56-9	500	2 000
45. Tetrahydro-3,5-dimethyl-1,3,5,-thiadiazine-2-thione (Dazomet) (see note 21)	533-74-4	100	200
46. Methyl acrylate (see note 21)	96-33-3	500	2 000
47. 3-Methylpyridine (see note 21)	108-99-6	500	2 000
48. 1-Bromo-3-chloropropane (see note 21)	109-70-6	500	2 000

(1) The CAS number is shown only for indication.

NOTES TO ANNEX I

1. Substances and mixtures are classified in accordance with Regulation (EC) No 1272/2008.

2. Mixtures shall be treated in the same way as pure substances provided they remain within concentration limits set according to their properties under Regulation (EC) No 1272/2008, or its latest adaptation to technical progress, unless a percentage composition or other description is specifically given.

3. The qualifying quantities set out above relate to each establishment.

   The quantities to be considered for the application of the relevant Articles are the maximum quantities which are present or are likely to be present at any one time. Dangerous substances present at an establishment only in quantities equal to or less than 2 % of the relevant qualifying quantity shall be ignored for the purposes of calculating the total quantity present if their location within an establishment is such that it cannot act as an initiator of a major accident elsewhere at that establishment.

4. The following rules governing the addition of dangerous substances, or categories of dangerous substances, shall apply where appropriate:

   In the case of an establishment where no individual dangerous substance is present in a quantity above or equal to the relevant qualifying quantities, the following rule shall be applied to determine whether the establishment is covered by the relevant requirements of this Directive.

   This Directive shall apply to upper-tier establishments if the sum:

   $q_1/Q_{U1} + q_2/Q_{U2} + q_3/Q_{U3} + q_4/Q_{U4} + q_5/Q_{U5} + \ldots$ is greater than or equal to 1,

   where q_x = the quantity of dangerous substance x (or category of dangerous substances) falling within Part 1 or Part 2 of this Annex,

   and Q_{UX} = the relevant qualifying quantity for dangerous substance or category x from Column 3 of Part 1 or from Column 3 of Part 2 of this Annex.

   This Directive shall apply to lower-tier establishments if the sum:

   $q_1/Q_{L1} + q_2/Q_{L2} + q_3/Q_{L3} + q_4/Q_{L4} + q_5/Q_{L5} + \ldots$ is greater than or equal to 1,

   where q_x = the quantity of dangerous substance x (or category of dangerous substances) falling within Part 1 or Part 2 of this Annex,

and Q_{LX} = the relevant qualifying quantity for dangerous substance or category x from Column 2 of Part 1 or from Column 2 of Part 2 of this Annex.

This rule shall be used to assess the health hazards, physical hazards and environmental hazards. It must therefore be applied three times:

(a) for the addition of dangerous substances listed in Part 2 that fall within acute toxicity category 1, 2 or 3 (inhalation route) or STOT SE category 1, together with dangerous substances falling within section H, entries H1 to H3 of Part 1;

(b) for the addition of dangerous substances listed in Part 2 that are explosives, flammable gases, flammable aerosols, oxidising gases, flammable liquids, self-reactive substances and mixtures, organic peroxides, pyrophoric liquids and solids, oxidising liquids and solids, together with dangerous substances falling within section P, entries P1 to P8 of Part 1;

(c) for the addition of dangerous substances listed in Part 2 that fall within hazardous to the aquatic environment acute category 1, chronic category 1 or chronic category 2, together with dangerous substances falling within section E, entries E1 and E2 of Part 1.

The relevant provisions of this Directive apply where any of the sums obtained by (a), (b) or (c) is greater than or equal to 1.

5. In the case of dangerous substances which are not covered by Regulation (EC) No 1272/2008, including waste, but which nevertheless are present, or are likely to be present, in an establishment and which possess or are likely to possess, under the conditions found at the establishment, equivalent properties in terms of major-accident potential, these shall be provisionally assigned to the most analogous category or named dangerous substance falling within the scope of this Directive.

6. In the case of dangerous substances with properties giving rise to more than one classification, for the purposes of this Directive the lowest qualifying quantities shall apply. However, for the application of the rule in Note 4, the lowest qualifying quantity for each group of categories in Notes 4(a), 4(b) and 4(c) corresponding to the classification concerned shall be used.

7. Dangerous substances that fall within Acute Toxic Category 3 via the oral route (H 301) shall fall under entry H2 ACUTE TOXIC in those cases where neither acute inhalation toxicity classification nor acute dermal toxicity classification can be derived, for example due to lack of conclusive inhalation and dermal toxicity data.

8. The hazard class Explosives includes explosive articles (see Section 2.1 of Annex I to Regulation (EC) No 1272/2008). If the quantity of the explosive substance or mixture contained in the article is known, that quantity shall be considered for the purposes of this Directive. If the quantity of the explosive substance or mixture contained in the article is not known, then, for the purposes of this Directive, the whole article shall be treated as explosive.

9. Testing for explosive properties of substances and mixtures is only necessary if the screening procedure according to Appendix 6, Part 3 of the UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria (UN Manual of Tests and Criteria) [1] identifies the substance or mixture as potentially having explosive properties.

10. If Explosives of Division 1.4 are unpacked or repacked, they shall be assigned to the entry P1a, unless the hazard is shown to still correspond to Division 1.4, in accordance with Regulation (EC) No 1272/2008.

11.1. Flammable aerosols are classified in accordance with the Council Directive 75/324/EEC of 20 May 1975 on the approximation of the laws of the Member States relating to aerosol dispensers [2] (Aerosol Dispensers Directive). 'Extremely flammable' and 'Flammable' aerosols of Directive 75/324/EEC correspond to Flammable Aerosols Category 1 or 2 respectively of Regulation (EC) No 1272/2008.

11.2. In order to use this entry, it must be documented that the aerosol dispenser does not contain Flammable Gas Category 1 or 2 nor Flammable Liquid Category 1.

[1] More guidance on waiving of the test can be found in the A.14 method description, see Commission Regulation (EC) No 440/2008 of 30 May 2008 laying down test methods pursuant to Regulation (EC) No 1907/2006 of the European Parliament and of the Council on the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH) (OJ L 142, 31.5.2008, p. 1).

[2] OJ L 147, 9.6.1975, p. 40.

12. According to paragraph 2.6.4.5 in Annex I to Regulation (EC) No 1272/2008, liquids with a flash point of more than 35 °C need not be classified in Category 3 if negative results have been obtained in the sustained combustibility test L.2, Part III, section 32 of the UN Manual of Tests and Criteria. This is however not valid under elevated conditions such as high temperature or pressure, and therefore such liquids are included in this entry.

13. Ammonium nitrate (5 000 / 10 000): fertilisers capable of self-sustaining decomposition

This applies to ammonium nitrate-based compound/composite fertilisers (compound/composite fertilisers contain ammonium nitrate with phosphate and/or potash) which are capable of self-sustaining decomposition according to the UN Trough Test (see UN Manual of Tests and Criteria, Part III, subsection 38.2), and in which the nitrogen content as a result of ammonium nitrate is

— between 15,75 % [1] and 24,5 % [2] by weight, and either with not more than 0,4 % total combustible/organic materials or which fulfil the requirements of Annex III-2 to Regulation (EC) No 2003/2003 of the European Parliament and of the Council of 13 October 2003 relating to fertilisers [3],

— 15,75 % by weight or less and unrestricted combustible materials.

14. Ammonium nitrate (1 250 / 5 000): fertiliser grade

This applies to straight ammonium nitrate-based fertilisers and to ammonium nitrate-based compound/composite fertilisers which fulfil the requirements of Annex III-2 to Regulation (EC) No 2003/2003 and in which the nitrogen content as a result of ammonium nitrate is

— more than 24,5 % by weight, except for mixtures of straight ammonium nitrate-based fertilisers with dolomite, limestone and/or calcium carbonate with a purity of at least 90 %,

— more than 15,75 % by weight for mixtures of ammonium nitrate and ammonium sulphate,

— more than 28 % [4] by weight for mixtures of straight ammonium nitrate-based fertilisers with dolomite, limestone and/or calcium carbonate with a purity of at least 90 %.

15. Ammonium nitrate (350 / 2 500): technical grade

This applies to ammonium nitrate and mixtures of ammonium nitrate in which the nitrogen content as a result of the ammonium nitrate is

— between 24,5 % and 28 % by weight, and which contain not more than 0,4 % combustible substances,

— more than 28 % by weight, and which contain not more than 0,2 % combustible substances.

It also applies to aqueous ammonium nitrate solutions in which the concentration of ammonium nitrate is more than 80 % by weight.

16. Ammonium nitrate (10 / 50): 'off-specs' material and fertilisers not fulfilling the detonation test

This applies to

— material rejected during the manufacturing process and to ammonium nitrate and mixtures of ammonium nitrate, straight ammonium nitrate-based fertilisers and ammonium nitrate-based compound/composite fertilisers referred to in Notes 14 and 15, that are being or have been returned from the final user to a manufacturer, temporary storage or reprocessing plant for reworking, recycling or treatment for safe use, because they no longer comply with the specifications of Notes 14 and 15,

— fertilisers referred to in first indent of Note 13, and Note 14 to this Annex which do not fulfil the requirements of Annex III-2 to Regulation (EC) No 2003/2003.

17. Potassium nitrate (5 000 / 10 000)

This applies to those composite potassium-nitrate based fertilisers (in prilled/granular form) which have the same hazardous properties as pure potassium nitrate.

[1] 15,75 % nitrogen content by weight as a result of ammonium nitrate corresponds to 45 % ammonium nitrate.
[2] 24,5 % nitrogen content by weight as a result of ammonium nitrate corresponds to 70 % ammonium nitrate.
[3] OJ L 304, 21.11.2003, p. 1.
[4] 28 % nitrogen content by weight as a result of ammonium nitrate corresponds to 80 % ammonium nitrate.

18. Potassium nitrate (1 250 / 5 000)

This applies to those composite potassium-nitrate based fertilisers (in crystalline form) which have the same hazardous properties as pure potassium nitrate.

19. Upgraded biogas

For the purpose of the implementation of this Directive, upgraded biogas may be classified under entry 18 of Part 2 of Annex I where it has been processed in accordance with applicable standards for purified and upgraded biogas ensuring a quality equivalent to that of natural gas, including the content of Methane, and which has a maximum of 1 % Oxygen.

20. Polychlorodibenzofurans and polychlorodibenzodioxins

The quantities of polychlorodibenzofurans and polychlorodibenzodioxins are calculated using the following factors:

WHO 2005 TEF			
2,3,7,8-TCDD	1	2,3,7,8-TCDF	0,1
1,2,3,7,8-PeCDD	1	2,3,4,7,8-PeCDF	0,3
		1,2,3,7,8-PeCDF	0,03
1,2,3,4,7,8-HxCDD	0,1		
1,2,3,6,7,8-HxCDD	0,1	1,2,3,4,7,8-HxCDF	0,1
1,2,3,7,8,9-HxCDD	0,1	1,2,3,7,8,9-HxCDF	0,1
		1,2,3,6,7,8-HxCDF	0,1
1,2,3,4,6,7,8-HpCDD	0,01	2,3,4,6,7,8-HxCDF	0,1
OCDD	0,0003	1,2,3,4,6,7,8-HpCDF	0,01
		1,2,3,4,7,8,9-HpCDF	0,01
		OCDF	0,0003

(T = tetra, P = penta, Hx = hexa, Hp = hepta, O = octa)

21. In cases where this dangerous substance falls within category P5a Flammable liquids or P5b Flammable liquids, then for the purposes of this Directive the lowest qualifying quantities shall apply.

ANNEX II

Minimum data and information to be considered in the safety report referred to in Article 10

1. Information on the management system and on the organisation of the establishment with a view to major-accident prevention.

   This information shall contain the elements indicated in Annex III.

2. Presentation of the environment of the establishment:

   (a) description of the establishment and its environment including the geographical location, meteorological, geological, hydrographic conditions and, if necessary, its history;

   (b) identification of installations and other activities of the establishment which could present a major-accident hazard;

   (c) on the basis of available information, identification of neighbouring establishments, as well as sites that fall outside the scope of this Directive, areas and developments that could be the source of, or increase the risk or consequences of a major accident and of domino effects;

   (d) description of areas where a major accident may occur.

3. Description of the installation:

   (a) description of the main activities and products of the parts of the establishment which are important from the point of view of safety, sources of major-accident risks and conditions under which such a major accident could happen, together with a description of proposed preventive measures;

   (b) description of processes, in particular the operating methods; where applicable, taking into account available information on best practices;

   (c) description of dangerous substances:

      (i) inventory of dangerous substances including:

         — the identification of dangerous substances: chemical name, CAS number, name according to IUPAC nomenclature,

         — the maximum quantity of dangerous substances present or likely to be present;

      (ii) physical, chemical, toxicological characteristics and indication of the hazards, both immediate and delayed for human health and the environment;

      (iii) physical and chemical behaviour under normal conditions of use or under foreseeable accidental conditions.

4. Identification and accidental risks analysis and prevention methods:

   (a) detailed description of the possible major-accident scenarios and their probability or the conditions under which they occur including a summary of the events which may play a role in triggering each of these scenarios, the causes being internal or external to the installation; including in particular:

      (i) operational causes;

      (ii) external causes, such as those related to domino effects, sites that fall outside the scope of this Directive, areas and developments that could be the source of, or increase the risk or consequences of a major accident;

      (iii) natural causes, for example earthquakes or floods;

   (b) assessment of the extent and severity of the consequences of identified major accidents including maps, images or, as appropriate, equivalent descriptions, showing areas which are likely to be affected by such accidents arising from the establishment;

(c) review of past accidents and incidents with the same substances and processes used, consideration of lessons learned from these, and explicit reference to specific measures taken to prevent such accidents;

(d) description of technical parameters and equipment used for the safety of installations.

5. Measures of protection and intervention to limit the consequences of a major accident:

(a) description of the equipment installed in the plant to limit the consequences of major accidents for human health and environment, including for example detection/protection systems, technical devices for limiting the size of accidental releases, including water spray; vapour screens; emergency catch pots or collection vessels; shut-off-valves; inerting systems; fire water retention;

(b) organisation of alert and intervention;

(c) description of mobilisable resources, internal or external;

(d) description of any technical and non-technical measures relevant for the reduction of the impact of a major accident.

ANNEX III

Information referred to in Article 8(5) and Article 10 on the safety management system and the organisation of the establishment with a view to the prevention of major accidents

For the purpose of implementing the operator's safety management system, account shall be taken of the following elements:

(a) the safety management system shall be proportionate to the hazards, industrial activities and complexity of the organisation in the establishment and be based on assessment of the risks; it should include the part of the general management system which includes the organisational structure, responsibilities, practices, procedures, processes and resources for determining and implementing the major-accident prevention policy (MAPP);

(b) the following issues shall be addressed by the safety management system:

(i) organisation and personnel — the roles and responsibilities of personnel involved in the management of major hazards at all levels in the organisation, together with the measures taken to raise awareness of the need for continuous improvement. The identification of training needs of such personnel and the provision of the training so identified. The involvement of employees and of subcontracted personnel working in the establishment which are important from the point of view of safety;

(ii) identification and evaluation of major hazards — adoption and implementation of procedures for systematically identifying major hazards arising from normal and abnormal operation including subcontracted activities where applicable and the assessment of their likelihood and severity;

(iii) operational control — adoption and implementation of procedures and instructions for safe operation, including maintenance, of plant, processes and equipment, and for alarm management and temporary stoppages; taking into account available information on best practices for monitoring and control, with a view to reducing the risk of system failure; management and control of the risks associated with ageing equipment installed in the establishment and corrosion; inventory of the establishment's equipment, strategy and methodology for monitoring and control of the condition of the equipment; appropriate follow-up actions and any necessary countermeasures;

(iv) management of change — adoption and implementation of procedures for planning modifications to, or the design of new installations, processes or storage facilities;

(v) planning for emergencies — adoption and implementation of procedures to identify foreseeable emergencies by systematic analysis, to prepare, test and review emergency plans to respond to such emergencies and to provide specific training for the staff concerned. Such training shall be given to all personnel working in the establishment, including relevant subcontracted personnel;

(vi) monitoring performance — adoption and implementation of procedures for the ongoing assessment of compliance with the objectives set by the operator's MAPP and safety management system, and the mechanisms for investigation and taking corrective action in case of non-compliance. The procedures shall cover the operator's system for reporting major accidents or 'near misses', particularly those involving failure of protective measures, and their investigation and follow-up on the basis of lessons learnt. The procedures could also include performance indicators such as safety performance indicators (SPIs) and/or other relevant indicators;

(vii) audit and review — adoption and implementation of procedures for periodic systematic assessment of the MAPP and the effectiveness and suitability of the safety management system; the documented review of performance of the policy and safety management system and its updating by senior management, including consideration and incorporation of necessary changes indicated by the audit and review.

ANNEX IV

Data and information to be included in the emergency plans referred to in Article 12

1. Internal emergency plans:

   (a) Names or positions of persons authorised to set emergency procedures in motion and the person in charge of and coordinating the on-site mitigatory action;

   (b) Name or position of the person with responsibility for liaising with the authority responsible for the external emergency plan;

   (c) For foreseeable conditions or events which could be significant in bringing about a major accident, a description of the action which should be taken to control the conditions or events and to limit their consequences, including a description of the safety equipment and the resources available;

   (d) Arrangements for limiting the risks to persons on site including how warnings are to be given and the actions persons are expected to take on receipt of a warning;

   (e) Arrangements for providing early warning of the incident to the authority responsible for setting the external emergency plan in motion, the type of information which should be contained in an initial warning and the arrangements for the provision of more detailed information as it becomes available;

   (f) where necessary, arrangements for training staff in the duties they will be expected to perform and, as appropriate, coordinating this with off-site emergency services;

   (g) Arrangements for providing assistance with off-site mitigatory action.

2. External emergency plans:

   (a) Names or positions of persons authorised to set emergency procedures in motion and of persons authorised to take charge of and coordinate off-site action;

   (b) Arrangements for receiving early warning of incidents, and alert and call-out procedures;

   (c) Arrangements for coordinating resources necessary to implement the external emergency plan;

   (d) Arrangements for providing assistance with on-site mitigatory action;

   (e) Arrangements for off-site mitigatory action, including responses to major-accident scenarios as set out in the safety report and considering possible domino effects, including those having an impact on the environment;

   (f) Arrangements for providing the public and any neighbouring establishments or sites that fall outside the scope of this Directive in accordance with Article 9 with specific information relating to the accident and the behaviour which should be adopted;

   (g) Arrangements for the provision of information to the emergency services of other Member States in the event of a major accident with possible transboundary consequences.

ANNEX V

Items of information to the public as provided for in Article 14(1) and in point (a) of Article 14(2)

PART 1

For all establishments covered by this Directive:

1. Name or trade name of the operator and the full address of the establishment concerned.

2. Confirmation that the establishment is subject to the regulations and/or administrative provisions implementing this Directive and that the notification referred to in Article 7(1) or the safety report referred to in Article 10(1) has been submitted to the competent authority.

3. An explanation in simple terms of the activity or activities undertaken at the establishment.

4. The common names or, in the case of dangerous substances covered by Part 1 of Annex I, the generic names or the hazard classification of the relevant dangerous substances involved at the establishment which could give rise to a major accident, with an indication of their principal dangerous characteristics in simple terms.

5. General information about how the public concerned will be warned, if necessary; adequate information about the appropriate behaviour in the event of a major accident or indication of where that information can be accessed electronically.

6. The date of the last site visit in accordance with Article 20(4), or reference to where that information can be accessed electronically; information on where more detailed information about the inspection and the related inspection plan can be obtained upon request, subject to the requirements of Article 22.

7. Details of where further relevant information can be obtained, subject to the requirements of Article 22.

PART 2

For upper-tier establishments, in addition to the information referred to in Part 1 of this Annex:

1. General information relating to the nature of the major-accident hazards, including their potential effects on human health and the environment and summary details of the main types of major-accident scenarios and the control measures to address them.

2. Confirmation that the operator is required to make adequate arrangements on site, in particular liaison with the emergency services, to deal with major accidents and to minimise their effects.

3. Appropriate information from the external emergency plan drawn up to cope with any off-site effects from an accident. This should include advice to cooperate with any instructions or requests from the emergency services at the time of an accident.

4. Where applicable, indication whether the establishment is close to the territory of another Member State with the possibility of a major accident with transboundary effects under the Convention of the United Nations Economic Commission for Europe on the Transboundary Effects of Industrial Accidents.

ANNEX VI

Criteria for the notification of a major accident to the Commission as provided for in Article 18(1)

I. Any major accident covered by paragraph 1 or having at least one of the consequences described in paragraphs 2, 3, 4 and 5 must be notified to the Commission.

1. Dangerous substances involved

Any fire or explosion or accidental discharge of a dangerous substance involving a quantity of at least 5 % of the qualifying quantity laid down in Column 3 of Part 1 or in Column 3 of Part 2 of Annex I.

2. Injury to persons and damage to real estate:

(a) a death;

(b) six persons injured within the establishment and hospitalised for at least 24 hours;

(c) one person outside the establishment hospitalised for at least 24 hours;

(d) dwelling(s) outside the establishment damaged and unusable as a result of the accident;

(e) the evacuation or confinement of persons for more than 2 hours (persons × hours): the value is at least 500;

(f) the interruption of drinking water, electricity, gas or telephone services for more than 2 hours (persons × hours): the value is at least 1 000.

3. Immediate damage to the environment:

(a) permanent or long-term damage to terrestrial habitats:

(i) 0,5 ha or more of a habitat of environmental or conservation importance protected by legislation;

(ii) 10 or more hectares of more widespread habitat, including agricultural land;

(b) significant or long-term damage to freshwater and marine habitats:

(i) 10 km or more of river or canal;

(ii) 1 ha or more of a lake or pond;

(iii) 2 ha or more of delta;

(iv) 2 ha or more of a coastline or open sea;

(c) significant damage to an aquifer or underground water:

1 ha or more.

4. Damage to property:

(a) damage to property in the establishment: at least EUR 2 000 000;

(b) damage to property outside the establishment: at least EUR 500 000.

5. Cross-border damage

Any major accident directly involving a dangerous substance giving rise to effects outside the territory of the Member State concerned.

II. Accidents or 'near misses' which Member States regard as being of particular technical interest for preventing major accidents and limiting their consequences and which do not meet the quantitative criteria above should be notified to the Commission.

(Acts adopted under the EC Treaty/Euratom Treaty whose publication is obligatory)

DIRECTIVES

DIRECTIVE 2008/50/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 21 May 2008

on ambient air quality and cleaner air for Europe

THE EUROPEAN PARLIAMENT AND THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty establishing the European Community, and in particular Article 175 thereof,

Having regard to the proposal from the Commission,

Having regard to the opinion of the European Economic and Social Committee [1],

Having regard to the opinion of the Committee of the Regions [2],

Acting in accordance with the procedure laid down in Article 251 of the Treaty [3],

Whereas:

(1) The Sixth Community Environment Action Programme adopted by Decision No 1600/2002/EC of the European Parliament and of the Council of 22 July 2002 [4] establishes the need to reduce pollution to levels which minimise harmful effects on human health, paying particular attention to sensitive populations, and the environment as a whole, to improve the monitoring and assessment of air quality including the deposition of pollutants and to provide information to the public.

(2) In order to protect human health and the environment as a whole, it is particularly important to combat emissions of pollutants at source and to identify and implement the most effective emission reduction measures at local, national and Community level. Therefore, emissions of harmful air pollutants should be avoided, prevented or reduced and appropriate objectives set for ambient air quality taking into account relevant World Health Organisation standards, guidelines and programmes.

(3) Council Directive 96/62/EC of 27 September 1996 on ambient air quality assessment and management [5], Council Directive 1999/30/EC of 22 April 1999 relating to limit values for sulphur dioxide, nitrogen dioxide and oxides of nitrogen, particulate matter and lead in ambient air [6], Directive 2000/69/EC of the European Parliament and of the Council of 16 November 2000 relating to limit values for benzene and carbon monoxide in ambient air [7], Directive 2002/3/EC of the European Parliament and of the Council of 12 February 2002 relating to ozone in ambient air [8] and Council Decision 97/101/EC of 27 January 1997 establishing a reciprocal exchange of information and data from networks and individual stations measuring ambient air pollution within the Member States [9] need to be substantially revised in order to incorporate the latest health and scientific developments and the experience of the Member States. In the interests of clarity, simplification and administrative efficiency it is therefore appropriate that those five acts be replaced by a single Directive and, where appropriate, by implementing measures.

---

(1) OJ C 195, 18.8.2006, p. 84.

(2) OJ C 206, 29.8.2006, p. 1.

(3) Opinion of the European Parliament of 26 September 2006 (OJ C 306 E, 15.12.2006, p. 102), Council Common Position of 25 June 2007 (OJ C 236 E, 6.11.2007, p. 1) and Position of the European Parliament of 11 December 2007. Council Decision of 14 April 2008.

(4) OJ L 242, 10.9.2002, p. 1.

(5) OJ L 296, 21.11.1996, p. 55. Directive as amended by Regulation (EC) No 1882/2003 of the European Parliament and of the Council (OJ L 284, 31.10.2003, p. 1).

(6) OJ L 163, 29.6.1999, p. 41. Directive as amended by Commission Decision 2001/744/EC (OJ L 278, 23.10.2001, p. 35).

(7) OJ L 313, 13.12.2000, p. 12.

(8) OJ L 67, 9.3.2002, p. 14.

(9) OJ L 35, 5.2.1997, p. 14. Decision as amended by Commission Decision 2001/752/EC (OJ L 282, 26.10.2001, p. 69).

(4) Once sufficient experience has been gained in relation to the implementation of Directive 2004/107/EC of the European Parliament and of the Council of 15 December 2004 relating to arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons in ambient air [1] consideration may be given to the possibility of merging its provisions with those of this Directive.

(5) A common approach to the assessment of ambient air quality should be followed according to common assessment criteria. When assessing ambient air quality, account should be taken of the size of populations and ecosystems exposed to air pollution. It is therefore appropriate to classify the territory of each Member State into zones or agglomerations reflecting the population density.

(6) Where possible modelling techniques should be applied to enable point data to be interpreted in terms of geographical distribution of concentration. This could serve as a basis for calculating the collective exposure of the population living in the area.

(7) In order to ensure that the information collected on air pollution is sufficiently representative and comparable across the Community, it is important that standardised measurement techniques and common criteria for the number and location of measuring stations are used for the assessment of ambient air quality. Techniques other than measurements can be used to assess ambient air quality and it is therefore necessary to define criteria for the use and required accuracy of such techniques.

(8) Detailed measurements of fine particulate matter at rural background locations should be made in order to understand better the impacts of this pollutant and to develop appropriate policies. Such measurements should be made in a manner consistent with those of the cooperative programme for monitoring and evaluation of the long range transmission of air pollutants in Europe (EMEP) set up under the 1979 Convention on Long-range Transboundary Air Pollution approved by Council Decision 81/462/EEC of 11 June 1981 [2].

(9) Air quality status should be maintained where it is already good, or improved. Where the objectives for ambient air quality laid down in this Directive are not met, Member States should take action in order to comply with the limit values and critical levels, and where possible, to attain the target values and long-term objectives.

(10) The risk posed by air pollution to vegetation and natural ecosystems is most important in places away from urban areas. The assessment of such risks and the compliance with critical levels for the protection of vegetation should therefore focus on places away from built-up areas.

(11) Fine particulate matter ($PM_{2,5}$) is responsible for significant negative impacts on human health. Further, there is as yet no identifiable threshold below which $PM_{2,5}$ would not pose a risk. As such, this pollutant should not be regulated in the same way as other air pollutants. The approach should aim at a general reduction of concentrations in the urban background to ensure that large sections of the population benefit from improved air quality. However, to ensure a minimum degree of health protection everywhere, that approach should be combined with a limit value, which is to be preceded in a first stage by a target value.

(12) The existing target values and long-term objectives of ensuring effective protection against harmful effects on human health and vegetation and ecosystems from exposure to ozone should remain unchanged. An alert threshold and an information threshold for ozone should be set for the protection of the general population and sensitive sections, respectively, from brief exposures to elevated ozone concentrations. Those thresholds should trigger the dissemination of information to the public on the risks of exposure and the implementation, if appropriate, of short-term measures to reduce ozone levels where the alert threshold is exceeded.

(13) Ozone is a transboundary pollutant formed in the atmosphere from the emission of primary pollutants addressed by Directive 2001/81/EC of the European Parliament and of the Council of 23 October 2001 on national emission ceilings for certain atmospheric pollutants [3]. Progress towards the air quality targets and long term objectives for ozone set in this Directive should be determined by the targets and emission ceilings provided for in Directive 2001/81/EC and, if appropriate, by implementing air quality plans as provided for in this Directive.

(14) Fixed measurements should be mandatory in zones and agglomerations where the long-term objectives for ozone or the assessment thresholds for other pollutants are exceeded. Information from fixed measurements may be supplemented by modelling techniques and/or indicative measurements to enable point data to be interpreted in terms of geographical distribution of concentrations. The use of supplementary techniques of assessment should also allow for reduction of the required minimum number of fixed sampling points.

(15) Contributions from natural sources can be assessed but cannot be controlled. Therefore, where natural contributions to pollutants in ambient air can be determined with sufficient certainty, and where exceedances are due in whole or in part to these natural contributions, these may, under the conditions laid down in this Directive, be subtracted when assessing compliance with air quality limit values. Contributions to exceedances of particulate matter PM_{10} limit values attributable to winter-sanding or -salting of roads may also be subtracted when assessing compliance with air quality limit values provided that reasonable measures have been taken to lower concentrations.

[1] OJ L 23, 26.1.2005, p. 3.
[2] OJ L 171, 27.6.1981, p. 11.
[3] OJ L 309, 27.11.2001, p. 22. Directive as last amended by Council Directive 2006/105/EC (OJ L 363, 20.12.2006, p. 368).

(16) For zones and agglomerations where conditions are particularly difficult, it should be possible to postpone the deadline for compliance with the air quality limit values in cases where, notwithstanding the implementation of appropriate pollution abatement measures, acute compliance problems exist in specific zones and agglomerations. Any postponement for a given zone or agglomeration should be accompanied by a comprehensive plan to be assessed by the Commission to ensure compliance by the revised deadline. The availability of necessary Community measures reflecting the chosen ambition level in the Thematic Strategy on air pollution to reduce emissions at source will be important for an effective emission reduction by the timeframe established in this Directive for compliance with the limit values and should be taken into account when assessing requests to postpone deadlines for compliance.

(17) The necessary Community measures to reduce emissions at source, in particular measures to improve the effectiveness of Community legislation on industrial emissions, to limit the exhaust emissions of engines installed in heavy duty vehicles, to further reduce the Member States' permitted national emissions of key pollutants and the emissions associated with refuelling of petrol cars at service stations, and to address the sulphur content of fuels including marine fuels should be duly examined as a priority by all institutions involved.

(18) Air quality plans should be developed for zones and agglomerations within which concentrations of pollutants in ambient air exceed the relevant air quality target values or limit values, plus any temporary margins of tolerance, where applicable. Air pollutants are emitted from many different sources and activities. To ensure coherence between different policies, such air quality plans should where feasible be consistent, and integrated with plans and programmes prepared pursuant to Directive 2001/80/EC of the European Parliament and of the Council of 23 October 2001 on the limitation of emissions of certain pollutants into the air from large combustion plants [1], Directive 2001/81/EC, and Directive 2002/49/EC of the European Parliament and of the Council of 25 June 2002 relating to the assessment and management of environmental noise [2]. Full account will also be taken of the ambient air quality objectives provided for in this Directive, where permits are granted for industrial activities pursuant to Directive 2008/1/EC of the European Parliament and of the Council of 15 January 2008 concerning integrated pollution prevention and control [3].

(19) Action plans should be drawn up indicating the measures to be taken in the short term where there is a risk of an exceedance of one or more alert thresholds in order to reduce that risk and to limit its duration. When the risk applies to one or more limit values or target values, Member States may, where appropriate, draw up such short-term action plans. In respect of ozone, such short-term action plans should take into account the provisions of Commission Decision 2004/279/EC of 19 March 2004 concerning guidance for implementation of Directive 2002/3/EC of the European Parliament and of the Council relating to ozone in ambient air [4].

(20) Member States should consult with one another if, following significant pollution originating in another Member State, the level of a pollutant exceeds, or is likely to exceed, the relevant air quality objectives plus the margin of tolerance where applicable or, as the case may be, the alert threshold. The transboundary nature of specific pollutants, such as ozone and particulate matter, may require coordination between neighbouring Member States in drawing up and implementing air quality plans and short-term action plans and in informing the public. Where appropriate, Member States should pursue cooperation with third countries, with particular emphasis on the early involvement of candidate countries.

(21) It is necessary for the Member States and the Commission to collect, exchange and disseminate air quality information in order to understand better the impacts of air pollution and develop appropriate policies. Up-to-date information on concentrations of all regulated pollutants in ambient air should also be readily available to the public.

(22) In order to facilitate the handling and comparison of air quality information, data should be made available to the Commission in a standardised form.

(23) It is necessary to adapt procedures for data provision, assessment and reporting of air quality to enable electronic means and the Internet to be used as the main tools to make information available, and so that such procedures are compatible with Directive 2007/2/EC of the European Parliament and the Council of 14 March 2007 establishing an infrastructure for spatial information in the European Community (INSPIRE) [5].

(24) It is appropriate to provide for the possibility of adapting the criteria and techniques used for the assessment of the ambient air quality to scientific and technical progress and adapting thereto the information to be provided.

(25) Since the objectives of this Directive cannot be sufficiently achieved by the Member States by reason of the transboundary nature of air pollutants and can therefore be better achieved at Community level, the Community may adopt measures, in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty. In accordance with the principle of proportionality, as set out in that Article, this Directive does not go beyond what is necessary in order to achieve those objectives.

(1) OJ L 309, 27.11.2001, p. 1. Directive as last amended by Directive 2006/105/EC.

(2) OJ L 189, 18.7.2002, p. 12.

(3) OJ L 24, 29.1.2008, p. 8.

(4) OJ L 87, 25.3.2004, p. 50.

(5) OJ L 108, 25.4.2007, p. 1.

(26) Member States should lay down rules on penalties applicable to infringements of the provisions of this Directive and ensure that they are implemented. The penalties should be effective, proportionate and dissuasive.

(27) Certain provisions of the acts repealed by this Directive should remain in force in order to ensure the continuance of existing air quality limits for nitrogen dioxide until they are replaced from 1 January 2010, the continuance of air quality reporting provisions until new implementing measures are adopted, and the continuance of obligations relating to the preliminary assessments of air quality required under Directive 2004/107/EC.

(28) The obligation to transpose this Directive into national law should be confined to those provisions which represent a substantive change as compared with the earlier Directives.

(29) In accordance with point 34 of the Interinstitutional Agreement on better lawmaking [1], Member States are encouraged to draw up, for themselves and in the interest of the Community, their own tables illustrating, as far as possible, the correlation between the Directive and the transposition measures, and to make them public.

(30) This Directive respects the fundamental rights and observes the principles recognised in particular by the Charter of Fundamental Rights of the European Union. In particular, this Directive seeks to promote the integration into the policies of the Union of a high level of environmental protection and the improvement of the quality of the environment in accordance with the principle of sustainable development as laid down in Article 37 of the Charter of Fundamental Rights of the European Union.

(31) The measures necessary for the implementation of this Directive should be adopted in accordance with Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission [2].

(32) The Commission should be empowered to amend Annexes I to VI, Annexes VIII to X and Annex XV. Since those measures are of general scope and are designed to amend non-essential elements of this Directive, they must be adopted in accordance with the regulatory procedure with scrutiny provided for in Article 5a of Decision 1999/468/EC.

(33) The transposition clause requires Member States to ensure that the necessary urban background measurements are in place well in time to define the Average Exposure Indicator, in order to guarantee that the requirements related to the assessment of the National Exposure Reduction Target and to the calculation of the Average Exposure Indicator are met,

HAVE ADOPTED THIS DIRECTIVE:

CHAPTER I

GENERAL PROVISIONS

Article 1

Subject matter

This Directive lays down measures aimed at the following:

1. defining and establishing objectives for ambient air quality designed to avoid, prevent or reduce harmful effects on human health and the environment as a whole;

2. assessing the ambient air quality in Member States on the basis of common methods and criteria;

3. obtaining information on ambient air quality in order to help combat air pollution and nuisance and to monitor long-term trends and improvements resulting from national and Community measures;

4. ensuring that such information on ambient air quality is made available to the public;

5. maintaining air quality where it is good and improving it in other cases;

6. promoting increased cooperation between the Member States in reducing air pollution.

Article 2

Definitions

For the purposes of this Directive:

1. 'ambient air' shall mean outdoor air in the troposphere, excluding workplaces as defined by Directive 89/654/EEC [3] where provisions concerning health and safety at work apply and to which members of the public do not have regular access;

2. 'pollutant' shall mean any substance present in ambient air and likely to have harmful effects on human health and/or the environment as a whole;

3. 'level' shall mean the concentration of a pollutant in ambient air or the deposition thereof on surfaces in a given time;

[1] OJ C 321, 31.12.2003, p. 1.

[2] OJ L 184, 17.7.1999, p. 23. Decision as amended by Decision 2006/512/EC (OJ L 200, 22.7.2006, p. 11).

[3] Council Directive 89/654/EEC of 30 November 1989 concerning the minimum safety and health requirements for the workplace (OJ L 393, 30.12.1989, p. 1). Directive as amended by Directive 2007/30/EC of the European Parliament and of the Council (OJ L 165, 27.6.2007, p. 21).

4. 'assessment' shall mean any method used to measure, calculate, predict or estimate levels;

5. 'limit value' shall mean a level fixed on the basis of scientific knowledge, with the aim of avoiding, preventing or reducing harmful effects on human health and/or the environment as a whole, to be attained within a given period and not to be exceeded once attained;

6. 'critical level' shall mean a level fixed on the basis of scientific knowledge, above which direct adverse effects may occur on some receptors, such as trees, other plants or natural ecosystems but not on humans;

7. 'margin of tolerance' shall mean the percentage of the limit value by which that value may be exceeded subject to the conditions laid down in this Directive;

8. 'air quality plans' shall mean plans that set out measures in order to attain the limit values or target values;

9. 'target value' shall mean a level fixed with the aim of avoiding, preventing or reducing harmful effects on human health and/or the environment as a whole, to be attained where possible over a given period;

10. 'alert threshold' shall mean a level beyond which there is a risk to human health from brief exposure for the population as a whole and at which immediate steps are to be taken by the Member States;

11. 'information threshold' shall mean a level beyond which there is a risk to human health from brief exposure for particularly sensitive sections of the population and for which immediate and appropriate information is necessary;

12. 'upper assessment threshold' shall mean a level below which a combination of fixed measurements and modelling techniques and/or indicative measurements may be used to assess ambient air quality;

13. 'lower assessment threshold' shall mean a level below which modelling or objective-estimation techniques alone may be used to assess ambient air quality;

14. 'long-term objective' shall mean a level to be attained in the long term, save where not achievable through proportionate measures, with the aim of providing effective protection of human health and the environment;

15. 'contributions from natural sources' shall mean emissions of pollutants not caused directly or indirectly by human activities, including natural events such as volcanic eruptions, seismic activities, geothermal activities, wild-land fires, high-wind events, sea sprays or the atmospheric re-suspension or transport of natural particles from dry regions;

16. 'zone' shall mean part of the territory of a Member State, as delimited by that Member State for the purposes of air quality assessment and management;

17. 'agglomeration' shall mean a zone that is a conurbation with a population in excess of 250 000 inhabitants or, where the population is 250 000 inhabitants or less, with a given population density per km^2 to be established by the Member States;

18. 'PM_{10}' shall mean particulate matter which passes through a size-selective inlet as defined in the reference method for the sampling and measurement of PM_{10}, EN 12341, with a 50 % efficiency cut-off at 10 μm aerodynamic diameter;

19. '$PM_{2,5}$' shall mean particulate matter which passes through a size-selective inlet as defined in the reference method for the sampling and measurement of $PM_{2,5}$, EN 14907, with a 50 % efficiency cut-off at 2,5 μm aerodynamic diameter;

20. 'average exposure indicator' shall mean an average level determined on the basis of measurements at urban background locations throughout the territory of a Member State and which reflects population exposure. It is used to calculate the national exposure reduction target and the exposure concentration obligation;

21. 'exposure concentration obligation' shall mean a level fixed on the basis of the average exposure indicator with the aim of reducing harmful effects on human health, to be attained over a given period;

22. 'national exposure reduction target' shall mean a percentage reduction of the average exposure of the population of a Member State set for the reference year with the aim of reducing harmful effects on human health, to be attained where possible over a given period;

23. 'urban background locations' shall mean places in urban areas where levels are representative of the exposure of the general urban population;

24. 'oxides of nitrogen' shall mean the sum of the volume mixing ratio (ppbv) of nitrogen monoxide (nitric oxide) and nitrogen dioxide expressed in units of mass concentration of nitrogen dioxide (μg/m^3);

25. 'fixed measurements' shall mean measurements taken at fixed sites, either continuously or by random sampling, to determine the levels in accordance with the relevant data quality objectives;

26. 'indicative measurements' shall mean measurements which meet data quality objectives that are less strict than those required for fixed measurements;

27. 'volatile organic compounds' (VOC) shall mean organic compounds from anthropogenic and biogenic sources, other than methane, that are capable of producing photochemical oxidants by reactions with nitrogen oxides in the presence of sunlight;

28. 'ozone precursor substances' means substances which contribute to the formation of ground-level ozone, some of which are listed in Annex X.

Article 3

Responsibilities

Member States shall designate at the appropriate levels the competent authorities and bodies responsible for the following:

(a) assessment of ambient air quality;

(b) approval of measurement systems (methods, equipment, networks and laboratories);

(c) ensuring the accuracy of measurements;

(d) analysis of assessment methods;

(e) coordination on their territory if Community-wide quality assurance programmes are being organised by the Commission;

(f) cooperation with the other Member States and the Commission.

Where relevant, the competent authorities and bodies shall comply with Section C of Annex I.

Article 4

Establishment of zones and agglomerations

Member States shall establish zones and agglomerations throughout their territory. Air quality assessment and air quality management shall be carried out in all zones and agglomerations.

CHAPTER II

ASSESSMENT OF AMBIENT AIR QUALITY

SECTION 1

Assessment of ambient air quality in relation to sulphur dioxide, nitrogen dioxide and oxides of nitrogen, particulate matter, lead, benzene and carbon monoxide

Article 5

Assessment regime

1. The upper and lower assessment thresholds specified in Section A of Annex II shall apply to sulphur dioxide, nitrogen dioxide and oxides of nitrogen, particulate matter (PM_{10} and $PM_{2,5}$), lead, benzene and carbon monoxide.

Each zone and agglomeration shall be classified in relation to those assessment thresholds.

2. The classification referred to in paragraph 1 shall be reviewed at least every five years in accordance with the procedure laid down in Section B of Annex II.

However, classifications shall be reviewed more frequently in the event of significant changes in activities relevant to the ambient concentrations of sulphur dioxide, nitrogen dioxide or, where relevant, oxides of nitrogen, particulate matter (PM_{10}, $PM_{2,5}$), lead, benzene or carbon monoxide.

Article 6

Assessment criteria

1. Member States shall assess ambient air quality with respect to the pollutants referred to in Article 5 in all their zones and agglomerations, in accordance with the criteria laid down in paragraphs 2, 3 and 4 of this Article and in accordance with the criteria laid down in Annex III.

2. In all zones and agglomerations where the level of pollutants referred to in paragraph 1 exceeds the upper assessment threshold established for those pollutants, fixed measurements shall be used to assess the ambient air quality. Those fixed measurements may be supplemented by modelling techniques and/or indicative measurements to provide adequate information on the spatial distribution of the ambient air quality.

3. In all zones and agglomerations where the level of pollutants referred to in paragraph 1 is below the upper assessment threshold established for those pollutants, a combination of fixed measurements and modelling techniques and/or indicative measurements may be used to assess the ambient air quality.

4. In all zones and agglomerations where the level of pollutants referred to in paragraph 1 is below the lower assessment threshold established for those pollutants, modelling techniques or objective-estimation techniques or both shall be sufficient for the assessment of the ambient air quality.

5. In addition to the assessments referred to in paragraphs 2, 3 and 4, measurements shall be made, at rural background locations away from significant sources of air pollution, for the purposes of providing, as a minimum, information on the total mass concentration and the chemical speciation concentrations of fine particulate matter ($PM_{2,5}$) on an annual average basis and shall be conducted using the following criteria:

(a) one sampling point shall be installed every 100 000 km^2;

(b) each Member State shall set up at least one measuring station or may, by agreement with adjoining Member States, set up one or several common measuring stations, covering the relevant neighbouring zones, to achieve the necessary spatial resolution;

(c) where appropriate, monitoring shall be coordinated with the monitoring strategy and measurement programme of the Cooperative Programme for Monitoring and Evaluation of the Long-range Transmission of Air Pollutants in Europe (EMEP);

(d) Sections A and C of Annex I shall apply in relation to the data quality objectives for mass concentration measurements of particulate matter and Annex IV shall apply in its entirety.

Member States shall inform the Commission of the measurement methods used in the measurement of the chemical composition of fine particulate matter ($PM_{2,5}$).

Article 7

Sampling points

1. The location of sampling points for the measurement of sulphur dioxide, nitrogen dioxide and oxides of nitrogen, particulate matter (PM_{10}, $PM_{2,5}$), lead, benzene and carbon monoxide in ambient air shall be determined using the criteria listed in Annex III.

2. In each zone or agglomeration where fixed measurements are the sole source of information for assessing air quality, the number of sampling points for each relevant pollutant shall not be less than the minimum number of sampling points specified in Section A of Annex V.

3. For zones and agglomerations within which information from fixed measurement sampling points is supplemented by information from modelling and/or indicative measurement, the total number of sampling points specified in Section A of Annex V may be reduced by up to 50 %, provided that the following conditions are met:

(a) the supplementary methods provide sufficient information for the assessment of air quality with regard to limit values or alert thresholds, as well as adequate information for the public;

(b) the number of sampling points to be installed and the spatial resolution of other techniques are sufficient for the concentration of the relevant pollutant to be established in accordance with the data quality objectives specified in Section A of Annex I and enable assessment results to meet the criteria specified in Section B of Annex I.

The results of modelling and/or indicative measurement shall be taken into account for the assessment of air quality with respect to the limit values.

4. The application in Member States of the criteria for selecting sampling points shall be monitored by the Commission so as to facilitate the harmonised application of those criteria throughout the European Union.

Article 8

Reference measurement methods

1. Member States shall apply the reference measurement methods and criteria specified in Section A and Section C of Annex VI.

2. Other measurement methods may be used subject to the conditions set out in Section B of Annex VI.

SECTION 2

Assessment of ambient air quality in relation to ozone

Article 9

Assessment criteria

1. Where, in a zone or agglomeration, concentrations of ozone have exceeded the long-term objectives specified in Section C of Annex VII during any of the previous five years of measurement, fixed measurements shall be taken.

2. Where fewer than five years' data are available, Member States may, for the purposes of determining whether the long-term objectives referred to in paragraph 1 have been exceeded during those five years, combine the results from measurement campaigns of short duration carried out when and where levels are likely to be at their highest, with the results obtained from emission inventories and modelling.

Article 10

Sampling points

1. The siting of sampling points for the measurement of ozone shall be determined using the criteria set out in Annex VIII.

2. The sampling points for fixed measurements of ozone in each zone or agglomeration within which measurement is the sole source of information for assessing air quality shall not be less than the minimum number of sampling points specified in Section A of Annex IX.

3. For zones and agglomerations within which information from sampling points for fixed measurements is supplemented by information from modelling and/or indicative measurements, the number of sampling points specified in Section A of Annex IX may be reduced provided that the following conditions are met:

(a) the supplementary methods provide sufficient information for the assessment of air quality with regard to target values, long-term objectives, information and alert thresholds;

(b) the number of sampling points to be installed and the spatial resolution of other techniques are sufficient for the concentration of ozone to be established in accordance with the data quality objectives specified in Section A of Annex I and enable assessment results to meet the criteria specified in Section B of Annex I;

(c) the number of sampling points in each zone or agglomeration amounts to at least one sampling point per two million inhabitants or one sampling point per 50 000 km^2, whichever produces the greater number of sampling points, but must not be less than one sampling point in each zone or agglomeration;

(d) nitrogen dioxide is measured at all remaining sampling points except at rural background stations as referred to in Section A of Annex VIII.

The results of modelling and/or indicative measurement shall be taken into account for the assessment of air quality with respect to the target values.

4. Nitrogen dioxide shall be measured at a minimum of 50 % of the ozone sampling points required under Section A of Annex IX. That measurement shall be continuous except at rural background stations, as referred to in Section A of Annex VIII, where other measurement methods may be used.

5. In zones and agglomerations where, during each of the previous five years of measurement, concentrations are below the long-term objectives, the number of sampling points for fixed measurements shall be determined in accordance with Section B of Annex IX.

6. Each Member State shall ensure that at least one sampling point is installed and operated in its territory to supply data on concentrations of the ozone precursor substances listed in Annex X. Each Member State shall choose the number and siting of the stations at which ozone precursor substances are to be measured, taking into account the objectives and methods laid down in Annex X.

Article 11

Reference measurement methods

1. Member States shall apply the reference method for measurement of ozone, set out in point 8 of Section A of Annex VI. Other measuring methods may be used subject to the conditions set out in Section B of Annex VI.

2. Each Member State shall inform the Commission of the methods it uses to sample and measure VOC, as listed in Annex X.

CHAPTER III

AMBIENT AIR QUALITY MANAGEMENT

Article 12

Requirements where levels are lower than the limit values

In zones and agglomerations where the levels of sulphur dioxide, nitrogen dioxide, PM_{10}, $PM_{2,5}$, lead, benzene and carbon monoxide in ambient air are below the respective limit values specified in Annexes XI and XIV, Member States shall maintain the levels of those pollutants below the limit values and shall endeavour to preserve the best ambient air quality, compatible with sustainable development.

Article 13

Limit values and alert thresholds for the protection of human health

1. Member States shall ensure that, throughout their zones and agglomerations, levels of sulphur dioxide, PM_{10}, lead, and carbon monoxide in ambient air do not exceed the limit values laid down in Annex XI.

In respect of nitrogen dioxide and benzene, the limit values specified in Annex XI may not be exceeded from the dates specified therein.

Compliance with these requirements shall be assessed in accordance with Annex III.

The margins of tolerance laid down in Annex XI shall apply in accordance with Article 22(3) and Article 23(1).

2. The alert thresholds for concentrations of sulphur dioxide and nitrogen dioxide in ambient air shall be those laid down in Section A of Annex XII.

Article 14

Critical levels

1. Member States shall ensure compliance with the critical levels specified in Annex XIII as assessed in accordance with Section A of Annex III.

2. Where fixed measurements are the sole source of information for assessing air quality, the number of sampling points shall not be less than the minimum number specified in Section C of Annex V. Where that information is supplemented by indicative measurements or modelling, the minimum number of sampling points may be reduced by up to 50 % so long as the assessed concentrations of the relevant pollutant can be established in accordance with the data quality objectives specified in Section A of Annex I.

Article 15

National $PM_{2,5}$ exposure reduction target for the protection of human health

1. Member States shall take all necessary measures not entailing disproportionate costs to reduce exposure to $PM_{2,5}$ with a view to attaining the national exposure reduction target laid down in Section B of Annex XIV by the year specified therein.

2. Member States shall ensure that the average exposure indicator for the year 2015 established in accordance with Section A of Annex XIV does not exceed the exposure concentration obligation laid down in Section C of that Annex.

3. The average exposure indicator for $PM_{2,5}$ shall be assessed in accordance with Section A of Annex XIV.

4. Each Member State shall, in accordance with Annex III, ensure that the distribution and the number of sampling points on which the average exposure indicator for $PM_{2,5}$ is based reflect the general population exposure adequately. The number of sampling points shall be no less than that determined by application of Section B of Annex V.

Article 16

$PM_{2,5}$ target value and limit value for the protection of human health

1. Member States shall take all necessary measures not entailing disproportionate costs to ensure that concentrations of $PM_{2,5}$ in ambient air do not exceed the target value laid down in Section D of Annex XIV as from the date specified therein.

2. Member States shall ensure that concentrations of $PM_{2,5}$ in ambient air do not exceed the limit value laid down in Section E of Annex XIV throughout their zones and agglomerations as from the date specified therein. Compliance with this requirement shall be assessed in accordance with Annex III.

3. The margin of tolerance laid down in Section E of Annex XIV shall apply in accordance with Article 23(1).

Article 17

Requirements in zones and agglomerations where ozone concentrations exceed the target values and long-term objectives

1. Member States shall take all necessary measures not entailing disproportionate costs to ensure that the target values and long-term objectives are attained.

2. For zones and agglomerations in which a target value is exceeded, Member States shall ensure that the programme prepared pursuant to Article 6 of Directive 2001/81/EC and, if appropriate, an air quality plan is implemented in order to attain the target values, save where not achievable through measures not entailing disproportionate costs, as from the date specified in Section B of Annex VII to this Directive.

3. For zones and agglomerations in which the levels of ozone in ambient air are higher than the long-term objectives but below, or equal to, the target values, Member States shall prepare and implement cost-effective measures with the aim of achieving the long-term objectives. Those measures shall, at least, be consistent with all the air quality plans and the programme referred to in paragraph 2.

Article 18

Requirements in zones and agglomerations where ozone concentrations meet the long-term objectives

In zones and agglomerations in which ozone levels meet the long-term objectives, Member States shall, in so far as factors including the transboundary nature of ozone pollution and meteorological conditions permit, maintain those levels below the long-term objectives and shall preserve through proportionate measures the best ambient air quality compatible with sustainable development and a high level of environmental and human health protection.

Article 19

Measures required in the event of information or alert thresholds being exceeded

Where the information threshold specified in Annex XII or any of the alert thresholds laid down therein is exceeded, Member States shall take the necessary steps to inform the public by means of radio, television, newspapers or the Internet.

Member States shall also forward to the Commission, on a provisional basis, information concerning the levels recorded and the duration of the periods during which the alert threshold or information threshold was exceeded.

Article 20

Contributions from natural sources

1. Member States shall transmit to the Commission, for a given year, lists of zones and agglomerations where exceedances of limit values for a given pollutant are attributable to natural sources. Member States shall provide information on concentrations and sources and the evidence demonstrating that the exceedances are attributable to natural sources.

2. Where the Commission has been informed of an exceedance attributable to natural sources in accordance with paragraph 1, that exceedance shall not be considered as an exceedance for the purposes of this Directive.

3. The Commission shall by 11 June 2010 publish guidelines for demonstration and subtraction of exceedances attributable to natural sources.

Article 21

Exceedances attributable to winter-sanding or -salting of roads

1. Member States may designate zones or agglomerations within which limit values for PM_{10} are exceeded in ambient air due to the re-suspension of particulates following winter-sanding or -salting of roads.

2. Member States shall send the Commission lists of any such zones or agglomerations together with information on concentrations and sources of PM_{10} therein.

3. When informing the Commission in accordance with Article 27, Member States shall provide the necessary evidence to demonstrate that any exceedances are due to re-suspended particulates and that reasonable measures have been taken to lower the concentrations.

4. Without prejudice to Article 20, in the case of zones and agglomerations referred to in paragraph 1 of this Article, Member States need to establish the air quality plan provided for in Article 23 only in so far as exceedances are attributable to PM_{10} sources other than winter-sanding or -salting of roads.

5. The Commission shall by 11 June 2010 publish guidelines for determination of contributions from the re-suspension of particulates following winter-sanding or -salting of roads.

Article 22

Postponement of attainment deadlines and exemption from the obligation to apply certain limit values

1. Where, in a given zone or agglomeration, conformity with the limit values for nitrogen dioxide or benzene cannot be achieved by the deadlines specified in Annex XI, a Member State may postpone those deadlines by a maximum of five years for that particular zone or agglomeration, on condition that an air quality plan is established in accordance with Article 23 for the zone or agglomeration to which the postponement would apply; such air quality plan shall be supplemented by the information listed in Section B of Annex XV related to the pollutants concerned and shall demonstrate how conformity will be achieved with the limit values before the new deadline.

2. Where, in a given zone or agglomeration, conformity with the limit values for PM_{10} as specified in Annex XI cannot be achieved because of site-specific dispersion characteristics, adverse climatic conditions or transboundary contributions, a Member State shall be exempt from the obligation to apply those limit values until 11 June 2011 provided that the conditions laid down in paragraph 1 are fulfilled and that the Member State shows that all appropriate measures have been taken at national, regional and local level to meet the deadlines.

3. Where a Member State applies paragraphs 1 or 2, it shall ensure that the limit value for each pollutant is not exceeded by more than the maximum margin of tolerance specified in Annex XI for each of the pollutants concerned.

4. Member States shall notify the Commission where, in their view, paragraphs 1 or 2 are applicable, and shall communicate the air quality plan referred to in paragraph 1 including all relevant information necessary for the Commission to assess whether or not the relevant conditions are satisfied. In its assessment, the Commission shall take into account estimated effects on ambient air quality in the Member States, at present and in the future, of measures that have been taken by the Member States as well as estimated effects on ambient air quality of current Community measures and planned Community measures to be proposed by the Commission.

Where the Commission has raised no objections within nine months of receipt of that notification, the relevant conditions for the application of paragraphs 1 or 2 shall be deemed to be satisfied.

If objections are raised, the Commission may require Member States to adjust or provide new air quality plans.

CHAPTER IV

PLANS

Article 23

Air quality plans

1. Where, in given zones or agglomerations, the levels of pollutants in ambient air exceed any limit value or target value, plus any relevant margin of tolerance in each case, Member States shall ensure that air quality plans are established for those zones and agglomerations in order to achieve the related limit value or target value specified in Annexes XI and XIV.

In the event of exceedances of those limit values for which the attainment deadline is already expired, the air quality plans shall set out appropriate measures, so that the exceedance period can be kept as short as possible. The air quality plans may additionally include specific measures aiming at the protection of sensitive population groups, including children.

Those air quality plans shall incorporate at least the information listed in Section A of Annex XV and may include measures pursuant to Article 24. Those plans shall be communicated to the Commission without delay, but no later than two years after the end of the year the first exceedance was observed.

Where air quality plans must be prepared or implemented in respect of several pollutants, Member States shall, where appropriate, prepare and implement integrated air quality plans covering all pollutants concerned.

2. Member States shall, to the extent feasible, ensure consistency with other plans required under Directive 2001/80/EC, Directive 2001/81/EC or Directive 2002/49/EC in order to achieve the relevant environmental objectives.

Article 24

Short-term action plans

1. Where, in a given zone or agglomeration, there is a risk that the levels of pollutants will exceed one or more of the alert thresholds specified in Annex XII, Member States shall draw up action plans indicating the measures to be taken in the short term in order to reduce the risk or duration of such an exceedance. Where this risk applies to one or more limit values or target values specified in Annexes VII, XI and XIV, Member States may, where appropriate, draw up such short-term action plans.

However, where there is a risk that the alert threshold for ozone specified in Section B of Annex XII will be exceeded, Member States shall only draw up such short-term action plans when in their opinion there is a significant potential, taking into account national geographical, meteorological and economic conditions, to reduce the risk, duration or severity of such an exceedance. When drawing up such a short-term action plan Member States shall take account of Decision 2004/279/EC.

2. The short-term action plans referred to in paragraph 1 may, depending on the individual case, provide for effective measures to control and, where necessary, suspend activities which contribute to the risk of the respective limit values or target values or alert threshold being exceeded. Those action plans may include measures in relation to motor-vehicle traffic, construction works, ships at berth, and the use of industrial plants or products and domestic heating. Specific actions aiming at the protection of sensitive population groups, including children, may also be considered in the framework of those plans.

3. When Member States have drawn up a short-term action plan, they shall make available to the public and to appropriate organisations such as environmental organisations, consumer organisations, organisations representing the interests of sensitive population groups, other relevant health-care bodies and the relevant industrial federations both the results of their investigations on the feasibility and the content of specific short-term action plans as well as information on the implementation of these plans.

4. For the first time before 11 June 2010 and at regular intervals thereafter, the Commission shall publish examples of best practices for the drawing-up of short-term action plans, including examples of best practices for the protection of sensitive population groups, including children.

Article 25

Transboundary air pollution

1. Where any alert threshold, limit value or target value plus any relevant margin of tolerance or long-term objective is exceeded due to significant transboundary transport of air pollutants or their precursors, the Member States concerned shall cooperate and, where appropriate, draw up joint activities, such as the preparation of joint or coordinated air quality plans pursuant to Article 23 in order to remove such exceedances through the application of appropriate but proportionate measures.

2. The Commission shall be invited to be present and to assist in any cooperation referred to in paragraph 1. Where appropriate, the Commission shall, taking into account the reports established pursuant to Article 9 of Directive 2001/81/EC, consider whether further action should be taken at Community level in order to reduce precursor emissions responsible for transboundary pollution.

3. Member States shall, if appropriate pursuant to Article 24, prepare and implement joint short-term action plans covering neighbouring zones in other Member States. Member States shall ensure that neighbouring zones in other Member States which have developed short-term action plans receive all appropriate information.

4. Where the information threshold or alert thresholds are exceeded in zones or agglomerations close to national borders, information shall be provided as soon as possible to the competent authorities in the neighbouring Member States concerned. That information shall also be made available to the public.

5. In drawing up plans as provided for in paragraphs 1 and 3 and in informing the public as referred to in paragraph 4, Member States shall, where appropriate, endeavour to pursue cooperation with third countries, and in particular with candidate countries.

CHAPTER V

INFORMATION AND REPORTING

Article 26

Public information

1. Member States shall ensure that the public as well as appropriate organisations such as environmental organisations, consumer organisations, organisations representing the interests of sensitive populations, other relevant health-care bodies and the relevant industrial federations are informed, adequately and in good time, of the following:

(a) ambient air quality in accordance with Annex XVI;

(b) any postponement decisions pursuant to Article 22(1);

(c) any exemptions pursuant to Article 22(2);

(d) air quality plans as provided for in Article 22(1) and Article 23 and programmes referred to in Article 17(2).

The information shall be made available free of charge by means of any easily accessible media including the Internet or any other appropriate means of telecommunication, and shall take into account the provisions laid down in Directive 2007/2/EC.

2. Member States shall make available to the public annual reports for all pollutants covered by this Directive.

Those reports shall summarise the levels exceeding limit values, target values, long-term objectives, information thresholds and alert thresholds, for the relevant averaging periods. That information shall be combined with a summary assessment of the effects of those exceedances. The reports may include, where appropriate, further information and assessments on forest protection as well as information on other pollutants for which monitoring provisions are specified in this Directive, such as, *inter alia*, selected non-regulated ozone precursor substances as listed in Section B of Annex X.

3. Member States shall inform the public of the competent authority or body designated in relation to the tasks referred to in Article 3.

Article 27

Transmission of information and reporting

1. Member States shall ensure that information on ambient air quality is made available to the Commission within the required timescale as determined by the implementing measures referred to in Article 28(2).

2. In any event, for the specific purpose of assessing compliance with the limit values and critical levels and the attainment of target values, such information shall be made available to the Commission no later than nine months after the end of each year and shall include:

(a) the changes made in that year to the list and delimitation of zones and agglomerations established under Article 4;

(b) the list of zones and agglomerations in which the levels of one or more pollutants are higher than the limit values plus the margin of tolerance where applicable or higher than target values or critical levels; and for these zones and agglomerations:

(i) levels assessed and, if relevant, the dates and periods when such levels were observed;

(ii) if appropriate, an assessment on contributions from natural sources and from re-suspension of particulates following winter-sanding or -salting of roads to the levels assessed, as declared to the Commission under Articles 20 and 21.

3. Paragraphs 1 and 2 shall apply to information collected as from the beginning of the second calendar year after the entry into force of the implementing measures referred to in Article 28(2).

Article 28

Implementing measures

1. Measures designed to amend the non-essential elements of this Directive, namely Annexes I to VI, Annexes VIII to X and Annex XV, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 29(3).

However, the amendments may not have the effect of directly or indirectly modifying either of the following:

(a) the limit values, exposure reduction targets, critical levels, target values, information or alert thresholds or long-term objectives specified in Annex VII and Annexes XI to XIV;

(b) the dates for compliance with any of the parameters referred to in point (a).

2. The Commission shall, in accordance with the regulatory procedure referred to in Article 29(2), determine the additional information to be made available by Member States pursuant to Article 27 as well as the timescales in which such information is to be communicated.

The Commission shall also identify ways of streamlining the way data are reported and the reciprocal exchange of information and data from networks and individual stations measuring ambient air pollution within the Member States, in accordance with the regulatory procedure referred to in Article 29(2).

3. The Commission shall draw up guidelines for the agreements on setting up common measuring stations as referred to in Article 6(5).

4. The Commission shall publish guidance on the demonstration of equivalence referred to in Section B of Annex VI.

CHAPTER VI

COMMITTEE, TRANSITIONAL AND FINAL PROVISIONS

Article 29

Committee

1. The Commission shall be assisted by a committee, 'the Ambient Air Quality Committee'.

2. Where reference is made to this paragraph, Articles 5 and 7 of Decision 1999/468/EC shall apply, having regard to the provisions of Article 8 thereof.

The period laid down in Article 5(6) of Decision 1999/468/EC shall be set at three months.

3. Where reference is made to this paragraph, Article 5a(1) to (4) and Article 7 of Decision 1999/468/EC shall apply, having regard to the provisions of Article 8 thereof.

Article 30

Penalties

Member States shall lay down the rules on penalties applicable to infringements of the national provisions adopted pursuant to this Directive and shall take all measures necessary to ensure that they are implemented. The penalties provided for must be effective, proportionate and dissuasive.

Article 31

Repeal and transitional provisions

1. Directives 96/62/EC, 1999/30/EC, 2000/69/EC and 2002/3/EC shall be repealed as from 11 June 2010, without prejudice to the obligations on the Member States relating to time-limits for transposition or application of those Directives.

However, from 11 June 2008, the following shall apply:

(a) in Directive 96/62/EC, paragraph 1 of Article 12 shall be replaced by the following:

'1. The detailed arrangements for forwarding the information to be provided under Article 11 shall be adopted in accordance with the procedure referred to in paragraph 3.';

(b) in Directive 1999/30/EC, Article 7(7), footnote 1 in point I of Annex VIII and point VI of Annex IX shall be deleted;

(c) in Directive 2000/69/EC, Article 5(7) and point III in Annex VII shall be deleted;

(d) in Directive 2002/3/EC, Article 9(5) and point II of Annex VIII shall be deleted.

2. Notwithstanding the first subparagraph of paragraph 1, the following Articles shall remain in force:

(a) Article 5 of Directive 96/62/EC until 31 December 2010;

(b) Article 11(1) of Directive 96/62/EC and Article 10(1), (2) and (3) of Directive 2002/3/EC until the end of the second calendar year following the entry into force of the implementing measures referred to in Article 28(2) of this Directive;

(c) Article 9(3) and (4) of Directive 1999/30/EC until 31 December 2009.

3. References made to the repealed Directives shall be construed as being made to this Directive and should be read in accordance with the correlation table in Annex XVII.

4. Decision 97/101/EC shall be repealed with effect from the end of the second calendar year following the entry into force of the implementing measures referred to in Article 28(2) of this Directive.

However, the third, fourth and fifth indents of Article 7 of Decision 97/101/EC shall be deleted with effect from 11 June 2008.

Article 32

Review

1. In 2013 the Commission shall review the provisions related to $PM_{2,5}$ and, as appropriate, other pollutants, and shall present a proposal to the European Parliament and the Council.

As regards $PM_{2,5}$, the review shall be undertaken with a view to establishing a legally binding national exposure reduction obligation in order to replace the national exposure reduction target and to review the exposure concentration obligation laid down in Article 15, taking into account, *inter alia*, the following elements:

— latest scientific information from WHO and other relevant organisations,

— air quality situations and reduction potentials in the Member States,

— the revision of Directive 2001/81/EC,

— progress made in implementing Community reduction measures for air pollutants,

2. The Commission shall take into account the feasibility of adopting a more ambitious limit value for $PM_{2,5}$, shall review the indicative limit value of the second stage for $PM_{2,5}$ and consider confirming or altering that value.

3. As part of the review, the Commission shall also prepare a report on the experience and on the necessity of monitoring of PM_{10} and $PM_{2,5}$, taking into account technical progress in automatic measuring techniques. If appropriate, new reference methods for the measurement of PM_{10} and $PM_{2,5}$ shall be proposed.

Article 33

Transposition

1. Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with this Directive before 11 June 2010. They shall forthwith communicate to the Commission the text of those measures.

When Member States adopt these measures, they shall contain a reference to this Directive or shall be accompanied by such reference on the occasion of their official publication. The methods of making such reference shall be laid down by Member States.

2. However, Member States shall ensure that a sufficient number of urban background measurement stations of $PM_{2,5}$ necessary for the calculation of the Average Exposure Indicator, in accordance with Section B of Annex V, is established at the latest by 1 January 2009, in order to comply with the timeframe and the conditions indicated in Section A of Annex XIV.

3. Member States shall communicate to the Commission the text of the main provisions of national law which they adopt in the field covered by this Directive.

Article 34

Entry into force

This Directive shall enter into force on the day of its publication in the *Official Journal of the European Union*.

Article 35

Addressees

This Directive is addressed to the Member States.

Done at Strasbourg, 21 May 2008.

For the European Parliament	*For the Council*
The President	*The President*
H.-G. PÖTTERING	J. LENARČIČ

ANNEX I

DATA QUALITY OBJECTIVES

A. Data quality objectives for ambient air quality assessment

	Sulphur dioxide, nitrogen dioxide and oxides of nitrogen and carbon monoxide	Benzene	Particulate matter (PM_{10}/$PM_{2,5}$) and lead	Ozone and related NO and NO_2
Fixed measurements (1)				
Uncertainty	15 %	25 %	25 %	15 %
Minimum data capture	90 %	90 %	90 %	90 % during summer 75 % during winter
Minimum time coverage:				
— urban background and traffic	—	35 % (2)	—	—
— industrial sites	—	90 %	—	—
Indicative measurements				
Uncertainty	25 %	30 %	50 %	30 %
Minimum data capture	90 %	90 %	90 %	90 %
Minimum time coverage	14 % (4)	14 % (3)	14 % (4)	> 10 % during summer
Modelling uncertainty:				
Hourly	50 %	—	—	50 %
Eight-hour averages	50 %	—	—	50 %
Daily averages	50 %	—	not yet defined	—
Annual averages	30 %	50 %	50 %	—
Objective estimation Uncertainty	75 %	100 %	100 %	75 %

(1) Member States may apply random measurements instead of continuous measurements for benzene, lead and particulate matter if they can demonstrate to the Commission that the uncertainty, including the uncertainty due to random sampling, meets the quality objective of 25 % and the time coverage is still larger than the minimum time coverage for indicative measurements. Random sampling must be evenly distributed over the year in order to avoid skewing of results. The uncertainty due to random sampling may be determined by the procedure laid down in ISO 11222 (2002) 'Air Quality — Determination of the Uncertainty of the Time Average of Air Quality Measurements'. If random measurements are used to assess the requirements of the PM_{10} limit value, the 90,4 percentile (to be lower than or equal to 50 $\mu g/m^3$) should be evaluated instead of the number of exceedances, which is highly influenced by data coverage.

(2) Distributed over the year to be representative of various conditions for climate and traffic.

(3) One day's measurement a week at random, evenly distributed over the year, or eight weeks evenly distributed over the year.

(4) One measurement a week at random, evenly distributed over the year, or eight weeks evenly distributed over the year.

The uncertainty (expressed at a 95 % confidence level) of the assessment methods will be evaluated in accordance with the principles of the CEN Guide to the Expression of Uncertainty in Measurement (ENV 13005-1999), the methodology of ISO 5725:1994 and the guidance provided in the CEN report 'Air Quality — Approach to Uncertainty Estimation for Ambient Air Reference Measurement Methods' (CR 14377:2002E). The percentages for uncertainty in the above table are given for individual measurements averaged over the period considered by the limit value (or target value in the case of ozone), for a 95 % confidence interval. The uncertainty for the fixed measurements shall be interpreted as being applicable in the region of the appropriate limit value (or target value in the case of ozone).

The uncertainty for modelling is defined as the maximum deviation of the measured and calculated concentration levels for 90 % of individual monitoring points, over the period considered, by the limit value (or target value in the case of ozone), without taking into account the timing of the events. The uncertainty for modelling shall be interpreted as being applicable in the region of the appropriate limit value (or target value in the case of ozone). The fixed measurements that have to be selected for comparison with modelling results shall be representative of the scale covered by the model.

The uncertainty for objective estimation is defined as the maximum deviation of the measured and calculated concentration levels, over the period considered, by the limit value (or target value in the case of ozone), without taking into account the timing of the events.

The requirements for minimum data capture and time coverage do not include losses of data due to the regular calibration or the normal maintenance of the instrumentation.

B. **Results of air quality assessment**

The following information shall be compiled for zones or agglomerations within which sources other than measurement are employed to supplement information from measurement or as the sole means of air quality assessment:

— a description of assessment activities carried out,

— the specific methods used, with references to descriptions of the method,

— the sources of data and information,

— a description of results, including uncertainties and, in particular, the extent of any area or, if relevant, the length of road within the zone or agglomeration over which concentrations exceed any limit value, target value or long-term objective plus margin of tolerance, if applicable, and of any area within which concentrations exceed the upper assessment threshold or the lower assessment threshold,

— the population potentially exposed to levels in excess of any limit value for protection of human health.

C. **Quality assurance for ambient air quality assessment: data validation**

1. To ensure accuracy of measurements and compliance with the data quality objectives laid down in Section A, the appropriate competent authorities and bodies designated pursuant to Article 3 shall ensure the following:

   — that all measurements undertaken in relation to the assessment of ambient air quality pursuant to Articles 6 and 9 are traceable in accordance with the requirements set out in Section 5.6.2.2 of the ISO/IEC 17025:2005,

   — that institutions operating networks and individual stations have an established quality assurance and quality control system which provides for regular maintenance to assure the accuracy of measuring devices,

   — that a quality assurance/quality control process is established for the process of data collection and reporting and that institutions appointed for this task actively participate in the related Community-wide quality assurance programmes,

   — that the national laboratories, when appointed by the appropriate competent authority or body designated pursuant to Article 3, that are taking part in Community-wide intercomparisons covering pollutants regulated in this Directive, are accredited according to EN/ISO 17025 by 2010 for the reference methods referred to in Annex VI. These laboratories shall be involved in the coordination on Member States territory of the Community wide quality assurance programmes to be organised by the Commission and shall also coordinate, on the national level, the appropriate realisation of reference methods and the demonstration of equivalence of non-reference methods.

2. All reported data under Article 27 shall be deemed to be valid except data flagged as provisional.

ANNEX II

Determination of requirements for assessment of concentrations of sulphur dioxide, nitrogen dioxide and oxides of nitrogen, particulate matter (PM_{10} and $PM_{2,5}$), lead, benzene and carbon monoxide in ambient air within a zone or agglomeration

A. **Upper and lower assessment thresholds**

The following upper and lower assessment thresholds will apply:

1. *Sulphur dioxide*

	Health protection	Vegetation protection
Upper assessment threshold	60 % of 24-hour limit value (75 µg/m³, not to be exceeded more than 3 times in any calendar year)	60 % of winter critical level (12 µg/m³)
Lower assessment threshold	40 % of 24-hour limit value (50 µg/m³, not to be exceeded more than three times in any calendar year)	40 % of winter critical level (8 µg/m³)

2. *Nitrogen dioxide and oxides of nitrogen*

	Hourly limit value for the protection of human health (NO_2)	Annual limit value for the protection of human health (NO_2)	Annual critical level for the protection of vegetation and natural ecosystems (NO_x)
Upper assessment threshold	70 % of limit value (140 µg/m³, not to be exceeded more than 18 times in any calendar year)	80 % of limit value (32 µg/m³)	80 % of critical level (24 µg/m³)
Lower assessment threshold	50 % of limit value (100 µg/m³, not to be exceeded more than 18 times in any calendar year)	65 % of limit value (26 µg/m³)	65 % of critical level (19,5 µg/m³)

3. *Particulate matter (PM_{10}/$PM_{2,5}$)*

	24-hour average PM_{10}	Annual average PM_{10}	Annual average $PM_{2,5}$ [1]
Upper assessment threshold	70 % of limit value (35 µg/m³, not to be exceeded more than 35 times in any calendar year)	70 % of limit value (28 µg/m³)	70 % of limit value (17 µg/m³)
Lower assessment threshold	50 % of limit value (25 µg/m³, not to be exceeded more than 35 times in any calendar year)	50 % of limit value (20 µg/m³)	50 % of limit value (12 µg/m³)

[1] The upper assessment threshold and the lower assessment threshold for $PM_{2,5}$ do not apply to the measurements to assess compliance with the $PM_{2,5}$ exposure reduction target for the protection of human health.

4. *Lead*

	Annual average
Upper assessment threshold	70 % of limit value (0,35 µg/m³)
Lower assessment threshold	50 % of limit value (0,25 µg/m³)

5. *Benzene*

	Annual average
Upper assessment threshold	70 % of limit value (3,5 μg/m^3)
Lower assessment threshold	40 % of limit value (2 μg/m^3)

6. *Carbon monoxide*

	Eight-hour average
Upper assessment threshold	70 % of limit value (7 mg/m^3)
Lower assessment threshold	50 % of limit value (5 mg/m^3)

B. **Determination of exceedances of upper and lower assessment thresholds**

Exceedances of upper and lower assessment thresholds shall be determined on the basis of concentrations during the previous five years where sufficient data are available. An assessment threshold shall be deemed to have been exceeded if it has been exceeded during at least three separate years out of those previous five years.

Where fewer than five years' data are available, Member States may combine measurement campaigns of short duration during the period of the year and at locations likely to be typical of the highest pollution levels with results obtained from information from emission inventories and modelling to determine exceedances of the upper and lower assessment thresholds.

ANNEX III

Assessment of ambient air quality and location of sampling points for the measurement of sulphur dioxide, nitrogen dioxide and oxides of nitrogen, particulate matter (PM_{10} and $PM_{2,5}$), lead, benzene and carbon monoxide in ambient air

A. **General**

Ambient air quality shall be assessed in all zones and agglomerations in accordance with the following criteria:

1. Ambient air quality shall be assessed at all locations except those listed in paragraph 2, in accordance with the criteria established by Sections B and C for the location of sampling points for fixed measurement. The principles established by Sections B and C shall also apply in so far as they are relevant in identifying the specific locations in which concentration of the relevant pollutants are established where ambient air quality is assessed by indicative measurement or modelling.

2. Compliance with the limit values directed at the protection of human health shall not be assessed at the following locations:

   (a) any locations situated within areas where members of the public do not have access and there is no fixed habitation;

   (b) in accordance with Article 2(1), on factory premises or at industrial installations to which all relevant provisions concerning health and safety at work apply;

   (c) on the carriageway of roads; and on the central reservations of roads except where there is normally pedestrian access to the central reservation.

B. **Macroscale siting of sampling points**

1. Protection of human health

   (a) Sampling points directed at the protection of human health shall be sited in such a way as to provide data on the following:

   — the areas within zones and agglomerations where the highest concentrations occur to which the population is likely to be directly or indirectly exposed for a period which is significant in relation to the averaging period of the limit value(s),

   — levels in other areas within the zones and agglomerations which are representative of the exposure of the general population,

   (b) Sampling points shall in general be sited in such a way as to avoid measuring very small micro-environments in their immediate vicinity, which means that a sampling point must be sited in such a way that the air sampled is representative of air quality for a street segment no less than 100 m length at traffic-orientated sites and at least 250 m × 250 m at industrial sites, where feasible;

   (c) Urban background locations shall be located so that their pollution level is influenced by the integrated contribution from all sources upwind of the station. The pollution level should not be dominated by a single source unless such a situation is typical for a larger urban area. Those sampling points shall, as a general rule, be representative for several square kilometres;

   (d) Where the objective is to assess rural background levels, the sampling point shall not be influenced by agglomerations or industrial sites in its vicinity, i.e. sites closer than five kilometres;

   (e) Where contributions from industrial sources are to be assessed, at least one sampling point shall be installed downwind of the source in the nearest residential area. Where the background concentration is not known, an additional sampling point shall be situated within the main wind direction;

   (f) Sampling points shall, where possible, also be representative of similar locations not in their immediate vicinity;

   (g) Account shall be taken of the need to locate sampling points on islands where that is necessary for the protection of human health.

2. Protection of vegetation and natural ecosystems

Sampling points targeted at the protection of vegetation and natural ecosystems shall be sited more than 20 km away from agglomerations or more than 5 km away from other built-up areas, industrial installations or motorways or major roads with traffic counts of more than 50 000 vehicles per day, which means that a sampling point must be sited in such a way that the air sampled is representative of air quality in a surrounding area of at least 1 000 km^2. A Member State may provide for a sampling point to be sited at a lesser distance or to be representative of air quality in a less extended area, taking account of geographical conditions or of the opportunities to protect particularly vulnerable areas.

Account shall be taken of the need to assess air quality on islands.

C. **Microscale siting of sampling points**

In so far as is practicable, the following shall apply:

— the flow around the inlet sampling probe shall be unrestricted (free in an arc of at least 270°) without any obstructions affecting the airflow in the vicinity of the sampler (normally some metres away from buildings, balconies, trees and other obstacles and at least 0,5 m from the nearest building in the case of sampling points representing air quality at the building line),

— in general, the inlet sampling point shall be between 1,5 m (the breathing zone) and 4 m above the ground. Higher positions (up to 8 m) may be necessary in some circumstances. Higher siting may also be appropriate if the station is representative of a large area,

— the inlet probe shall not be positioned in the immediate vicinity of sources in order to avoid the direct intake of emissions unmixed with ambient air,

— the sampler's exhaust outlet shall be positioned so that recirculation of exhaust air to the sampler inlet is avoided,

— for all pollutants, traffic-orientated sampling probes shall be at least 25 m from the edge of major junctions and no more than 10 m from the kerbside.,

The following factors may also be taken into account:

— interfering sources,

— security,

— access,

— availability of electrical power and telephone communications,

— visibility of the site in relation to its surroundings,

— safety of the public and operators,

— the desirability of co-locating sampling points for different pollutants,

— planning requirements.,

D. **Documentation and review of site selection**

The site-selection procedures shall be fully documented at the classification stage by such means as compass-point photographs of the surrounding area and a detailed map. Sites shall be reviewed at regular intervals with repeated documentation to ensure that selection criteria remain valid over time.

ANNEX IV

MEASUREMENTS AT RURAL BACKGROUND LOCATIONS IRRESPECTIVE OF CONCENTRATION

A. Objectives

The main objectives of such measurements are to ensure that adequate information is made available on levels in the background. This information is essential to judge the enhanced levels in more polluted areas (such as urban background, industry related locations, traffic related locations), assess the possible contribution from long-range transport of air pollutants, support source apportionment analysis and for the understanding of specific pollutants such as particulate matter. It is also essential for the increased use of modelling also in urban areas.

B. Substances

Measurement of $PM_{2,5}$ must include at least the total mass concentration and concentrations of appropriate compounds to characterise its chemical composition. At least the list of chemical species given below shall be included.

SO_4^{2-}	Na^+	NH_4^+	Ca^{2+}	elemental carbon (EC)
NO_3^-	K^+	Cl^-	Mg^{2+}	organic carbon (OC)

C. Siting

Measurements should be taken in particular in rural background areas in accordance with parts A, B and C of Annex III.

ANNEX V

Criteria for determining minimum numbers of sampling points for fixed measurement of concentrations of sulphur dioxide, nitrogen dioxide and oxides of nitrogen, particulate matter (PM_{10}, $PM_{2,5}$), lead, benzene and carbon monoxide in ambient air

A. Minimum number of sampling points for fixed measurement to assess compliance with limit values for the protection of human health and alert thresholds in zones and agglomerations where fixed measurement is the sole source of information

1. *Diffuse sources*

Population of agglomeration or zone (thousands)	If maximum concentrations exceed the upper assessment threshold (1)		If maximum concentrations are between the upper and lower assessment thresholds	
	Pollutants except PM	PM (2) (sum of PM_{10} and $PM_{2,5}$)	Pollutants except PM	PM (2) (sum of PM_{10} and $PM_{2,5}$)
0-249	1	2	1	1
250-499	2	3	1	2
500-749	2	3	1	2
750-999	3	4	1	2
1 000-1 499	4	6	2	3
1 500-1 999	5	7	2	3
2 000-2 749	6	8	3	4
2 750-3 749	7	10	3	4
3 750-4 749	8	11	3	6
4 750-5 999	9	13	4	6
≥ 6 000	10	15	4	7

(1) For nitrogen dioxide, particulate matter, benzene and carbon monoxide: to include at least one urban background monitoring station and one traffic-orientated station provided this does not increase the number of sampling points. For these pollutants, the total number of urban-background stations and the total number of traffic oriented stations in a Member State required under Section A(1) shall not differ by more than a factor of 2. Sampling points with exceedances of the limit value for PM_{10} within the last three years shall be maintained, unless a relocation is necessary owing to special circumstances, in particular spatial development.

(2) Where $PM_{2,5}$ and PM_{10} are measured in accordance with Article 8 at the same monitoring station, these shall count as two separate sampling points. The total number of $PM_{2,5}$ and PM_{10} sampling points in a Member State required under Section A(1) shall not differ by more than a factor of 2, and the number of $PM_{2,5}$ sampling points in the urban background of agglomerations and urban areas shall meet the requirements under Section B of Annex V.

2. *Point sources*

For the assessment of pollution in the vicinity of point sources, the number of sampling points for fixed measurement shall be calculated taking into account emission densities, the likely distribution patterns of ambient-air pollution and the potential exposure of the population.

B. Minimum number of sampling points for fixed measurement to assess compliance with the $PM_{2,5}$ exposure reduction target for the protection of human health

One sampling point per million inhabitants summed over agglomerations and additional urban areas in excess of 100 000 inhabitants shall be operated for this purpose. Those sampling points may coincide with sampling points under Section A.

C. Minimum number of sampling points for fixed measurements to assess compliance with critical levels for the protection of vegetation in zones other than agglomerations

If maximum concentrations exceed the upper assessment threshold	If maximum concentrations are between upper and lower assessment threshold
1 station every 20 000 km^2	1 station every 40 000 km^2

In island zones the number of sampling points for fixed measurement should be calculated taking into account the likely distribution patterns of ambient-air pollution and the potential exposure of vegetation.

ANNEX VI

Reference methods for assessment of concentrations of sulphur dioxide, nitrogen dioxide and oxides of nitrogen, particulate matter (PM_{10} and $PM_{2,5}$), lead, benzene, carbon monoxide, and ozone

A. **Reference measurement methods**

1. *Reference method for the measurement of sulphur dioxide*

The reference method for the measurement of sulphur dioxide is that described in EN 14212:2005 'Ambient air quality — Standard method for the measurement of the concentration of sulphur dioxide by ultraviolet fluorescence'.

2. *Reference method for the measurement of nitrogen dioxide and oxides of nitrogen*

The reference method for the measurement of nitrogen dioxide and oxides of nitrogen is that described in EN 14211:2005 'Ambient air quality — Standard method for the measurement of the concentration of nitrogen dioxide and nitrogen monoxide by chemiluminescence'.

3. *Reference method for the sampling and measurement of lead*

The reference method for the sampling of lead is that described in Section A(4) of this Annex. The reference method for the measurement of lead is that described in EN 14902:2005 'Standard method for measurement of Pb/Cd/As/Ni in the PM_{10} fraction of suspended particulate matter'.

4. *Reference method for the sampling and measurement of PM_{10}*

The reference method for the sampling and measurement of PM_{10} is that described in EN 12341:1999 'Air Quality — Determination of the PM_{10} fraction of suspended particulate matter — Reference method and field test procedure to demonstrate reference equivalence of measurement methods'.

5. *Reference method for the sampling and measurement of $PM_{2,5}$*

The reference method for the sampling and measurement of $PM_{2,5}$ is that described in EN 14907:2005 'Standard gravimetric measurement method for the determination of the $PM_{2,5}$ mass fraction of suspended particulate matter'.

6. *Reference method for the sampling and measurement of benzene*

The reference method for the measurement of benzene is that described in EN 14662:2005, parts 1, 2 and 3 'Ambient air quality — Standard method for measurement of benzene concentrations'.

7. *Reference method for the measurement of carbon monoxide*

The reference method for the measurement of carbon monoxide is that described in EN 14626:2005 'Ambient air quality — Standard method for the measurement of the concentration of carbon monoxide by non-dispersive infrared spectroscopy'.

8. *Reference method for measurement of ozone*

The reference method for the measurement of ozone is that described in EN 14625:2005 'Ambient air quality — Standard method for the measurement of the concentration of ozone by ultraviolet photometry'.

B. **Demonstration of equivalence**

1. A Member State may use any other method which it can demonstrate gives results equivalent to any of the methods referred to in Section A or, in the case of particulate matter, any other method which the Member State concerned can demonstrate displays a consistent relationship to the reference method. In that event the results achieved by that method must be corrected to produce results equivalent to those that would have been achieved by using the reference method.

2. The Commission may require the Member States to prepare and submit a report on the demonstration of equivalence in accordance with paragraph 1.

3. When assessing the acceptability of the report mentioned in paragraph 2, the Commission will make reference to its guidance on the demonstration of equivalence (to be published). Where Member States have been using interim factors to approximate equivalence, the latter shall be confirmed and/or amended with reference to the Commission's guidance.

4. Member States should ensure that whenever appropriate, the correction is also applied retroactively to past measurement data in order to achieve better data comparability.

C. **Standardisation**

For gaseous pollutants the volume must be standardised at a temperature of 293 K and an atmospheric pressure of 101,3 kPa. For particulate matter and substances to be analysed in particulate matter (e.g. lead) the sampling volume refers to ambient conditions in terms of temperature and atmospheric pressure at the date of measurements.

D. **Introduction of new equipment**

All new equipment purchased for implementation of this Directive must comply with the reference method or equivalent by 11 June 2010.

All equipment used in fixed measurements must comply with the reference method or equivalent by 11 June 2013.

E. **Mutual recognition of data**

In carrying out the type approval to demonstrate that equipment meets the performance requirements of the reference methods listed in Section A, competent authorities and bodies designated pursuant to Article 3 shall accept test reports issued in other Member States by laboratories accredited to EN ISO 17025 for carrying out such testing.

ANNEX VII

OZONE TARGET VALUES AND LONG-TERM OBJECTIVES

A. Definitions and criteria

1. *Definitions*

AOT40 (expressed in (µg/m³) · hours) means the sum of the difference between hourly concentrations greater than 80 µg/m³ (= 40 parts per billion) and 80 µg/m³ over a given period using only the one-hour values measured between 8.00 and 20.00 Central European Time (CET) each day.

2. *Criteria*

The following criteria shall be used for checking validity when aggregating data and calculating statistical parameters:

Parameter	Required proportion of valid data
One hour values	75 % (i.e. 45 minutes)
Eight hours values	75 % of values (i.e. six hours)
Maximum daily 8 hours mean from hourly running 8 hours	75 % of the hourly running eight hours averages (i.e. 18 eight-hourly averages per day)
AOT40	90 % of the one hour values over the time period defined for calculating the AOT40 value (1)
Annual mean	75 % of the one hour values over summer (April to September) and 75 % over winter (January to March, October to December) seasons separately
Number of exceedances and maximum values per month	90 % of the daily maximum eight hours mean values (27 available daily values per month) 90 % of the one hour values between 8.00 and 20.00 CET
Number of exceedances and maximum values per year	five out of six months over the summer season (April to September)

(1) In cases where all possible measured data are not available, the following factor shall be used to calculate AOT40 values:

$$AOT40_{estimate} = AOT40_{measured} \times \frac{\text{total possible number of hours (*)}}{\text{number of measured hourly values}}$$

(*) being the number of hours within the time period of AOT40 definition, (i.e. 08:00 to 20:00 CET from 1 May to 31 July each year, for vegetation protection and from 1 April to 30 September each year for forest protection).

B. Target values

Objective	Averaging period	Target value	Date by which target value should be met (1)
Protection of human health	Maximum daily eight-hour mean (2)	120 µg/m³ not to be exceeded on more than 25 days per calendar year averaged over three years (3)	1.1.2010
Protection of vegetation	May to July	AOT40 (calculated from 1 h values) 18 000 µg/m³ · h averaged over five years (3)	1.1.2010

(1) Compliance with target values will be assessed as of this date. That is, 2010 will be the first year the data for which is used in calculating compliance over the following three or five years, as appropriate.

(2) The maximum daily eight-hour mean concentration shall be selected by examining eight-hour running averages, calculated from hourly data and updated each hour. Each eight -hour average so calculated shall be assigned to the day on which it ends. i.e. the first calculation period for any one day will be the period from 17:00 on the previous day to 01:00 on that day; the last calculation period for any one day will be the period from 16:00 to 24:00 on the day.

(3) If the three or five year averages cannot be determined on the basis of a full and consecutive set of annual data, the minimum annual data required for checking compliance with the target values will be as follows:

— for the target value for the protection of human health: valid data for one year,

— for the target value for the protection of vegetation: valid data for three years.

C. **Long-term objectives**

Objective	Averaging period	Longterm objective	Date by which the longterm objective should be met
Protection of human health	Maximum daily eight-hour mean within a calendar year	120 μg/m^3	not defined
Protection of vegetation	May to July	AOT40 (calculated from 1 h values) 6 000 μg/m^3 · h	not defined

ANNEX VIII

Criteria for classifying and locating sampling points for assessments of ozone concentrations

The following apply to fixed measurements:

A. **Macroscale siting**

Type of station	Objectives of measurement	Representativeness [1]	Macroscale siting criteria
Urban	Protection of human health: to assess the exposure of the urban population to ozone, i.e. where population density and ozone concentration are relatively high and representative of the exposure of the general population	A few km^2	Away from the influence of local emissions such as traffic, petrol stations, etc.; vented locations where well mixed levels can be measured; locations such as residential and commercial areas of cities, parks (away from the trees), big streets or squares with very little or no traffic, open areas characteristic of educational, sports or recreation facilities
Suburban	Protection of human health and vegetation: to assess the exposure of the population and vegetation located in the outskirts of the agglomeration, where the highest ozone levels, to which the population and vegetation are likely to be directly or indirectly exposed occur	Some tens of km^2	At a certain distance from the area of maximum emissions, downwind following the main wind direction/directions during conditions favourable to ozone formation; where population, sensitive crops or natural ecosystems located in the outer fringe of an agglomeration are exposed to high ozone levels; where appropriate, some suburban stations also upwind of the area of maximum emissions, in order to determine the regional background levels of ozone
Rural	Protection of human health and vegetation: to assess the exposure of population, crops and natural ecosystems to sub-regional scale ozone concentrations	Sub-regional levels (some hundreds of km^2)	Stations can be located in small settlements and/or areas with natural ecosystems, forests or crops; representative for ozone away from the influence of immediate local emissions such as industrial installations and roads; at open area sites, but not on summits of higher mountains
Rural background	Protection of vegetation and human health: to assess the exposure of crops and natural ecosystems to regional-scale ozone concentrations as well as exposure of the population	Regional/ national/ continental levels (1 000 to 10 000 km^2)	Station located in areas with lower population density, e.g. with natural ecosystems, forests, at a distance of at least 20 km from urban and industrial areas and away from local emissions; avoid locations which are subject to locally enhanced formation of ground-near inversion conditions, also summits of higher mountains; coastal sites with pronounced diurnal wind cycles of local character are not recommended.

[1] Sampling points should, where possible, be representative of similar locations not in their immediate vicinity.

For rural and rural background stations the location shall, where appropriate, be coordinated with the monitoring requirements of Commission Regulation (EC) No 1737/2006 of 7 November 2006 laying down detailed rules for the implementation of Regulation (EC) No 2152/2003 of the European Parliament and of the Council concerning monitoring of forests and environmental interactions in the Community [1].

[1] OJ L 334, 30.11.2006, p. 1.

B. **Microscale siting**

In so far as is practicable the procedure on microscale siting in Section C of Annex III shall be followed, ensuring also that the inlet probe is positioned well away from such sources as furnaces and incineration flues and more than 10 m from the nearest road, with distance increasing as a function of traffic intensity.

C. **Documentation and review of site selection**

The procedures in Section D of Annex III shall be followed, applying proper screening and interpretation of the monitoring data in the context of the meteorological and photochemical processes affecting the ozone concentrations measured at the respective sites.

ANNEX IX

Criteria for determining the minimum number of sampling points for fixed measurement of concentrations of ozone

A. **Minimum number of sampling points for fixed continuous measurements to assess compliance with target values, long-term objectives and information and alert thresholds where such measurements are the sole source of information**

Population (× 1 000)	Agglomerations (urban and suburban) (1)	Other zones (suburban and rural) (1)	Rural background
< 250		1	1 station/50 000 km² as an average density over all zones per country (2)
< 500	1	2	
< 1 000	2	2	
< 1 500	3	3	
< 2 000	3	4	
< 2 750	4	5	
< 3 750	5	6	
> 3 750	One additional station per 2 million inhabitants	One additional station per 2 million inhabitants	

(1) At least 1 station in suburban areas, where the highest exposure of the population is likely to occur. In agglomerations at least 50 % of the stations shall be located in suburban areas.

(2) 1 station per 25 000 km² for complex terrain is recommended.

B. **Minimum number of sampling points for fixed measurements for zones and agglomerations attaining the long-term objectives**

The number of sampling points for ozone shall, in combination with other means of supplementary assessment such as air quality modelling and collocated nitrogen dioxide measurements, be sufficient to examine the trend of ozone pollution and check compliance with the long-term objectives. The number of stations located in agglomerations and other zones may be reduced to one-third of the number specified in Section A. Where information from fixed measurement stations is the sole source of information, at least one monitoring station shall be kept. If, in zones where there is supplementary assessment, the result of this is that a zone has no remaining station, coordination with the number of stations in neighbouring zones shall ensure adequate assessment of ozone concentrations against long-term objectives. The number of rural background stations shall be one per 100 000 km².

ANNEX X

MEASUREMENTS OF OZONE PRECURSOR SUBSTANCES

A. Objectives

The main objectives of such measurements are to analyse any trend in ozone precursors, to check the efficiency of emission reduction strategies, to check the consistency of emission inventories and to help attribute emission sources to observed pollution concentrations.

An additional aim is to support the understanding of ozone formation and precursor dispersion processes, as well as the application of photochemical models.

B. Substances

Measurement of ozone precursor substances shall include at least nitrogen oxides (NO and NO_2), and appropriate volatile organic compounds (VOC). A list of volatile organic compounds recommended for measurement is given below:

	1-Butene	Isoprene	Ethyl benzene
Ethane	Trans-2-Butene	n-Hexane	m + p-Xylene
Ethylene	cis-2-Butene	i-Hexane	o-Xylene
Acetylene	1,3-Butadiene	n-Heptane	1,2,4-Trimethylebenzene
Propane	n-Pentane	n-Octane	1,2,3-Trimethylebenzene
Propene	i-Pentane	i-Octane	1,3,5-Trimethylebenzene
n-Butane	1-Pentene	Benzene	Formaldehyde
i-Butane	2-Pentene	Toluene	Total non-methane hydrocarbons

C. Siting

Measurements shall be taken in particular in urban or suburban areas at any monitoring site set up in accordance with the requirements of this Directive and considered appropriate with regard to the monitoring objectives referred to in Section A.

ANNEX XI

LIMIT VALUES FOR THE PROTECTION OF HUMAN HEALTH

A. **Criteria**

Without prejudice to Annex I, the following criteria shall be used for checking validity when aggregating data and calculating statistical parameters:

Parameter	Required proportion of valid data
One hour values	75 % (i.e. 45 minutes)
Eight hours values	75 % of values (i.e. 6 hours)
Maximum daily 8-hour mean	75 % of the hourly running eight hour averages (i.e. 18 eight hour averages per day)
24-hour values	75 % of the hourly averages (i.e. at least 18 hour values)
Annual mean	90 % (1) of the one hour values or (if not available) 24-hour values over the year

(1) The requirements for the calculation of annual mean do not include losses of data due to the regular calibration or the normal maintenance of the instrumentation.

B. **Limit values**

Averaging Period	Limit value	Margin of tolerance	Date by which limit value is to be met
Sulphur dioxide			
One hour	350 µg/m^3, not to be exceeded more than 24 times a calendar year	150 µg/m^3 (43 %)	— (1)
One day	125 µg/m^3, not to be exceeded more than 3 times a calendar year	None	— (1)
Nitrogen dioxide			
One hour	200 µg/m^3, not to be exceeded more than 18 times a calendar year	50 % on 19 July 1999, decreasing on 1 January 2001 and every 12 months thereafter by equal annual percentages to reach 0 % by 1 January 2010	1 January 2010
Calendar year	40 µg/m^3	50 % on 19 July 1999, decreasing on 1 January 2001 and every 12 months thereafter by equal annual percentages to reach 0 % by 1 January 2010	1 January 2010
Benzene			
Calendar year	5 µg/m^3	5 µg/m^3 (100 %) on 13 December 2000, decreasing on 1 January 2006 and every 12 months thereafter by 1 µg/m^3 to reach 0 % by 1 January 2010	1 January 2010
Carbon monoxide			
maximum daily eight hour mean (2)	10 mg/m^3	60 %	— (1)

Averaging Period	Limit value	Margin of tolerance	Date by which limit value is to be met
Lead			
Calendar year	0,5 µg/m³ (3)	100 %	— (3)
PM_{10}			
One day	50 µg/m³, not to be exceeded more than 35 times a calendar year	50 %	— (1)
Calendar year	40 µg/m³	20 %	— (1)

(1) Already in force since 1 January 2005

(2) The maximum daily eight hour mean concentration will be selected by examining eight hour running averages, calculated from hourly data and updated each hour. Each eight hour average so calculated will be assigned to the day on which it ends i.e. the first calculation period for any one day will be the period from 17:00 on the previous day to 01:00 on that day; the last calculation period for any one day will be the period from 16:00 to 24:00 on that day.

(3) Already in force since 1 January 2005. Limit value to be met only by 1 January 2010 in the immediate vicinity of the specific industrial sources situated on sites contaminated by decades of industrial activities. In such cases, the limit value until 1 January 2010 will be 1,0 µg/m³. The area in which higher limit values apply must not extend further than 1 000 m from such specific sources.

ANNEX XII

INFORMATION AND ALERT THRESHOLDS

A. Alert thresholds for pollutants other than ozone

To be measured over three consecutive hours at locations representative of air quality over at least 100 km^2 or an entire zone or agglomeration, whichever is the smaller.

Pollutant	Alert threshold
Sulphur dioxide	500 $\mu g/m^3$
Nitrogen dioxide	400 $\mu g/m^3$

B. Information and alert thresholds for ozone

Purpose	Averaging period	Threshold
Information	1 hour	180 $\mu g/m^3$
Alert	1 hour (1)	240 $\mu g/m^3$

(1) For the implementation of Article 24, the exceedance of the threshold is to be measured or predicted for three consecutive hours.

ANNEX XIII

CRITICAL LEVELS FOR THE PROTECTION OF VEGETATION

Averaging period	Critical level	Margin of tolerance
Sulphur dioxide		
Calendar year and winter (1 October to 31 March)	20 μg/m^3	None
Oxides of nitrogen		
Calendar year	30 μg/m^3 NO_x	None

ANNEX XIV

NATIONAL EXPOSURE REDUCTION TARGET, TARGET VALUE AND LIMIT VALUE FOR $PM_{2,5}$

A. Average exposure indicator

The Average Exposure Indicator expressed in μg/m³ (AEI) shall be based upon measurements in urban background locations in zones and agglomerations throughout the territory of a Member State. It should be assessed as a three-calendar year running annual mean concentration averaged over all sampling points established pursuant to Section B of Annex V. The AEI for the reference year 2010 shall be the mean concentration of the years 2008, 2009 and 2010.

However, where data are not available for 2008, Member States may use the mean concentration of the years 2009 and 2010 or the mean concentration of the years 2009, 2010 and 2011. Member States making use of these possibilities shall communicate their decisions to the Commission by 11 September 2008.

The AEI for the year 2020 shall be the three-year running mean concentration averaged over all those sampling points for the years 2018, 2019 and 2020. The AEI is used for the examination whether the national exposure reduction target is met.

The AEI for the year 2015 shall be the three-year running mean concentration averaged over all those sampling points for the years 2013, 2014 and 2015. The AEI is used for the examination whether the exposure concentration obligation is met.

B. National exposure reduction target

Exposure reduction target relative to the AEI in 2010		Year by which the exposure reduction target should be met
Initial concentration in μg/m³	Reduction target in percent	2020
< 8,5 = 8,5	0 %	
> 8,5 — < 13	10 %	
= 13 — < 18	15 %	
= 18 — < 22	20 %	
≥ 22	All appropriate measures to achieve 18 μg/m³	

Where the AEI in the reference year is 8,5 μg/m³ or less the exposure reduction target shall be zero. The reduction target shall be zero also in cases where the AEI reaches the level of 8,5 μg/m³ at any point of time during the period from 2010 to 2020 and is maintained at or below that level.

C. Exposure concentration obligation

Exposure concentration obligation	Year by which the obligation value is to be met
20 μg/m³	2015

D. Target value

Averaging period	Target value	Date by which target value should be met
Calendar year	25 μg/m³	1 January 2010

E. **Limit value**

Averaging period	Limit value	Margin of tolerance	Date by which limit value is to be met
STAGE 1			
Calendar year	25 μg/m^3	20 % on 11 June 2008, decreasing on the next 1 January and every 12 months thereafter by equal annual percentages to reach 0 % by 1 January 2015	1 January 2015
STAGE 2 (1)			
Calendar year	20 μg/m^3		1 January 2020

(1) Stage 2 — indicative limit value to be reviewed by the Commission in 2013 in the light of further information on health and environmental effects, technical feasibility and experience of the target value in Member States.

ANNEX XV

Information to be included in the local, regional or national air quality plans for improvement in ambient air quality

A. **Information to be provided under article 23 (air quality plans)**

1. *Localisation of excess pollution*

   (a) region;

   (b) city (map);

   (c) measuring station (map, geographical coordinates).

2. *General information*

   (a) type of zone (city, industrial or rural area);

   (b) estimate of the polluted area (km^2) and of the population exposed to the pollution;

   (c) useful climatic data;

   (d) relevant data on topography;

   (e) sufficient information on the type of targets requiring protection in the zone.

3. *Responsible authorities*

   Names and addresses of persons responsible for the development and implementation of improvement plans.

4. *Nature and assessment of pollution*

   (a) concentrations observed over previous years (before the implementation of the improvement measures);

   (b) concentrations measured since the beginning of the project;

   (c) techniques used for the assessment.

5. *Origin of pollution*

   (a) list of the main emission sources responsible for pollution (map);

   (b) total quantity of emissions from these sources (tonnes/year);

   (c) information on pollution imported from other regions.

6. *Analysis of the situation*

   (a) details of those factors responsible for the exceedance (e.g. transport, including cross-border transport, formation of secondary pollutants in the atmosphere);

   (b) details of possible measures for the improvement of air quality.

7. *Details of those measures or projects for improvement which existed prior to 11 June 2008, i.e:*

   (a) local, regional, national, international measures;

   (b) observed effects of these measures.

8. *Details of those measures or projects adopted with a view to reducing pollution following the entry into force of this Directive:*

   (a) listing and description of all the measures set out in the project;

   (b) timetable for implementation;

   (c) estimate of the improvement of air quality planned and of the expected time required to attain these objectives.

9. *Details of the measures or projects planned or being researched for the long term.*

10. *List of the publications, documents, work, etc., used to supplement information required under this Annex.*

B. **Information to be provided under article 22(1)**

1. All information as laid down in Section A.

2. Information concerning the status of implementation of the following Directives:

   1. Council Directive 70/220/EEC of 20 March 1970 on the approximation of the laws of the Member States on measures to be taken against air pollution by emissions from motor vehicles ([1]);

   2. Directive 94/63/EC of the European Parliament and of the Council of 20 December 1994 on the control of volatile organic compound (VOC) emissions resulting from the storage of petrol and its distribution from terminals to service stations ([2]);

   3. Directive 2008/1/EC of the European Parliament and of the Council of 15 January 2008 concerning integrated pollution prevention and control ([3]);

   4. Directive 97/68/EC of the European Parliament and of the Council of 16 December 1997 on the approximation of the laws of the Member States relating to measures against the emission of gaseous and particulate pollutants from internal combustion engines to be installed in non-road mobile machinery ([4]);

   5. Directive 98/70/EC of the European Parliament and of the Council of 13 October 1998 relating to the quality of petrol and diesel fuels ([5]);

   6. Council Directive 1999/13/EC of 11 March 1999 on the limitation of emissions of volatile organic compounds due to the use of organic solvents in certain activities and installations ([6]);

   7. Council Directive 1999/32/EC of 26 April 1999 relating to a reduction in the sulphur content of certain liquid fuels ([7]);

   8. Directive 2000/76/EC of the European Parliament and of the Council of 4 December 2000 on the incineration of waste ([8]);

   9. Directive 2001/80/EC of the European Parliament and of the Council of 23 October 2001 on the limitation of emissions of certain pollutants into the air from large combustion plants;

   10. Directive 2001/81/EC of the European Parliament and of the Council of 23 October 2001 on national emission ceilings for certain atmospheric pollutants;

([1]) OJ L 76, 6.4.1970, p. 1. Directive as last amended by Directive 2006/96/EC (OJ L 363, 20.12.2006, p. 81).
([2]) OJ L 365, 31.12.1994, p. 24. Directive as amended by Regulation (EC) No 1882/2003 (OJ L 284, 31.10.2003, p. 1).
([3]) OJ L 24, 29.1.2008, p. 8.

([5]) OJ L 350, 28.12.1998, p. 58. Directive as amended by Regulation (EC) No 1882/2003.
([6]) OJ L 85, 29.3.1999, p. 1. Directive as last amended by Directive 2004/42/EC of the European Parliament and of the Council (OJ L 143, 30.4.2004, p. 87).
([7]) OJ L 121, 11.5.1999, p. 13. Directive as last amended by Directive 2005/33/EC of the European Parliament and of the Council (OJ L 191, 22.7.2005, p. 59).
([8]) OJ L 332, 28.12.2000, p. 91.

11. Directive 2004/42/EC of the European Parliament and of the Council of 21 April 2004 on the limitation of emissions of volatile organic compounds due to the use of organic solvents in certain paints and varnishes and vehicle refinishing products [1];

12. Directive 2005/33/EC of the European Parliament and of the Council of 6 July 2005 amending Directive 1999/32/EC as regards the sulphur content of marine fuels [2];

13. Directive 2005/55/EC of the European Parliament and of the Council of 28 September 2005 on the approximation of the laws of the Member States relating to the measures to be taken against the emission of gaseous and particulate pollutants from compression-ignition engines for use in vehicles, and the emission of gaseous pollutants from positive-ignition engines fuelled with natural gas or liquefied petroleum gas for use in vehicles [3];

14. Directive 2006/32/EC of the European Parliament and of the Council of 5 April 2006 on energy end-use efficiency and energy services [4].

3. Information on all air pollution abatement measures that have been considered at appropriate local, regional or national level for implementation in connection with the attainment of air quality objectives, including:

(a) reduction of emissions from stationary sources by ensuring that polluting small and medium sized stationary combustion sources (including for biomass) are fitted with emission control equipment or replaced;

(b) reduction of emissions from vehicles through retrofitting with emission control equipment. The use of economic incentives to accelerate take-up should be considered;

(c) procurement by public authorities, in line with the handbook on environmental public procurement, of road vehicles, fuels and combustion equipment to reduce emissions, including the purchase of:

— new vehicles, including low emission vehicles,

— cleaner vehicle transport services,

— low emission stationary combustion sources,

— low emission fuels for stationary and mobile sources,

(d) measures to limit transport emissions through traffic planning and management (including congestion pricing, differentiated parking fees or other economic incentives; establishing low emission zones);

(e) measures to encourage a shift of transport towards less polluting modes;

(f) ensuring that low emission fuels are used in small, medium and large scale stationary sources and in mobile sources;

(g) measures to reduce air pollution through the permit system under Directive 2008/1/EC, the national plans under Directive 2001/80/EC, and through the use of economic instruments such as taxes, charges or emission trading.

(h) where appropriate, measures to protect the health of children or other sensitive groups.

ANNEX XVI

PUBLIC INFORMATION

1. Member States shall ensure that up-to-date information on ambient concentrations of the pollutants covered by this Directive is routinely made available to the public.

2. Ambient concentrations provided shall be presented as average values according to the appropriate averaging period as laid down in Annex VII and Annexes XI to XIV. The information shall at least indicate any levels exceeding air quality objectives including limit values, target values, alert thresholds, information thresholds or long term objectives of the regulated pollutant. It shall also provide a short assessment in relation to the air quality objectives and appropriate information regarding effects on health, or, where appropriate, vegetation.

3. Information on ambient concentrations of sulphur dioxide, nitrogen dioxide, particulate matter (at least PM_{10}), ozone and carbon monoxide shall be updated on at least a daily basis, and, wherever practicable, information shall be updated on an hourly basis. Information on ambient concentrations of lead and benzene, presented as an average value for the last 12 months, shall be updated on a three-monthly basis, and on a monthly basis, wherever practicable.

4. Member States shall ensure that timely information about actual or predicted exceedances of alert thresholds, and any information threshold is provided to the public. Details supplied shall include at least the following information:

   (a) information on observed exceedance(s):

      — location or area of the exceedance,

      — type of threshold exceeded (information or alert),

      — start time and duration of the exceedance,

      — highest one hour concentration and in addition highest eight hour mean concentration in the case of ozone;

   (b) forecast for the following afternoon/day(s):

      — geographical area of expected exceedances of information and/or alert threshold,

      — expected changes in pollution (improvement, stabilisation or deterioration), together with the reasons for those changes;

   (c) information on the type of population concerned, possible health effects and recommended behaviour:

      — information on population groups at risk,

      — description of likely symptoms,

      — recommended precautions to be taken by the population concerned,

      — where to find further information;

   (d) information on preventive action to reduce pollution and/or exposure to it: indication of main source sectors; recommendations for action to reduce emissions;

   (e) in the case of predicted exceedances, Member State shall take steps to ensure that such details are supplied to the extent practicable.

STATEMENT BY THE COMMISSION

The Commission takes note of the text adopted by the Council and the European Parliament for the Directive on ambient air quality and cleaner air for Europe. In particular, the Commission notes the importance attributed by the European Parliament and the Member States in Article 22(4) and recital 16 to Community measures for the abatement of air pollutant emissions at source.

The Commission recognises the need to reduce the emissions of harmful air pollutants if significant progress is to be delivered towards the objectives established in the Sixth Environmental Action Programme. The Commission's communication on a thematic strategy on air pollution sets out a significant number of possible Community measures. Significant progress on these and other measures has been made since the adoption of the strategy:

— the Council and Parliament have already adopted new legislation limiting the exhaust emissions of light duty vehicles,

— the Commission has adopted a proposal for new legislation to improve the effectiveness of Community industrial emissions legislation including intensive agricultural installations and measures to tackle smaller scale industrial combustion sources,

— the Commission has adopted a proposal for new legislation limiting the exhaust emissions of engines installed in heavy duty vehicles,

— in 2008 the Commission foresees new legislative proposals that would:

  — further reduce the Member States' permitted national emissions of key pollutants,

  — reduce emissions associated with refuelling of petrol cars at service stations,

  — address the sulphur content of fuels including marine fuels,

— preparatory work is also underway to investigate the feasibility of:

  — improving the eco-design and reducing the emissions of domestic boilers and water heaters,

  — reducing the solvent content of paints, varnishes and vehicle refinishing products,

  — reducing the exhaust emissions of non-road mobile machinery and thereby maximise the benefit of lower sulphur non-road fuels already proposed by the Commission,

— The Commission also continues to push for substantial emissions reductions from ships at the International Maritime Organisation and it is committed to bringing forward proposals for Community measures should the IMO fail to deliver sufficiently ambitious proposals as foreseen in 2008.

The Commission is, however, committed to the aims of its Better Regulation initiative and the need for proposals to be underpinned by a comprehensive assessment of the impacts and benefits. In this regard and in accordance with the Treaty establishing the European Community, the Commission will continue to evaluate the need to bring forward new legislative proposals but reserves its right to decide if and when it would be appropriate to present any such proposal.

STATEMENT BY THE NETHERLANDS

The Netherlands has always supported the development of ambitious and effective European policy on air quality and will continue to do so in the future. It is, therefore, happy with the compromise agreed by the Council and the European Parliament and compliments the Parliament, the Commission and the Presidency on the results achieved. The new Directive on ambient air quality marks significant progress for both the environment and public health.

As the Netherlands pointed out when the Common Position was drawn up, the air quality in our country is strongly influenced by transboundary developments and will therefore benefit enormously from an effective European approach. The Netherlands' main concern has been that the Directive should contain a balanced package of European and national measures, as well as realistic time limits to achieve the air quality targets. Only then will Member States be able to achieve the ambitious targets that have been set.

The Netherlands is pleased with the Commission's statement that it will present Community measures in good time. Timely, EU-wide compliance with the air quality standards will depend on sound European policy tackling pollution at the source. The Netherlands would especially point to the lack of data and prevailing uncertainties about emissions and concentrations of fine particulates ($PM_{2,5}$). It will of course make every effort to meet the objectives of the Directive by the target date. On the basis of the knowledge currently at our command, this will largely be feasible. The Dutch government is developing a National Air Quality Cooperation Programme to tackle locations where emission ceilings are persistently exceeded, so that, there too, air quality standards may be met by the target date.

The Netherlands is pleased that the Council and the European Parliament concluded their second reading in time for the Directive to take effect as of early 2008. This is essential for our own national programme, as well as actions in the countries around us. The Netherlands will work hard to ensure that the national cooperation programme and all local and regional measures are sufficient.

►B DIRECTIVE 2004/107/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 15 December 2004 relating to arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons in ambient air

(OJ L 23, 26.1.2005, p. 3)

▼B

DIRECTIVE 2004/107/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 15 December 2004

relating to arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons in ambient air

THE EUROPEAN PARLIAMENT AND THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty establishing the European Community, and in particular Article 175(1) thereof,

Having regard to the proposal from the Commission,

Having regard to the opinion of the European Economic and Social Committee ([1]),

After consulting the Committee of the Regions,

Acting in accordance with the procedure laid down in Article 251 of the Treaty ([2]),

Whereas:

(1) On the basis of principles enshrined in Article 175(3) of the Treaty, the Sixth Community Environment Action Programme, adopted by Decision No 1600/2002/EC of the European Parliament and of the Council ([3]), establishes the need to reduce pollution to levels which minimise harmful effects on human health, paying particular attention to sensitive populations, and the environment as a whole, to improve the monitoring and assessment of air quality including the deposition of pollutants and to provide information to the public.

(2) Article 4(1) of Council Directive 96/62/EC of 27 September 1996 on ambient air quality assessment and management ([4]) requires the Commission to submit proposals for regulating the pollutants listed in Annex I to that Directive taking into account the provisions laid down in paragraphs 3 and 4 of that Article.

(3) Scientific evidence shows that arsenic, cadmium, nickel and some polycyclic aromatic hydrocarbons are human genotoxic carcinogens and that there is no identifiable threshold below which these substances do not pose a risk to human health. Impact on human health and the environment occurs via concentrations in ambient air and via deposition. With a view to cost-effectiveness, ambient air concentrations of arsenic, cadmium, nickel and polycyclic aromatic hydrocarbons, which would not pose a significant risk to human health, cannot be achieved in specific areas.

(4) With the aim of minimising harmful effects on human health, paying particular attention to sensitive populations, and the environment as a whole, of airborne arsenic, cadmium and nickel and polycyclic aromatic hydrocarbons, target values should be set, to be attained as far as possible. Benzo(a)pyrene should be used as a marker for the carcinogenic risk of polycyclic aromatic hydrocarbons in ambient air.

(5) The target values would not require any measures entailing disproportionate costs. Regarding industrial installations, they would not involve measures beyond the application of best available techniques (BAT) as required by Council Directive

([1]) OJ C 110, 30.4.2004, p. 16.
([2]) Opinion of the European Parliament of 20 April 2004 (not yet published in the Official Journal), Council Decision of 15 November 2004.
([3]) OJ L 242, 10.9.2002, p. 1.
([4]) OJ L 296, 21.11.1996, p. 55. Directive as amended by Regulation (EC) No 1882/2003 of the European Parliament and of the Council (OJ L 284, 31.10.2003, p. 1).

▼B

96/61/EC of 24 September 1996 concerning integrated pollution prevention and control ([1]) and in particular would not lead to the closure of installations. However, they would require Member States to take all cost-effective abatement measures in the relevant sectors.

(6) In particular, the target values of this Directive are not to be considered as environmental quality standards as defined in Article 2(7) of Directive 96/61/EC and which, according to Article 10 of that Directive, require stricter conditions than those achievable by the use of BAT.

(7) In accordance with Article 176 of the Treaty, Member States may maintain or introduce more stringent protective measures relating to arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons provided that they are compatible with the Treaty and that they are notified to the Commission.

(8) Where concentrations exceed certain assessment thresholds, monitoring of arsenic, cadmium, nickel and benzo(a)pyrene should be mandatory. Supplementary means of assessment may reduce the required number of sampling points for fixed measurements. Further monitoring of background ambient air concentrations and deposition is foreseen.

(9) Mercury is a very hazardous substance for human health and the environment. It is present throughout the environment and, in the form of methylmercury, has the capacity to accumulate in organisms, and in particular to concentrate in organisms higher up the food chain. Mercury released into the atmosphere is capable of being transported over long distances.

(10) The Commission intends to come forward in 2005 with a coherent strategy containing measures to protect human health and the environment from the release of mercury, based on a life-cycle approach, and taking into account production, use, waste treatment and emissions. In this context, the Commission should consider all appropriate measures with a view to reducing the quantity of mercury in terrestrial and aquatic ecosystems, and thereby the ingestion of mercury via food, and avoiding mercury in certain products.

(11) The effects of arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons on human health, including via the food chain, and the environment as a whole, occur through concentrations in ambient air and via deposition; the accumulation of these substances in soils and the protection of ground water should be taken into account. In order to facilitate review of this Directive in 2010, the Commission and the Member States should consider promoting research into the effects of arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons on human health and the environment, particularly via deposition.

(12) Standardised accurate measurement techniques and common criteria for the location of measuring stations are important elements in assessing ambient air quality so that the information obtained is comparable throughout the Community. Providing reference measurement methods is acknowledged to be an important issue. The Commission has already mandated work on the preparation of CEN standards for the measurement of those constituents in ambient air where target values are defined (arsenic, cadmium, nickel and benzo(a)pyrene) as well as for the deposition of heavy metals with a view to their early development and adoption. In the absence of CEN standard methods, the use of international or national standard reference measurement methods should be permitted.

([1]) OJ L 257, 10.10.1996, p. 26. Directive as last amended by Regulation (EC) No 1882/2003.

▼B

(13) Information on the concentrations and the deposition of the regulated pollutants should be forwarded to the Commission as a basis for regular reports.

(14) Up-to-date information on ambient air concentrations and deposition of regulated pollutants should be readily available to the public.

(15) The Member States should lay down rules on penalties applicable to infringements of the provisions of this Directive and ensure that they are implemented. Those penalties should be effective, proportionate and dissuasive.

(16) The measures necessary for the implementation of this Directive should be adopted in accordance with Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission ([1]).

(17) The amendments necessary for adaptation of this Directive to scientific and technical progress should relate solely to criteria and techniques for the assessment of concentrations and deposition of regulated pollutants or detailed arrangements for forwarding information to the Commission. They should not have the effect of modifying the target values either directly or indirectly,

HAVE ADOPTED THIS DIRECTIVE:

Article 1

Objectives

The objectives of this Directive shall be to:

(a) establish a target value for the concentration of arsenic, cadmium, nickel and benzo(a)pyrene in ambient air so as to avoid, prevent or reduce harmful effects of arsenic, cadmium, nickel and polycyclic aromatic hydrocarbons on human health and the environment as a whole;

(b) ensure, with respect to arsenic, cadmium, nickel and polycyclic aromatic hydrocarbons, that ambient air quality is maintained where it is good and that it is improved in other cases;

(c) determine common methods and criteria for the assessment of concentrations of arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons in ambient air as well as of the deposition of arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons;

(d) ensure that adequate information on concentrations of arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons in ambient air as well as on the deposition of arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons is obtained and ensure that it is made available to the public.

Article 2

Definitions

For the purposes of this Directive the definitions in Article 2 of Directive 96/62/EC, with the exception of the definition of ‘target value’, shall apply.

([1]) OJ L 184, 17.7.1999, p. 23.

▼B

The objectives of this Directive shall be to:

(a) ‘target value’ means a concentration in the ambient air fixed with the aim of avoiding, preventing or reducing harmful effects on human health and the environment as a whole, to be attained where possible over a given period;

(b) ‘total or bulk deposition’ means the total mass of pollutants which is transferred from the atmosphere to surfaces (e.g. soil, vegetation, water, buildings, etc.) in a given area within a given time;

(c) ‘upper assessment threshold’ means a level specified in Annex II below which a combination of measurements and modelling techniques may be used to assess ambient air quality, in accordance with Article 6(3) of Directive 96/62/EC;

(d) ‘lower assessment threshold’ means a level specified in Annex II below which the sole use of modelling or objective estimation techniques shall be possible to assess ambient air quality, in accordance with Article 6(4) of Directive 96/62/EC;

(e) ‘fixed measurements’ means measurements taken at fixed sites either continuously or by random sampling, in accordance with Article 6(5) of Directive 96/62/EC;

(f) ‘arsenic’, ‘cadmium’, ‘nickel’ and ‘benzo(a)pyrene’ mean the total content of these elements and compounds in the PM_{10} fraction;

(g) ‘PM_{10}’ means particulate matter, which passes through a size-selective inlet as defined in EN 12341 with a 50 % efficiency cut-off at 10 μm aerodynamic diameter;

(h) ‘polycyclic aromatic hydrocarbons’ means those organic compounds, composed of at least two fused aromatic rings made entirely from carbon and hydrogen;

(i) ‘total gaseous mercury’ means elemental mercury vapour (Hg^0) and reactive gaseous mercury, i.e. water-soluble mercury species with sufficiently high vapour pressure to exist in the gas phase.

Article 3

Target values

1. Member States shall take all necessary measures not entailing disproportionate costs to ensure that, as from 31 December 2012, concentrations of arsenic, cadmium, nickel and benzo(a)pyrene, used as a marker for the carcinogenic risk of polycyclic aromatic hydrocarbons, in ambient air, as assessed in accordance with Article 4, do not exceed the target values laid down in Annex I.

2. Member States shall draw up a list of zones and agglomerations in which the levels of arsenic, cadmium, nickel, and benzo(a)pyrene are below the respective target values. Member States shall maintain the levels of these pollutants in these zones and agglomerations below the respective target values and shall endeavour to preserve the best ambient air quality, compatible with sustainable development.

3. Member States shall draw up a list of the zones and agglomerations where the target values laid down in Annex I are exceeded.

For such zones and agglomerations, Member States shall specify the areas of exceedance and the sources contributing thereto. In the areas concerned, Member States shall demonstrate the application of all necessary measures not entailing disproportionate costs, directed in particular at the predominant emission sources, in order to attain the target values. In the case of industrial installations covered by Directive 96/61/EC this means the application of BAT as defined by Article 2(11) of that Directive.

▼B

Article 4

Assessment of ambient air concentrations and deposition rates

1. Ambient air quality with respect to arsenic, cadmium, nickel and benzo(a)pyrene shall be assessed throughout the territory of the Member States.

2. In accordance with the criteria referred to in paragraph 7, measurement is mandatory in the following zones:

(a) zones and agglomerations in which levels are between the upper and the lower assessment threshold, and

(b) other zones and agglomerations where levels exceed the upper assessment threshold.

The measurements provided for may be supplemented by modelling techniques to provide an adequate level of information on ambient air quality.

3. A combination of measurements, including indicative measurements as referred to in Annex IV, Section I, and modelling techniques may be used to assess ambient air quality in zones and agglomerations where the levels over a representative period are between the upper and lower assessment thresholds, to be determined pursuant to Annex II, Section II.

4. In zones and agglomerations where the levels are below the lower assessment threshold, to be determined pursuant to Annex II, Section II, the sole use of modelling or objective estimation techniques for assessing levels shall be possible.

5. Where pollutants have to be measured, the measurements shall be taken at fixed sites either continuously or by random sampling. The number of measurements shall be sufficient to enable the levels to be determined.

6. The upper and lower assessment thresholds for arsenic, cadmium, nickel and benzo(a)pyrene in ambient air shall be those laid down in Section I of Annex II. The classification of each zone or agglomeration for the purposes of this Article shall be reviewed at least every five years in accordance with the procedure laid down in Section II of Annex II. Classification shall be reviewed earlier in the event of significant change in activities relevant to concentrations of arsenic, cadmium, nickel and benzo(a)pyrene, in ambient air.

7. The criteria for determining the location of sampling points for the measurement of arsenic, cadmium, nickel and benzo(a)pyrene in ambient air in order to assess compliance with the target values shall be those listed in Sections I and II of Annex III. The minimum number of sampling points for fixed measurements of concentrations of each pollutant shall be as laid down in Section IV of Annex III, and they shall be installed in each zone or agglomeration within which measurement is required if fixed measurement is the sole source of data on concentrations within it.

8. To assess the contribution of benzo(a)pyrene in ambient air, each Member State shall monitor other relevant polycyclic aromatic hydrocarbons at a limited number of measurement sites. These compounds shall include at least: benzo(a)anthracene, benzo(b)fluoranthene, benzo (j)fluoranthene, benzo(k)fluoranthene, indeno(1,2,3-cd)pyrene, and dibenz(a,h)anthracene. Monitoring sites for these polycyclic aromatic hydrocarbons shall be co-located with sampling sites for benzo(a) pyrene and shall be selected in such a way that geographical variation and long-term trends can be identified. Sections I, II and III of Annex III shall apply.

▼M1

9. Irrespective of concentration levels, one background sampling point shall be installed every 100 000 km^2 for the indicative

▼M1

measurement, in ambient air, of arsenic, cadmium, nickel, total gaseous mercury, benzo(a)pyrene and the other polycyclic aromatic hydrocarbons referred to in paragraph 8, and of the total deposition of arsenic, cadmium, mercury, nickel, benzo(a)pyrene and the other polycyclic aromatic hydrocarbons referred to in paragraph 8. Each Member State shall set up at least one measuring station. However, Member States may, by agreement, and in accordance with guidelines to be drawn up under the regulatory procedure referred to in Article 6(2), set up one or several common measuring stations, covering neighbouring zones in adjoining Member States, to achieve the necessary spatial resolution. Measurement of particulate and gaseous divalent mercury is also recommended. Where appropriate, monitoring shall be coordinated with the European Monitoring and Evaluation of Pollutants (EMEP) monitoring strategy and measurement programme. The sampling sites for these pollutants shall be selected in such a way that geographical variation and long-term trends can be identified. Sections I, II and III of Annex III shall apply.

▼B

10. The use of bio indicators may be considered where regional patterns of the impact on ecosystems are to be assessed.

11. For zones and agglomerations within which information from fixed measurement stations is supplemented by information from other sources, such as emission inventories, indicative measurement methods and air quality modelling, the number of fixed measuring stations to be installed and the spatial resolution of other techniques shall be sufficient for the concentrations of air pollutants to be established in accordance with Section I of Annex III and Section I of Annex IV.

12. Data quality objectives are laid down in Section I of Annex IV. Where air quality models are used for assessment, Section II of Annex IV shall apply.

13. The reference methods for the sampling and analysis of arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons in ambient air shall be as laid down in Sections I, II and III of Annex V. Section IV of Annex V sets out reference techniques for measuring the total deposition of arsenic, cadmium, mercury, nickel and the polycyclic aromatic hydrocarbons and Section V of Annex V refers to reference air quality modelling techniques when such techniques are available.

14. The date by which Member States shall inform the Commission of the methods used for the preliminary assessment of air quality under Article 11(1)(d) of Directive 96/62/EC shall be the date referred to in Article 10 of this Directive.

▼M1

15. Any amendments necessary to adapt the provisions of this Article and of Section II of Annex II and of Annexes III, IV and V to scientific and technical progress shall be adopted by the Commission. Those measures, designed to amend non-essential elements of this Directive, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 6(3). They may not result in any direct or indirect changes to target values.

▼B

Article 5

Transmission of information and reporting

1. With regard to the zones and agglomerations where any of the target values laid down in Annex I is exceeded, Member States shall forward the following information to the Commission:

(a) the lists of the zones and agglomerations concerned,

(b) the areas of exceedance,

▼B

(c) the concentration values assessed,

(d) the reasons for exceedance, and in particular any sources contributing to it,

(e) the population exposed to such exceedance.

Member States shall also report all data assessed in accordance with Article 4, unless already reported under Council Decision 97/101/EC of 27 January 1997 establishing a reciprocal exchange of information and data from networks and individual stations measuring ambient air pollution within the Member States ([1]).

The information shall be transmitted for each calendar year, by no later than 30 September of the following year, and for the first time for the calendar year following 15 February 2007.

2. In addition to the requirements laid down in paragraph 1, Member States shall also report any measures taken pursuant to Article 3.

3. The Commission shall ensure that all information submitted pursuant to paragraph 1 is promptly made available to the public by appropriate means, such as Internet, press and other easily accessible media.

▼M1

4. The Commission shall adopt, in accordance with the regulatory procedure referred to in Article 6(2), any detailed arrangements for forwarding the information to be provided under paragraph 1 of this Article.

▼B

Article 6

Committee

1. The Commission shall be assisted by the committee established by Article 12(2) of Directive 96/62/EC.

2. Where reference is made to this Article, Articles 5 and 7 of Decision 1999/468/EC shall apply, having regard to the provisions of Article 8 thereof.

The period laid down in Article 5(6) of Decision 1999/468/EC shall be set at three months.

▼M1

3. Where reference is made to this paragraph, Article 5a(1) to (4) and Article 7 of Decision 1999/468/EC shall apply, having regard to the provisions of Article 8 thereof.

▼B

Article 7

Public information

1. Member States shall ensure that clear and comprehensible information is accessible and is routinely made available to the public as well as to appropriate organisations, such as environmental organisations, consumer organisations, organisations representing the interests of sensitive populations and other relevant healthcare bodies, on ambient air concentrations of arsenic, cadmium, mercury, nickel and benzo(a)pyrene and the other polycyclic aromatic hydrocarbons referred to in Article 4(8) as well as on deposition rates of arsenic, cadmium, mercury, nickel and benzo(a)pyrene and the other polycyclic aromatic hydrocarbons referred to in Article 4(8).

([1]) OJ L 35, 5.2.1997, p. 14. Decision as amended by Commission Decision 2001/752/EC (OJ L 282, 26.10.2001, p. 69).

▼B

2. The information shall also indicate any annual exceedance of the target values for arsenic, cadmium, nickel and benzo(a)pyrene laid down in Annex I. The information shall give the reasons for the exceedance and the area to which it applies. It shall also provide a short assessment in relation to the target value and appropriate information regarding effects on health and impact on the environment.

Information on any measures taken pursuant to Article 3 shall be made available to the organisations referred to in paragraph 1 of this Article.

3. The information shall be made available by means of, for example, Internet, press and other easily accessible media.

Article 8

Report and review

1. The Commission shall, by 31 December 2010 at the latest, submit to the European Parliament and the Council a report based on:

(a) the experience acquired in the application of this Directive,

(b) in particular, the results of the most recent scientific research concerning the effects on human health, paying particular attention to sensitive populations, and on the environment as a whole, of exposure to arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons, and

(c) technological developments including the progress achieved in methods of measuring and otherwise assessing concentrations of these pollutants in ambient air as well as their deposition.

2. The report referred to in paragraph 1 shall take into account:

(a) current air quality, trends and projections up to and beyond 2015;

(b) the scope for making further reductions in polluting emissions from all relevant sources, and the possible merit in introducing limit values aimed at reducing the risk to human health, for the pollutants listed in Annex I, taking account of technical feasibility and cost-effectiveness and any significant additional health and environmental protection that this would provide;

(c) the relationships between pollutants and opportunities for combined strategies for improving Community air quality and related objectives;

(d) current and future requirements for informing the public and for the exchange of information between Member States and Commission;

(e) the experience acquired in the application of this Directive in Member States, and in particular the conditions under which measurement has been carried out as laid down in Annex III;

(f) secondary economic benefits for the environment and health in reducing the emissions of arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons to the extent that these can be assessed;

(g) the adequacy of the particle size fraction used for sampling in view of general particulate matter measurement requirements;

(h) the suitability of benzo(a)pyrene as a marker for the total carcinogenic activity of polycyclic aromatic hydrocarbons, having regard to predominantly gaseous forms of polycyclic aromatic hydrocarbons such as fluoranthene.

In the light of the latest scientific and technological developments the Commission shall also examine the effect of arsenic, cadmium and nickel on human health with a view to quantifying their genotoxic carcinogenicity. Taking account of measures adopted pursuant to the mercury strategy the Commission shall also consider whether there

▼B

would be merit in taking further action in relation to mercury, taking account of technical feasibility and cost-effectiveness and any significant additional health and environmental protection that this would provide.

3. With a view to achieving levels of ambient air concentrations that would further reduce harmful effects on human health and would lead to a high level of protection of the environment as a whole, taking into account the technical feasibility and cost-effectiveness of further action, the report referred to in paragraph 1 may be accompanied, if appropriate, by proposals for amendments to this Directive, particularly taking into account the results obtained in accordance with paragraph 2. In addition the Commission shall consider regulating the deposition of arsenic, cadmium, mercury, nickel and specific polycyclic aromatic hydrocarbons.

Article 9

Penalties

Member States shall determine the penalties applicable to infringements of the national provisions adopted pursuant to this Directive and shall take all the measures necessary to ensure that they are implemented. The penalties provided for must be effective, proportionate and dissuasive.

Article 10

Implementation

1. Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with this Directive by 15 February 2007 at the latest. They shall forthwith inform the Commission thereof.

When Member States adopt these measures, they shall contain a reference to this Directive or be accompanied by such a reference on the occasion of their official publication. Member States shall determine how such reference is to be made.

2. Member States shall communicate to the Commission the texts of the main provisions of national law, which they adopt in the field covered by this Directive.

Article 11

Entry into force

This Directive shall enter into force on the twentieth day following that of its publication in the *Official Journal of the European Union.*

Article 12

Addressees

This Directive is addressed to the Member States.

▼B

ANNEX I

Target values for arsenic, cadmium, nickel and benzo(a)pyrene

Pollutant	Target value (1)
Arsenic	6 ng/m^3
Cadmium	5 ng/m^3
Nickel	20 ng/m^3
Benzo(a)pyrene	1 ng/m^3

(1) For the total content in the PM_{10} fraction averaged over a calendar year.

▼B

ANNEX II

Determination of requirements for assessment of concentrations of arsenic, cadmium, nickel and benzo(a)pyrene in ambient air within a zone or agglomeration

I. **Upper and lower assessment thresholds**

The following upper and lower assessment thresholds will apply:

	Arsenic	Cadmium	Nickel	B(a)P
Upper assessment threshold in percent of the target value	60 % (3,6 ng/m^3)	60 % (3 ng/m^3)	70 % (14 ng/m^3)	60 % (0,6 ng/m^3)
Lower assessment threshold in percent of the target value	40 % (2,4 ng/m^3)	40 % (2 ng/m^3)	50 % (10 ng/m^3)	40 % (0,4 ng/m^3)

II. **Determination of exceedances of upper and lower assessment thresholds**

Exceedances of upper and lower assessment thresholds must be determined on the basis of concentrations during the previous five years where sufficient data are available. An assessment threshold will be deemed to have been exceeded if it has been exceeded during at least three calendar years out of those previous five years.

Where fewer than five years' data are available, Member States may combine measurement campaigns of short duration during the period of the year and at locations likely to be typical of the highest pollution levels with results obtained from information from emission inventories and modelling to determine exceedances of the upper and lower assessment thresholds.

▼B

ANNEX III

Location and minimum number of sampling points for the measurement of concentrations in ambient air and deposition rates

I. **Macroscale siting**

The sites of sampling points should be selected in such a way as to:

— provide data on the areas within zones and agglomerations where the population is likely to be directly or indirectly exposed to the highest concentrations averaged over a calendar year;

— provide data on levels in other areas within zones and agglomerations which are representative of the exposure of the general population;

— provide data on deposition rates representing the indirect exposure of the population through the food chain.

Sampling points should in general be sited so as to avoid measuring very small micro-environments in their immediate vicinity. As a guideline, a sampling point should be representative of air quality in surrounding areas of no less than 200 m^2 at traffic-orientated sites, at least 250 m × 250 m at industrial sites, where feasible, and several square kilometres at urban-background sites.

Where the objective is to assess background levels the sampling site should not be influenced by agglomerations or industrial sites in its vicinity, i.e. sites closer than a few kilometres.

Where contributions from industrial sources are to be assessed, at least one sampling point shall be installed downwind of the source in the nearest residential area. Where the background concentration is not known, an additional sampling point shall be situated within the main wind direction. In particular where Article 3(3) applies, the sampling points should be sited such that the application of BAT can be monitored.

Sampling points should also, where possible, be representative of similar locations not in their immediate vicinity. Where appropriate they should be co-located with sampling points for PM_{10}.

II. **Microscale siting**

The following guidelines should be met as far as practicable:

— the flow around the inlet sampling probe should be unrestricted, without any obstructions affecting the airflow in the vicinity of the sampler (normally some metres away from buildings, balconies, trees and other obstacles and at least 0,5 m from the nearest building in the case of sampling points representing air quality at the building line);

— in general, the inlet sampling point should be between 1,5 m (the breathing zone) and 4 m above the ground. Higher positions (up to 8 m) may be necessary in some circumstances. Higher siting may also be appropriate if the station is representative of a large area;

— the inlet probe should not be positioned in the immediate vicinity of sources in order to avoid direct intake of emissions unmixed with ambient air;

— the sampler's exhaust outlet should be positioned so that recirculation of exhaust air to the sample inlet is avoided;

— traffic-orientated sampling points should be at least 25 metres from the edge of major junctions and at least 4 m from the centre of the nearest traffic lane; inlets should be sited so as to be representative of air quality near the building line;

— for the deposition measurements in rural background areas, the EMEP guidelines and criteria should be applied as far as practicable and where not provided for in the Annexes.

The following factors may also be taken into account:

— interfering sources

— security

— access

▼B

— availability of electrical power and telephone communications

— visibility of the site in relation to its surroundings

— safety of the public and operators

— the desirability of co-locating sampling points for different pollutants

— planning requirements.

III. **Documentation and review of site selection**

The site selection procedures should be fully documented at the classification stage by such means as compass-point photographs of the surrounding area and a detailed map. Sites should be reviewed at regular intervals with repeated documentation to ensure that selection criteria remain valid over time.

IV. **Criteria for determining numbers of sampling points for fixed measurement of concentrations of arsenic, cadmium, nickel and benzo (a)pyrene in ambient air**

Minimum number of sampling points for fixed measurement to assess compliance with target values for the protection of human health in zones and agglomerations where fixed measurement is the sole source of information.

(a) *Diffuse sources*

Population of agglomeration or zone (thousands)	If maximum concentrations exceed the upper assessment threshold (1)		If maximum concentrations are between the upper and lower assessment thresholds	
	As, Cd, Ni	B(a)P	As, Cd, Ni	B(a)P
0–749	1	1	1	1
750–1 999	2	2	1	1
2 000–3 749	2	3	1	1
3 750–4 749	3	4	2	2
4 750–5 999	4	5	2	2
≥ 6 000	5	5	2	2

(1) To include at least one urban-background station and for benzo(a)pyrene also one traffic-oriented station provided this does not increase the number of sampling points.

(b) *Point sources*

For the assessment of pollution in the vicinity of point sources, the number of sampling points for fixed measurement should be determined taking into account emission densities, the likely distribution patterns of ambient air pollution and potential exposure of the population.

The sampling points should be sited such that the application of BAT as defined by Article 2(11) of Directive 96/61/EC can be monitored.

▼B

ANNEX IV

Data quality objectives and requirements for air quality models

I. **Data quality objectives**

The following data quality objectives are provided as a guide to quality assurance.

	Benzo(a)pyrene	Arsenic, cadmium and nickel	Polycyclic aromatic hydrocarbons other than benzo(a) pyrene, total gaseous mercury	Total deposition
— Uncertainty				
Fixed and indicative measurements	50 %	40 %	50 %	70 %
Modelling	60 %	60 %	60 %	60 %
— Minimum data capture	90 %	90 %	90 %	90 %
— Minimum time coverage:				
Fixed measurements	33 %	50 %		
Indicative measurements (*)	14 %	14 %	14 %	33 %

(*) Indicative measurement being measurements which are performed at reduced regularity but fulfil the other data quality objectives.

The uncertainty (expressed at a 95 % confidence level) of the methods used for the assessment of ambient air concentrations will be evaluated in accordance with the principles of the CEN Guide to the expression of uncertainty in measurement (ENV 13005-1999), the methodology of ISO 5725:1994, and the guidance provided in the CEN Report, 'Air quality — Approach to uncertainty estimation for ambient air reference measurement methods' (CR 14377:2002E). The percentages for uncertainty are given for individual measurements, which are averaged over typical sampling times, for a 95 % confidence interval. The uncertainty of the measurements should be interpreted as being applicable in the region of the appropriate target value. Fixed and indicative measurements must be evenly distributed over the year in order to avoid skewing of results.

The requirements for minimum data capture and time coverage do not include losses of data due to regular calibration or normal maintenance of the instrumentation. Twenty-four-hour sampling is required for the measurement of benzo(a)pyrene and other polycyclic aromatic hydrocarbons. With care, individual samples taken over a period of up to one month can be combined and analysed as a composite sample, provided the method ensures that the samples are stable for that period. The three congeners benzo(b) fluoranthene, benzo(j)fluoranthene, benzo(k)fluoranthene can be difficult to resolve analytically. In such cases they can be reported as sum. Twenty-four hour sampling is also advisable for the measurement of arsenic, cadmium and nickel concentrations. Sampling must be spread evenly over the weekdays and the year. For the measurement of deposition rates monthly, or weekly, samples throughout the year are recommended.

Member States may use wet only instead of bulk sampling if they can demonstrate that the difference between them is within 10 %. Deposition rates should generally be given as $\mu g/m^2$ per day.

Member States may apply a minimum time coverage lower than indicated in the table, but not lower than 14 % for fixed measurements and 6 % for indicative measurements provided that they can demonstrate that the 95 % expanded uncertainty for the annual mean, calculated from the data quality objectives in the table according to ISO 11222:2002 — 'Determination of the uncertainty of the time average of air quality measurements' will be met.

II. **Requirements for air quality models**

Where an air quality model is used for assessment, references to descriptions of the model and information on the uncertainty shall be compiled. The uncertainty for modelling is defined as the maximum deviation of the

▼B

measured and calculated concentration levels, over a full year, without taking into account the timing of the events.

III. **Requirements for objective estimation techniques**

Where objective estimation techniques are used, the uncertainty shall not exceed 100 %.

IV. **Standardisation**

For substances to be analysed in the PM_{10} fraction, the sampling volume refers to ambient conditions.

▼B

ANNEX V

Reference methods for assessment of concentrations in ambient air and deposition rates

I. **Reference method for the sampling and analysis of arsenic, cadmium and nickel in ambient air**

The reference method for the measurement of arsenic, cadmium and nickel concentrations in ambient air is currently being standardised by CEN and shall be based on manual PM_{10} sampling equivalent to EN 12341, followed by digestion of the samples and analysis by Atomic Absorption Spectrometry or ICP Mass Spectrometry. In the absence of a CEN standard method, Member States are allowed to use national standard methods or ISO standard methods.

A Member State may also use any other methods which it can demonstrate give results equivalent to the above method.

II. **Reference method for the sampling and analysis of polycyclic aromatic hydrocarbons in ambient air**

The reference method for the measurement of benzo(a)pyrene concentrations in ambient air is currently being standardised by CEN and shall be based on manual PM_{10} sampling equivalent to EN 12341. In the absence of a CEN standard method, for benzo(a)pyrene or the other polycyclic aromatic hydrocarbons referred to in Article 4(8), Member States are allowed to use national standard methods or ISO methods such as ISO standard 12884.

A Member State may also use any other methods which it can demonstrate give results equivalent to the above method.

III. **Reference method for the sampling and analysis of mercury in ambient air**

The reference method for the measurement of total gaseous mercury concentrations in ambient air shall be an automated method based on Atomic Absorption Spectrometry or Atomic Fluorescence Spectrometry. In the absence of a CEN standardised method, Member States are allowed to use national standard methods or ISO standard methods.

A Member State may also use any other methods which it can demonstrate give results equivalent to the above method.

IV. **Reference method for the sampling and analysis of the deposition of arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons**

The reference method for the sampling of deposited arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons shall be based on the exposition of cylindrical deposit gauges with standardised dimensions. In the absence of a CEN standardised method, Member States are allowed to use national standard methods.

▼M1

V. **Reference air quality modelling techniques**

Reference air quality modelling techniques cannot be specified at present. The Commission may make amendments to adapt this point to scientific and technical progress. Those measures, designed to amend non-essential elements of this Directive, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 6(3).

▼B

DIRECTIVE 2001/81/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 23 October 2001

on national emission ceilings for certain atmospheric pollutants

THE EUROPEAN PARLIAMENT AND THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty establishing the European Community, and in particular Article 175(1) thereof,

Having regard to the proposal from the Commission ([1]),

Having regard to the Opinion of the Economic and Social Committee ([2]),

Having regard to the Opinion of the Committee of the Regions ([3]),

Acting in accordance with the procedure laid down in Article 251 of the Treaty ([4]), in the light of the joint text approved by the Conciliation Committee on 2 August 2001,

Whereas:

(1) The general approach and strategy of the Fifth Environmental Action Programme was approved by the Resolution of 1 February 1993 of the Council and the Representatives of the Governments of the Member States meeting within the Council on a Community programme of policy and action in relation to the environment and sustainable development ([5]) and it sets as objectives that critical loads and levels for acidification in the Community are not to be exceeded. The programme requires that all people should be effectively protected against health risks from air pollution and that permitted levels of pollution should take account of the protection of the environment. The programme also requires that guideline values from the World Health Organisation (WHO) should become mandatory at Community level.

(2) The Member States have signed the Gothenburg Protocol of 1 December 1999 to the United Nations Economic Commission for Europe (UNECE) Convention on long-range transboundary air pollution to abate acidification, eutrophication and ground-level ozone.

(3) Decision No 2179/98/EC of the European Parliament and of the Council of 24 September 1998 on the review of the European Community programme of policy and action in relation to the environment and sustainable development 'Towards sustainability' ([6]) specified that particular attention should be given to developing and implementing a strategy with the goal of ensuring

([1]) OJ C 56 E, 29.2.2000, p. 34.
([2]) OJ C 51, 23.2.2000, p. 11.
([3]) OJ C 317, 6.11.2000, p. 35.
([4]) Opinion of the European Parliament of 15 March 2000 (OJ C 377, 29.12.2000, p. 159), Council Common Position of 7 November 2000 (OJ C 375, 28.12.2000, p. 1) and Decision of the European Parliament of 14 March 2001 (not yet published in the Official Journal). Decision of the European Parliament of 20 September 2001 and Decision of the Council of 27 September 2001.
([5]) OJ C 138, 17.5.1993, p. 1.
([6]) OJ L 275, 10.10.1998, p. 1.

▼B

that critical loads, in relation to exposure to acidifying, eutrophying and photochemical air pollutants, are not exceeded.

(4) Council Directive 92/72/EEC of 21 September 1992 on air pollution by ozone [1] requires the Commission to submit to the Council a report on the evaluation of photochemical pollution in the Community, accompanied by any proposals the Commission deems appropriate on the control of air pollution by ground-level ozone and, if necessary, on reducing emissions of ozone precursors.

(5) Significant areas of the Community are exposed to depositions of acidifying and eutrophying substances at levels which have adverse effects on the environment. The WHO guideline values for the protection of human health and vegetation from photochemical pollution are substantially exceeded in all Member States.

(6) The exceedance of critical loads should therefore be gradually eliminated and guideline levels respected.

(7) At present it is not technically feasible to meet the long-term objectives of eliminating the adverse effects of acidification and reducing exposure to ground-level ozone of man and the environment to the guideline values established by the WHO. It is therefore necessary to provide for interim environmental objectives for acidification and ground-level ozone pollution, on which the necessary measures to reduce such pollution are to be based.

(8) Interim environmental objectives and the measures to meet them should take account of technical feasibility and the associated costs and benefits. Such measures should ensure that any action taken is cost-effective for the Community as a whole and should take account of the need to avoid excessive costs for any individual Member State.

(9) Transboundary pollution contributes to acidification, soil eutrophication and ground-level ozone formation, the abatement of which requires coordinated Community action.

(10) Reducing emissions of the pollutants causing acidification and exposure to ground-level ozone will also reduce soil eutrophication.

(11) A set of national ceilings for each Member State for emissions of sulphur dioxide, nitrogen oxides, volatile organic compounds and ammonia is a cost-effective way of meeting interim environmental objectives. Such emission ceilings will allow the Community and the Member States flexibility in determining how to comply with them.

(12) Member States should be responsible for implementing measures to comply with national emission ceilings. It will be necessary to evaluate progress towards compliance with the emission ceilings. National programmes for the reduction of emissions should therefore be drawn up and reported on to the Commission and should include information on the measures adopted or envisaged to comply with the emission ceilings.

(13) In accordance with the principle of subsidiarity as set out in Article 5 of the Treaty and taking account, in particular, of the precautionary principle, the objective of this Directive, namely limitation of emissions of acidifying and eutrophying pollutants and ozone precursors, cannot be sufficiently achieved by the Member States because of the transboundary nature of the pollution and can therefore be better achieved by the Community; in accordance with the principle of proportionality

[1] OJ L 297, 13.10.1992, p. 1.

▼B

this Directive does not go beyond what is necessary to achieve that purpose.

(14) There should be a timely review of the progress made by Member States towards the emission ceilings, as well as a review of the extent to which implementing the ceilings is likely to meet interim environmental objectives, for the Community as a whole. Such review should consider also scientific and technical progress, developments in Community legislation and emission reductions outside the Community with special regard to progress made inter alia by the accession candidate countries. In that review, the Commission should undertake a further examination of the costs and benefits of the emission ceilings, including their cost-effectiveness, marginal costs and benefits and socio-economic impact and any impact on competitiveness. The review should also consider the limitations on the scope of this Directive.

(15) The Commission should for this purpose prepare a report to the European Parliament and the Council and, if it considers it necessary, propose appropriate amendments to this Directive taking account of the effects of any relevant Community legislation *inter alia* setting emission limits and product standards for relevant sources of emissions and international regulations concerning ship and aircraft emissions.

(16) Sea transport is a significant contributor to emissions of sulphur dioxide and nitrogen oxides and also to concentrations and depositions of air pollutants in the Community. Such emissions should therefore be reduced. Article 7(3) of Council Directive 1999/32/EC of 26 April 1999 relating to a reduction in the sulphur content of certain liquid fuels and amending Directive 93/12/EEC [1] requires the Commission to consider which measures could be taken to reduce the contribution to acidification of the combustion of marine fuels other than those specified in Article 2(3) of that Directive.

(17) Member States should seek to ratify Annex VI to the International Convention for the Prevention of Pollution from Ships (MARPOL) as soon as possible.

(18) Owing to the transboundary nature of acidification and ozone pollution, the Commission should continue to examine further the need to develop harmonised Community measures, without prejudice to Article 18 of Council Directive 96/61/EC of 24 September 1996 concerning integrated pollution prevention and control [2], with the aim of avoiding distortion of competition, and taking into account the balance between benefits and cost of action.

(19) The provisions of this Directive should apply without prejudice to the Community legislation regulating emissions of those pollutants from specific sources and to the provisions of Council Directive 96/61/EC in relation to emission limit values and use of best available techniques.

(20) Emission inventories are necessary to monitor progress towards compliance with the emission ceilings and must be calculated in accordance with internationally agreed methodology and reported on regularly to the Commission and the European Environment Agency (EEA).

(21) Member States should lay down rules on penalties applicable to infringements of the provisions of this Directive and ensure that they are implemented. The penalties should be effective, proportionate and dissuasive.

---

[2] OJ L 257, 10.10.1996, p. 26.

▼B

(22) The measures necessary for the implementation of this Directive should be adopted in accordance with Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission ([1]).

(23) The Commission and Members States should cooperate internationally with a view to achieving the objectives of this Directive,

HAVE ADOPTED THIS DIRECTIVE:

Article 1

Objective

The aim of this Directive is to limit emissions of acidifying and eutrophying pollutants and ozone precursors in order to improve the protection in the Community of the environment and human health against risks of adverse effects from acidification, soil eutrophication and ground-level ozone and to move towards the long-term objectives of not exceeding critical levels and loads and of effective protection of all people against recognised health risks from air pollution by establishing national emission ceilings, taking the years 2010 and 2020 as benchmarks, and by means of successive reviews as set out in Articles 4 and 10.

Article 2

Scope

This Directive covers emissions in the territory of the Member States and their exclusive economic zones from all sources of the pollutants referred to in Article 4 which arise as a result of human activities.

It does not cover:

(a) emissions from international maritime traffic;

(b) aircraft emissions beyond the landing and take-off cycle;

(c) for Spain, emissions in the Canary Islands;

(d) for France, emissions in the overseas departments;

(e) for Portugal, emissions in Madeira and the Azores.

Article 3

Definitions

For the purposes of this Directive:

(a) ‘AOT 40’ means the sum of the difference between hourly concentrations of ground-level ozone greater than 80 μg/m^3 (= 40 ppb) and 80 μg/m^3 during daylight hours accumulated from May to July each year;

(b) ‘AOT 60’ means the sum of the difference between hourly concentrations of ground-level ozone greater than 120 μg/m^3 (=60 ppb) and 120 μg/m^3 accumulated throughout the year;

(c) ‘critical load’ means a quantitative estimate of an exposure to one or more pollutants below which significant adverse effects on specified sensitive elements of the environment do not occur, according to present knowledge;

([1]) OJ L 184, 17.7.1999, p. 23.

▼B

(d) ‘critical level’ means the concentration of pollutants in the atmosphere above which direct adverse effects on receptors, such as human beings, plants, ecosystems or materials, may occur, according to present knowledge;

(e) ‘emission’ means the release of a substance from a point or diffuse source into the atmosphere;

(f) ‘grid cell’ means a square 150 km x 150 km, which is the resolution used when mapping critical loads on a European scale, and also when monitoring emissions and depositions of air pollutants under the Cooperative Programme for Monitoring and Evaluation of the long-range Transmission of Air Pollutants in Europe (EMEP);

(g) ‘landing and take-off cycle’ means a cycle represented by the following time in each operating mode: approach 4,0 minutes; taxi/-ground idle 26,0 minutes, take-off 0,7 minutes; climb 2,2 minutes;

(h) ‘national emission ceiling’ means the maximum amount of a substance expressed in kilotonnes, which may be emitted from a Member State in a calendar year;

(i) ‘nitrogen oxides’ and ‘NO_x’ mean nitric oxide and nitrogen dioxide, expressed as nitrogen dioxide;

(j) ‘ground-level ozone’ means ozone in the lowermost part of the troposphere;

(k) ‘volatile organic compounds’ and ‘VOC’ mean all organic compounds arising from human activities, other than methane, which are capable of producing photochemical oxidants by reactions with nitrogen oxides in the presence of sunlight.

Article 4

National emission ceilings

1. By the year 2010 at the latest, Member States shall limit their annual national emissions of the pollutants sulphur dioxide (SO_2), nitrogen oxides (NO_x), volatile organic compounds (VOC) and ammonia (NH_3) to amounts not greater than the emission ceilings laid down in Annex I, taking into account any modifications made by Community measures adopted following the reports referred to in Article 9.

2. Member States shall ensure that the emission ceilings laid down in Annex I are not exceeded in any year after 2010.

Article 5

Interim environmental objectives

The national emission ceilings in Annex I shall have as their purpose to meet broadly the following interim environmental objectives, for the Community as a whole, by 2010:

(a) *Acidification*

The areas where critical loads are exceeded shall be reduced by at least 50 % (in each grid cell) compared with the 1990 situation.

(b) *Health-related ground-level ozone exposure*

The ground-level ozone load above the critical level for human health (AOT60=0) shall be reduced by two-thirds in all grid cells compared with the 1990 situation. In addition, the ground-level ozone load shall not exceed an absolute limit of 2,9 ppm.h in any grid cell.

(c) *Vegetation-related ground-level ozone exposure*

▼B

The ground-level ozone load above the critical level for crops and semi-natural vegetation (AOT40=3 ppm.h) shall be reduced by one-third in all grid cells compared with the 1990 situation. In addition, the ground-level ozone load shall not exceed an absolute limit of 10 ppm.h, expressed as an exceedance of the critical level of 3 ppm.h in any grid cell.

Article 6

National programmes

1. Member States shall, by 1 October 2002 at the latest, draw up programmes for the progressive reduction of national emissions of the pollutants referred to in Article 4 with the aim of complying at least with the national emission ceilings laid down in Annex I by 2010 at the latest.

2. The national programmes shall include information on adopted and envisaged policies and measures and quantified estimates of the effect of these policies and measures on emissions of the pollutants in 2010. Anticipated significant changes in the geographical distribution of national emissions shall be indicated.

3. Member States shall update and revise the national programmes as necessary by 1 October 2006.

4. Member States shall make available to the public and to appropriate organisations such as environmental organisations the programmes drawn up in accordance with paragraphs 1, 2 and 3. Information made available to the public and to organisations under this paragraph shall be clear, comprehensible and easily accessible.

Article 7

Emission inventories and projections

1. Member States shall prepare and annually update national emission inventories and emission projections for 2010 for the pollutants referred to in Article 4.

2. Member States shall establish their emission inventories and projections using the methodologies specified in Annex III.

3. The Commission, assisted by the European Environment Agency, shall, in cooperation with the Member States and on the basis of the information provided by them, establish inventories and projections of the pollutants referred to in Article 4. The inventories and projections shall be made publicly available.

▼M2

4. Any updating of the methodologies to be used in accordance with Annex III shall be adopted by the Commission. Those measures, designed to amend non-essential elements of this Directive, *inter alia,* by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 13(3).

▼B

Article 8

Reports by the Member States

1. Member States shall each year, by 31 December at the latest, report their national emission inventories and their emission projections for 2010 established in accordance with Article 7 to the Commission and the European Environment Agency. They shall report their final emission inventories for the previous year but one and their provisional emission inventories for the previous year. Emission projections shall

▼B

include information to enable a quantitative understanding of the key socioeconomic assumptions used in their preparation.

2. Member States shall, by 31 December 2002 at the latest, inform the Commission of the programmes drawn up in accordance with Article 6(1) and (2).

Member States shall, by 31 December 2006 at the latest, inform the Commission of the updated programmes drawn up in accordance with Article 6(3).

3. The Commission shall forward the national programmes received to the other Member States within one month of their reception.

4. The Commission shall, in accordance with the procedure set out in Article 13(2), establish provisions to ensure consistent and transparent reporting of national programmes.

Article 9

Reports by the Commission

1. In 2004 and 2008 the Commission shall report to the European Parliament and the Council on progress on the implementation of the national emission ceilings laid down in Annex I and on the extent to which the interim environmental objectives set out in Article 5 are likely to be met by 2010 and on the extent to which the long-term objectives set out in Article 1 could be met by 2020. The reports shall include an economic assessment, including cost-effectiveness, benefits, an assessment of marginal costs and benefits and the socioeconomic impact of the implementation of the national emission ceilings on particular Member States and sectors. They shall also include a review of the limitations of the scope of this Directive as defined in Article 2 and an evaluation of the extent to which further emission reductions might be necessary in order to meet the interim environmental objectives set out in Article 5. They shall take into account the reports made by Member States pursuant to Article 8(1) and (2), as well as, *inter alia*:

(a) any new Community legislation which may have been adopted setting emission limits and product standards for relevant sources of emissions;

(b) developments of best available techniques in the framework of the exchange of information under Article 16 of Directive 96/61/EC;

(c) emission reduction objectives for 2008 for emissions of sulphur dioxide and nitrogen oxides from existing large combustion plants, reported by Member States pursuant to Directive 2001/80/EC of the European Parliament and of the Council of 23 October 2001 on the limitation of emissions of certain pollutants into the air from large combustion plants ([1]);

(d) emission reductions and reduction commitments by third countries, with particular focus on measures to be taken in the accession candidate countries, and the possibility for further emission reductions in regions in the vicinity of the Community;

(e) any new Community legislation and any international regulations concerning ship and aircraft emissions;

(f) the development of transport and any further action to control transport emissions;

(g) developments in the field of agriculture, new livestock projections and improvements in emission reduction methods in the agricultural sector;

([1]) See p. 1 of this edition of the Official Journal.

▼B

(h) any major changes in the energy supply market within a Member State and new forecasts reflecting the actions taken by Member States to comply with their international obligations in relation to climate change;

(i) assessment of the current and projected exceedances of critical loads and the WHO's guideline values for ground-level ozone;

(j) the possibility of identification of a proposed interim objective for reducing soil eutrophication;

(k) new technical and scientific data including an assessment of the uncertainties in:

(i) national emission inventories;

(ii) input reference data;

(iii) knowledge of the transboundary transport and deposition of pollutants;

(iv) critical loads and levels;

(v) the model used;

and an assessment of the resulting uncertainty in the national emission ceilings required to meet the interim environmental objectives mentioned in Article 5.

(l) whether there is a need to avoid excessive costs for any individual Member State;

(m) a comparison of model calculations with observations of acidification, eutrophication and ground-level ozone with a view to improving models;

(n) the possible use, where appropriate, of relevant economic instruments.

2. In 2012 the Commission shall report to the European Parliament and the Council on compliance with the ceilings in Annex I and on progress in relation to the interim environmental objectives in Article 5 and the long-term objectives set out in Article 1. Its report shall take account of the reports made by Member States pursuant to Article 8(1) and (2) as well as the matters listed in points (a) to (n) of paragraph 1.

Article 10

Review

1. The reports referred to in Article 9 shall take into account the factors listed in Article 9(1). In the light of these factors, of progress towards attaining the emission ceilings by the year 2010, of scientific and technical progress, and of the situation regarding progress towards attaining the interim objectives of this Directive and the long-term objectives of no exceedance of critical loads and levels and of WHO air quality guidelines for ozone, the Commission shall carry out a review of this Directive in preparation for each report.

2. In the review to be completed in 2004 an evaluation will be carried out of the indicative emission ceilings for the Community as a whole set out in Annex II. The evaluation of these indicative ceilings shall be a factor for consideration during analysis of further cost-effective actions that might be taken in order to reduce emissions of all relevant pollutants, with the aim of attaining the interim environmental objectives set out in Article 5, for the Community as a whole by 2010.

3. All reviews shall include a further investigation of the estimated costs and benefits of national emission ceilings, computed with state-of-the-art models and making use of the best available data to achieve the

▼B

least possible uncertainty and taking also into account progress in the enlargement of the European Union, and of the merits of alternative methodologies, in the light of the factors listed in Article 9.

4. Without prejudice to Article 18 of Directive 96/61/EC, with the aim of avoiding distortion of competition, and taking into account the balance between benefits and costs of action, the Commission shall examine further the need to develop harmonised Community measures, for the most relevant economic sectors and products contributing to acidification, eutrophication and formation of ground-level ozone.

5. The reports referred to in Article 9 will, if appropriate, be accompanied by proposals for:

(a) modifications of the national ceilings in Annex I with the aim of meeting the interim environmental objectives of Article 5 and/or for modifications to those interim environmental objectives;

(b) possible further emission reductions with the aim of meeting, preferably by 2020, the long-term objectives of this Directive;

(c) measures to ensure compliance with the ceilings.

Article 11

Cooperation with third countries

To promote the achievement of the objective set out in Article 1, the Commission and Member States, as appropriate, shall, without prejudice to Article 300 of the Treaty, pursue bilateral and multilateral cooperation with third countries and relevant international organisations such as the United Nations Economic Commission for Europe (UNECE), the International Maritime Organization (IMO) and the International Civil Aviation Organization (ICAO), including through the exchange of information, concerning technical and scientific research and development and with the aim of improving the basis for the facilitation of emission reductions.

Article 12

Reports concerning ship and aircraft emission

1. By the end of 2002 the Commission shall report to the European Parliament and Council on the extent to which emissions from international maritime traffic contribute to acidification, eutrophication and the formation of ground-level ozone within the Community.

2. By the end of 2004 the Commission shall report to the European Parliament and Council on the extent to which emissions from aircraft beyond the landing and take-off cycle contribute to acidification, eutrophication and the formation of ground-level ozone within the Community.

3. Each report shall specify a programme of actions which could be taken at international and Community level as appropriate to reduce emissions from the sector concerned, as a basis for further consideration by the European Parliament and Council.

Article 13

Committee

1. The Commission shall be assisted by the Committee set up by Article 12 of Directive 96/62/EC, hereinafter referred to as ‘the Committee’.

▼B

2. Where reference is made to this paragraph, Articles 4 and 7 of Decision 1999/468/EC shall apply, having regard to the provisions of Article 8 thereof.

The period referred to in Article 4(3) of Decision 1999/468/EC shall be set at three months.

▼M2

3. Where reference is made to this paragraph, Article 5a(1) to (4) and Article 7 of Decision 1999/468/EC shall apply, having regard to the provisions of Article 8 thereof.

▼B

Article 14

Penalties

Member States shall determine the penalties applicable to breaches of the national provisions adopted pursuant to this Directive. The penalties shall be effective, proportionate and dissuasive.

Article 15

Transposition

1. Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with this Directive before 27 November 2002. They shall forthwith inform the Commission thereof.

When Member States adopt those provisions, they shall contain a reference to this Directive or be accompanied by such reference on the occasion of their official publication. Member States shall determine how such reference is to be made.

2. Member States shall communicate to the Commission the text of the main provisions of national law, which they adopt in the field covered by this Directive.

Article 16

Entry into force

This Directive shall enter into force on the day of its publication in the *Official Journal of the European Communities*.

Article 17

Addressees

This Directive is addressed to the Member States.

▼M1

ANNEX I

National emission ceilings for SO_2, NO_x, VOC and NH_3, to be obtained by 2010 (1)

Country	SO_2 Kilotonnes	NO_x Kilotonnes	VOC Kilotonnes	NH_3 Kilotonnes
Belgium	99	176	139	74
Bulgaria (2)	836	247	175	108
Czech Republic	265	286	220	80
Denmark	55	127	85	69
Germany	520	1 051	995	550
Estonia	100	60	49	29
Greece	523	344	261	73
Spain	746	847	662	353
France	375	810	1 050	780
Ireland	42	65	55	116
Italy	475	990	1 159	419
Cyprus	39	23	14	09
Latvia	101	61	136	44
Lithuania	145	110	92	84
Luxembourg	4	11	9	7
Hungary	500	198	137	90
Malta	9	8	12	3
Netherlands	50	260	185	128
Austria	39	103	159	66
Poland	1 397	879	800	468
Portugal	160	250	180	90
Romania (2)	918	437	523	210
Slovenia	27	45	40	20
Slovakia	110	130	140	39
Finland	110	170	130	31
Sweden	67	148	241	57
United Kingdom	585	1 167	1 200	297
EC 27	8 297	9 003	8 848	4 294

(1) These national emission ceilings are designed with the aim of broadly meeting the interim environmental objectives set out in Article 5. Meeting those objectives is expected to result in a reduction of soil eutrophication to such an extent that the Community area with depositions of nutrient nitrogen in excess of the critical loads will be reduced by about 30 % compared with the situation in 1990.

(2) These national emission ceilings are temporary and are without prejudice to the review according to Article 10 of this Directive, which is to be completed in 2008.

▼B

ANNEX II

Emission ceilings for SO_2, NO_x and VOC (thousand tonnes)

▼M1

	SO_2 Kilotonnes	NO_x Kilotonnes	VOC Kilotonnes
EC 27 ([1])	7 832	8 180	7 585

([1]) These emission ceilings are temporary and are without prejudice to the review according to Article 10 of this Directive, which is to be completed in 2008.

▼B

These emission ceilings are designed with the aim of attaining the interim environmental objectives set out in Article 5 for the Community as a whole by 2010.

▼B

ANNEX III

Methodologies for emission inventories and projections

Member States shall establish emission inventories and projections using the methodologies agreed upon by the Convention on Long-range Transboundary Air Pollution and are requested to use the joint EMEP/CORINAIR (*) guidebook in preparing these inventories and projections.

(*) Air emissions inventory of the European Environment Agency.

I

(Acts whose publication is obligatory)

REGULATION (EC) No 166/2006 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 18 January 2006

concerning the establishment of a European Pollutant Release and Transfer Register and amending Council Directives 91/689/EEC and 96/61/EC

(Text with EEA relevance)

THE EUROPEAN PARLIAMENT AND THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty establishing the European Community, and in particular Article 175(1) thereof,

Having regard to the proposal from the Commission,

Having regard to the opinion of the European Economic and Social Committee ([1]),

After consulting the Committee of the Regions,

Acting in accordance with the procedure laid down in Article 251 of the Treaty ([2]),

Whereas:

(1) The Sixth Community Environment Action Programme adopted by Decision No 1600/2002/EC of the European Parliament and of the Council ([3]) requires supporting the provision of accessible information to citizens on the state and trends of the environment in relation to social, economic and health trends as well as the general raising of environmental awareness.

(2) The UNECE Convention on Access to Information, Public Participation in Decision-making and Access to Justice in Environmental Matters (hereinafter 'the Aarhus Convention'), signed by the European Community on 25 June 1998, recognises that increased public access to environmental information and the dissemination of such information contribute to a greater awareness of environmental matters, a free exchange of views, more effective participation by the public in environmental decision-making and, eventually, to a better environment.

(3) Pollutant release and transfer registers (hereinafter 'PRTRs') are a cost-effective tool for encouraging improvements in environmental performance, for providing public access to information on releases of pollutants and off-site transfers of pollutants and waste, and for use in tracking trends, demonstrating progress in pollution reduction, monitoring compliance with certain international agreements, setting priorities and evaluating progress achieved through Community and national environmental policies and programmes.

(4) An integrated and coherent PRTR gives the public, industry, scientists, insurance companies, local authorities, non-governmental organisations and other decision-makers a solid database for comparisons and future decisions in environmental matters.

(5) On 21 May 2003 the European Community signed the UNECE Protocol on Pollutant Release and Transfer Registers (hereinafter 'the Protocol'). Provisions of Community law should be consistent with that Protocol with a view to its conclusion by the Community.

(6) A European Pollutant Emission Register (hereinafter 'EPER') was established by Commission Decision 2000/479/EC ([4]). The Protocol builds on the same principles as EPER, but goes beyond, by including reporting on more pollutants, more activities, releases to land, releases from diffuse sources and off-site transfers.

(7) The objectives and goals pursued by a European PRTR can only be achieved if data are reliable and comparable. An adequate harmonisation of the data collection and transfer system is therefore needed to ensure the quality and comparability of data. In accordance with the Protocol the European PRTR should be designed for maximum ease of public access through the Internet. Releases and transfers should be easily identified in different aggregated and non-aggregated forms in order to access a maximum of information in a reasonable time.

([1]) Opinion of 6 April 2005 (not yet published in the Official Journal).

([2]) Opinion of the European Parliament of 6 July 2005 (not yet published in the Official Journal) and Decision of the Council of 2 December 2005.

([3]) OJ L 242, 10.9.2002, p. 1.

([4]) OJ L 192, 28.7.2000, p. 36.

(8) In order to further promote the objective of supporting the provision of accessible information to citizens on the state and trends of the environment as well as the general raising of environmental awareness, the European PRTR should contain links to other similar databases in Member States, non-Member States and international organisations.

(9) In accordance with the Protocol, the European PRTR should also contain information on specific waste disposal operations, to be reported as releases to land; recovery operations such as sludge and manure spreading are not reported under this category.

(10) In order to achieve the objective of the European PRTR to provide reliable information to the public and to allow for knowledge-based decisions it is necessary to provide for reasonable but strict timeframes for data collection and reporting; this is particularly relevant for reporting by Member States to the Commission.

(11) Reporting of releases from industrial facilities, although not yet always consistent, complete and comparable, is a well established procedure in many Member States. Where appropriate, reporting on releases from diffuse sources should be improved in order to enable decision-makers to better put into context those releases and to choose the most effective solution for pollution reduction.

(12) Data reported by the Member States should be of high quality in particular as regards their completeness, consistency and credibility. It is of great importance to coordinate future efforts of both operators and Member States to improve the quality of the reported data. The Commission will therefore initiate work, together with the Member States, on quality assurance.

(13) In accordance with the Aarhus Convention, the public should be granted access to the information contained in the European PRTR without an interest to be stated, primarily by ensuring that the European PRTR provides for direct electronic access through the Internet.

(14) Access to information provided by the European PRTR should be unrestricted and exceptions from this rule should only be possible where explicitly granted by existing Community legislation.

(15) In accordance with the Aarhus Convention, public participation should be ensured in the further development of the European PRTR by early and effective opportunities to submit comments, information, analysis or relevant opinions for the decision-making process. Applicants should be able to seek an administrative or judicial review of the acts or omissions of a public authority in relation to a request.

(16) In order to enhance the usefulness and impact of the European PRTR, the Commission and the Member States should cooperate in developing guidance supporting the implementation of the European PRTR, in promoting awareness of the public and in providing appropriate and timely technical assistance.

(17) The measures necessary for the implementation of this Regulation should be adopted in accordance with Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission [1].

(18) Since the objective of the action to be taken, namely to enhance public access to environmental information through the establishment of an integrated, coherent Community-wide electronic database, cannot be sufficiently achieved by the Member States, because the need for comparability of data throughout the Member States argues for a high level of harmonisation, and can therefore be better achieved at Community level, the Community may adopt measures in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty. In accordance with the principle of proportionality as set out in that Article, this Regulation does not go beyond what is necessary in order to achieve that objective.

(19) In order to simplify and streamline reporting requirements, Council Directive 91/689/EEC of 12 December 1991 on hazardous waste [2] and Council Directive 96/61/EC of 24 September 1996 concerning integrated pollution prevention and control [3] should be amended.

(20) The European PRTR aims, among other things, at informing the public about important pollutant emissions due, in particular, to activities covered by Directive 96/61/EC. Consequently, under this Regulation, information should be provided to the public on emissions from installations covered by Annex I of that Directive.

(21) To reduce duplicate reporting, pollutant release and transfer register systems may, under the Protocol, be integrated to the degree practicable with existing information sources such as reporting mechanisms under licences or operating permits. In accordance with the Protocol, the provisions of this Regulation should not affect the right of the Member States to maintain or introduce a more extensive or more publicly accessible pollutant release and transfer register than required under the Protocol,

---

[1] OJ L 184, 17.7.1999, p. 23.

[2] OJ L 377, 31.12.1991, p. 20. Directive as amended by Directive 94/31/EC (OJ L 168, 2.7.1994, p. 28).

[3] OJ L 257, 10.10.1996, p. 26. Directive as last amended by Regulation (EC) No 1882/2003 of the European Parliament and of the Council (OJ L 284, 31.10.2003, p. 1).

HAVE ADOPTED THIS REGULATION:

Article 1

Subject matter

This Regulation establishes an integrated pollutant release and transfer register at Community level (hereinafter 'the European PRTR') in the form of a publicly accessible electronic database and lays down rules for its functioning, in order to implement the UNECE Protocol on Pollutant Release and Transfer Registers (hereinafter 'the Protocol') and facilitate public participation in environmental decision-making, as well as contributing to the prevention and reduction of pollution of the environment.

Article 2

Definitions

For the purposes of this Regulation the following definitions shall apply:

(1) 'the public' means one or more natural or legal persons, and, in accordance with national legislation or practice, their associations, organisations or groups;

(2) 'competent authority' means the national authority or authorities, or any other competent body or bodies, designated by the Member States;

(3) 'installation' means a stationary technical unit where one or more activities listed in Annex I are carried out, and any other directly associated activities which have a technical connection with the activities carried out on that site and which could have an effect on emissions and pollution;

(4) 'facility' means one or more installations on the same site that are operated by the same natural or legal person;

(5) 'site' means the geographical location of the facility;

(6) 'operator' means any natural or legal person who operates or controls the facility or, where this is provided for in national legislation, to whom decisive economic power over the technical functioning of the facility has been delegated;

(7) 'reporting year' means the calendar year for which data on releases of pollutants and off-site transfers must be gathered;

(8) 'substance' means any chemical element and its compounds, with the exception of radioactive substances;

(9) 'pollutant' means a substance or a group of substances that may be harmful to the environment or to human health on account of its properties and of its introduction into the environment;

(10) 'release' means any introduction of pollutants into the environment as a result of any human activity, whether deliberate or accidental, routine or non-routine, including spilling, emitting, discharging, injecting, disposing or dumping, or through sewer systems without final waste-water treatment;

(11) 'off-site transfer' means the movement beyond the boundaries of a facility of waste destined for recovery or disposal and of pollutants in waste water destined for waste-water treatment;

(12) 'diffuse sources' means the many smaller or scattered sources from which pollutants may be released to land, air or water, whose combined impact on those media may be significant and for which it is impractical to collect reports from each individual source;

(13) 'waste' means any substance or object as defined in Article 1(a) of Council Directive 75/442/EEC of 15 July 1975 on waste [1];

(14) 'hazardous waste' means any substance or object as defined in Article 1(4) of Directive 91/689/EEC;

(15) 'waste water' means urban, domestic and industrial waste water, as defined in Article 2(1), (2) and (3) of Council Directive 91/271/EEC of 21 May 1991 concerning urban waste water treatment [2], and any other used water which is subject, because of the substances or objects it contains, to regulation by Community law;

(16) 'disposal' means any of the operations provided for in Annex IIA to Directive 75/442/EEC;

(17) 'recovery' means any of the operations provided for in Annex IIB to Directive 75/442/EEC.

Article 3

Content of the European PRTR

The European PRTR shall include information on:

(a) releases of pollutants referred to in Article 5(1)(a) that must be reported by the operators of the facilities carrying out the activities listed in Annex I;

[1] OJ L 194, 25.7.1975, p. 39. Directive as last amended by Regulation (EC) No 1882/2003.

[2] OJ L 135, 30.5.1991, p. 40. Directive as last amended by Regulation (EC) No 1882/2003.

(b) off-site transfers of waste referred to in Article 5(1)(b) and of pollutants in waste water referred to in Article 5(1)(c), that must be reported by the operators of the facilities carrying out the activities listed in Annex I;

(c) releases of pollutants from diffuse sources referred to in Article 8(1), where available.

Article 4

Design and structure

1. The Commission shall publish the European PRTR, presenting the data in both aggregated and non-aggregated forms, so that releases and transfers can be searched for and identified by:

(a) facility, including the facility's parent company where applicable, and its geographical location, including the river basin;

(b) activity;

(c) occurrence at Member State or Community level;

(d) pollutant or waste, as appropriate;

(e) each environmental medium (air, water, land) into which the pollutant is released;

(f) off-site transfers of waste and their destination, as appropriate;

(g) off-site transfers of pollutants in waste water;

(h) diffuse sources;

(i) facility owner or operator.

2. The European PRTR shall be designed for maximum ease of public access to allow the information, under normal operating conditions, to be continuously and readily accessible on the Internet and by other electronic means. Its design shall take into account the possibility of its future expansion and shall include all data reported for previous reporting years, up to at least the last ten previous reporting years.

3. The European PRTR shall include links to the following:

(a) the national PRTRs of Member States;

(b) other relevant existing, publicly accessible databases on subject matters related to PRTRs, including national PRTRs of other Parties to the Protocol and, where feasible, those of other countries;

(c) facilities' websites if they exist and links are volunteered by the facilities.

Article 5

Reporting by operators

1. The operator of each facility that undertakes one or more of the activities specified in Annex I above the applicable capacity thresholds specified therein shall report the amounts annually to its competent authority, along with an indication of whether the information is based on measurement, calculation or estimation, of the following:

(a) releases to air, water and land of any pollutant specified in Annex II for which the applicable threshold value specified in Annex II is exceeded;

(b) off-site transfers of hazardous waste exceeding 2 tonnes per year or of non hazardous waste exceeding 2 000 tonnes per year, for any operations of recovery or disposal with the exception of the disposal operations of land treatment and deep injection referred to in Article 6, indicating with 'R' or 'D' respectively whether the waste is destined for recovery or disposal and, for transboundary movements of hazardous waste, the name and address of the recoverer or the disposer of the waste and the actual recovery or disposal site;

(c) off-site transfers of any pollutant specified in Annex II in waste water destined for waste-water treatment for which the threshold value specified in Annex II, column 1b is exceeded.

The operator of each facility that undertakes one or more of the activities specified in Annex I above the applicable capacity thresholds specified therein shall communicate to its competent authority the information identifying the facility in accordance with Annex III unless that information is already available to the competent authority.

In the case of data indicated as being based on measurement or calculation the analytical method and/or the method of calculation shall be reported.

The releases referred to in Annex II reported under point (a) of this paragraph shall include all releases from all sources included in Annex I at the site of the facility.

2. The information referred to in paragraph 1 shall include information on releases and transfers resulting as totals of all deliberate, accidental, routine and non-routine activities.

In providing this information operators shall specify, where available, any data that relate to accidental releases.

3. The operator of each facility shall collect with appropriate frequency the information needed to determine which of the facility's releases and off-site transfers are subject to reporting requirements under paragraph 1.

4. When preparing the report, the operator concerned shall use the best available information, which may include monitoring data, emission factors, mass balance equations, indirect monitoring or other calculations, engineering judgements and other methods in line with Article 9(1) and in accordance with internationally approved methodologies, where these are available.

5. The operator of each facility concerned shall keep available for the competent authorities of the Member State the records of the data from which the reported information was derived for a period of five years, starting from the end of the reporting year concerned. These records shall also describe the methodology used for data gathering.

Article 6

Releases to land

Waste which is subject to 'land treatment' or 'deep injection' disposal operations, as specified in Annex IIA to Directive 75/442/EEC, shall be reported as a release to land only by the operator of the facility originating the waste.

Article 7

Reporting by Member States

1. The Member States shall determine, having regard to the requirements set out in paragraphs 2 and 3 of this Article, a date by which operators shall provide all the data referred to in Article 5(1) and (2) and the information referred to in Article 5(3), (4) and (5) to its competent authority.

2. Member States shall provide all the data referred to in Article 5(1) and (2) to the Commission by electronic transfer in the format set out in Annex III and within the following time-limits:

(a) for the first reporting year, within 18 months after the end of the reporting year;

(b) for all reporting years thereafter, within 15 months after the end of the reporting year.

The first reporting year shall be the year 2007.

3. The Commission, assisted by the European Environment Agency, shall incorporate the information reported by the Member States into the European PRTR within the following time-limits:

(a) for the first reporting year, within 21 months after the end of the reporting year;

(b) for all reporting years thereafter, within 16 months after the end of the reporting year.

Article 8

Releases from diffuse sources

1. The Commission, assisted by the European Environment Agency, shall include in the European PRTR information on releases from diffuse sources where such information exists and has already been reported by the Member States.

2. The information referred to in paragraph 1 shall be organised such as to allow users to search for and identify releases of pollutants from diffuse sources according to an adequate geographical disaggregation and shall include information on the type of methodology used to derive the information.

3. Where the Commission determines that no data on the releases from diffuse sources exist, it shall take measures to initiate reporting on releases of relevant pollutants from one or more diffuse sources in accordance with the procedure referred to in Article 19(2), using internationally approved methodologies where appropriate.

Article 9

Quality assurance and assessment

1. The operator of each facility subject to the reporting requirements set out in Article 5 shall assure the quality of the information that they report.

2. The competent authorities shall assess the quality of the data provided by the operators of the facilities referred to in paragraph 1, in particular as to their completeness, consistency and credibility.

3. The Commission shall coordinate work on quality assurance and quality assessment in consultation with the Committee referred to in Article 19(1).

4. The Commission may adopt guidelines for the monitoring and reporting of emissions in accordance with the procedure referred to in Article 19(2). These guidelines shall be in accordance with internationally approved methodologies, where appropriate, and shall be consistent with other Community legislation.

Article 10

Access to information

1. The Commission, assisted by the European Environment Agency, shall make the European PRTR publicly accessible by dissemination free of charge on the Internet in accordance with the timeframe set out in Article 7(3).

2. Where the information contained in the European PRTR is not easily accessible to the public by direct electronic means, the Member State concerned and the Commission shall facilitate electronic access to the European PRTR in publicly accessible locations.

Article 11

Confidentiality

Whenever information is kept confidential by a Member State in accordance with Article 4 of Directive 2003/4/EC of the European Parliament and of the Council of 28 January 2003 on public access to environmental information [1], the Member State shall, in its report under Article 7(2) of this Regulation for the reporting year concerned, indicate separately for each facility claiming confidentiality the type of information that has been withheld and the reason for which it has been withheld.

Article 12

Public participation

1. The Commission shall provide the public with early and effective opportunities to participate in the further development of the European PRTR, including capacity-building and the preparation of amendments to this Regulation.

2. The public shall have the opportunity to submit any relevant comments, information, analyses or opinions within a reasonable timeframe.

3. The Commission shall take due account of such input and shall inform the public about the outcome of the public participation.

Article 13

Access to justice

Access to justice in matters relating to public access to environmental information shall be ensured in accordance with Article 6 of Directive 2003/4/EC and, where the institutions of the Community are involved, in accordance with Articles 6, 7 and 8 of Regulation (EC) No 1049/2001 of the European Parliament and of the Council of 30 May 2001 regarding public access to European Parliament, Council and Commission documents [2].

Article 14

Guidance document

1. The Commission shall draw up a guidance document supporting the implementation of the European PRTR as soon as possible but no later than four months before the beginning of the first reporting year and in consultation with the Committee referred to in Article 19(1).

2. The guidance document for implementation of the European PRTR shall address in particular details on the following:

(a) reporting procedures;

(b) the data to be reported;

(c) quality assurance and assessment;

(d) indication of type of withheld data and reasons why they were withheld in the case of confidential data;

(e) reference to internationally approved release determination and analytical methods, sampling methodologies;

(f) indication of parent companies;

(g) coding of activities according to Annex I to this Regulation and to Directive 96/61/EC.

Article 15

Awareness raising

The Commission and the Member States shall promote awareness of the public of the European PRTR and shall ensure that assistance is provided in accessing the European PRTR and in understanding and using the information contained in it.

Article 16

Additional information to be reported by the Member States

1. Member States shall, in a single report based on the information from the last three reporting years to be delivered every three years together with the data provided in accordance with Article 7, inform the Commission on practice and measures taken regarding the following:

(a) requirements according to Article 5;

(b) quality assurance and assessment according to Article 9;

(c) access to information according to Article 10(2);

(d) awareness raising activities according to Article 15;

(e) confidentiality of information according to Article 11;

(f) penalties provided for according to Article 20 and experience with their application.

[1] OJ L 41, 14.2.2003, p. 26.
[2] OJ L 145, 31.5.2001, p. 43.

2. To facilitate the reporting by Member States referred to in paragraph 1 the Commission shall submit a proposal for a questionnaire, which shall be adopted in accordance with the procedure referred to in Article 19(2).

Article 17

Review by the Commission

1. The Commission shall review the information provided by Member States according to Article 7 and after consultation with the Member States shall publish a report every three years based on the information from the last three reporting years available, six months after the presentation of this information on the Internet.

2. This report shall be submitted to the European Parliament and the Council, together with an assessment of the operation of the European PRTR.

Article 18

Amendments to the Annexes

Any amendment necessary for adapting:

(a) Annexes II or III to this Regulation to scientific or technical progress,

or

(b) Annexes II and III to this Regulation as a result of the adoption by the Meeting of the Parties to the Protocol of any amendment to the Annexes to the Protocol,

shall be adopted in accordance with the procedure referred to in Article 19(2).

Article 19

Committee Procedure

1. The Commission shall be assisted by a committee.

2. Where reference is made to this paragraph, Articles 5 and 7 of Decision 1999/468/EC shall apply, having regard to the provisions of Article 8 thereof.

The period provided for in Article 5(6) of Decision 1999/468/EC shall be set at three months.

Article 20

Penalties

1. Member States shall lay down the rules on penalties applicable to infringements of the provisions of this Regulation and shall take all measures necessary to ensure that they are implemented. The penalties provided for must be effective, proportionate and dissuasive.

2. The Member States shall notify those provisions to the Commission one year after entry into force of this Regulation at the latest and shall notify it without delay of any subsequent amendment affecting them.

Article 21

Amendments to Directives 91/689/EEC and 96/61/EC

1. Article 8(3) of Directive 91/689/EEC shall be deleted.

2. Article 15(3) of Directive 96/61/EC shall be deleted.

Article 22

Entry into force

This Regulation shall enter into force on the twentieth day following that of its publication in the *Official Journal of the European Union*.

This Regulation shall be binding in its entirety and directly applicable in all Member States.

Done at Strasbourg, 18 January 2006.

For the European Parliament
The President
J. BORRELL FONTELLES

For the Council
The President
H. WINKLER

ANNEX I

Activities

No	Activity	Capacity threshold
1.	Energy sector	
(a)	Mineral oil and gas refineries	* (1)
(b)	Installations for gasification and liquefaction	*
(c)	Thermal power stations and other combustion installations	With a heat input of 50 megawatts (MW)
(d)	Coke ovens	*
(e)	Coal rolling mills	With a capacity of 1 tonne per hour
(f)	Installations for the manufacture of coal products and solid smokeless fuel	*
2.	Production and processing of metals	
(a)	Metal ore (including sulphide ore) roasting or sintering installations	*
(b)	Installations for the production of pig iron or steel (primary or secondary melting) including continuous casting	With a capacity of 2,5 tonnes per hour
(c)	Installations for the processing of ferrous metals:	
	(i) Hot-rolling mills	With a capacity of 20 tonnes of crude steel per hour
	(ii) Smitheries with hammers	With an energy of 50 kilojoules per hammer, where the calorific power used exceeds 20 MW
	(iii) Application of protective fused metal coats	With an input of 2 tonnes of crude steel per hour
(d)	Ferrous metal foundries	With a production capacity of 20 tonnes per day
(e)	Installations:	
	(i) For the production of non-ferrous crude metals from ore, concentrates or secondary raw materials by metallurgical, chemical or electrolytic processes	*
	(ii) For the smelting, including the alloying, of non-ferrous metals, including recovered products (refining, foundry casting, etc.)	With a melting capacity of 4 tonnes per day for lead and cadmium or 20 tonnes per day for all other metals
(f)	Installations for surface treatment of metals and plastic materials using an electrolytic or chemical process	Where the volume of the treatment vats equals 30 m^3
3.	Mineral industry	
(a)	Underground mining and related operations	*
(b)	Opencast mining and quarrying	Where the surface of the area effectively under extractive operation equals 25 hectares
(c)	Installations for the production of:	
	(i) Cement clinker in rotary kilns	With a production capacity of 500 tonnes per day
	(ii) Lime in rotary kilns	With a production capacity of 50 tonnes per day
	(iii) Cement clinker or lime in other furnaces	With a production capacity of 50 tonnes per day
(d)	Installations for the production of asbestos and the manufacture of asbestos-based products	*

No	Activity	Capacity threshold
(e)	Installations for the manufacture of glass, including glass fibre	With a melting capacity of 20 tonnes per day
(f)	Installations for melting mineral substances, including the production of mineral fibres	With a melting capacity of 20 tonnes per day
(g)	Installations for the manufacture of ceramic products by firing, in particular roofing tiles, bricks, refractory bricks, tiles, stoneware or porcelain	With a production capacity of 75 tonnes per day, or with a kiln capacity of 4 m^3 and with a setting density per kiln of 300 kg/m^3
4.	Chemical industry	
(a)	Chemical installations for the production on an industrial scale of basic organic chemicals, such as: (i) Simple hydrocarbons (linear or cyclic, saturated or unsaturated, aliphatic or aromatic) (ii) Oxygen-containing hydrocarbons such as alcohols, aldehydes, ketones, carboxylic acids, esters, acetates, ethers, peroxides, epoxy resins (iii) Sulphurous hydrocarbons (iv) Nitrogenous hydrocarbons such as amines, amides, nitrous compounds, nitro compounds or nitrate compounds, nitriles, cyanates, isocyanates (v) Phosphorus-containing hydrocarbons (vi) Halogenic hydrocarbons (vii) Organometallic compounds (viii) Basic plastic materials (polymers, synthetic fibres and cellulose-based fibres) (ix) Synthetic rubbers (x) Dyes and pigments (xi) Surface-active agents and surfactants	*
(b)	Chemical installations for the production on an industrial scale of basic inorganic chemicals, such as: (i) Gases, such as ammonia, chlorine or hydrogen chloride, fluorine or hydrogen fluoride, carbon oxides, sulphur compounds, nitrogen oxides, hydrogen, sulphur dioxide, carbonyl chloride (ii) Acids, such as chromic acid, hydrofluoric acid, phosphoric acid, nitric acid, hydrochloric acid, sulphuric acid, oleum, sulphurous acids (iii) Bases, such as ammonium hydroxide, potassium hydroxide, sodium hydroxide (iv) Salts, such as ammonium chloride, potassium chlorate, potassium carbonate, sodium carbonate, perborate, silver nitrate (v) Non-metals, metal oxides or other inorganic compounds such as calcium carbide, silicon, silicon carbide	*

No	Activity	Capacity threshold
(c)	Chemical installations for the production on an industrial scale of phosphorous-, nitrogen- or potassium-based fertilisers (simple or compound fertilisers)	*
(d)	Chemical installations for the production on an industrial scale of basic plant health products and of biocides	*
(e)	Installations using a chemical or biological process for the production on an industrial scale of basic pharmaceutical products	*
(f)	Installations for the production on an industrial scale of explosives and pyrotechnic products	*
5.	Waste and wastewater management	
(a)	Installations for the recovery or disposal of hazardous waste	Receiving 10 tonnes per day
(b)	Installations for the incineration of non-hazardous waste in the scope of Directive 2000/76/EC of the European Parliament and of the Council of 4 December 2000 on the incineration of waste (2)	With a capacity of 3 tonnes per hour
(c)	Installations for the disposal of non-hazardous waste	With a capacity of 50 tonnes per day
(d)	Landfills (excluding landfills of inert waste and landfills, which were definitely closed before 16.7.2001 or for which the after-care phase required by the competent authorities according to Article 13 of Council Directive 1999/31/EC of 26 April 1999 on the landfill of waste (3) has expired)	Receiving 10 tonnes per day or with a total capacity of 25 000 tonnes
(e)	Installations for the disposal or recycling of animal carcasses and animal waste	With a treatment capacity of 10 tonnes per day
(f)	Urban waste-water treatment plants	With a capacity of 100 000 population equivalents
(g)	Independently operated industrial waste-water treatment plants which serve one or more activities of this annex	With a capacity of 10 000 m^3 per day (4)
6.	Paper and wood production and processing	
(a)	Industrial plants for the production of pulp from timber or similar fibrous materials	*
(b)	Industrial plants for the production of paper and board and other primary wood products (such as chipboard, fibreboard and plywood)	With a production capacity of 20 tonnes per day
(c)	Industrial plants for the preservation of wood and wood products with chemicals	With a production capacity of 50 m^3 per day
7.	Intensive livestock production and aquaculture	
(a)	Installations for the intensive rearing of poultry or pigs	(i) With 40 000 places for poultry (ii) With 2 000 places for production pigs (over 30 kg) (iii) With 750 places for sows
(b)	Intensive aquaculture	With a production capacity of 1 000 tonnes of fish or shellfish per year

No	Activity	Capacity threshold
8.	Animal and vegetable products from the food and beverage sector	
(a)	Slaughterhouses	With a carcass production capacity of 50 tonnes per day
(b)	Treatment and processing intended for the production of food and beverage products from:	
	(i) Animal raw materials (other than milk)	With a finished product production capacity of 75 tonnes per day
	(ii) Vegetable raw materials	With a finished product production capacity of 300 tonnes per day (average value on a quarterly basis)
(c)	Treatment and processing of milk	With a capacity to receive 200 tonnes of milk per day (average value on an annual basis)
9.	Other activities	
(a)	Plants for the pre-treatment (operations such as washing, bleaching, mercerisation) or dyeing of fibres or textiles	With a treatment capacity of 10 tonnes per day
(b)	Plants for the tanning of hides and skins	With a treatment capacity of 12 tonnes of finished product per day
(c)	Installations for the surface treatment of substances, objects or products using organic solvents, in particular for dressing, printing, coating, degreasing, waterproofing, sizing, painting, cleaning or impregnating	With a consumption capacity of 150 kg per hour or 200 tonnes per year
(d)	Installations for the production of carbon (hard-burnt coal) or electro-graphite by means of incineration or graphitisation	*
(e)	Installations for the building of, and painting or removal of paint from ships	With a capacity for ships 100 m long

(1) An asterisk (*) indicates that no capacity threshold is applicable (all facilities are subject to reporting).
(2) OJ L 332, 28.12.2000, p. 91.
(3) OJ L 182, 16.7.1999, p. 1. Directive as amended by Regulation (EC) No 1882/2003.
(4) The capacity threshold shall be reviewed by 2010 at the latest in the light of the results of the first reporting cycle.

ANNEX II

Pollutants (*)

No	CAS number	Pollutant (1)	Threshold for releases (column 1)		
			to air (column 1a) kg/year	to water (column 1b) kg/year	to land (column 1c) kg/year
1	74-82-8	Methane (CH_4)	100 000	— (2)	—
2	630-08-0	Carbon monoxide (CO)	500 000	—	—
3	124-38-9	Carbon dioxide (CO_2)	100 million	—	—
4		Hydro-fluorocarbons (HFCs) (3)	100	—	—
5	10024-97-2	Nitrous oxide (N_2O)	10 000	—	—
6	7664-41-7	Ammonia (NH_3)	10 000	—	—
7		Non-methane volatile organic compounds (NMVOC)	100 000	—	—
8		Nitrogen oxides (NO_x/NO_2)	100 000	—	—
9		Perfluorocarbons (PFCs) (4)	100	—	—
10	2551-62-4	Sulphur hexafluoride (SF_6)	50	—	—
11		Sulphur oxides (SO_x/SO_2)	150 000	—	—
12		Total nitrogen	—	50 000	50 000
13		Total phosphorus	—	5 000	5 000
14		Hydrochlorofluorocarbons (HCFCs) (5)	1	—	—
15		Chlorofluorocarbons (CFCs) (6)	1	—	—
16		Halons (7)	1	—	—
17		Arsenic and compounds (as As) (8)	20	5	5
18		Cadmium and compounds (as Cd) (8)	10	5	5
19		Chromium and compounds (as Cr) (8)	100	50	50
20		Copper and compounds (as Cu) (8)	100	50	50
21		Mercury and compounds (as Hg) (8)	10	1	1
22		Nickel and compounds (as Ni) (8)	50	20	20
23		Lead and compounds (as Pb) (8)	200	20	20
24		Zinc and compounds (as Zn) (8)	200	100	100
25	15972-60-8	Alachlor	—	1	1
26	309-00-2	Aldrin	1	1	1
27	1912-24-9	Atrazine	—	1	1
28	57-74-9	Chlordane	1	1	1

(*) Releases of pollutants falling into several categories of pollutants shall be reported for each of these categories.

No	CAS number	Pollutant [1]	Threshold for releases (column 1)

87	1806-26-4	Octylphenols and Octylphenol ethoxylates	—	1	—

No	CAS number	Pollutant (1)	Threshold for releases (column 1)		
			to air (column 1a) kg/year	to water (column 1b) kg/year	to land (column 1c) kg/year
88	206-44-0	Fluoranthene	—	1	—
89	465-73-6	Isodrin	—	1	—
90	36355-1-8	Hexabromobiphenyl	0,1	0,1	0,1
91	191-24-2	Benzo(g,h,i)perylene		1	

(1) Unless otherwise specified any pollutant specified in Annex II shall be reported as the total mass of that pollutant or, where the pollutant is a group of substances, as the total mass of the group.

(2) A hyphen (—) indicates that the parameter and medium in question do not trigger a reporting requirement.

(3) Total mass of hydrogen fluorocarbons: sum of HFC23, HFC32, HFC41, HFC4310mee, HFC125, HFC134, HFC134a, HFC152a, HFC143, HFC143a, HFC227ea, HFC236fa, HFC245ca, HFC365mfc.

(4) Total mass of perfluorocarbons: sum of CF_4, C_2F_6, C_3F_8, C_4F_{10}, c-C_4F_8, C_5F_{12}, C_6F_{14}.

(5) Total mass of substances including their isomers listed in Group VIII of Annex I to Regulation (EC) No 2037/2000 of the European Parliament and of the Council of 29 June 2000 on substances that deplete the ozone layer (OJ L 244, 29.9.2000, p. 1). Regulation as amended by Regulation (EC) No 1804/2003 (OJ L 265, 16.10.2003, p. 1).

(6) Total mass of substances including their isomers listed in Group I and II of Annex I to Regulation (EC) No 2037/2000.

(7) Total mass of substances including their isomers listed in Group III and VI of Annex I to Regulation (EC) No 2037/2000.

(8) All metals shall be reported as the total mass of the element in all chemical forms present in the release.

(9) Halogenated organic compounds which can be adsorbed to activated carbon expressed as chloride.

(10) Expressed as I-TEQ.

(11) Single pollutants are to be reported if the threshold for BTEX (the sum parameter of benzene, toluene, ethyl benzene, xylenes) is exceeded.

(12) Total mass of the following brominated diphenylethers: penta-BDE, octa-BDE and deca-BDE.

(13) Total mass of phenol and simple substituted phenols expressed as total carbon.

(14) Polycyclic aromatic hydrocarbons (PAHs) are to be measured for reporting of releases to air as benzo(a)pyrene (50-32-8), benzo(b)fluoranthene (205-99-2), benzo(k)fluoranthene (207-08-9), indeno(1,2,3-cd)pyrene (193-39-5) (derived from Regulation (EC) No 850/2004 of the European Parliament and of the Council of 29 April 2004 on persistent organic pollutants (OJ L 229, 29.6.2004, p. 5)).

(15) Total mass of tributyltin compounds, expressed as mass of tributyltin.

(16) Total mass of triphenyltin compounds, expressed as mass of triphenyltin.

(17) Total mass of xylene (ortho-xylene, meta-xylene, para-xylene).

ANNEX III

Format for the reporting of release and transfer data by Member States to the Commission

Reference year		
Identification of the facility		
Name of the parent company Name of the facility Identification number of facility Street address Town/village Postal code Country Coordinates of the location River basin district (1) NACE-code (4 digits) Main economic activity Production volume (optional) Number of installations (optional) Number of operating hours in year (optional) Number of employees (optional) Text field for textual information or website address delivered by facility or parent company (optional)		
All Annex I activities of the facility (according to the coding system given in Annex I and the IPPC code where available)		
Activity 1 (main Annex I activity) Activity 2 Activity N		
Release data to air for the facility for each pollutant exceeding threshold value (according to Annex II)		Releases to air
Pollutant 1 Pollutant 2 Pollutant N	M: measured; Analytical Method used C: calculated; Calculation Method used E: estimated	T: Total in kg/year A: accidental in kg/year
Release data to water for the facility for each pollutant exceeding threshold value (according to Annex II)		Releases to water
Pollutant 1 Pollutant 2 Pollutant N	M: measured; Analytical Method used C: calculated; Calculation Method used E: estimated	T: Total in kg/year A: accidental in kg/year
Release data to land for the facility for each pollutant exceeding threshold value (according to Annex II)		Releases to land
Pollutant 1 Pollutant 2 Pollutant N	M: measured; Analytical Method used C: calculated; Calculation Method used E: estimated	T: Total in kg/year A: accidental in kg/year

Off-site transfer of each pollutant destined for waste-water treatment in quantities exceeding threshold value (according to Annex II)		
Pollutant 1 Pollutant 2 Pollutant N	M: measured; Analytical Method used C: calculated; Calculation Method used E: estimated	in kg/year
Off-site transfers of hazardous waste for the facility exceeding threshold value (according to Article 5)		
Within the country: For Recovery (R)	M: measured; Analytical Method used C: calculated; Calculation Method used E: estimated	in tonnes/year
Within the country: For Disposal (D)	M: measured; Analytical Method used C: calculated; Calculation Method used E: estimated	in tonnes/year
To other countries: For Recovery (R) Name of the recoverer Address of the recoverer Address of actual recovery site receiving the transfer	M: measured; Analytical Method used C: calculated; Calculation Method used E: estimated	in tonnes/year
To other countries: For Disposal (D) Name of the disposer Address of the disposer Address of actual disposal site receiving the transfer	M: measured; Analytical Method used C: calculated; Calculation Method used E: estimated	in tonnes/year
Off-site transfer of non-hazardous waste for the facility exceeding threshold value (according to Article 5)		
For Recovery (R)	M: measured; Analytical Method used C: calculated; Calculation Method used E: estimated	in tonnes/year
For Disposal (D)	M: measured; Analytical Method used C: calculated; Calculation Method used E: estimated	in tonnes/year
Competent authority for requests of the public: Name Street address Town/village Telephone No Fax No E-mail address		

(1) According to Article 3(1) of Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy (OJ L 327, 22.12.2000, p. 1). Directive as amended by Decision No 2455/2001/EC (OJ L 331, 15.12.2001, p. 1).

(Legislative acts)

DIRECTIVES

DIRECTIVE 2011/92/EU OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 13 December 2011

on the assessment of the effects of certain public and private projects on the environment

(codification)

(Text with EEA relevance)

THE EUROPEAN PARLIAMENT AND THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty on the Functioning of the European Union, and in particular Article 192(1) thereof,

Having regard to the proposal from the European Commission,

After transmission of the draft legislative act to the national parliaments,

Having regard to the opinion of the European Economic and Social Committee [1],

After consulting the Committee of the Regions,

Acting in accordance with the ordinary legislative procedure [2],

Whereas:

(1) Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment [3] has been substantially amended several times [4]. In the interests of clarity and rationality the said Directive should be codified.

(2) Pursuant to Article 191 of the Treaty on the Functioning of the European Union, Union policy on the environment is based on the precautionary principle and on the principles that preventive action should be taken, that environmental damage should, as a priority, be rectified at source and that the polluter should pay. Effects on the environment should be taken into account at the earliest possible stage in all the technical planning and decision-making processes.

(3) The principles of the assessment of environmental effects should be harmonised, in particular with reference to the projects which should be subject to assessment, the main obligations of the developers and the content of the assessment. The Member States may lay down stricter rules to protect the environment.

(4) In addition, it is necessary to achieve one of the objectives of the Union in the sphere of the protection of the environment and the quality of life.

(5) The environmental legislation of the Union includes provisions enabling public authorities and other bodies to take decisions which may have a significant effect on the environment as well as on personal health and well-being.

(6) General principles for the assessment of environmental effects should be laid down with a view to supplementing and coordinating development consent procedures governing public and private projects likely to have a major effect on the environment.

(7) Development consent for public and private projects which are likely to have significant effects on the environment should be granted only after an assessment of the likely significant environmental effects of those projects has been carried out. That assessment should be conducted on the basis of the appropriate information supplied by the developer, which may be supplemented by the authorities and by the public likely to be concerned by the project in question.

---

[1] OJ C 248, 25.8.2011, p. 154.

[2] Position of the European Parliament of 13 September 2011 (not yet published in the Official Journal) and decision of the Council of 15 November 2011.

[3] OJ L 175, 5.7.1985, p. 40.

[4] See Annex VI, Part A.

(8) Projects belonging to certain types have significant effects on the environment and those projects should, as a rule, be subject to a systematic assessment.

(9) Projects of other types may not have significant effects on the environment in every case and those projects should be assessed where the Member States consider that they are likely to have significant effects on the environment.

(10) Member States may set thresholds or criteria for the purpose of determining which of such projects should be subject to assessment on the basis of the significance of their environmental effects. Member States should not be required to examine projects below those thresholds or outside those criteria on a case-by-case basis.

(11) When setting such thresholds or criteria or examining projects on a case-by-case basis, for the purpose of determining which projects should be subject to assessment on the basis of their significant environmental effects, Member States should take account of the relevant selection criteria set out in this Directive. In accordance with the subsidiarity principle, the Member States are in the best position to apply those criteria in specific instances.

(12) For projects which are subject to assessment, a certain minimal amount of information should be supplied, concerning the project and its effects.

(13) It is appropriate to lay down a procedure in order to enable the developer to obtain an opinion from the competent authorities on the content and extent of the information to be elaborated and supplied for the assessment. Member States, in the framework of this procedure, may require the developer to provide, inter alia, alternatives for the projects for which it intends to submit an application.

(14) The effects of a project on the environment should be assessed in order to take account of concerns to protect human health, to contribute by means of a better environment to the quality of life, to ensure maintenance of the diversity of species and to maintain the reproductive capacity of the ecosystem as a basic resource for life.

(15) It is desirable to lay down strengthened provisions concerning environmental impact assessment in a transboundary context to take account of developments at international level. The European Community signed the Convention on Environmental Impact Assessment in a Transboundary Context on 25 February 1991, and ratified it on 24 June 1997.

(16) Effective public participation in the taking of decisions enables the public to express, and the decision-maker to take account of, opinions and concerns which may be relevant to those decisions, thereby increasing the accountability and transparency of the decision-making process and contributing to public awareness of environmental issues and support for the decisions taken.

(17) Participation, including participation by associations, organisations and groups, in particular non-governmental organisations promoting environmental protection, should accordingly be fostered, including, inter alia, by promoting environmental education of the public.

(18) The European Community signed the UN/ECE Convention on Access to Information, Public Participation in Decision-Making and Access to Justice in Environmental Matters (the Aarhus Convention) on 25 June 1998 and ratified it on 17 February 2005.

(19) Among the objectives of the Aarhus Convention is the desire to guarantee rights of public participation in decision-making in environmental matters in order to contribute to the protection of the right to live in an environment which is adequate for personal health and well-being.

(20) Article 6 of the Aarhus Convention provides for public participation in decisions on the specific activities listed in Annex I thereto and on activities not so listed which may have a significant effect on the environment.

(21) Article 9(2) and (4) of the Aarhus Convention provides for access to judicial or other procedures for challenging the substantive or procedural legality of decisions, acts or omissions subject to the public participation provisions of Article 6 of that Convention.

(22) However, this Directive should not be applied to projects the details of which are adopted by a specific act of national legislation, since the objectives of this Directive, including that of supplying information, are achieved through the legislative process.

(23) Furthermore, it may be appropriate in exceptional cases to exempt a specific project from the assessment procedures laid down by this Directive, subject to appropriate information being supplied to the Commission and to the public concerned.

(24) Since the objectives of this Directive cannot be sufficiently achieved by the Member States and can therefore, by reason of the scale and effects of the action, be better achieved at Union level, the Union may adopt measures in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty on European Union. In accordance with the principle of proportionality, as set out in that Article, this Directive does not go beyond what is necessary in order to achieve those objectives.

(25) This Directive should be without prejudice to the obligations of the Member States relating to the time limits for transposition into national law of the Directives set out in Annex V, Part B,

HAVE ADOPTED THIS DIRECTIVE:

Article 1

1. This Directive shall apply to the assessment of the environmental effects of those public and private projects which are likely to have significant effects on the environment.

2. For the purposes of this Directive, the following definitions shall apply:

(a) 'project' means:

— the execution of construction works or of other installations or schemes,

— other interventions in the natural surroundings and landscape including those involving the extraction of mineral resources;

(b) 'developer' means the applicant for authorisation for a private project or the public authority which initiates a project;

(c) 'development consent' means the decision of the competent authority or authorities which entitles the developer to proceed with the project;

(d) 'public' means one or more natural or legal persons and, in accordance with national legislation or practice, their associations, organisations or groups;

(e) 'public concerned' means the public affected or likely to be affected by, or having an interest in, the environmental decision-making procedures referred to in Article 2(2). For the purposes of this definition, non-governmental organisations promoting environmental protection and meeting any requirements under national law shall be deemed to have an interest;

(f) 'competent authority or authorities' means that authority or those authorities which the Member States designate as responsible for performing the duties arising from this Directive.

3. Member States may decide, on a case-by-case basis if so provided under national law, not to apply this Directive to projects serving national defence purposes, if they deem that such application would have an adverse effect on those purposes.

4. This Directive shall not apply to projects the details of which are adopted by a specific act of national legislation, since the objectives of this Directive, including that of supplying information, are achieved through the legislative process.

Article 2

1. Member States shall adopt all measures necessary to ensure that, before consent is given, projects likely to have significant effects on the environment by virtue, inter alia, of their nature, size or location are made subject to a requirement for development consent and an assessment with regard to their effects. Those projects are defined in Article 4.

2. The environmental impact assessment may be integrated into the existing procedures for consent to projects in the Member States, or, failing this, into other procedures or into procedures to be established to comply with the aims of this Directive.

3. Member States may provide for a single procedure in order to fulfil the requirements of this Directive and the requirements of Directive 2008/1/EC of the European Parliament and of the Council of 15 January 2008 concerning integrated pollution prevention and control [1].

4. Without prejudice to Article 7, Member States may, in exceptional cases, exempt a specific project in whole or in part from the provisions laid down in this Directive.

In that event, the Member States shall:

(a) consider whether another form of assessment would be appropriate;

(b) make available to the public concerned the information obtained under other forms of assessment referred to in point (a), the information relating to the decision granting exemption and the reasons for granting it;

(c) inform the Commission, prior to granting consent, of the reasons justifying the exemption granted, and provide it with the information made available, where applicable, to their own nationals.

The Commission shall immediately forward the documents received to the other Member States.

The Commission shall report annually to the European Parliament and to the Council on the application of this paragraph.

[1] OJ L 24, 29.1.2008, p. 8.

Article 3

The environmental impact assessment shall identify, describe and assess in an appropriate manner, in the light of each individual case and in accordance with Articles 4 to 12, the direct and indirect effects of a project on the following factors:

(a) human beings, fauna and flora;

(b) soil, water, air, climate and the landscape;

(c) material assets and the cultural heritage;

(d) the interaction between the factors referred to in points (a), (b) and (c).

Article 4

1. Subject to Article 2(4), projects listed in Annex I shall be made subject to an assessment in accordance with Articles 5 to 10.

2. Subject to Article 2(4), for projects listed in Annex II, Member States shall determine whether the project shall be made subject to an assessment in accordance with Articles 5 to 10. Member States shall make that determination through:

(a) a case-by-case examination;

or

(b) thresholds or criteria set by the Member State.

Member States may decide to apply both procedures referred to in points (a) and (b).

3. When a case-by-case examination is carried out or thresholds or criteria are set for the purpose of paragraph 2, the relevant selection criteria set out in Annex III shall be taken into account.

4. Member States shall ensure that the determination made by the competent authorities under paragraph 2 is made available to the public.

Article 5

1. In the case of projects which, pursuant to Article 4, are to be made subject to an environmental impact assessment in accordance with this Article and Articles 6 to 10, Member States shall adopt the necessary measures to ensure that the developer supplies in an appropriate form the information specified in Annex IV inasmuch as:

(a) the Member States consider that the information is relevant to a given stage of the consent procedure and to the specific characteristics of a particular project or type of project and of the environmental features likely to be affected;

(b) the Member States consider that a developer may reasonably be required to compile this information having regard, inter alia, to current knowledge and methods of assessment.

2. Member States shall take the necessary measures to ensure that, if the developer so requests before submitting an application for development consent, the competent authority shall give an opinion on the information to be supplied by the developer in accordance with paragraph 1. The competent authority shall consult the developer and authorities referred to in Article 6(1) before it gives its opinion. The fact that the authority has given an opinion under this paragraph shall not preclude it from subsequently requiring the developer to submit further information.

Member States may require the competent authorities to give such an opinion, irrespective of whether the developer so requests.

3. The information to be provided by the developer in accordance with paragraph 1 shall include at least:

(a) a description of the project comprising information on the site, design and size of the project;

(b) a description of the measures envisaged in order to avoid, reduce and, if possible, remedy significant adverse effects;

(c) the data required to identify and assess the main effects which the project is likely to have on the environment;

(d) an outline of the main alternatives studied by the developer and an indication of the main reasons for his choice, taking into account the environmental effects;

(e) a non-technical summary of the information referred to in points (a) to (d).

4. Member States shall, if necessary, ensure that any authorities holding relevant information, with particular reference to Article 3, make this information available to the developer.

Article 6

1. Member States shall take the measures necessary to ensure that the authorities likely to be concerned by the project by reason of their specific environmental responsibilities are given an opportunity to express their opinion on the information supplied by the developer and on the request for development consent. To that end, Member States shall designate the authorities to be consulted, either in general terms or on a case-by-case basis. The information gathered pursuant to Article 5 shall be forwarded to those authorities. Detailed arrangements for consultation shall be laid down by the Member States.

2. The public shall be informed, whether by public notices or by other appropriate means such as electronic media where available, of the following matters early in the environmental decision-making procedures referred to in Article 2(2) and, at the latest, as soon as information can reasonably be provided:

(a) the request for development consent;

(b) the fact that the project is subject to an environmental impact assessment procedure and, where relevant, the fact that Article 7 applies;

(c) details of the competent authorities responsible for taking the decision, those from which relevant information can be obtained, those to which comments or questions can be submitted, and details of the time schedule for transmitting comments or questions;

(d) the nature of possible decisions or, where there is one, the draft decision;

(e) an indication of the availability of the information gathered pursuant to Article 5;

(f) an indication of the times and places at which, and the means by which, the relevant information will be made available;

(g) details of the arrangements for public participation made pursuant to paragraph 5 of this Article.

3. Member States shall ensure that, within reasonable time-frames, the following is made available to the public concerned:

(a) any information gathered pursuant to Article 5;

(b) in accordance with national legislation, the main reports and advice issued to the competent authority or authorities at the time when the public concerned is informed in accordance with paragraph 2 of this Article;

(c) in accordance with the provisions of Directive 2003/4/EC of the European Parliament and of the Council of 28 January 2003 on public access to environmental information [1], information other than that referred to in paragraph 2 of this Article which is relevant for the decision in accordance with Article 8 of this Directive and which only becomes available after the time the public concerned was informed in accordance with paragraph 2 of this Article.

4. The public concerned shall be given early and effective opportunities to participate in the environmental decision-making procedures referred to in Article 2(2) and shall, for that purpose, be entitled to express comments and opinions when all options are open to the competent authority or authorities before the decision on the request for development consent is taken.

5. The detailed arrangements for informing the public (for example by bill posting within a certain radius or publication in local newspapers) and for consulting the public concerned (for example by written submissions or by way of a public inquiry) shall be determined by the Member States.

6. Reasonable time-frames for the different phases shall be provided, allowing sufficient time for informing the public and for the public concerned to prepare and participate effectively in environmental decision-making subject to the provisions of this Article.

Article 7

1. Where a Member State is aware that a project is likely to have significant effects on the environment in another Member State or where a Member State likely to be significantly affected so requests, the Member State in whose territory the project is intended to be carried out shall send to the affected Member State as soon as possible and no later than when informing its own public, inter alia:

(a) a description of the project, together with any available information on its possible transboundary impact;

(b) information on the nature of the decision which may be taken.

The Member State in whose territory the project is intended to be carried out shall give the other Member State a reasonable time in which to indicate whether it wishes to participate in the environmental decision-making procedures referred to in Article 2(2), and may include the information referred to in paragraph 2 of this Article.

2. If a Member State which receives information pursuant to paragraph 1 indicates that it intends to participate in the environmental decision-making procedures referred to in Article 2(2), the Member State in whose territory the project is intended to be carried out shall, if it has not already done so, send to the affected Member State the information required to be given pursuant to Article 6(2) and made available pursuant to points (a) and (b) of Article 6(3).

3. The Member States concerned, each insofar as it is concerned, shall also:

(a) arrange for the information referred to in paragraphs 1 and 2 to be made available, within a reasonable time, to the authorities referred to in Article 6(1) and the public concerned in the territory of the Member State likely to be significantly affected; and

[1] OJ L 41, 14.2.2003, p. 26.

(b) ensure that the authorities referred to in Article 6(1) and the public concerned are given an opportunity, before development consent for the project is granted, to forward their opinion within a reasonable time on the information supplied to the competent authority in the Member State in whose territory the project is intended to be carried out.

4. The Member States concerned shall enter into consultations regarding, inter alia, the potential transboundary effects of the project and the measures envisaged to reduce or eliminate such effects and shall agree on a reasonable timeframe for the duration of the consultation period.

5. The detailed arrangements for implementing this Article may be determined by the Member States concerned and shall be such as to enable the public concerned in the territory of the affected Member State to participate effectively in the environmental decision-making procedures referred to in Article 2(2) for the project.

Article 8

The results of consultations and the information gathered pursuant to Articles 5, 6 and 7 shall be taken into consideration in the development consent procedure.

Article 9

1. When a decision to grant or refuse development consent has been taken, the competent authority or authorities shall inform the public thereof in accordance with the appropriate procedures and shall make available to the public the following information:

(a) the content of the decision and any conditions attached thereto;

(b) having examined the concerns and opinions expressed by the public concerned, the main reasons and considerations on which the decision is based, including information about the public participation process;

(c) a description, where necessary, of the main measures to avoid, reduce and, if possible, offset the major adverse effects.

2. The competent authority or authorities shall inform any Member State which has been consulted pursuant to Article 7, forwarding to it the information referred to in paragraph 1 of this Article.

The consulted Member States shall ensure that that information is made available in an appropriate manner to the public concerned in their own territory.

Article 10

The provisions of this Directive shall not affect the obligation on the competent authorities to respect the limitations imposed by national laws, regulations and administrative provisions and accepted legal practices with regard to commercial and industrial confidentiality, including intellectual property, and the safeguarding of the public interest.

Where Article 7 applies, the transmission of information to another Member State and the receipt of information by another Member State shall be subject to the limitations in force in the Member State in which the project is proposed.

Article 11

1. Member States shall ensure that, in accordance with the relevant national legal system, members of the public concerned:

(a) having a sufficient interest, or alternatively;

(b) maintaining the impairment of a right, where administrative procedural law of a Member State requires this as a precondition;

have access to a review procedure before a court of law or another independent and impartial body established by law to challenge the substantive or procedural legality of decisions, acts or omissions subject to the public participation provisions of this Directive.

2. Member States shall determine at what stage the decisions, acts or omissions may be challenged.

3. What constitutes a sufficient interest and impairment of a right shall be determined by the Member States, consistently with the objective of giving the public concerned wide access to justice. To that end, the interest of any non-governmental organisation meeting the requirements referred to in Article 1(2) shall be deemed sufficient for the purpose of point (a) of paragraph 1 of this Article. Such organisations shall also be deemed to have rights capable of being impaired for the purpose of point (b) of paragraph 1 of this Article.

4. The provisions of this Article shall not exclude the possibility of a preliminary review procedure before an administrative authority and shall not affect the requirement of exhaustion of administrative review procedures prior to recourse to judicial review procedures, where such a requirement exists under national law.

Any such procedure shall be fair, equitable, timely and not prohibitively expensive.

5. In order to further the effectiveness of the provisions of this Article, Member States shall ensure that practical information is made available to the public on access to administrative and judicial review procedures.

Article 12

1. The Member States and the Commission shall exchange information on the experience gained in applying this Directive.

2. In particular, Member States shall inform the Commission of any criteria and/or thresholds adopted for the selection of the projects in question, in accordance with Article 4(2).

3. On the basis of that exchange of information, the Commission shall if necessary submit additional proposals to the European Parliament and to the Council, with a view to ensuring that this Directive is applied in a sufficiently coordinated manner.

Article 13

Member States shall communicate to the Commission the texts of the provisions of national law which they adopt in the field covered by this Directive.

Article 14

Directive 85/337/EEC, as amended by the Directives listed in Annex V, Part A, is repealed, without prejudice to the obligations of the Member States relating to the time limits for transposition into national law of the Directives set out in Annex V, Part B.

References to the repealed Directive shall be construed as references to this Directive and shall be read in accordance with the correlation table in Annex VI.

Article 15

This Directive shall enter into force on the 20th day following its publication in the *Official Journal of the European Union*.

Article 16

This Directive is addressed to the Member States.

ANNEX I

PROJECTS REFERRED TO IN ARTICLE 4(1)

1. Crude-oil refineries (excluding undertakings manufacturing only lubricants from crude oil) and installations for the gasification and liquefaction of 500 tonnes or more of coal or bituminous shale per day.

2. (a) Thermal power stations and other combustion installations with a heat output of 300 megawatts or more;

   (b) Nuclear power stations and other nuclear reactors including the dismantling or decommissioning of such power stations or reactors [1] (except research installations for the production and conversion of fissionable and fertile materials, whose maximum power does not exceed 1 kilowatt continuous thermal load).

3. (a) Installations for the reprocessing of irradiated nuclear fuel;

   (b) Installations designed:

      (i) for the production or enrichment of nuclear fuel;

      (ii) for the processing of irradiated nuclear fuel or high-level radioactive waste;

      (iii) for the final disposal of irradiated nuclear fuel;

      (iv) solely for the final disposal of radioactive waste;

      (v) solely for the storage (planned for more than 10 years) of irradiated nuclear fuels or radioactive waste in a different site than the production site.

4. (a) Integrated works for the initial smelting of cast iron and steel;

   (b) Installations for the production of non-ferrous crude metals from ore, concentrates or secondary raw materials by metallurgical, chemical or electrolytic processes.

5. Installations for the extraction of asbestos and for the processing and transformation of asbestos and products containing asbestos: for asbestos-cement products, with an annual production of more than 20 000 tonnes of finished products, for friction material, with an annual production of more than 50 tonnes of finished products, and for other uses of asbestos, utilisation of more than 200 tonnes per year.

6. Integrated chemical installations, i.e. those installations for the manufacture on an industrial scale of substances using chemical conversion processes, in which several units are juxtaposed and are functionally linked to one another and which are:

   (a) for the production of basic organic chemicals;

   (b) for the production of basic inorganic chemicals;

   (c) for the production of phosphorous-, nitrogen- or potassium-based fertilisers (simple or compound fertilisers);

   (d) for the production of basic plant health products and of biocides;

   (e) for the production of basic pharmaceutical products using a chemical or biological process;

   (f) for the production of explosives.

[1] Nuclear power stations and other nuclear reactors cease to be such an installation when all nuclear fuel and other radioactively contaminated elements have been removed permanently from the installation site.

7. (a) Construction of lines for long-distance railway traffic and of airports [1] with a basic runway length of 2 100 m or more;

   (b) Construction of motorways and express roads [2];

   (c) Construction of a new road of four or more lanes, or realignment and/or widening of an existing road of two lanes or less so as to provide four or more lanes, where such new road or realigned and/or widened section of road would be 10 km or more in a continuous length.

8. (a) Inland waterways and ports for inland-waterway traffic which permit the passage of vessels of over 1 350 tonnes;

   (b) Trading ports, piers for loading and unloading connected to land and outside ports (excluding ferry piers) which can take vessels of over 1 350 tonnes.

9. Waste disposal installations for the incineration, chemical treatment as defined in Annex I to Directive 2008/98/EC of the European Parliament and of the Council of 19 November 2008 on waste [3] under heading D9, or landfill of hazardous waste, as defined in point 2 of Article 3 of that Directive.

10. Waste disposal installations for the incineration or chemical treatment as defined in Annex I to Directive 2008/98/EC under heading D9 of non-hazardous waste with a capacity exceeding 100 tonnes per day.

11. Groundwater abstraction or artificial groundwater recharge schemes where the annual volume of water abstracted or recharged is equivalent to or exceeds 10 million cubic metres.

12. (a) Works for the transfer of water resources between river basins where that transfer aims at preventing possible shortages of water and where the amount of water transferred exceeds 100 million cubic metres/year;

    (b) In all other cases, works for the transfer of water resources between river basins where the multi-annual average flow of the basin of abstraction exceeds 2 000 million cubic metres/year and where the amount of water transferred exceeds 5 % of that flow.

    In both cases transfers of piped drinking water are excluded.

13. Waste water treatment plants with a capacity exceeding 150 000 population equivalent as defined in point 6 of Article 2 of Council Directive 91/271/EEC of 21 May 1991 concerning urban waste-water treatment [4].

14. Extraction of petroleum and natural gas for commercial purposes where the amount extracted exceeds 500 tonnes/day in the case of petroleum and 500 000 cubic metres/day in the case of gas.

15. Dams and other installations designed for the holding back or permanent storage of water, where a new or additional amount of water held back or stored exceeds 10 million cubic metres.

16. Pipelines with a diameter of more than 800 mm and a length of more than 40 km:

    (a) for the transport of gas, oil, chemicals;

    (b) for the transport of carbon dioxide (CO_2) streams for the purposes of geological storage, including associated booster stations.

17. Installations for the intensive rearing of poultry or pigs with more than:

    (a) 85 000 places for broilers, 60 000 places for hens;

    (b) 3 000 places for production pigs (over 30 kg); or

    (c) 900 places for sows.

---

[1] For the purposes of this Directive, 'airport' means an airport which complies with the definition in the 1944 Chicago Convention setting up the International Civil Aviation Organisation (Annex 14).

[2] For the purposes of this Directive, 'express road' means a road which complies with the definition in the European Agreement on Main International Traffic Arteries of 15 November 1975.

[3] OJ L 312, 22.11.2008, p. 3.

[4] OJ L 135, 30.5.1991, p. 40.

18. Industrial plants for the production of:

    (a) pulp from timber or similar fibrous materials;

    (b) paper and board with a production capacity exceeding 200 tonnes per day.

19. Quarries and open-cast mining where the surface of the site exceeds 25 hectares, or peat extraction, where the surface of the site exceeds 150 hectares.

20. Construction of overhead electrical power lines with a voltage of 220 kV or more and a length of more than 15 km.

21. Installations for storage of petroleum, petrochemical, or chemical products with a capacity of 200 000 tonnes or more.

22. Storage sites pursuant to Directive 2009/31/EC of the European Parliament and of the Council of 23 April 2009 on the geological storage of carbon dioxide [1].

23. Installations for the capture of CO_2 streams for the purposes of geological storage pursuant to Directive 2009/31/EC from installations covered by this Annex, or where the total yearly capture of CO_2 is 1,5 megatonnes or more.

24. Any change to or extension of projects listed in this Annex where such a change or extension in itself meets the thresholds, if any, set out in this Annex.

---

[1] OJ L 140, 5.6.2009, p. 114.

ANNEX II

PROJECTS REFERRED TO IN ARTICLE 4(2)

1. AGRICULTURE, SILVICULTURE AND AQUACULTURE

   (a) Projects for the restructuring of rural land holdings;

   (b) Projects for the use of uncultivated land or semi-natural areas for intensive agricultural purposes;

   (c) Water management projects for agriculture, including irrigation and land drainage projects;

   (d) Initial afforestation and deforestation for the purposes of conversion to another type of land use;

   (e) Intensive livestock installations (projects not included in Annex I);

   (f) Intensive fish farming;

   (g) Reclamation of land from the sea.

2. EXTRACTIVE INDUSTRY

   (a) Quarries, open-cast mining and peat extraction (projects not included in Annex I);

   (b) Underground mining;

   (c) Extraction of minerals by marine or fluvial dredging;

   (d) Deep drillings, in particular:

      (i) geothermal drilling;

      (ii) drilling for the storage of nuclear waste material;

      (iii) drilling for water supplies;

      with the exception of drillings for investigating the stability of the soil;

   (e) Surface industrial installations for the extraction of coal, petroleum, natural gas and ores, as well as bituminous shale.

3. ENERGY INDUSTRY

   (a) Industrial installations for the production of electricity, steam and hot water (projects not included in Annex I);

   (b) Industrial installations for carrying gas, steam and hot water; transmission of electrical energy by overhead cables (projects not included in Annex I);

   (c) Surface storage of natural gas;

   (d) Underground storage of combustible gases;

   (e) Surface storage of fossil fuels;

   (f) Industrial briquetting of coal and lignite;

   (g) Installations for the processing and storage of radioactive waste (unless included in Annex I);

   (h) Installations for hydroelectric energy production;

   (i) Installations for the harnessing of wind power for energy production (wind farms);

(j) Installations for the capture of CO_2 streams for the purposes of geological storage pursuant to Directive 2009/31/EC from installations not covered by Annex I to this Directive.

4. PRODUCTION AND PROCESSING OF METALS

(a) Installations for the production of pig iron or steel (primary or secondary fusion) including continuous casting;

(b) Installations for the processing of ferrous metals:

(i) hot-rolling mills;

(ii) smitheries with hammers;

(iii) application of protective fused metal coats;

(c) Ferrous metal foundries;

(d) Installations for the smelting, including the alloyage, of non-ferrous metals, excluding precious metals, including recovered products (refining, foundry casting, etc.);

(e) Installations for surface treatment of metals and plastic materials using an electrolytic or chemical process;

(f) Manufacture and assembly of motor vehicles and manufacture of motor-vehicle engines;

(g) Shipyards;

(h) Installations for the construction and repair of aircraft;

(i) Manufacture of railway equipment;

(j) Swaging by explosives;

(k) Installations for the roasting and sintering of metallic ores.

5. MINERAL INDUSTRY

(a) Coke ovens (dry coal distillation);

(b) Installations for the manufacture of cement;

(c) Installations for the production of asbestos and the manufacture of asbestos products (projects not included in Annex I);

(d) Installations for the manufacture of glass including glass fibre;

(e) Installations for smelting mineral substances including the production of mineral fibres;

(f) Manufacture of ceramic products by burning, in particular roofing tiles, bricks, refractory bricks, tiles, stoneware or porcelain.

6. CHEMICAL INDUSTRY (PROJECTS NOT INCLUDED IN ANNEX I)

(a) Treatment of intermediate products and production of chemicals;

(b) Production of pesticides and pharmaceutical products, paint and varnishes, elastomers and peroxides;

(c) Storage facilities for petroleum, petrochemical and chemical products.

7. FOOD INDUSTRY

(a) Manufacture of vegetable and animal oils and fats;

(b) Packing and canning of animal and vegetable products;

(c) Manufacture of dairy products;

(d) Brewing and malting;

(e) Confectionery and syrup manufacture;

(f) Installations for the slaughter of animals;

(g) Industrial starch manufacturing installations;

(h) Fish-meal and fish-oil factories;

(i) Sugar factories.

8. TEXTILE, LEATHER, WOOD AND PAPER INDUSTRIES

(a) Industrial plants for the production of paper and board (projects not included in Annex I);

(b) Plants for the pre-treatment (operations such as washing, bleaching, mercerisation) or dyeing of fibres or textiles;

(c) Plants for the tanning of hides and skins;

(d) Cellulose-processing and production installations.

9. RUBBER INDUSTRY

Manufacture and treatment of elastomer-based products.

10. INFRASTRUCTURE PROJECTS

(a) Industrial estate development projects;

(b) Urban development projects, including the construction of shopping centres and car parks;

(c) Construction of railways and intermodal transhipment facilities, and of intermodal terminals (projects not included in Annex I);

(d) Construction of airfields (projects not included in Annex I);

(e) Construction of roads, harbours and port installations, including fishing harbours (projects not included in Annex I);

(f) Inland-waterway construction not included in Annex I, canalisation and flood-relief works;

(g) Dams and other installations designed to hold water or store it on a long-term basis (projects not included in Annex I);

(h) Tramways, elevated and underground railways, suspended lines or similar lines of a particular type, used exclusively or mainly for passenger transport;

(i) Oil and gas pipeline installations and pipelines for the transport of CO_2 streams for the purposes of geological storage (projects not included in Annex I);

(j) Installations of long-distance aqueducts;

(k) Coastal work to combat erosion and maritime works capable of altering the coast through the construction, for example, of dykes, moles, jetties and other sea defence works, excluding the maintenance and reconstruction of such works;

(l) Groundwater abstraction and artificial groundwater recharge schemes not included in Annex I;

(m) Works for the transfer of water resources between river basins not included in Annex I.

11. OTHER PROJECTS

(a) Permanent racing and test tracks for motorised vehicles;

(b) Installations for the disposal of waste (projects not included in Annex I);

(c) Waste-water treatment plants (projects not included in Annex I);

(d) Sludge-deposition sites;

(e) Storage of scrap iron, including scrap vehicles;

(f) Test benches for engines, turbines or reactors;

(g) Installations for the manufacture of artificial mineral fibres;

(h) Installations for the recovery or destruction of explosive substances;

(i) Knackers' yards.

12. TOURISM AND LEISURE

(a) Ski runs, ski lifts and cable cars and associated developments;

(b) Marinas;

(c) Holiday villages and hotel complexes outside urban areas and associated developments;

(d) Permanent campsites and caravan sites;

(e) Theme parks.

13. (a) Any change or extension of projects listed in Annex I or this Annex, already authorised, executed or in the process of being executed, which may have significant adverse effects on the environment (change or extension not included in Annex I);

(b) Projects in Annex I, undertaken exclusively or mainly for the development and testing of new methods or products and not used for more than two years.

ANNEX III

SELECTION CRITERIA REFERRED TO IN ARTICLE 4(3)

1. CHARACTERISTICS OF PROJECTS

The characteristics of projects must be considered having regard, in particular, to:

(a) the size of the project;

(b) the cumulation with other projects;

(c) the use of natural resources;

(d) the production of waste;

(e) pollution and nuisances;

(f) the risk of accidents, having regard in particular to substances or technologies used.

2. LOCATION OF PROJECTS

The environmental sensitivity of geographical areas likely to be affected by projects must be considered, having regard, in particular, to:

(a) the existing land use;

(b) the relative abundance, quality and regenerative capacity of natural resources in the area;

(c) the absorption capacity of the natural environment, paying particular attention to the following areas:

(i) wetlands;

(ii) coastal zones;

(iii) mountain and forest areas;

(iv) nature reserves and parks;

(v) areas classified or protected under Member States' legislation; special protection areas designated by Member States pursuant to Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds [1] and to Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora [2];

(vi) areas in which the environmental quality standards laid down in Union legislation have already been exceeded;

(vii) densely populated areas;

(viii) landscapes of historical, cultural or archaeological significance.

3. CHARACTERISTICS OF THE POTENTIAL IMPACT

The potential significant effects of projects must be considered in relation to criteria set out in points 1 and 2, and having regard in particular to:

(a) the extent of the impact (geographical area and size of the affected population);

(b) the transfrontier nature of the impact;

(c) the magnitude and complexity of the impact;

(d) the probability of the impact;

(e) the duration, frequency and reversibility of the impact.

[1] OJ L 20, 26.1.2010, p. 7.
[2] OJ L 206, 22.7.1992, p. 7.

ANNEX IV

INFORMATION REFERRED TO IN ARTICLE 5(1)

1. A description of the project, including in particular:

   (a) a description of the physical characteristics of the whole project and the land-use requirements during the construction and operational phases;

   (b) a description of the main characteristics of the production processes, for instance, the nature and quantity of the materials used;

   (c) an estimate, by type and quantity, of expected residues and emissions (water, air and soil pollution, noise, vibration, light, heat, radiation, etc.) resulting from the operation of the proposed project.

2. An outline of the main alternatives studied by the developer and an indication of the main reasons for this choice, taking into account the environmental effects.

3. A description of the aspects of the environment likely to be significantly affected by the proposed project, including, in particular, population, fauna, flora, soil, water, air, climatic factors, material assets, including the architectural and archaeological heritage, landscape and the interrelationship between the above factors.

4. A description [1] of the likely significant effects of the proposed project on the environment resulting from:

   (a) the existence of the project;

   (b) the use of natural resources;

   (c) the emission of pollutants, the creation of nuisances and the elimination of waste.

5. The description by the developer of the forecasting methods used to assess the effects on the environment referred to in point 4.

6. A description of the measures envisaged to prevent, reduce and where possible offset any significant adverse effects on the environment.

7. A non-technical summary of the information provided under headings 1 to 6.

8. An indication of any difficulties (technical deficiencies or lack of know-how) encountered by the developer in compiling the required information.

[1] This description should cover the direct effects and any indirect, secondary, cumulative, short, medium and long-term, permanent and temporary, positive and negative effects of the project.

ANNEX V

PART A

Repealed Directive with list of its successive amendments

(referred to in Article 14)

Council Directive 85/337/EEC
(OJ L 175, 5.7.1985, p. 40)

Council Directive 97/11/EC
(OJ L 73, 14.3.1997, p. 5)

Directive 2003/35/EC of the European Parliament and of the Council — Article 3 only
(OJ L 156, 25.6.2003, p. 17)

Directive 2009/31/EC of the European Parliament and of the Council — Article 31 only
(OJ L 140, 5.6.2009, p. 114)

PART B

List of time limits for transposition into national law

(referred to in Article 14)

Directive	Time limit for transposition
85/337/EEC	3 July 1988
97/11/EC	14 March 1999
2003/35/EC	25 June 2005
2009/31/EC	25 June 2011

DECISIONS

COMMISSION IMPLEMENTING DECISION

of 28 February 2012

establishing the best available techniques (BAT) conclusions under Directive 2010/75/EU of the European Parliament and of the Council on industrial emissions for the manufacture of glass

(notified under document C(2012) 865)

(Text with EEA relevance)

(2012/134/EU)

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Having regard to Directive 2010/75/EU of the European Parliament and of the Council of 24 November 2010 on industrial emissions (integrated pollution prevention and control) ([1]) and in particular Article 13(5) thereof,

Whereas:

(1) Article 13(1) of Directive 2010/75/EU requires the Commission to organise an exchange of information on industrial emissions between it and Member States, the industries concerned and non-governmental organisations promoting environmental protection in order to facilitate the drawing up of best available techniques (BAT) reference documents as defined in Article 3(11) of that Directive.

(2) In accordance with Article 13(2) of Directive 2010/75/EU, the exchange of information is to address the performance of installations and techniques in terms of emissions, expressed as short- and long-term averages, where appropriate, and the associated reference conditions, consumption and nature of raw materials, water consumption, use of energy and generation of waste and the techniques used, associated monitoring, cross-media effects, economic and technical viability and developments therein and best available techniques and emerging techniques identified after considering the issues mentioned in points (a) and (b) of Article 13(2) of that Directive.

([1]) OJ L 334, 17.12.2010, p. 17.

(3) 'BAT conclusions' as defined in Article 3(12) of Directive 2010/75/EU are the key element of BAT reference documents and lay down the conclusions on best available techniques, their description, information to assess their applicability, the emission levels associated with the best available techniques, associated monitoring, associated consumption levels and, where appropriate, relevant site remediation measures.

(4) In accordance with Article 14(3) of Directive 2010/75/EU, BAT conclusions are to be the reference for setting permit conditions for installations covered by Chapter 2 of that Directive.

(5) Article 15(3) of Directive 2010/75/EU requires the competent authority to set emission limit values that ensure that, under normal operating conditions, emissions do not exceed the emission levels associated with the best available techniques as laid down in the decisions on BAT conclusions referred to in Article 13(5) of Directive 2010/75/EU.

(6) Article 15(4) of Directive 2010/75/EU provides for derogations from the requirement laid down in Article 15(3) only where the costs associated with the achievement of emissions levels disproportionately outweigh the environmental benefits due to the geographical location, the local environmental conditions or the technical characteristics of the installation concerned.

(7) Article 16(1) of Directive 2010/75/EU provides that the monitoring requirements in the permit referred to in point (c) of Article 14(1) of the Directive are to be based on the conclusions on monitoring as described in the BAT conclusions.

(8) In accordance with Article 21(3) of Directive 2010/75/EU, within 4 years of publication of decisions on BAT conclusions, the competent authority is to reconsider and, if necessary, update all the permit conditions and ensure that the installation complies with those permit conditions.

(9) Commission Decision of 16 May 2011 establishing a forum for the exchange of information pursuant to Article 13 of Directive 2010/75/EU on industrial emissions [1] established a forum composed of representatives of Member States, the industries concerned and non-governmental organisations promoting environmental protection.

(10) In accordance with Article 13(4) of Directive 2010/75/EU, the Commission obtained the opinion [2] of that forum on the proposed content of the BAT reference document for the manufacture of glass on 13 September 2011 and made it publicly available.

(11) The measures provided for in this Decision are in accordance with the opinion of the Committee established by Article 75(1) of Directive 2010/75/EU,

HAS ADOPTED THIS DECISION:

Article 1

The BAT conclusions for the manufacture of glass are set out in the Annex to this Decision.

Article 2

This Decision is addressed to the Member States.

Done at Brussels, 28 February 2012.

For the Commission
Janez POTOČNIK
Member of the Commission

ANNEX

BAT CONCLUSIONS FOR THE MANUFACTURE OF GLASS

SCOPE

These BAT conclusions concern the industrial activities specified in Annex I to Directive 2010/75/EU, namely:

— 3.3. Manufacture of glass including glass fibre with a melting capacity exceeding 20 tonnes per day;

— 3.4. Melting mineral substances including the production of mineral fibres with a melting capacity exceeding 20 tonnes per day.

These BAT conclusions do not address the following activities:

— Production of water glass, covered by the reference document Large Volume Inorganic Chemicals – Solids and Other Industry (LVIC-S)

— Production of polycrystalline wool

— Production of mirrors, covered by the reference document Surface Treatment Using Organic Solvents (STS)

Other reference documents which are of relevance for the activities covered by these BAT conclusions are the following:

Reference documents	Activity
Emissions from Storage (EFS)	Storage and handling of raw materials
Energy Efficiency (ENE)	General energy efficiency
Economic and Cross-Media Effects (ECM)	Economics and cross-media effects of techniques
General Principles of Monitoring (MON)	Emissions and consumption monitoring

The techniques listed and described in these BAT conclusions are neither prescriptive nor exhaustive. Other techniques may be used that ensure at least an equivalent level of environmental protection.

DEFINITIONS

For the purposes of these BAT conclusions, the following definitions apply:

Term used	Definition
New plant	A plant introduced on the site of the installation following the publication of these BAT conclusions or a complete replacement of a plant on the existing foundations of the installation following the publication of these BAT conclusions
Existing plant	A plant which is not a new plant
New furnace	A furnace introduced on the site of the installation following the publication of these BAT conclusions or a complete rebuild of a furnace following the publication of these BAT conclusions
Normal furnace rebuild	A rebuild between campaigns without a significant change in furnace requirements or technology and in which the furnace frame is not significantly adjusted and the furnace dimensions remain basically unchanged. The refractory of the furnace and, where appropriate, the regenerators are repaired by the full or partial replacement of the material.
Complete furnace rebuild	A rebuild involving a major change in the furnace requirements or technology and with major adjustment or replacement of the furnace and associated equipments.

GENERAL CONSIDERATIONS

Averaging periods and reference conditions for air emissions

Unless stated otherwise, emission levels associated with the best available techniques (BAT-AELs) for air emissions given in these BAT conclusions apply under the reference conditions shown in Table 1. All values for concentrations in waste gases refer to standard conditions: dry gas, temperature 273,15 K, pressure 101,3 kPa.

For discontinuous measurements	BAT-AELs refer to the average value of three spot samples of at least 30 minutes each; for regenerative furnaces the measuring period should cover a minimum of two firing reversals of the regenerator chambers
For continuous measurements	BAT-AELs refer to daily average values

Table 1

Reference conditions for BAT-AELs concerning air emissions

Activities		Unit	Reference conditions
Melting activities	Conventional melting furnace in continuous melters	mg/Nm^3	8 % oxygen by volume
	Conventional melting furnace in discontinuous melters	mg/Nm^3	13 % oxygen by volume
	Oxy-fuel-fired furnaces	kg/tonne melted glass	The expression of emission levels measured as mg/Nm^3 to a reference oxygen concentration is not applicable
	Electric furnaces	mg/Nm^3 or kg/tonne melted glass	The expression of emission levels measured as mg/Nm^3 to a reference oxygen concentration is not applicable
	Frit melting furnaces	mg/Nm^3 or kg/tonne melted frit	Concentrations refer to 15 % oxygen by volume. When air-gas firing is used, BAT AELs expressed as emission concentration (mg/Nm^3) apply. When only oxy-fuel firing is employed, BAT AELs expressed as specific mass emissions (kg/tonne melted frit) apply. When oxygen-enriched air-fuel firing is used, BAT AELs expressed as either emission concentration (mg/Nm^3) or as specific mass emissions (kg/tonne melted frit) apply
	All type of furnaces	kg/tonne melted glass	The specific mass emissions refer to 1 tonne of melted glass
Non-melting activities, including downstream processes	All processes	mg/Nm^3	No correction for oxygen
	All processes	kg/tonne glass	The specific mass emissions refer to 1 tonne of produced glass

Conversion to reference oxygen concentration

The formula for calculating the emissions concentration at a reference oxygen level (see Table 1) is shown below.

$$E_R = \frac{21 - O_R}{21 - O_M} \times E_M$$

Where:

E_R (mg/Nm^3): emissions concentration corrected to the reference oxygen level O_R

O_R (vol %): reference oxygen level

E_M (mg/Nm^3): emissions concentration referred to the measured oxygen level O_M

O_M (vol %): measured oxygen level.

Conversion from concentrations to specific mass emissions

BAT-AELs given in Sections 1.2 to 1.9 as specific mass emissions (kg/tonne melted glass) are based on the calculation reported below except for oxy-fuel fired furnaces and, in a limited number of cases, for electric melting where BAT-AELs given in kg/tonne melted glass were derived from specific reported data.

The calculation procedure used for the conversion from concentrations to specific mass emissions is shown below.

Specific mass emission (kg/tonne of melted glass) = conversion factor × emissions concentration (mg/Nm^3)

Where: conversion factor = $(Q/P) \times 10^{-6}$

with Q = waste gas volume in Nm^3/h

P = pull rate in tonnes of melted glass/h.

The waste gas volume (Q) is determined by the specific energy consumption, type of fuel, and the oxidant (air, air enriched by oxygen and oxygen with purity depending on the production process). The energy consumption is a complex function of (predominantly) the type of furnace, the type of glass and the cullet percentage.

However, a range of factors can influence the relationship between concentration and specific mass flow, including:

— type of furnace (air preheating temperature, melting technique)

— type of glass produced (energy requirement for melting)

— energy mix (fossil fuel/electric boosting)

— type of fossil fuel (oil, gas)

— type of oxidant (oxygen, air, oxygen-enriched air)

— cullet percentage

— batch composition

— age of the furnace

— furnace size.

The conversion factors given in Table 2 have been used for converting BAT-AELs from concentrations into specific mass emissions.

The conversion factors have been determined on the basis of energy efficient furnaces and relate only to full air/fuel-fired furnaces.

Table 2

Indicative factors used for converting mg/Nm^3 into kg/tonne of melted glass based on energy efficient fuel-air furnaces

Sectors		Factors to convert mg/Nm^3 into kg/tonne of melted glass
Flat glass		$2,5 \times 10^{-3}$
Container glass	General case	$1,5 \times 10^{-3}$
	Specific cases [1]	Case-by-case study (often $3,0 \times 10^{-3}$)
Continuous filament glass fibre		$4,5 \times 10^{-3}$

Sectors		Factors to convert mg/Nm^3 into kg/tonne of melted glass
Domestic glass	Soda lime	$2,5 \times 10^{-3}$
	Specific cases (2)	Case-by-case study (between 2,5 and > 10×10^{-3}; often $3,0 \times 10^{-3}$)
Mineral wool	Glass wool	2×10^{-3}
	Stone wool cupola	$2,5 \times 10^{-3}$
Special glass	TV glass (panels)	3×10^{-3}
	TV glass (funnel)	$2,5 \times 10^{-3}$
	Borosilicate (tube)	4×10^{-3}
	Glass ceramics	$6,5 \times 10^{-3}$
	Lighting glass (soda-lime)	$2,5 \times 10^{-3}$
Frits		Case-by-case study (between $5 - 7,5 \times 10^{-3}$)

(1) Specific cases correspond to less favourable cases (i.e. small special furnaces with a production of generally below 100 tonnes/day and a cullet rate of below 30 %). This category represents only 1 or 2 % of the container glass production.
(2) Specific cases corresponding to less favourable cases and/or non-soda-lime glasses: borosilicates, glass ceramic, crystal glass and, less frequently, lead crystal glass.

DEFINITIONS FOR CERTAIN AIR POLLUTANTS

For the purpose of these BAT conclusions and for the BAT-AELs reported in Sections 1.2 to 1.9, the following definitions apply:

NO_X expressed as NO_2	The sum of nitrogen oxide (NO) and nitrogen dioxide (NO_2) expressed as NO_2
SO_X expressed as SO_2	The sum of sulphur dioxide (SO_2) and sulphur trioxide (SO_3) expressed as SO_2
Hydrogen chloride expressed as HCl	All gaseous chlorides expressed as HCl
Hydrogen fluoride expressed as HF	All gaseous fluorides expressed as HF

AVERAGING PERIODS FOR WASTE WATER DISCHARGES

Unless stated otherwise, emission levels associated with the best available techniques (BAT-AELs) for waste water emissions given in these BAT conclusions refer to the average value of a composite sample taken over a period of 2 hours or 24 hours.

1.1. *General BAT conclusions for the manufacture of glass*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all installations.

The process-specific BAT included in Sections 1.2 – 1.9 apply in addition to the general BAT mentioned in this section.

1.1.1. Environmental management systems

1. BAT is to implement and adhere to an environmental management system (EMS) that incorporates all of the following features:

(i) commitment of the management, including senior management;

(ii) definition of an environmental policy that includes the continuous improvement for the installation by the management;

(iii) planning and establishing the necessary procedures, objectives and targets, in conjunction with financial planning and investment;

(iv) implementation of the procedures paying particular attention to:

(a) structure and responsibility

(b) training, awareness and competence

(c) communication

(d) employee involvement

(e) documentation

(f) efficient process control

(g) maintenance programmes

(h) emergency preparedness and response

(i) safeguarding compliance with environmental legislation.

(v) checking performance and taking corrective action, paying particular attention to:

(a) monitoring and measurement (see also the reference document on the General Principles of Monitoring)

(b) corrective and preventive action

(c) maintenance of records

(d) independent (where practicable) internal or external auditing in order to determine whether or not the EMS conforms to planned arrangements and has been properly implemented and maintained;

(vi) review of the EMS and its continuing suitability, adequacy and effectiveness by senior management;

(vii) following the development of cleaner technologies;

(viii) consideration for the environmental impacts from the eventual decommissioning of the installation at the stage of designing a new plant, and throughout its operating life;

(ix) application of sectoral benchmarking on a regular basis.

Applicability

The scope (e.g. level of details) and nature of the EMS (e.g. standardised or non-standardised) will generally be related to the nature, scale and complexity of the installation, and the range of environmental impacts it may have.

1.1.2. Energy efficiency

2. BAT is to reduce the specific energy consumption by using one or a combination of the following techniques:

Technique	Applicability
(i) Process optimisation, through the control of the operating parameters	The techniques are generally applicable
(ii) Regular maintenance of the melting furnace	
(iii) Optimisation of the furnace design and the selection of the melting technique	Applicable for new plants. For existing plants, the implementation requires a complete rebuild of the furnace
(iv) Application of combustion control techniques	Applicable to fuel/air and oxy-fuel fired furnaces

Technique	Applicability
(v) Use of increasing levels of cullet, where available and economically and technically viable	Not applicable to the continuous filament glass fibre, high temperature insulation wool and frits sectors
(vi) Use of a waste heat boiler for energy recovery, where technically and economically viable	Applicable to fuel/air and oxy-fuel fired furnaces. The applicability and economic viability of the technique is dictated by the overall efficiency that may be obtained, including the effective use of the steam generated
(vii) Use of batch and cullet preheating, where technically and economically viable	Applicable to fuel/air and oxy-fuel fired furnaces. The applicability is normally restricted to batch compositions with more than 50 % cullet

1.1.3. Materials storage and handling

3. BAT is to prevent, or where that is not practicable, to reduce diffuse dust emissions from the storage and handling of solid materials by using one or a combination of the following techniques:

I. Storage of raw materials

(i) Store bulk powder materials in enclosed silos equipped with a dust abatement system (e.g. fabric filter)

(ii) Store fine materials in enclosed containers or sealed bags

(iii) Store under cover stockpiles of coarse dusty materials

(iv) Use of road cleaning vehicles and water damping techniques

II. Handling of raw materials

Technique	Applicability
(i) For materials which are transported by above ground, use enclosed conveyors to prevent material loss	The techniques are generally applicable
(ii) Where pneumatic conveying is used, apply a sealed system equipped with a filter to clean the transport air before release	
(iii) Moistening of the batch	The use of this technique is limited by the negative consequences on the furnace energy efficiency. Restrictions may apply to some batch formulations, in particular for borosilicate glass production
(iv) Application of a slightly negative pressure within the furnace	Applicable only as an inherent aspect of operation (i.e. melting furnaces for frits production) due to a detrimental impact on furnace energy efficiency
(v) Use of raw materials that do not cause decrepitation phenomena (mainly dolomite and limestone). These phenomena consist of minerals that 'crackle' when exposed to heat, with a consequent potential increase of dust emissions	Applicable within the constraints associated with the availability of raw materials
(vi) Use of an extraction which vents to a filter system in processes where dust is likely to be generated (e.g. bag opening, frits batch mixing, fabric filter dust disposal, cold-top melters)	The techniques are generally applicable
(vii) Use of enclosed screw feeders	
(viii) Enclosure of feed pockets	Generally applicable. Cooling may be necessary to avoid damage to the equipment

4. BAT is to prevent, or where that is not practicable, to reduce diffuse gaseous emissions from the storage and handling of volatile raw materials by using one or a combination of the following techniques:

(i) Use of tank paint with low solar absorbency for bulk storage subject to temperature changes due to solar heating.

(ii) Control of temperature in the storage of volatile raw materials.

(iii) Tank insulation in the storage of volatile raw materials.

(iv) Inventory management

(v) Use of floating roof tanks in the storage of large quantities of volatile petroleum products.

(vi) Use of vapour return transfer systems in the transfer of volatile fluids (e.g. from tank trucks to storage tank).

(vii) Use of bladder roof tanks in the storage of liquid raw materials.

(viii) Use of pressure/vacuum valves in tanks designed to withstand pressure fluctuations.

(ix) Application of a release treatment (e.g. adsorption, absorption, condensation) in the storage of hazardous materials.

(x) Application of subsurface filling in the storage of liquids that tend to foam.

1.1.4. General primary techniques

5. BAT is to reduce energy consumption and emissions to air by carrying out a constant monitoring of the operational parameters and a programmed maintenance of the melting furnace.

Technique	Applicability
The technique consists of a series of monitoring and maintenance operations which can be used individually or in combination appropriate to the type of furnace, with the aim of minimising the ageing effects on the furnace, such as sealing the furnace and burner blocks, keep the maximum insulation, control the stabilised flame conditions, control the fuel/air ratio, etc.	Applicable to regenerative, recuperative, and oxy-fuel fired furnaces. The applicability to other types of furnaces requires an installation-specific assessment

6. BAT is to carry out a careful selection and control of all substances and raw materials entering the melting furnace in order to reduce or prevent emissions to air by using one or a combination of the following techniques.

Technique	Applicability
(i) Use of raw materials and external cullet with low levels of impurities (e.g. metals, chlorides, fluorides)	Applicable within the constraints of the type of glass produced at the installation and the availability of raw materials and fuels
(ii) Use of alternative raw materials (e.g. less volatile)	
(iii) Use of fuels with low metal impurities	

7. BAT is to carry out monitoring of emissions and/or other relevant process parameters on a regular basis, including the following:

Technique	Applicability
(i) Continuous monitoring of critical process parameters to ensure process stability, e.g. temperature, fuel feed and airflow	The techniques are generally applicable
(ii) Regular monitoring of process parameters to prevent/reduce pollution, e.g. O_2 content of the combustion gases to control the fuel/air ratio.	
(iii) Continuous measurements of dust, NO_X and SO_2 emissions or discontinuous measurements at least twice per year, associated with the control of surrogate parameters to ensure that the treatment system is working properly between measurements	
(iv) Continuous or regular periodic measurements of NH_3 emissions, when selective catalytic reduction (SCR) or selective non-catalytic reduction (SNCR) techniques are applied	The techniques are generally applicable
(v) Continuous or regular periodic measurements of CO emissions when primary techniques or chemical reduction by fuel techniques are applied for NO_X emissions reductions or partial combustion may occur.	
(vi) Regular periodic measurements of emissions of HCl, HF, CO and metals, in particular when raw materials containing such substances are used or partial combustion may occur	The techniques are generally applicable
(vii) Continuous monitoring of surrogate parameters to ensure that the waste gas treatment system is working properly and that the emission levels are maintained between discontinuous measurements. The monitoring of surrogate parameters includes: reagent feed, temperature, water feed, voltage, dust removal, fan speed, etc.	

8. BAT is to operate the waste gas treatment systems during normal operating conditions at optimal capacity and availability in order to prevent or reduce emissions

Applicability

Special procedures can be defined for specific operating conditions, in particular:

(i) during start-up and shutdown operations

(ii) during other special operations which could affect the proper functioning of the systems (e.g. regular and extra-ordinary maintenance work and cleaning operations of the furnace and/or of the waste gas treatment system, or severe production change)

(iii) in the case of insufficient waste gas flow or temperature which prevents the use of the system at full capacity.

9. BAT is to limit carbon monoxide (CO) emissions from the melting furnace, when applying primary techniques or chemical reduction by fuel, for the reduction of NO_X emissions

Technique	Applicability
Primary techniques for the reduction of NO_X emissions are based on combustion modifications (e.g. reduction of air/fuel ratio, staged combustion low-NO_X burners, etc.). Chemical reduction by fuel consists of the addition of hydrocarbon fuel to the waste gas stream to reduce the NO_X formed in the furnace. The increase in CO emissions due to the application of these techniques can be limited by a careful control of the operational parameters	Applicable to conventional air/fuel fired furnaces.

Table 3

BAT-AELs for carbon monoxide emissions from melting furnaces

Parameter	BAT-AEL
Carbon monoxide, expressed as CO	< 100 mg/Nm^3

10. BAT is to limit ammonia (NH_3) emissions, when applying selective catalytic reduction (SCR) or selective non-catalytic reduction (SNCR) techniques for a high efficiency NO_X emissions reduction

Technique	Applicability
The technique consists of adopting and maintaining suitable operating conditions of the SCR or SNCR waste gas treatment systems, with the aim of limiting emissions of unreacted ammonia	Applicable to melting furnaces fitted with SCR or SNCR

Table 4

BAT-AELs for ammonia emissions, when SCR or SNCR techniques are applied

Parameter	BAT-AELs ([1])
Ammonia, expressed as NH_3	< 5 – 30 mg/Nm^3

([1]) The higher levels are associated with higher inlet NO_X concentrations, higher reduction rates and the ageing of the catalyst.

11. BAT is to reduce boron emissions from the melting furnace, when boron compounds are used in the batch formulation, by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Operation of a filtration system at a suitable temperature for enhancing the separation of boron compounds in the solid state, taking into account that some boric acid species may be present in the flue-gas as gaseous compounds at temperatures below 200 °C, but also as low as 60 °C	The applicability to existing plants may be limited by technical constraints associated with the position and characteristics of the existing filter system
(ii) Use of dry or semi-dry scrubbing in combination with a filtration system	The applicability may be limited by a decreased removal efficiency of other gaseous pollutants (SO_X, HCl, HF) caused by the deposition of boron compounds on the surface of the dry alkaline reagent
(iii) Use of wet scrubbing	The applicability to existing plants may be limited by the need of a specific waste water treatment

([1]) A description of the techniques is given in Sections 1.10.1, 1.10.4 and 1.10.6.

Monitoring

The monitoring of boron emissions should be carried out according to a specific methodology which allows measurement of both solid and gaseous forms and to determine the effective removal of these species from the flue gases.

1.1.5. Emissions to water from glass manufacturing processes

12. BAT is to reduce water consumption by using one or a combination of the following techniques:

Technique	Applicability
(i) Minimisation of spillages and leaks	The technique is generally applicable
(ii) Reuse of cooling and cleaning waters after purging	The technique is generally applicable. Recirculation of scrubbing water is applicable to most scrubbing systems; however, periodic discharge and replacement of the scrubbing medium may be necessary

Technique	Applicability
(iii) Operate a quasi-closed loop water system as far as technically and economically feasible	The applicability of this technique may be limited by the constraints associated with the safety management of the production process. In particular: — open circuit cooling may be used when safety issues require for it (e.g. incidents when large quantities of glass need to be cooled) — water used in some specific process (e.g. downstream activities in the continuous filament glass fibre sector, acid polishing in the domestic and special glass sectors, etc.) may have to be discharged in total or in part to the waste water treatment system

13. BAT is to reduce the emission load of pollutants in the waste water discharges by using one or a combination of the following waste water treatment systems:

Technique	Applicability
(i) Standard pollution control techniques, such as settlement, screening, skimming, neutralisation, filtration, aeration, precipitation, coagulation and flocculation, etc. Standard good practice techniques to control emissions from storage of liquid raw materials and intermediates, such as containments, inspection/testing of tanks, overfill protection, etc.	The techniques are generally applicable
(ii) Biological treatment systems, such as activated sludge, biofiltration to remove/degrade the organic compounds	The applicability is limited to the sectors which use organic substances in the production process (e.g. continuous filament glass fibre and mineral wool sectors)
(iii) Discharge to municipal waste water treatment Plants	Applicable to installations where further reduction of pollutants is necessary
(iv) External reuse of waste waters	The applicability is generally limited to the frits sector (possible reuse in the ceramic industry)

Table 5

BAT-AELs for waste water discharges to surface waters from the manufacture of glass

Parameter [1]	Unit	BAT-AEL [2] (composite sample)
pH	—	6,5 – 9
Total suspended solids	mg/l	< 30
Chemical oxygen demand (COD)	mg/l	< 5 – 130 [3]
Sulphates, expressed as SO_4^{2-}	mg/l	< 1 000
Fluorides, expressed as F^-	mg/l	< 6 [4]
Total hydrocarbons	mg/l	< 15 [5]
Lead, expressed as Pb	mg/l	< 0,05 – 0,3 [6]
Antimony, expressed as Sb	mg/l	< 0,5
Arsenic, expressed as As	mg/l	< 0,3
Barium, expressed as Ba	mg/l	< 3,0

Parameter (1)	Unit	BAT-AEL (2) (composite sample)
Zinc, expressed as Zn	mg/l	< 0,5
Copper, expressed as Cu	mg/l	< 0,3
Chromium, expressed as Cr	mg/l	< 0,3
Cadmium, expressed as Cd	mg/l	< 0,05
Tin, expressed as Sn	mg/l	< 0,5
Nickel, expressed as Ni	mg/l	< 0,5
Ammonia, expressed as NH_4	mg/l	< 10
Boron, expressed as B	mg/l	< 1 – 3
Phenol	mg/l	< 1

(1) The relevance of the pollutants listed in the table depends on the sector of the glass industry and on the different activities carried out at the plant.
(2) The levels refer to a composite sample taken over a time period of 2 hours or 24 hours.
(3) For the continuous filament glass fibre sector, BAT-AEL is < 200 mg/l.
(4) The level refers to treated water coming from activities involving acid polishing.
(5) In general, total hydrocarbons are composed of mineral oils.
(6) The higher level of the range is associated with downstream processes for the production of lead crystal glass.

1.1.6. Waste from the glass manufacturing processes

14. BAT is to reduce the production of solid waste to be disposed of by using one or a combination of the following techniques:

Technique	Applicability
(i) Recycling of waste batch materials, where quality requirements allow for it	The applicability may be limited by the constraints associated with the quality of the final glass product
(ii) Minimising material losses during the storage and handling of raw materials	The technique is generally applicable
(iii) Recycling of internal cullet from rejected production	Generally, not applicable to the continuous filament glass fibre, high temperature insulation wool and frits sectors
(iv) Recycling of dust in the batch formulation where quality requirements allow for it	The applicability may be limited by different factors: — quality requirements of the final glass product — cullet percentage used in the batch formulation — potential carryover phenomena and corrosion of the refractory materials — sulphur balance constraints
(v) Valorisation of solid waste and/or sludge through appropriate use on-site (e.g. sludge from water treatment) or in other industries	Generally applicable to the domestic glass sector (for lead crystal cutting sludge) and to the container glass sector (fine particles of glass mixed with oil). Limited applicability to other glass manufacturing sectors due to unpredictable, contaminated composition, low volumes and economic viability
(vi) Valorisation of end-of-life refractory materials for possible use in other industries	The applicability is limited by the constraints imposed by the refractory manufacturers and potential end-users
(vii) Applying cement bonded briquetting of waste for recycling into hot blast cupola furnaces where quality requirements allow for it	The applicability of cement bonded briquetting of waste is limited to the stone wool sector. A trade-off approach between air emissions and the generation of solid waste stream should be undertaken

1.1.7. Noise from the glass manufacturing processes

15. BAT is to reduce noise emissions by using one or a combination of the following techniques:

(i) Make an environmental noise assessment and formulate a noise management plan as appropriate to the local environment

(ii) Enclose noisy equipment/operation in a separate structure/unit

(iii) Use embankments to screen the source of noise

(iv) Carry out noisy outdoor activities during the day

(v) Use noise protection walls or natural barriers (trees, bushes) between the installation and the protected area, on the basis of local conditions.

1.2. *BAT conclusions for container glass manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all container glass manufacturing installations.

1.2.1. Dust emissions from melting furnaces

16. BAT is to reduce dust emissions from the waste gases of the melting furnace by applying a flue-gas cleaning system such as an electrostatic precipitator or a bag filter.

Technique ([1])	Applicability
The flue-gas cleaning systems consist of end-of-pipe techniques based on the filtration of all materials that are solid at the point of measurement	The technique is generally applicable

([1]) A description of filtration systems (i.e. electrostatic precipitator, bag filter) is given in Section 1.10.1.

Table 6

BAT-AELs for dust emissions from the melting furnace in the container glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass ([1])
Dust	< 10 – 20	< 0,015 – 0,06

([1]) The conversion factors of $1,5 \times 10^{-3}$ and 3×10^{-3} have been used for the determination of the lower and higher value of the range respectively.

1.2.2. Nitrogen oxides (NO_X) from melting furnaces

17. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

I. primary techniques, such as:

Technique ([1])	Applicability
(i) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	Applicable only under installation-specific circumstances due to a lower furnace efficiency and higher fuel demand (i.e. use of recuperative furnaces in place of regenerative furnaces)

Technique [1]	Applicability
(c) Staged combustion: — Air staging — Fuel staging	Fuel staging is applicable to most conventional air/fuel furnaces. Air staging has very limited applicability due to its technical complexity
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. The achieved environmental benefits are generally lower for applications to cross-fired, gas-fired furnaces due to technical constraints and a lower degree of flexibility of the furnace. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State
(ii) Special furnace design	The applicability is limited to batch formulations that contain high levels of external cullet (> 70 %). The application requires a complete rebuild of the melting furnace. The shape of the furnace (long and narrow) may pose space restrictions
(iii) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day). Not applicable for productions requiring large pull variations. The implementation requires a complete furnace rebuild
(iv) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

[1] A description of the techniques is given in Section 1.10.2.

II. secondary techniques, such as:

Technique [1]	Applicability
(i) Selective catalytic reduction (SCR)	The application may require an upgrade of the dust abatement system in order to guarantee a dust concentration of below 10 – 15 mg/Nm^3 and a desulphurisation system for the removal of SO_X emissions. Due to the optimum operating temperature window, the applicability is limited to the use of electrostatic precipitators. In general, the technique is not used with a bag filter system because the low operating temperature, in the range of 180 – 200 °C, would require reheating of the waste gases. The implementation of the technique may require significant space availability
(ii) Selective non-catalytic reduction(SNCR)	The technique is applicable to recuperative furnaces. Very limited applicability to conventional regenerative furnaces, where the correct temperature window is difficult to access or does not allow a good mixing of the flue-gases with the reagent. It may be applicable to new regenerative furnaces equipped with split regenerators; however, the temperature window is difficult to maintain due to the reversal of fire between the chambers that causes a cyclical temperature change

[1] A description of the techniques is given in Section 1.10.2.

Table 7

BAT-AELs for NO_X emissions from the melting furnace in the container glass sector

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
NO_X expressed as NO_2	Combustion modifications, special furnace designs (2) (3)	500 – 800	0,75 – 1,2
	Electric melting	< 100	< 0,3
	Oxy-fuel melting (4)	Not applicable	< 0,5 – 0,8
	Secondary techniques	< 500	< 0,75

(1) The conversion factor reported in Table 2 for general cases ($1,5 \times 10^{-3}$) has been applied, with the exception of electric melting (specific cases: 3×10^{-3}).
(2) The lower value refers to the use of special furnace designs, where applicable.
(3) These values should be reconsidered in the occasion of a normal or complete rebuild of the melting furnace.
(4) The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).

18. When nitrates are used in the batch formulation and/or special oxidising combustion conditions are required in the melting furnace for ensuring the quality of the final product, BAT is to reduce NO_X emissions by minimising the use of these raw materials, in combination with primary or secondary techniques

The BAT-AELs are set out in Table 7.

If nitrates are used in the batch formulation for short campaigns or for melting furnaces with a capacity of < 100 t/day, the BAT-AEL is set out in Table 8.

Technique (1)	Applicability
Primary techniques: — Minimising the use of nitrates in the batch formulation The use of nitrates is applied for very high quality products (i.e. flacconage, perfume bottles and cosmetic containers). Effective alternative materials are sulphates, arsenic oxides, cerium oxide. The application of process modifications (e.g. special oxidising combustion conditions) represents an alternative to the use of nitrates	The substitution of nitrates in the batch formulation may be limited by the high costs and/or higher environmental impact of the alternative materials

(1) A description of the techniques is given in Section 1.10.2.

Table 8

BAT-AEL for NO_X emissions from the melting furnace in the container glass sector, when nitrates are used in the batch formulation and/or special oxidising combustion conditions in cases of short campaigns or for melting furnaces with a capacity of < 100 t/day

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
NO_X expressed as NO_2	Primary techniques	< 1 000	< 3

(1) The conversion factor reported in Table 2 for specific cases (3×10^{-3}) has been applied.

1.2.3. Sulphur oxides (SO_X) from melting furnaces

19. BAT is to reduce SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable
(ii) Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	The minimisation of the sulphur content in the batch formulation is generally applicable within the constraints of quality requirements of the final glass product. The application of sulphur balance optimisation requires a trade-off approach between the removal of SO_X emissions and the management of the solid waste (filter dust). The effective reduction of SO_X emissions depends on the retention of sulphur compounds in the glass which may vary significantly depending on the glass type
(iii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State

(1) A description of the techniques is given in Section 1.10.3.

Table 9

BAT-AELs for SO_X emissions from the melting furnace in the container glass sector

Parameter	Fuel	BAT-AEL (1) (2)	
		mg/Nm^3	kg/tonne melted glass (3)
SO_X expressed as SO_2	Natural gas	< 200 – 500	< 0,3 – 0,75
	Fuel oil (4)	< 500 – 1 200	< 0,75 – 1,8

(1) For special types of coloured glasses (e.g. reduced green glasses), concerns related to the achievable emission levels may require investigating the sulphur balance. Values reported in the table may be difficult to achieve in combination with filter dust recycling and the rate of recycling of external cullet.
(2) The lower levels are associated with conditions where the reduction of SO_X is a high priority over a lower production of solid waste corresponding to the sulphate-rich filter dust.
(3) The conversion factor reported in Table 2 for general cases ($1,5 \times 10^{-3}$) has been applied.
(4) The associated emission levels are related to the use of 1 % sulphur fuel oil in combination with secondary abatement techniques.

1.2.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

20. BAT is to reduce HCl and HF emissions from the melting furnace (possibly combined with flue-gases from hot-end coating activities) by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The applicability may be limited by the constraints of the type of glass produced at the installation and the availability of raw materials
(ii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

(1) A description of the techniques is given in Section 1.10.4.

Table 10

BAT-AELs for HCl and HF emissions from the melting furnace in the container glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Hydrogen chloride, expressed as HCl (2)	< 10 – 20	< 0,02 – 0,03
Hydrogen fluoride, expressed as HF	< 1 – 5	< 0,001 – 0,008

(1) The conversion factor for general cases, reported in Table 2 ($1,5 \times 10^{-3}$) has been applied.
(2) The higher levels are associated with the simultaneous treatment of flue-gases from hot-end coating operations.

1.2.5. Metals from melting furnaces

21. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The applicability may be limited by the constraints imposed by the type of glass produced at the installation and the availability of the raw materials
(ii) Minimising the use of metal compounds in the batch formulation, where colouring and decolourising of glass is needed, subject to consumer glass quality requirements	
(iii) Applying a filtration system (bag filter or electrostatic precipitator)	The techniques are generally applicable
(iv) Applying a dry or semi-dry scrubbing, in combination with a filtration system	

(1) A description of the techniques is given in Section 1.10.5.

Table 11

BAT-AELs for metal emissions from the melting furnace in the container glass sector

Parameter	BAT-AEL (1) (2) (3)	
	mg/Nm^3	kg/tonne melted glass (4)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 0,2 – 1 (5)	$< 0,3 – 1,5 \times 10^{-3}$
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 1 – 5	$< 1,5 – 7,5 \times 10^{-3}$

(1) The levels refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) The lower levels are BAT-AELs when metal compounds are not intentionally used in the batch formulation.
(3) The upper levels are associated with the use of metals for colouring or decolourising the glass, or when the flue-gases from the hot-end coating operations are treated together with the melting furnace emissions.
(4) The conversion factor for general cases, reported in Table 2 ($1,5 \times 10^{-3}$) has been applied.
(5) In specific cases, when high quality flint glass is produced requiring higher amounts of selenium for decolourising (depending on the raw materials), higher values are reported, up to 3 mg/Nm^3.

1.2.6. Emissions from downstream processes

22. When tin, organotin or titanium compounds are used for hot-end coating operations, BAT is to reduce emissions by using one or a combination of the following techniques:

Technique	Applicability
(i) Minimising the losses of the coating product by ensuring a good sealing of the application system and applying an effective extracting hood. A good construction and sealing of the application system is essential for minimising losses of unreacted product into the air	The technique is generally applicable

Technique	Applicability
(ii) Combining the flue-gas from the coating operations with the waste gas from the melting furnace or with the combustion air of the furnace, when a secondary treatment system is applied (filter and dry or semi-dry scrubber). Based on the chemical compatibility, the waste gases from the coating operations may be combined with other flue-gases before treatment. These two options may be applied: — combination with the flue gases from the melting furnace, upstream of a secondary abatement system (dry or semi-dry scrubbing plus filtration system) — combination with combustion air before entering the regenerator, followed by secondary abatement treatment of the waste gases generated during the melting process (dry or semi-dry scrubbing + filtration system)	The combination with flue gases from the melting furnace is generally applicable. The combination with combustion air may be affected by technical constraints due to some potential effects on the glass chemistry and on the regenerator materials
(iii) Applying a secondary technique, e.g. wet scrubbing, dry scrubbing plus filtration ([1])	The techniques are generally applicable

([1]) A description of the techniques is given in Sections 1.10.4 and 1.10.7.

Table 12

BAT-AELs for air emissions from hot-end coating activities in the container glass sector when the flue-gases from downstream operations are treated separately

Parameter	BAT-AEL
	mg/Nm^3
Dust	< 10
Titanium compounds expressed as Ti	< 5
Tin compounds, including organotin, expressed as Sn	< 5
Hydrogen chloride, expressed as HCl	< 30

23. When SO_3 is used for surface treatment operations, BAT is to reduce SO_X emissions by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Minimising the product losses by ensuring a good sealing of the application system A good construction and maintenance of the application system is essential for minimising the losses of unreacted product into the air	The techniques are generally applicable
(ii) Applying a secondary technique, e.g. wet scrubbing	

([1]) A description of the techniques is given in Section 1.10.6.

Table 13

BAT-AEL for SO_X emissions from downstream activities when SO_3 is used for surface treatment operations in the container glass sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
SO_x, expressed as SO_2	< 100 – 200

1.3. *BAT conclusions for flat glass manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all flat glass manufacturing installations.

1.3.1. Dust emissions from melting furnaces

24. BAT is to reduce dust emissions from the waste gases of the melting furnace by applying an electrostatic precipitator or a bag filter system

A description of the techniques is given in Section 1.10.1.

Table 14

BAT-AELs for dust emissions from the melting furnace in the flat glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass ([1])
Dust	< 10 – 20	< 0,025 – 0,05

([1]) The conversion factor reported in Table 2 ($2,5 \times 10^{-3}$) has been applied.

1.3.2. Nitrogen oxides (NO_X) from melting furnaces

25. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

I. primary techniques, such as:

Technique ([1])	Applicability
(i) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	The applicability is restricted to small capacity furnaces for the production of specialty flat glass and under installation-specific circumstances, due to a lower furnace efficiency and higher fuel demand (i.e. use of recuperative furnaces in place of regenerative furnaces)
(c) Staged combustion: — Air staging — Fuel staging	Fuel staging is applicable to most conventional air/fuel furnaces. Air staging has very limited applicability due to its technical complexity
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. The achieved environmental benefits are generally lower for applications to cross-fired, gas-fired furnaces due to technical constraints and a lower degree of flexibility of the furnace. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State

Technique [1]	Applicability
(ii) Fenix process Based on the combination of a number of primary techniques for the optimisation of the combustion of cross-fired regenerative float furnaces. The main features are: — reduction of excess air — suppression of hotspots and homogenisation of the flame temperatures — controlled mixing of the fuel and combustion air	The applicability is limited to cross-fired regenerative furnaces. Applicable to new furnaces. For existing furnaces, the technique requires being directly integrated during the design and construction of the furnace, at a complete furnace rebuild
(iii) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

[1] A description of the techniques is given in Section 1.10.2.

II. secondary techniques, such as:

Technique [1]	Applicability
(i) Chemical reduction by fuel	Applicable to regenerative furnaces. The applicability is limited by an increased fuel consumption and consequent environmental and economic impact
(ii) Selective catalytic reduction (SCR)	The application may require an upgrade of the dust abatement system in order to guarantee a dust concentration of below 10 – 15 mg/Nm^3 and a desulphurisation system for the removal of SO_X emissions Due to the optimum operating temperature window, the applicability is limited to the use of electrostatic precipitators. In general, the technique is not used with a bag filter system because the low operating temperature, in the range of 180 – 200 °C, would require reheating of the waste gases. The implementation of the technique may require significant space availability

[1] A description of the techniques is given in Section 1.10.2.

Table 15

BAT-AELs for NO_X emissions from the melting furnace in the flat glass sector

Parameter	BAT	BAT-AEL [1]	
		mg/Nm^3	kg/tonne melted glass [2]
NO_X expressed as NO_2	Combustion modifications, Fenix process [3]	700 – 800	1,75 – 2,0
	Oxy-fuel melting [4]	Not applicable	< 1,25 – 2,0
	Secondary techniques [5]	400 – 700	1,0 – 1,75

[1] Higher emission levels are expected when nitrates are used occasionally for the production of special glasses.
[2] The conversion factor reported in Table 2 (2,5 × 10^{-3}) has been applied.
[3] The lower levels of the range are associated with the application of the Fenix process.
[4] The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).
[5] The higher levels of the range are associated with existing plants until a normal or complete rebuild of the melting furnace. The lower levels are associated with newer/retrofitted plants.

26. When nitrates are used in the batch formulation, BAT is to reduce NO_X emissions by minimising the use of these raw materials, in combination with primary or secondary techniques. If secondary techniques are applied, the BAT-AELs reported in Table 15 are applicable.

If nitrates are used in the batch formulation for the production of special glasses in a limited number of short campaigns, the BAT-AELs are set out in Table 16.

Technique [1]	Applicability
Primary techniques: minimising the use of nitrates in the batch formulation The use of nitrates is applied for special productions (i.e. coloured glass). Effective alternative materials are sulphates, arsenic oxides, cerium oxide	The substitution of nitrates in the batch formulation may be limited by the high costs and/or higher environmental impact of the alternative materials

[1] A description of the technique is given in Section 1.10.2.

Table 16

BAT-AEL for NO_X emissions from the melting furnace in the flat glass sector, when nitrates are used in the batch formulation for the production of special glasses in a limited number of short campaigns

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass [1]
NO_X expressed as NO_2	Primary techniques	< 1 200	< 3

[1] The conversion factor reported in Table 2 for specific cases ($2,5 \times 10^{-3}$) has been applied

1.3.3. Sulphur oxides (SO_X) from melting furnaces

27. BAT is to reduce SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique [1]	Applicability
(i) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable
(ii) Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	The minimisation of the sulphur content in the batch formulation is generally applicable within the constraints of quality requirements of the final glass product. The application of sulphur balance optimisation requires a trade-off approach between the removal of SO_X emissions and the management of the solid waste (filter dust)
(iii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State

[1] A description of the techniques is given in Section 1.10.3.

Table 17

BAT-AELs for SO_X emissions from the melting furnace in the flat glass sector

Parameter	Fuel	BAT-AEL [1]	
		mg/Nm^3	kg/tonne melted glass [2]
SO_x expressedas SO_2	Natural gas	< 300 – 500	< 0,75 – 1,25
	Fuel oil [3] [4]	500 – 1 300	1,25 – 3,25

[1] The lower levels are associated with conditions where the reduction of SO_X has a high priority over a lower production of solid waste corresponding to the sulphate-rich filter dust.
[2] The conversion factor reported in Table 2 ($2,5 \times 10^{-3}$) has been applied.
[3] The associated emission levels are related to the use of 1 % sulphur fuel oil in combination with secondary abatement techniques.
[4] For large flat glass furnaces, concerns related to the achievable emission levels may require investigating the sulphur balance. Values reported in the table may be difficult to achieve in combination with filter dust recycling.

1.3.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

28. BAT is to reduce HCl and HF emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The applicability may be limited by the constraints of the type of glass produced at the installation and the availability of raw materials
(ii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

(1) A description of the techniques is given in Section 1.10.4.

Table 18

BAT-AELs for HCl and HF emissions from the melting furnace in the flat glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Hydrogen chloride, expressed as HCl (2)	< 10 – 25	< 0,025 – 0,0625
Hydrogen fluoride, expressed as HF	< 1 – 4	< 0,0025 – 0,010

(1) The conversion factor reported in Table 2 ($2,5 \times 10^{-3}$) has been applied.
(2) The higher levels of the range are associated with the recycling of filter dust in the batch formulation

1.3.5. Metals from melting furnaces

29. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The applicability may be limited by the constraints imposed by the type of glass produced at the installation and the availability of the raw materials.
(ii) Applying a filtration system	The technique is generally applicable
(iii) Applying a dry or semi-dry scrubbing, in combination with a filtration system	

(1) A description of the techniques is given in Section 1.10.5.

Table 19

BAT-AELs for metal emissions from the melting furnace in the flat glass sector, with the exception of selenium coloured glasses

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 0,2 – 1	$< 0,5 – 2,5 \times 10^{-3}$
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 1 – 5	$< 2,5 – 12,5 \times 10^{-3}$

(1) The ranges refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) The conversion factor reported in Table 2 ($2,5 \times 10^{-3}$) has been applied

30. When selenium compounds are used for colouring the glass, BAT is to reduce selenium emissions from the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Minimising the evaporation of selenium from the batch composition by selecting raw materials with a higher retention efficiency in the glass and reduced volatilisation	The applicability may be limited by the constraints imposed by the type of glass produced at the installation and the availability of the raw materials
(ii) Applying a filtration system	The technique is generally applicable
(iii) Applying a dry or semi-dry scrubbing, in combination with a filtration system	

([1]) A description of the techniques is given in Section 1.10.5.

Table 20

BAT-AELs for selenium emissions from the melting furnace in the flat glass sector for the production of coloured glass

Parameter	BAT-AEL ([1]) ([2])	
	mg/Nm^3	kg/tonne melted glass ([3])
Selenium compounds, expressed as Se	1 – 3	$2,5 – 7,5 \times 10^{-3}$

([1]) The values refer to the sum of selenium present in the flue-gases in both solid and gaseous phases.
([2]) The lower levels correspond to conditions where the reduction of Se emissions is a priority over a lower production of solid waste from filter dust. In this case, a high stoichiometric ratio (reagent/pollutant) is applied and a significant solid waste stream is generated.
([3]) The conversion factor reported in Table 2 ($2,5 \times 10^{-3}$) has been applied.

1.3.6. Emissions from downstream processes

31. BAT is to reduce emissions to air from the downstream processes by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Minimising the losses of coating products applied to the flat glass by ensuring a good sealing of the application system	The techniques are generally applicable
(ii) Minimising the losses of SO_2 from the annealing lehr, by operating the control system in an optimum manner	
(iii) Combining the SO_2 emissions from the lehr with the waste gas from the melting furnace, when technically feasible, and where a secondary treatment system is applied (filter and dry or semi-dry scrubber)	
(iv) Applying a secondary technique, e.g. wet scrubbing, or dry scrubbing and filtration	The techniques are generally applicable. The selection of the technique and its performance will depend on the inlet waste gas composition

([1]) A description of the secondary treatment systems is given in Sections 1.10.3 and 1.10.6.

Table 21

BAT-AELs for air emissions from downstream processes in the flat glass sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Dust	< 15 – 20

Parameter	BAT-AEL
	mg/Nm^3
Hydrogen chloride, expressed as HCl	< 10
Hydrogen fluoride, expressed as HF	< 1 – 5
SO_X, expressed as SO_2	< 200
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 1
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 5

1.4. *BAT conclusions for continuous filament glass fibre manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all continuous filament glass fibre manufacturing installations.

1.4.1. Dust emissions from melting furnaces

The BAT-AELs reported in this section for dust refer to all materials that are solid at the point of measurement, including solid boron compounds. Gaseous boron compounds at the point of measurement are not included.

32. BAT is to reduce dust emissions from the waste gases of the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Reduction of the volatile components by raw material modifications The formulation of batch compositions without boron compounds or with low levels of boron is a primary measure for reducing dust emissions which are mainly generated by volatilisation phenomena. Boron is the main constituent of particulate matter emitted from the melting furnace	The application of the technique is limited by proprietary issues, since the boron-free or low-boron batch formulations are covered by a patent
(ii) Filtration system: electrostatic precipitator or bag filter	The technique is generally applicable. The maximum environmental benefits are achieved for applications on new plants where the positioning and characteristics of the filter may be decided without restrictions
(iii) Wet scrubbing system	The application to existing plants may be limited by technical constraints; i.e. need for a specific waste water treatment plant

([1]) A description of the secondary treatment systems is given in Sections 1.10.1 and 1.10.7.

Table 22

BAT-AELs for dust emissions from the melting furnace in the continuous filament glass fibre sector

Parameter	BAT-AEL ([1])	
	mg/Nm^3	kg/tonne melted glass ([2])
Dust	< 10 – 20	< 0,045 – 0,09

([1]) Values at levels of < 30 mg/Nm^3 (< 0,14 kg/tonne melted glass) have been reported for boron-free formulations, with the application of primary techniques.
([2]) The conversion factor reported in Table 2 ($4{,}5 \times 10^{-3}$) has been applied.

1.4.2. Nitrogen oxides (NO_X) from melting furnaces

33. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique [1]	Applicability
(i) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	Applicable to air/fuel conventional furnaces within the constraints of the furnace energy efficiency and higher fuel demand. Most furnaces are already of the recuperative type.
(c) Staged combustion: (d) Air staging (e) Fuel staging	Fuel staging is applicable to most air/fuel, oxy-fuel furnaces. Air staging has very limited applicability due to its technical complexity
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State
(ii) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

[1] A description of the techniques is given in Section 1.10.2.

Table 23

BAT-AELs for NO_X emissions from the melting furnace in the continuous filament glass fibre sector

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass
NO_X expressed as NO_2	Combustion modifications	< 600 – 1 000	< 2,7 – 4,5 [1]
	Oxy-fuel melting [2]	Not applicable	< 0,5 – 1,5

[1] The conversion factor reported in Table 2 ($4,5 \times 10^{-3}$) has been applied.
[2] The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).

1.4.3. Sulphur oxides (SO_X) from melting furnaces

34. BAT is to reduce SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique [1]	Applicability
(i) Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	The technique is generally applicable within the constraints of quality requirements of the final glass product. The application of sulphur balance optimisation requires a trade-off approach between the removal of SO_X emissions and the management of the solid waste (filter dust), which needs to be disposed of

Technique (1)	Applicability
(ii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable. The presence of high concentrations of boron compounds in the flue-gases may limit the abatement efficiency of the reagent used in the dry or semi-dry scrubbing systems
(iv) Use of wet scrubbing	The technique is generally applicable within technical constraints; i.e. need for a specific waste water treatment plant

(1) A description of the techniques is given in Sections 1.10.3 and 1.10.6.

Table 24

BAT-AELs for SO_X emissions from the melting furnace in the continuous filament glass fibre sector

Parameter	Fuel	BAT-AEL (1)	
		mg/Nm^3	kg/tonne melted glass (2)
SO_x expressed as SO_2	Natural gas (3)	< 200 – 800	< 0,9 – 3,6
	Fuel oil (4) (5)	< 500 – 1 000	< 2,25 – 4,5

(1) The higher levels of the range are associated with the use of sulphates in the batch formulation for refining the glass.
(2) The conversion factor reported in Table 2 ($4,5 \times 10^{-3}$) has been applied.
(3) For oxy-fuel furnaces with the application of wet scrubbing, the BAT-AEL is reported to be < 0,1 kg/tonne melted glass of SO_X, expressed as SO_2.
(4) The associated emission levels are related to the use of 1 % sulphur fuel oil in combination with secondary abatement techniques.
(5) The lower levels correspond to conditions where the reduction of SO_X is a priority over a lower production of solid waste corresponding to the sulphate-rich filter dust. In this case, the lower levels are associated with the use of a bag filter.

1.4.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

35. BAT is to reduce HCl and HF emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The technique is generally applicable within the constraints of the batch formulation and the availability of raw materials
(ii) Minimisation of the fluorine content in the batch formulation The minimisation of fluorine emissions from the melting process may be achieved as follows: — minimising/reducing the quantity of fluorine compounds (e.g. fluorspar) used in the batch formulation to the minimum commensurate with the quality of the final product. Fluorine compounds are used to optimise the melting process, help fiberisation and minimise filament breakage — substituting fluorine compounds with alternative materials (e.g. sulphates)	The substitution of fluorine compounds with alternative materials is limited by quality requirements of the product
(iii) dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable
(iv) wet scrubbing	The technique is generally applicable within technical constraints; i.e. need for a specific waste water treatment plant.

(1) A description of the techniques is given in Sections 1.10.4 and 1.10.6.

Table 25

BAT-AELs for HCl and HF emissions from the melting furnace in the continuous filament glass fibre sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Hydrogen chloride, expressed as HCl	< 10	< 0,05
Hydrogen fluoride, expressed as HF (2)	< 5 – 15	< 0,02 – 0,07

(1) The conversion factor reported in Table 2 ($4,5 \times 10^{-3}$) has been applied.
(2) The higher levels of the range are associated with the use of fluorine compounds in the batch formulation.

1.4.5. Metals from melting furnaces

36. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The technique is generally applicable within the constraints of the availability of raw materials
(ii) Applying a dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable
(iii) Applying wet scrubbing	The technique is generally applicable within technical constraints; i.e. need for a specific waste water treatment plant.

(1) A description of the techniques is given in Sections 1.10.5 and 1.10.6.

Table 26

BAT-AELs for metal emissions from the melting furnace in the continuous filament glass fibre sector

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 0,2 – 1	$< 0,9 – 4,5 \times 10^{-3}$
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 1 – 3	$< 4,5 – 13,5 \times 10^{-3}$

(1) The levels refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) The conversion factor reported in Table 2 ($4,5 \times 10^{-3}$) has been applied.

1.4.6. Emissions from downstream processes

37. BAT is to reduce emissions from downstream processes by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Wet scrubbing systems	The techniques are generally applicable for the treatment of waste gases from the forming process (application of the coating to the fibres) or secondary processes which involve the use of binder that must be cured or dried
(ii) Wet electrostatic precipitator	
(iii) Filtration system (bag filter)	The technique is generally applicable for the treatment of waste gases from cutting and milling operations of the products

(1) A description of the techniques is given in Sections 1.10.7 and 1.10.8.

Table 27

BAT-AELs for air emissions from downstream processes in the continuous filament glass fibre sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Emissions from forming and coating	
Dust	< 5 – 20
Formaldehyde	< 10
Ammonia	< 30
Total volatile organic compounds, expressed as C	< 20
Emissions from cutting and milling	
Dust	< 5 – 20

1.5. *BAT conclusions for domestic glass manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all domestic glass manufacturing installations.

1.5.1. Dust emissions from melting furnaces

38. BAT is to reduce dust emissions from the waste gases of the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Reduction of the volatile components by raw material modifications. The formulation of the batch composition may contain very volatile components (e.g. boron, fluorides) which significantly contribute to the formation of dust emissions from the melting furnace	The technique is generally applicable within the constraints of the type of glass produced and the availability of substitute raw materials
(ii) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day). Not applicable for productions requiring large pull variations The implementation requires a complete furnace rebuild
(iii) Oxy-fuel melting	The maximum environmental benefits are achieved for applications made at the time of a complete furnace rebuild
(iv) Filtration system: electrostatic precipitator or bag filter	The techniques are generally applicable
(v) Wet scrubbing system	The applicability is limited to specific cases, in particular to electric melting furnaces, where flue-gas volumes and dust emissions are generally low and related to carryover of the batch formulation

([1]) A description of the techniques is given in Sections 1.10.5 and 1.10.7.

Table 28

BAT-AELs for dust emissions from the melting furnace in the domestic glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Dust	< 10 – 20 (2)	< 0,03 – 0,06
	< 1 – 10 (3)	< 0,003 – 0,03

(1) A conversion factor of 3×10^{-3} has been applied (see Table 2). However, a case by case conversion factor may have to be applied for specific productions.
(2) Considerations concerning the economic viability for achieving the BAT-AELs in the case of furnaces with a capacity of < 80 t/d, producing soda-lime glass, are reported.
(3) This BAT-AEL applies to batch formulations containing significant amounts of constituents meeting the criteria as dangerous substances, in accordance with Regulation (EC) No 1272/2008 of the European Parliament and of the Council.

1.5.2. Nitrogen oxides (NO_X) from melting furnaces

39. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	Applicable only under installation-specific circumstances due to a lower furnace efficiency and higher fuel demand (i.e. use of recuperative furnaces in place of regenerative furnaces)
(c) Staged combustion: (f) Air staging (g) Fuel staging	Fuel staging is applicable to most conventional air/fuel furnaces. Air staging has very limited applicability due to its technical complexity
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. The achieved environmental benefits are generally lower for applications to cross-fired, gas-fired furnaces due to technical constraints and a lower degree of flexibility of the furnace. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State
(ii) Special furnace design	The applicability is limited to batch formulations that contain high levels of external cullet (> 70 %). The application requires a complete rebuild of the melting furnace. The shape of the furnace (long and narrow) may pose space restrictions

Technique (1)	Applicability
(iii) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day). Not applicable for productions requiring large pull variations. The implementation requires a complete furnace rebuild
(iv) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

(1) A description of the techniques is given in Section 1.10.2.

Table 29

BAT-AELs for NO_X emissions from the melting furnace in the domestic glass sector

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
NO_x expressed as NO_2	Combustion modifications, special furnace designs	< 500 – 1 000	< 1,25 – 2,5
	Electric melting	< 100	< 0,3
	Oxy-fuel melting (2)	Not applicable	< 0,5 – 1,5

(1) A conversion factor of $2,5 \times 10^{-3}$ has been applied for combustion modifications and special furnace designs and a conversion factor of 3×10^{-3} has been applied for electric melting (see Table 2). However, a case-by-case conversion factor may have to be applied for specific productions.
(2) The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).

40. When nitrates are used in the batch formulation, BAT is to reduce NO_X emissions by minimising the use of these raw materials, in combination with primary or secondary techniques.

The BAT-AELs are set out in Table 29.

If nitrates are used in the batch formulation for a limited number of short campaigns or for melting furnaces with a capacity < 100 t/day producing special types of soda-lime glasses (clear/ultra-clear glass or coloured glass using selenium) and other special glasses (i.e. borosilicate, glass ceramics, opal glass, crystal and lead crystal), the BAT-AELs are set out in Table 30.

Technique (1)	Applicability
Primary techniques:	
— Minimising the use of nitrates in the batch formulation The use of nitrates is applied for very high quality products, where a very colourless (clear) glass is required or special glasses are produced. Effective alternative materials are sulphates, arsenic oxides, cerium oxide	The substitution of nitrates in the batch formulation may be limited by the high costs and/or higher environmental impact of the alternative materials

(1) A description of the technique is given in Section 1.10.2.

Table 30

BAT-AELs for NO_X emissions from the melting furnace in the domestic glass sector, when nitrates are used in the batch formulation for a limited number of short campaigns or for melting furnaces with a capacity < 100 t/day producing special types of soda-lime glasses (clear/ultra-clear glass or coloured glass using selenium) and other special glasses (i.e. borosilicate, glass ceramics, opal glass, crystal and lead crystal

Parameter	Type of furnace	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass
NO_X expressed as NO_2	Fuel/air conventional furnaces	< 500 – 1 500	< 1,25 – 3,75 ([1])
	Electric melting	< 300 – 500	< 8 – 10

([1]) The conversion factor reported in Table 2 for soda-lime glass ($2,5 \times 10^{-3}$) has been applied.

1.5.3. Sulphur oxides (SO_X) from melting furnaces

41. BAT is to reduce SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	The minimisation of the sulphur content in the batch formulation is generally applicable within the constraints of quality requirements of the final glass product. The application of sulphur balance optimisation requires a trade-off approach between the removal of SO_X emissions and the management of the solid waste (filter dust)
(ii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

([1]) A description of the techniques is given in Section 1.10.3.

Table 31

BAT-AELs for SO_X emissions from the melting furnace in the domestic glass sector

Parameter	Fuel/melting technique	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass ([1])
SO_x expressed as SO_2	Natural gas	< 200 – 300	< 0,5 – 0,75
	Fuel oil ([2])	< 1 000	< 2,5
	Electric melting	< 100	< 0,25

([1]) A conversion factor of $2,5 \times 10^{-3}$ has been applied (see Table 2). However, a case-by-case conversion factor may have to be applied for specific productions.
([2]) The levels are related to the use of 1 % sulphur fuel oil in combination with secondary abatement techniques.

1.5.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

42. BAT is to reduce HCl and HF emissions from the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The applicability may be limited by the constraints of the batch formulation for the type of glass produced at the installation and the availability of raw materials

Technique (1)	Applicability
(ii) Minimisation of the fluorine content in the batch formulation and optimisation of the fluorine mass balance The minimisation of fluorine emissions from the melting process may be achieved by minimising/reducing the quantity of fluorine compounds (e.g. fluorspar) used in the batch formulation to the minimum commensurate with the quality of the final product. Fluorine compounds are added to the batch formulation to give an opaque or cloudy appearance to the glass	The technique is generally applicable within the constraints of the quality requirements for the final product
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable
(iv) Wet scrubbing	The technique is generally applicable within technical constraints; i.e. need for a specific waste water treatment plant. High costs, waste water treatment aspects, including restrictions in the recycle of sludge or solid residues from the water treatment, may limit the applicability of this technique

(1) A description of the techniques is given in Sections 1.10.4 and 1.10.6.

Table 32

BAT-AELs for HCl and HF emissions from the melting furnace in the domestic glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Hydrogen chloride, expressed as HCl (2) (3)	< 10 – 20	< 0,03 – 0,06
Hydrogen fluoride, expressed as HF (4)	< 1 – 5	< 0,003 – 0,015

(1) A conversion factor of 3×10^{-3} has been applied (see Table 2). However, a case-by-case conversion factor may have to be applied for specific productions.
(2) The lower levels are associated with the use of electric melting.
(3) In cases where KCl or NaCl are used as a refining agents, the BAT-AEL is < 30 mg/Nm^3 or < 0,09 kg/tonne melted glass.
(4) The lower levels are associated with the use of electric melting. The higher levels are associated with the production of opal glass, the recycling of filter dust or where high levels of external cullet are used in the batch formulation.

1.5.5. Metals from melting furnaces

43. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The applicability may be limited by the constraints imposed by the type of glass produced at the installation and the availability of raw materials
(ii) Minimising the use of metal compounds in the batch formulation, through a suitable selection of the raw materials where colouring and decolourising of glass is needed or where specific characteristics are conferred to the glass	For the production of crystal and lead crystal glasses the minimisation of metal compounds in the batch formulation is restricted by the limits defined in Directive 69/493/EEC which classifies the chemical composition of the final glass products.
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

(1) A description of the techniques is given in Section 1.10.5.

Table 33

BAT-AELs for metal emissions from the melting furnace in the domestic glass sector with the exception of glasses where selenium is used for decolourising

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 0,2 – 1	$< 0,6 – 3 \times 10^{-3}$
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 1 – 5	$< 3 – 15 \times 10^{-3}$

(1) The levels refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) A conversion factor of 3×10^{-3} has been applied (see Table 2). However, a case-by-case conversion factor may have to be applied for specific productions.

44. When selenium compounds are used for decolourising the glass, BAT is to reduce selenium emissions from the melting furnace by using one or a combination of the following techniques

Technique (1)	Applicability
(i) Minimising the use of selenium compounds in the batch formulation, through a suitable selection of the raw materials	The applicability may be limited by the constraints imposed by the type of glass produced at the installation and the availability of raw materials
(ii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

(1) A description of the techniques is given in Section 1.10.5.

Table 34

BAT-AELs for selenium emissions from the melting furnace in the domestic glass sector when selenium compounds are used for decolourising the glass

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Selenium compounds, as Se	< 1	$< 3 \times 10^{-3}$

(1) The values refer to the sum of selenium present in the flue-gases in both solid and gaseous phases.
(2) A conversion factor of 3×10^{-3} has been applied (see Table 2). However, a case-by-case conversion factor may have to be applied for specific productions.

45. When lead compounds are used for the manufacturing of lead crystal glass, BAT is to reduce lead emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day). Not applicable for productions requiring large pull variations. The implementation requires a complete furnace rebuild
(ii) Bag filter	The technique is generally applicable
(iii) Electrostatic precipitator	
(iv) Dry or semi-dry scrubbing, in combination with a filtration system	

(1) A description of the technique is given in Sections 1.10.1 and 1.10.5.

Table 35

BAT-AELs for lead emissions from the melting furnace in the domestic glass sector when lead compounds are used for manufacturing lead crystal glass

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Lead compounds, expressed as Pb	< 0,5 – 1	$< 1 - 3 \times 10^{-3}$

(1) The values refer to the sum of lead present in the flue-gases in both solid and gaseous phases.
(2) A conversion factor of 3×10^{-3} has been applied (see Table 2). However, a case-by-case conversion factor may have to be applied for specific productions.

1.5.6. Emissions from downstream processes

46. For downstream dusty processes, BAT is to reduce emissions of dust and metals by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Performing dusty operations (e.g. cutting, grinding, polishing) under liquid	The techniques are generally applicable
(ii) Applying a bag filter system	

(1) A description of the techniques is given in Section 1.10.8.

Table 36

BAT-AELs for air emissions from dusty downstream processes in the domestic glass sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Dust	< 1 – 10
Σ (As, Co, Ni, Cd, Se, Cr_{VI}) (1)	< 1
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn) (1)	< 1 – 5
Lead compounds, expressed as Pb (2)	< 1 – 1,5

(1) The levels refer to the sum of metals present in the waste gas.
(2) The levels refer to downstream operations on lead crystal glass.

47. For acid polishing processes, BAT is to reduce HF emissions by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Minimising the losses of polishing product by ensuring a good sealing of the application system	The techniques are generally applicable
(ii) Applying a secondary technique, e.g. wet scrubbing.	

(1) A description of the techniques is given in Section 1.10.6.

Table 37

BAT-AELs for HF emissions from acid polishing processes in the domestic glass sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Hydrogen fluoride, expressed as HF	< 5

1.6. *BAT conclusions for special glass manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all special glass manufacturing installations.

1.6.1. Dust emissions from melting furnaces

48. BAT is to reduce dust emissions from the waste gases of the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Reduction of the volatile components by raw material modifications The formulation of the batch composition may contain very volatile components (e.g. boron, fluorides) which represent the main constituents of dust emitted from the melting furnace	The technique is generally applicable within the constraints of the quality of the glass produced
(ii) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day) Not applicable for productions requiring large pull variations The implementation requires a complete furnace rebuild
(iii) Filtration system: electrostatic precipitator or bag filter	The technique is generally applicable

([1]) A description of the techniques is given in Section 1.10.1.

Table 38

BAT-AELs for dust emissions from the melting furnace in the special glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass ([1])
Dust	< 10 – 20	< 0,03 – 0,13
	< 1 – 10 ([2])	< 0,003 – 0,065

([1]) The conversions factors of 2,5 × 10^{-3} and 6,5 × 10^{-3} have been used for the determination of the lower and upper value of the BAT-AELs range (see Table 2), with some values being approximated. However, a-case-by-case conversion factor needs to be applied, depending on the type of glass produced (see Table 2).

([2]) The BAT-AELs apply to batch formulations containing significant amounts of constituents meeting the criteria as dangerous substances, in accordance with Regulation (EC) No 1272/2008.

1.6.2. Nitrogen oxides (NO_X) from melting furnaces

49. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

I. primary techniques, such as:

Technique ([1])	Applicability
(i) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	Applicable only under installation-specific circumstances due to a lower furnace efficiency and higher fuel demand (i.e. use of recuperative furnaces in place of regenerative furnaces)
(c) Staged combustion: — Air staging — Fuel staging	Fuel staging is applicable to most conventional air/fuel furnaces. Air staging has very limited applicability due to the technical complexity
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. The achieved environmental benefits are generally lower for applications to cross-fired, gas-fired furnaces due to technical constraints and a lower degree of flexibility of the furnace. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State
(ii) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day). Not applicable for productions requiring large pull variations. The implementation requires a complete furnace rebuild
(iii) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

([1]) A description of the techniques is given in Section 1.10.2.

II. secondary techniques, such as:

Technique ([1])	Applicability
(i) Selective catalytic reduction (SCR)	The application may require an upgrade of the dust abatement system in order to guarantee a dust concentration of below 10 – 15 mg/Nm^3 and a desulphurisation system for the removal of SO_X emissions Due to the optimum operating temperature window, the applicability is limited to the use of electrostatic precipitators. In general, the technique is not used with a bag filter system because the low operating temperature, in the range of 180 – 200 °C, would require reheating of the waste gases. The implementation of the technique may require significant space availability

Technique (1)	Applicability
(ii) Selective non-catalytic reduction (SNCR)	Very limited applicability to conventional regenerative furnaces, where the correct temperature window is difficult to access or does not allow a good mixing of the flue-gases with the reagent It may be applicable to new regenerative furnaces equipped with split regenerators; however, the temperature window is difficult to maintain due to the reversal of fire between the chambers that causes a cyclical temperature change

(1) A description of the techniques is given in Section 1.10.2.

Table 39

BAT-AELs for NO_X emissions from the melting furnace in the special glass sector

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
NO_X expressed as NO_2	Combustion modifications	600 – 800	1,5 – 3,2
	Electric melting	< 100	< 0,25 – 0,4
	Oxy-fuel melting (2) (3)	Not applicable	< 1 – 3
	Secondary techniques	< 500	< 1 – 3

(1) The conversion factors of 2,5 × 10^{-3} and 4 × 10^{-3} have been used for the determination of the lower and upper value of the BAT-AEL range (see Table 2), with some values being approximated. However, a case-by-case conversion factor needs to be applied based on the type of production (see Table 2).
(2) The higher values are related to a special production of borosilicate glass tubes for pharmaceutical use.
(3) The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).

50. When nitrates are used in the batch formulation, BAT is to reduce NO_X emissions by minimising the use of these raw materials, in combination with either primary or secondary techniques

Technique (1)	Applicability
Primary techniques — minimising the use of nitrates in the batch formulation The use of nitrates is applied for very high quality products, where special characteristics of the glass are required. Effective alternative materials are sulphates, arsenic oxides, cerium oxide	The substitution of nitrates in the batch formulation may be limited by the high costs and/or higher environmental impact of the alternative materials

(1) A description of the technique is given in Section 1.10.2.

Table 40

BAT-AELs for NO_X emissions from the melting furnace in the special glass sector when nitrates are used in the batch formulation

Parameter	BAT	BAT-AEL (1)	
		mg/Nm^3	kg/tonne melted glass (2)
NO_X expressed as NO_2	Minimisation of nitrate input in the batch formulation combined with primary or secondary techniques	< 500 – 1 000	< 1 – 6

(1) The lower levels are associated with the use of electric melting.
(2) The conversion factors of 2,5 × 10^{-3} and 6,5 × 10^{-3} have been used for the determination of the lower and upper value of the BAT-AEL range respectively, with values being approximated. A case-by-case conversion factor may have to be applied based on the type of production (see Table 2).

1.6.3. Sulphur oxides (SO_X) from melting furnaces

51. BAT is to reduce SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique [1]	Applicability
(i) Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	The technique is generally applicable within the constraints of quality requirements of the final glass product
(ii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

[1] A description of the techniques is given in Section 1.10.3.

Table 41

BAT-AELs for SO_X emissions from the melting furnace in the special glass sector

Parameter	Fuel/melting technique	BAT-AEL [1]	
		mg/Nm^3	kg/tonne melted glass [2]
SO_X expressed as SO_2	Natural gas, electric melting [3]	< 30 – 200	< 0,08 – 0,5
	Fuel oil [4]	500 – 800	1,25 – 2

[1] The ranges take into account the variable sulphur balances associated with the type of glass produced.
[2] The conversion factor of $2,5 \times 10^{-3}$ (see Table 2) has been used. However, a case-by-case conversion factor may have to be applied based on the type of production.
[3] The lower levels are associated with the use of electric melting and batch formulations without sulphates.
[4] The associated emission levels are related to the use of 1 % sulphur fuel oil in combination with secondary abatement techniques.

1.6.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

52. BAT is to reduce HCl and HF emissions from the melting furnace by using one or a combination of the following techniques:

Technique [1]	Applicability
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The applicability may be limited by the constraints of the batch formulation for the type of glass produced at the installation and the availability of raw materials
(ii) Minimisation of the fluorine and/or chlorine compounds in the batch formulation and optimisation of the fluorine and/or chlorine mass balance Fluorine compounds are used to confer particular characteristics to special glasses (i.e. opaque lighting glass, optical glass). Chlorine compounds may be used as fining agents for borosilicate glass production	The technique is generally applicable within the constraints of the quality requirements for the final product.
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

[1] A description of the techniques is given in Section 1.10.4.

Table 42

BAT-AELs for HCl and HF emissions from the melting furnace in the special glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Hydrogen chloride, expressed as HCl (2)	< 10 – 20	< 0,03 – 0,05
Hydrogen fluoride, expressed as HF	< 1 – 5	< 0,003 – 0,04 (3)

(1) The conversion factor of 2,5 × 10^{-3} (see Table 2) has been used; with some values being approximated. A case-by-case conversion factor may have to be applied based on the type of production.
(2) The higher levels are associated with the use of materials containing chlorine in the batch formulation.
(3) The upper value of the range has been derived from specific reported data.

1.6.5. Metals from melting furnaces

53. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The applicability may be limited by the constraints imposed by the type of glass produced at the installation and the availability of raw materials
(ii) Minimising the use of metal compounds in the batch formulation, through a suitable selection of the raw materials where colouring and decolourising of glass is needed or where specific characteristics are conferred to the glass	The techniques are generally applicable
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	

(1) A description of the techniques is given in Section 1.10.5.

Table 43

BAT-AELs for metal emissions from the melting furnace in the special glass sector

Parameter	BAT-AEL (1) (2)	
	mg/Nm^3	kg/tonne melted glass (3)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 0,1 – 1	< 0,3 – 3 × 10^{-3}
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 1 – 5	< 3 – 15 × 10^{-3}

(1) The levels refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) The lower levels are BAT-AELs when metal compounds are not intentionally used in the batch formulation.
(3) The conversion factor of 2,5 × 10^{-3} (see Table 2) has been used, with some values indicated in the table having been approximated. A case-by-case conversion factor may have to be applied based on the type of production.

1.6.6. Emissions from downstream processes

54. For downstream dusty processes, BAT is to reduce emissions of dust and metals by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Performing dusty operations (e.g. cutting, grinding, polishing) under liquid	The techniques are generally applicable
(ii) Applying a bag filter system	

(1) A description of the techniques is given in Section 1.10.8.

Table 44

BAT-AELs for dust and metal emissions from downstream processes in the special glass sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Dust	1 – 10
Σ (As, Co, Ni, Cd, Se, Cr_{VI}) (1)	< 1
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn) (1)	< 1 – 5

(1) The levels refer to the sum of metals present in the waste gas.

55. For acid polishing processes, BAT is to reduce HF emissions by using one or a combination of the following techniques:

Technique (1)	Description
(i) Minimising the losses of polishing product by ensuring a good sealing of the application system	The techniques are generally applicable
(ii) Applying a secondary technique, e.g. wet scrubbing	

(1) A description of the techniques is given in Section 1.10.6.

Table 45

BAT-AELs for HF emissions from acid polishing processes in the special glass sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Hydrogen fluoride, expressed as HF	< 5

1.7. *BAT conclusions for mineral wool manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all mineral wool manufacturing installations.

1.7.1. Dust emissions from melting furnaces

56. BAT is to reduce dust emissions from the waste gases of the melting furnace by applying an electrostatic precipitator or a bag filter system

Technique (1)	Applicability
Filtration system: electrostatic precipitator or bag filter	The technique is generally applicable. Electrostatic precipitators are not applicable to cupola furnaces for stone wool production, due to the risk of explosion from the ignition of carbon monoxide produced within the furnace

(1) A description of the techniques is given in Section 1.10.1.

Table 46

BAT-AELs for dust emissions from the melting furnace in the mineral wool sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Dust	< 10 – 20	< 0,02 – 0,050

(1) The conversion factors of 2×10^{-3} and $2{,}5 \times 10^{-3}$ have been used for the determination of the lower and upper value of the BAT-AELs range (see Table 2), in order to cover both the production of glass wool and stone wool.

1.7.2. Nitrogen oxides (NO_X) from melting furnaces

57. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique [1]	Applicability
(i) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	Applicable only under installation-specific circumstances due to a lower furnace efficiency and higher fuel demand (i.e. use of recuperative furnaces in place of regenerative furnaces)
(c) Staged combustion: — Air staging — Fuel staging	Fuel staging is applicable to most conventional air/fuel furnaces. Air staging has very limited applicability due to the technical complexity
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. The achieved environmental benefits are generally lower for applications to cross-fired, gas-fired furnaces due to technical constraints and a lower degree of flexibility of the furnace. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State
(ii) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day). Not applicable for productions requiring large pull variations. The implementation requires a complete furnace rebuild
(iii) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

[1] A description of the techniques is given in Section 1.10.2.

Table 47

BAT-AELs for NO_X emissions from the melting furnace in the mineral wool sector

Parameter	Product	Melting technique	BAT-AEL	
			mg/Nm^3	kg/tonne melted glass [1]
NO_X expressed as NO_2	Glass wool	Fuel/air and electric furnaces	< 200 – 500	< 0,4 – 1,0
		Oxy-fuel melting [2]	Not applicable	< 0,5
	Stone wool	All types of furnaces	< 400 – 500	< 1,0 – 1,25

[1] The conversion factors of 2×10^{-3} for glass wool and $2,5 \times 10^{-3}$ for stone wool have been used (see Table 2).
[2] The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).

58. When nitrates are used in the batch formulation for glass wool production, BAT is to reduce NO_X emissions by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Minimising the use of nitrates in the batch formulation The use of nitrates is applied as an oxidising agent in batch formulations with high levels of external cullet to compensate for the presence of organic material contained in the cullet	The technique is generally applicable within the constraints of the quality requirements for the final product
(ii) Electric melting	The technique is generally applicable. The implementation of electric melting requires a complete furnace rebuild
(iii) Oxy-fuel melting	The technique is generally applicable. The maximum environmental benefits are achieved for applications made at the time of a complete furnace rebuild

(1) A description of the techniques is given in Section 1.10.2.

Table 48

BAT-AELs for NO_X emissions from the melting furnace in glass wool production when nitrates are used in the batch formulation

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
NO_X expressed as NO_2	Minimisation of nitrate input in the batch formulation, combined with primary techniques	< 500 – 700	< 1,0 – 1,4 (2)

(1) The conversion factor of 2×10^{-3} has been used (see Table 2).
(2) The lower levels of the ranges are associated with the application of oxy-fuel melting.

1.7.3. Sulphur oxides (SO_X) from melting furnaces

59. BAT is to reduce SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	In glass wool production, the technique is generally applicable within the constraints of the availability of low-sulphur raw materials, in particular external cullet. High levels of external cullet in the batch formulation limit the possibility of optimising the sulphur balance due to a variable sulphur content. In the stone wool production, the optimisation of the sulphur balance may require a trade-off approach between the removal of SO_X emissions from the flue-gases and the management of the solid waste, deriving from the treatment of the flue-gases (filter dust) and/or from the fiberising process, which may be recycled into the batch formulation (cement briquettes) or may need to be disposed of
(ii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	Electrostatic precipitators are not applicable to cupola furnaces for stone wool production (see BAT 56)
(iv) Use of wet scrubbing	The technique is generally applicable within technical constraints; i.e. need for a specific waste water treatment plant

(1) A description of the techniques is given in Sections 1.10.3 and 1.10.6.

Table 49

BAT-AELs for SO_X emissions from the melting furnace in the mineral wool sector

Parameter	Product/conditions	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
SO_X expressed as SO_2	***Glass wool***		
	Gas-fired and electric furnaces (2)	< 50 – 150	< 0,1 – 0,3
	Stone wool		
	Gas-fired and electric furnaces	< 350	< 0,9
	Cupola furnaces, no briquettes or slag recycling (3)	< 400	< 1,0
	Cupola furnaces, with cement briquettes or slag recycling (4)	< 1 400	< 3,5

(1) The conversion factors of 2×10^{-3} for glass wool and $2,5 \times 10^{-3}$ for stone wool have been used (see Table 2).
(2) The lower levels of the ranges are associated with the use of electric melting. The higher levels are associated with high levels of cullet recycling.
(3) The BAT-AEL is associated with conditions where the reduction of SO_X emissions has a high priority over a lower production of solid waste.
(4) When reduction of waste has a high priority over SO_X emissions, higher emission values may be expected. The achievable levels should be based on a sulphur balance.

1.7.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

60. BAT is to reduce HCl and HF emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Description
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The technique is generally applicable within the constraints of the batch formulation and the availability of raw materials
(ii) Dry or semi-dry scrubbing, in combination with a filtration system	Electrostatic precipitators are not applicable to cupola furnaces for stone wool production (see BAT 56)

(1) A description of the techniques is given in Section 1.10.4.

Table 50

BAT-AELs for HCl and HF emissions from the melting furnace in the mineral wool sector

Parameter	Product	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
Hydrogen chloride, expressed as HCl	Glass wool	< 5 – 10	< 0,01 – 0,02
	Stone wool	< 10 – 30	< 0,025 – 0,075
Hydrogen fluoride, expressed as HF	All products	< 1 – 5	< 0,002 – 0,013 (2)

(1) The conversion factors of 2×10^{-3} for glass wool and $2,5 \times 10^{-3}$ for stone wool have been used (see Table 2).
(2) The conversion factors of 2×10^{-3} and $2,5 \times 10^{-3}$ have been used for the determination of the lower and upper values of the BAT-AELs range (see Table 2).

1.7.5. Hydrogen sulphide (H_2S) from stone wool melting furnaces

61. BAT is to reduce H_2S emissions from the melting furnace by applying a waste gas incineration system to oxidise hydrogen sulphide to SO_2

Technique (1)	Applicability
Waste gas incinerator system	The technique is generally applicable to stone wool cupola furnaces

(1) A description of the technique is given in Section 1.10.9.

Table 51

BAT-AELs for H_2S emissions from the melting furnace in stone wool production

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Hydrogen sulphide, expressed as H_2S	< 2	< 0,005

(1) The conversion factor of $2,5 \times 10^{-3}$ for stone wool has been applied (see Table 2).

1.7.6. Metals from melting furnaces

62. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The technique is generally applicable within the constraints of the availability of raw materials. In glass wool production, the use of manganese in the batch formulation as an oxidising agent depends on the quantity and quality of external cullet employed in the batch formulation and may be minimised accordingly
(ii) Application of a filtration system	Electrostatic precipitators are not applicable to cupola furnaces for stone wool production (see BAT 56)

(1) A description of the techniques is given in Section 1.10.5.

Table 52

BAT-AELs for metal emissions from the melting furnace in the mineral wool sector

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 0,2 – 1 (3)	$< 0,4 – 2,5 \times 10^{-3}$
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 1 – 2 (3)	$< 2 – 5 \times 10^{-3}$

(1) The ranges refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) The conversion factors of 2×10^{-3} and $2,5 \times 10^{-3}$ have been used for the determination of the lower and upper values of the BAT-AELs range (see Table 2).
(3) Higher values are associated with the use of cupola furnaces for the production of stone wool.

1.7.7. Emissions from downstream processes

63. BAT is to reduce emissions from downstream processes by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Impact jets and cyclones The technique is based on the removal of particles and droplets from waste gases by impaction/impingement, as well as gaseous substances by partial absorption with water. Process water is normally used for impact jets. The recycling process water is filtered before it is reapplied	The technique is generally applicable to the mineral wool sector, in particular to glass wool processes for the treatment of emissions from the forming area (application of the coating to the fibres). Limited applicability to stone wool processes since it could adversely affect other abatement techniques being used.
(ii) Wet scrubbers	The technique is generally applicable for the treatment of waste gases from the forming process (application of the coating to the fibres) or for combined waste gases (forming plus curing)
(iii) Wet electrostatic precipitators	The technique is generally applicable for the treatment of waste gases from the forming process (application of the coating to the fibres), from curing ovens or for combined waste gases (forming plus curing)
(iv) Stone wool filters It consists of a steel or concrete structure in which stone wool slabs are mounted and act as a filter medium. The filtering medium needs to be cleaned or exchanged periodically. This filter is suitable for waste gases with a high moisture content and particulate matter with an adhesive nature	The applicability is mainly limited to stone wool processes for waste gases from the forming area and/or curing ovens
(v) Waste gas incineration	The technique is generally applicable for the treatment of waste gases from curing ovens, in particular in the stone wool processes. The application to combined waste gases (forming plus curing) is not economically viable because of the high volume, low concentration, low temperature of the waste gases

([1]) A description of the techniques is given in Sections 1.10.7 and 1.10.9.

Table 53

BAT-AELs for air emissions from downstream processes in the mineral wool sector, when treated separately

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne finished product
Forming area – Combined forming and curing emissions-Combined forming, curing and cooling emissions		
Total particulate matter	< 20 – 50	—
Phenol	< 5 – 10	—
Formaldehyde	< 2 – 5	—
Ammonia	30 – 60	—

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne finished product
Amines	< 3	—
Total volatile organic compounds expressed as C	10 – 30	—
Curing oven emissions (1) (2)		
Total particulate matter	< 5 – 30	< 0,2
Phenol	< 2 – 5	< 0,03
Formaldehyde	< 2 – 5	< 0,03
Ammonia	< 20 – 60	< 0,4
Amines	< 2	< 0,01
Total volatile organic compounds expressed as C	< 10	< 0,065
NO_X, expressed as NO_2	< 100 – 200	< 1

(1) Emission levels expressed in kg/tonne of finished product are not affected by the thickness of the mineral wool mat produced nor by extreme concentration or dilution of the flue-gases. A conversion factor of $6,5 \times 10^{-3}$ has been used.
(2) If high density or high binder content mineral wools are produced, the emission levels associated with the techniques listed as BAT for the sector could be significantly higher than these BAT-AELs. If these types of products represent the majority of the production from a given installation, then consideration should be given to other techniques.

1.8. *BAT conclusions for high temperature insulation wools (HTIW) manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all HTIW manufacturing installations.

1.8.1. Dust emissions from melting and downstream processes

64. BAT is to reduce dust emissions from the waste gases of the melting furnace by applying a filtration system.

Technique (1)	Applicability
The filtration system usually consists of a bag filter	The technique is generally applicable

(1) A description of the technique is given in Section 1.10.1.

Table 54

BAT-AELs for dust emissions from the melting furnace in the HTIW sector

Parameter	BAT	BAT-AEL
		mg/Nm^3
Dust	Flue-gas cleaning by filtration systems	< 5 – 20 (1)

(1) The values are associated with the use of a bag filter system.

65. For downstream dusty processes, BAT is to reduce emissions using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Minimising the losses of product by ensuring a good sealing of the production line, where technically applicable. The potential sources of dust and fibre emissions are: — fiberisation and collection — mat formation (needling) — lubricant burn-off — cutting, trimming and packaging of the finished product A good construction, sealing and maintenance of the downstream processing systems are essential for minimising the losses of product into the air	The techniques are generally applicable
(ii) Cutting, trimming and packaging under vacuum, by applying an efficient extraction system in conjunction with a fabric filter. A negative pressure is applied to the workstation (i.e. cutting machine, cardboard box for packaging) in order to extract particulate and fibrous releases and convey it to a fabric filter	
(iii) Applying a fabric filter system ([1]) Waste gases from downstream operations (e.g. fiberising, mat formation, lubricant burn-off) are conveyed to a treatment system consisting of a bag filter	

([1]) A description of the technique is given in Section 1.10.1.

Table 55

BAT-AELs from dusty downstream processes in the HTIW sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Dust ([1])	1 – 5

([1]) The lower level of the range is associated with emissions of aluminium silicate glass wool/refractory ceramic fibres (ASW/RCF).

1.8.2. Nitrogen oxides (NO_X) from melting and downstream processes

66. BAT is to reduce NO_X emissions from the lubricant burn-off oven by applying combustion control and/or modifications

Technique	Applicability
Combustion control and/or modifications Techniques to reduce the formation of thermal NO_X emissions include a control of the main combustion parameters: — air/fuel ratio (oxygen content in the reaction zone) — flame temperature — residence time in the high temperature zone. A good combustion control consists of generating those conditions which are least favourable for NO_X formation	The technique is generally applicable

Table 56

BAT-AELs for NO_X from the lubricant burn-off oven in the HTIW sector

Parameter	BAT	BAT-AEL
		mg/Nm^3
NO_X expressed as NO_2	Combustion control and/or modifications	100 – 200

1.8.3. Sulphur oxides (SO_X) from melting and downstream processes

67. BAT is to reduce SO_X emissions from the melting furnaces and downstream processes by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Selection of raw materials for the batch formulation with a low content of sulphur	The technique is generally applicable within the constraints of the availability of raw materials
(ii) Use of low sulphur content fuel	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State

([1]) A description of the technique is given in Section 1.10.3.

Table 57

BAT-AELs for SO_X emissions from the melting furnaces and downstream processes in the HTIW sector

Parameter	BAT	BAT-AEL
		mg/Nm^3
SO_x expressed as SO_2	Primary techniques	< 50

1.8.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

68. BAT is to reduce HCl and HF emissions from the melting furnace by selecting raw materials for the batch formulation with a low content of chlorine and fluorine

Technique ([1])	Applicability
Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The technique is generally applicable

([1]) A description of the technique is given in Section 1.10.4.

Table 58

BAT-AELs for HCl and HF emissions from the melting furnace in the HTIW sector

Parameter	BAT-AEL
	mg/Nm^3
Hydrogen chloride, expressed as HCl	< 10
Hydrogen fluoride, expressed as HF	< 5

1.8.5. Metals from melting furnaces and downstream processes

69. BAT is to reduce metal emissions from the melting furnace and/or downstream processes by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The techniques are generally applicable
(ii) Applying a filtration system	

([1]) A description of the technique is given in Section 1.10.5.

Table 59

BAT-AELs for metal emissions from the melting furnace and/or downstream processes in the HTIW sector

Parameter	BAT-AEL ([1])
	mg/Nm^3
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 1
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 5

([1]) The levels refer to the sum of metals present in the flue-gases in both solid and gaseous phases.

1.8.6. Volatile organic compounds from downstream processes

70. BAT is to reduce volatile organic compound (VOC) emissions from the lubricant burn-off oven by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Combustion control, including monitoring the associated emissions of CO. The technique consists of the control of combustion parameters (e.g. oxygen content in the reaction zone, flame temperature) in order to ensure a complete combustion of the organic components (i.e. poly-ethylene glycol) in the waste gas. The monitoring of carbon monoxide emissions allows for controlling the presence of uncombusted organic materials	The technique is generally applicable
(ii) Waste gas incineration	The economic viability may limit the applicability of these techniques because of low waste gas volumes and VOC concentrations
(iii) Wet scrubbers	

([1]) A description of the techniques is given in Sections 1.10.6 and 1.10.9.

Table 60

BAT-AELs for VOC emissions from the lubricant burn-off oven in the HTIW sector, when treated separately

Parameter	BAT	BAT-AEL
		mg/Nm^3
Volatile organic compounds expressed as C	Primary and/or secondary techniques	10 – 20

1.9. *BAT conclusions for frits manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all frits glass manufacturing installations.

1.9.1. Dust emissions from melting furnaces

71. BAT is to reduce dust emissions from the waste gases of the melting furnace by means of an electrostatic precipitator or a bag filter system.

Technique (1)	Applicability
Filtration system: electrostatic precipitator or bag filter	The technique is generally applicable

(1) A description of the technique is given in Section 1.10.1.

Table 61

BAT-AELs for dust emissions from the melting furnace in the frits sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Dust	< 10 – 20	< 0,05 – 0,15

(1) The conversion factors of 5×10^{-3} and $7,5 \times 10^{-3}$ have been used for the determination of the lower and upper value of the BAT-AELs range (see Table 2). However, a case-by-case conversion factor may have to be applied based on the type of combustion.

1.9.2. Nitrogen oxides (NO_X) from melting furnaces

72. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Minimising the use of nitrates in the batch formulation In the frits production, nitrates are used in the batch formulation of many products in order to obtain the required characteristics	The substitution of nitrates in the batch formulation may be limited by the high costs and/or higher environmental impact of the alternative materials and/or the quality requirements of the final product
(ii) Reduction of the parasitic air entering the furnace The technique consists of preventing the ingress of air into the furnace by sealing the burner blocks, the batch material feeder and any other opening of the melting furnace	The technique is generally applicable
(iii) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	Applicable only under installation-specific circumstances due to a lower furnace efficiency and higher fuel demand
(c) Staged combustion: — Air staging — Fuel staging	Fuel staging is applicable to most conventional air/fuel furnaces. Air staging has very limited applicability due to its technical complexity

Technique (1)	Applicability
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State
(iv) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

(1) A description of the technique is given in Section 1.10.2.

Table 62

BAT-AELs for NO_X emissions from the melting furnace in the frits glass sector

Parameter	BAT	Operating conditions	BAT-AEL (1)	
			mg/Nm^3	kg/tonne melted glass (2)
NO_X expressed as NO_2	Primary techniques	Oxy-fuel firing, without nitrates (3)	Not applicable	< 2,5 – 5
		Oxy-fuel firing, with use of nitrates	Not applicable	5 – 10
		Fuel/air, fuel/oxygen-enriched air combustion, without nitrates	500 – 1 000	2,5 – 7,5
		Fuel/air, fuel/oxygen-enriched air combustion, with use of nitrates	< 1 600	< 12

(1) The ranges take into account the combination of flue-gases from furnaces applying different melting techniques and producing a variety of frit types, with or without nitrates in the batch formulations, which may be conveyed to a single stack, precluding the possibility of characterising each applied melting technique and the different products.
(2) The conversion factors of 5×10^{-3} and $7,5 \times 10^{-3}$ have been used for the determination of the lower and higher values of the range. However, a case-by-case conversion factor may have to be applied based on the type of combustion (see Table 2).
(3) The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).

1.9.3. Sulphur oxides (SO_X) from melting furnaces

73. BAT is to control SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of sulphur	The technique is generally applicable within the constraints of the availability of raw materials
(ii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable
(iii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State

(1) A description of the techniques is given in Section 1.10.3.

Table 63

BAT-AELs for SO_X emissions from the melting furnace in the frits sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass ([1])
SO_X, expressed as SO_2	< 50 – 200	< 0,25 – 1,5

([1]) The conversion factors of 5×10^{-3} and $7,5 \times 10^{-3}$ have been used; however, the values indicated in the table may have been approximated. A case-by-case conversion factor may have to be applied based on the type of combustion (see Table 2).

1.9.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

74. BAT is to reduce HCl and HF emissions from the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The technique is generally applicable within the constraints of the batch formulation and the availability of raw materials
(ii) Minimisation of the fluorine compounds in the batch formulation when used to ensure the quality of the final product Fluorine compounds are used to confer particular characteristics to the frits (i.e. thermal and chemical resistance)	The minimisation or substitution of fluorine compounds with alternative materials is limited by quality requirements of the product
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

([1]) A description of the techniques is given in Section 1.10.4.

Table 64

BAT-AELs for HCl and HF emissions from the melting furnace in the frits sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass ([1])
Hydrogen chloride, expressed as HCl	< 10	< 0,05
Hydrogen fluoride, expressed as HF	< 5	< 0,03

([1]) The conversion factor of 5×10^{-3} has been used with some values being approximated. A case-by-case conversion factor may have to be applied based on the type of combustion (see Table 2).

1.9.5. Metals from melting furnaces

75. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The technique is generally applicable within the constraints of the type of frit produced at the installation and the availability of raw materials

Technique (1)	Applicability
(ii) Minimising of the use of metal compounds in the batch formulation, where colouring is required or other specific characteristics are conferred to the frit	The techniques are generally applicable
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	

(1) A description of the techniques is given in Section 1.10.5.

Table 65

BAT-AELs for metal emissions from the melting furnace in the frits sector

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 1	$< 7,5 \times 10^{-3}$
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 5	$< 37 \times 10^{-3}$

(1) The levels refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) The conversion factor of $7,5 \times 10^{-3}$ has been used. A case-by-case conversion factor may have to be applied based on the type of combustion (see Table 2).

1.9.6. Emissions from downstream processes

76. For downstream dusty processes, BAT is to reduce emissions by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Applying wet milling techniques The technique consists of grinding the frit to the desired particle size distribution with sufficient liquid to form a slurry. The process is generally carried out in alumina ball mills with water	The techniques are generally applicable
(ii) Operating dry milling and dry product packaging under an efficient extraction system in conjunction with a fabric filter A negative pressure is applied to the milling equipment or to the work station where packaging is carried out in order to convey dust emissions to a fabric filter	
(iii) Applying a filtration system	

(1) A description of the techniques is given in Section 1.10.1.

Table 66

BAT-AELs for air emissions from downstream processes in the frits sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Dust	5 – 10
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 1 (1)
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 5 (1)

(1) The levels refer to the sum of metals present in the waste gas.

Glossary

1.10. *Description of techniques*

1.10.1. Dust emissions

Technique	Description
Electrostatic precipitator	Electrostatic precipitators operate such that particles are charged and separated under the influence of an electrical field. Electrostatic precipitators are capable of operating over a wide range of conditions
Bag filter	Bag filters are constructed from porous woven or felted fabric through which gases are flowed to remove particles. The use of a bag filter requires a fabric material selection adequate to the characteristics of the waste gases and the maximum operating temperature
Reduction of the volatile components by raw material modifications	The formulation of batch compositions might contain very volatile components (e.g. boron compounds) which could be minimised or substituted for reducing dust emissions mainly generated by volatilisation phenomena
Electric melting	The technique consists of a melting furnace where the energy is provided by resistive heating. In the cold-top furnaces (where the electrodes are generally inserted at the bottom of the furnace) the batch blanket covers the surface of the melt with a consequent, significant reduction of the volatilisation of batch components (i.e. lead compounds)

1.10.2. NO_X emissions

Technique	Description
Combustion modifications	
(i) Reduction of air/fuel ratio	The technique is mainly based on the following features: — minimisation of air leakages into the furnace — careful control of air used for combustion — modified design of the furnace combustion chamber
(ii) Reduced combustion air temperature	The use of recuperative furnaces, in place of regenerative furnaces, results in a reduced air preheat temperature and, consequently, a lower flame temperature. However, this is associated with a lower furnace efficiency (lower specific pull), lower fuel efficiency and higher fuel demand, resulting in potentially higher emissions (kg/tonne of glass)
(iii) Staged combustion	— Air staging – involves substoichiometric firing and the addition of the remaining air or oxygen into the furnace to complete combustion. — Fuel staging – a low impulse primary flame is developed in the port neck (10 % of total energy); a secondary flame covers the root of the primary flame reducing its core temperature
(iv) Flue-gas recirculation	Implies the reinjection of waste gas from the furnace into the flame to reduce the oxygen content and therefore the temperature of the flame. The use of special burners is based on internal recirculation of combustion gases which cool the root of the flames and reduce the oxygen content in the hottest part of the flames
(v) Low-NO_X burners	The technique is based on the principles of reducing peak flame temperatures, delaying but completing the combustion and increasing the heat transfer (increased emissivity of the flame). It may be associated with a modified design of the furnace combustion chamber

Technique	Description
(vi) Fuel choice	In general, oil-fired furnaces show lower NO_X emissions than gas-fired furnaces due to better thermal emissivity and lower flame temperatures
Special furnace design	Recuperative type furnace that integrates various features, allowing for lower flame temperatures. The main features are: — specific type of burners (number and positioning) — modified geometry of the furnace (height and size) — two-stage raw material preheating with waste gases passing over the raw materials entering the furnace and an external cullet preheater downstream of the recuperator used for preheating the combustion air
Electric melting	The technique consists of a melting furnace where the energy is provided by resistive heating. The main features are: — electrodes are generally inserted at the bottom of the furnace (cold-top) — nitrates are often required in the batch composition of cold-top electric furnaces to provide the necessary oxidising conditions for a stable, safe and efficient manufacturing process
Oxy-fuel melting	The technique involves the replacement of the combustion air with oxygen (> 90 % purity), with consequent elimination/reduction of thermal NO_X formation from nitrogen entering the furnace. The residual nitrogen content in the furnace depends on the purity of the oxygen supplied, on the quality of the fuel (% N_2 in natural gas) and on the potential air inlet
Chemical reduction by fuel	The technique is based on the injection of fossil fuel to the waste gas with chemical reduction of NO_X to N_2 through a series of reactions. In the 3R process, the fuel (natural gas or oil) is injected at the regenerator entrance. The technology is designed for use in regenerative furnaces
Selective catalytic reduction (SCR)	The technique is based on the reduction of NO_X to nitrogen in a catalytic bed by reaction with ammonia (in general aqueous solution) at an optimum operating temperature of around 300 – 450 °C. One or two layers of catalyst may be applied. A higher NO_X reduction is achieved with the use of higher amounts of catalyst (two layers)
Selective non-catalytic reduction (SNCR)	The technique is based on the reduction of NO_X to nitrogen by reaction with ammonia or urea at a high temperature. The operating temperature window must be maintained between 900 and 1 050 °C
Minimising the use of nitrates in the batch formulation	The minimisation of nitrates is used to reduce NO_X emissions deriving from the decomposition of these raw materials when applied as an oxidising agent for very high quality products where a very colourless (clear) glass is required or for other glasses to provide the required characteristics. The following options may be applied: — Reduce the presence of nitrates in the batch formulation to the minimum commensurate with the product and melting requirements. — Substitute nitrates with alternative materials. Effective alternatives are sulphates, arsenic oxides, cerium oxide. — Apply process modifications (e.g. special oxidising combustion conditions)

1.10.3. SO_X emissions

Technique	Description
Dry or semi-dry scrubbing, in combination with a filtration system	Dry powder or a suspension/solution of alkaline reagent are introduced and dispersed in the waste gas stream. The material reacts with the sulphur gaseous species to form a solid which has to be removed by filtration (bag filter or electrostatic precipitator). In general, the use of a reaction tower improves the removal efficiency of the scrubbing system
Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	The minimisation of sulphur content in the batch formulation is applied to reduce SO_X emissions deriving from the decomposition of sulphur-containing raw materials (in general, sulphates) used as fining agents. The effective reduction of SO_X emissions depends on the retention of sulphur compounds in the glass, which may vary significantly depending on the glass type, and on the optimisation of the sulphur balance
Use of low sulphur content fuels	The use of natural gas or low sulphur fuel oil is applied to reduce the amount of SO_X emissions deriving from the oxidation of sulphur contained in the fuel during combustion

1.10.4. HCl, HF emissions

Technique	Description
Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The technique consists of a careful selection of raw materials that may contain chlorides and fluorides as impurities (e.g. synthetic soda ash, dolomite, external cullet, recycled filter dust) in order to reduce at source HCl and HF emissions which arise from the decomposition of these materials during the melting process
Minimisation of the fluorine and/or chlorine compounds in the batch formulation and optimisation of the fluorine and/or chlorine mass balance	The minimisation of fluorine and/or chlorine emissions from the melting process may be achieved by minimising/reducing the quantity of these substances used in the batch formulation to the minimum commensurate with the quality of the final product. Fluorine compounds (e.g. fluorspar, cryolite, fluorsilicate) are used to confer particular characteristics to special glasses (e.g. opaque glass, optical glass). Chlorine compounds may be used as fining agents
Dry or semi-dry scrubbing, in combination with a filtration system	Dry powder or a suspension/solution of alkaline reagent are introduced and dispersed in the waste gas stream. The material reacts with the gaseous chlorides and fluorides to form a solid which has to be removed by filtration (electrostatic precipitator or bag filter)

1.10.5. Metal emissions

Technique	Description
Selection of raw materials for the batch formulation with a low content of metals	The technique consists of a careful selection of batch materials that may contain metals as impurities (e.g. external cullet), in order to reduce at source metal emissions which arise from the decomposition of these materials during the melting process
Minimising the use of metal compounds in the batch formulation, where colouring and decolourising of glass is needed, subject to consumer glass quality requirements	The minimisation of metal emissions from the melting process may be achieved as follows: — minimising the quantity of metal compounds in the batch formulation (e.g. iron, chromium, cobalt, copper, manganese compounds) in the production of coloured glasses — minimising the quantity of selenium compounds and cerium oxide used as decolourising agents for the production of clear glass

Technique	Description
Minimising the use of selenium compounds in the batch formulation, through a suitable selection of the raw materials	The minimisation of selenium emissions from the melting process may be achieved by: — minimising/reducing the quantity of selenium in the batch formulation to the minimum commensurate with the product requirements — selecting selenium raw materials with a lower volatility, in order to reduce the volatilisation phenomena during the melting process
Application of a filtration system	Dust abatement systems (bag filter and electrostatic precipitator) can reduce both dust and metal emissions since the emissions to air of metals from glass melting processes are largely contained in particulate form. However, for some metals presenting extremely volatile compounds (e.g. selenium) the removal efficiency may vary significantly with the filtration temperature
Dry or semi-dry scrubbing, in combination with a filtration system	Gaseous metals can be substantially reduced by the use of a dry or semi-dry scrubbing technique with an alkaline reagent. The alkaline reagent reacts with the gaseous species to form a solid which has to be removed by filtration (bag filter or electrostatic precipitator)

1.10.6. Combined gaseous emissions (e.g. SO_X, HCl, HF, boron compounds)

Wet scrubbing	In the wet scrubbing process, gaseous compounds are dissolved in a suitable liquid (water or alkaline solution). Downstream of the wet scrubber, the flue-gases are saturated with water and a separation of the droplets is required before discharging the flue-gases. The resulting liquid has to be treated by a waste water process and the insoluble matter is collected by sedimentation or filtration

1.10.7. Combined emissions (solid + gaseous)

Technique	Description
Wet scrubbing	In a wet scrubbing process (by a suitable liquid: water or alkaline solution), the simultaneous removal of solid and gaseous compounds may be achieved. The design criteria for particulate or gas removal are different; therefore, the design is often a compromise between the two options. The resulting liquid has to be treated by a waste water process and the insoluble matter (solid emissions and products from chemical reactions) is collected by sedimentation or filtration. In the mineral wool and continuous filament glass fibre sector, the most common systems applied are: — packed bed scrubbers with impact jets upstream — venturi scrubbers
Wet electrostatic precipitator	The technique consists of an electrostatic precipitator in which the collected material is removed from the plates of the collectors by flushing with a suitable liquid, usually water. Some mechanism is usually installed to remove water droplets before discharge of the waste gas (demister or a last dry field)

1.10.8. Emissions from cutting, grinding, polishing operations

Technique	Description
Performing dusty operations (e.g. cutting, grinding, polishing) under liquid	Water is generally used as a coolant for cutting, grinding and polishing operations and for preventing dust emissions. An extraction system equipped with a mist eliminator may be necessary

Technique	Description
Applying a bag filter system	The use of bag filters is suitable for the reduction of both dust and metal emissions since metals from downstream processes are largely contained in particulate form
Minimising the losses of polishing product by ensuring a good sealing of the application system	Acid polishing is performed by immersion of the glass articles in a polishing bath of hydrofluoric and sulphuric acids. The release of fumes may be minimised by a good design and maintenance of the application system in order to minimise losses
Applying a secondary technique, e.g. wet scrubbing	Wet scrubbing with water is used for the treatment of waste gases, due to the acidic nature of the emissions and the high solubility of the gaseous pollutants to be removed

1.10.9. H_2S, VOC emissions

Waste gas incineration	The technique consists of an afterburner system which oxidises the hydrogen sulphide (generated by strong reducing conditions in the melting furnace) to sulphur dioxide and carbon monoxide to carbon dioxide. Volatile organic compounds are thermally incinerated with consequent oxidation to carbon dioxide, water and other combustion products (e.g. NO_X, SO_X)

COMMISSION IMPLEMENTING DECISION

of 28 February 2012

establishing the best available techniques (BAT) conclusions under Directive 2010/75/EU of the European Parliament and of the Council on industrial emissions for iron and steel production

(notified under document C(2012) 903)

(Text with EEA relevance)

(2012/135/EU)

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Having regard to Directive 2010/75/EU of the European Parliament and of the Council of 24 November 2010 on industrial emissions (integrated pollution prevention and control) [1], and in particular Article 13(5) thereof,

Whereas:

(1) Article 13(1) of Directive 2010/75/EU requires the Commission to organise an exchange of information on industrial emissions between it and Member States, the industries concerned and non-governmental organisations promoting environmental protection in order to facilitate the drawing up of best available techniques (BAT) reference documents as defined in Article 3(11) of that Directive.

(2) In accordance with Article 13(2) of Directive 2010/75/EU, the exchange of information is to address the performance of installations and techniques in terms of emissions, expressed as short- and long-term averages, where appropriate, and the associated reference conditions, consumption and nature of raw materials, water consumption, use of energy and generation of waste and the techniques used, associated monitoring, cross-media effects, economic and technical viability and developments therein and also the best available techniques and emerging techniques identified after considering the issues mentioned in points (a) and (b) of Article 13(2) of that Directive.

(3) 'BAT conclusions' as defined in Article 3(12) of Directive 2010/75/EU are the key element of BAT reference documents and lay down the conclusions on best available techniques, their description, information to assess their applicability, the emission levels associated with the best available techniques, associated monitoring, associated consumption levels and, where appropriate, relevant site remediation measures.

(4) In accordance with Article 14(3) of Directive 2010/75/EU, BAT conclusions are to be the reference for setting the permit conditions for installations covered by Chapter 2 of that Directive.

(5) Article 15(3) of Directive 2010/75/EU requires the competent authority to set emission limit values that ensure that, under normal operating conditions, emissions do not exceed the emission levels associated with the best available techniques as laid down in the decisions on BAT conclusions referred to in Article 13(5) of that Directive.

(6) Article 15(4) of Directive 2010/75 provides for derogations from the requirement laid down in Article 15(3) only where the costs associated with the achievement of emissions levels disproportionately outweigh the environmental benefits due to the geographical location, the local environmental conditions or the technical characteristics of the installation concerned.

(7) Article 16(1) of Directive 2010/75/EU provides that the monitoring requirements in the permit referred to in point (c) of Article 14(1) are to be based on the conclusions on monitoring as described in the BAT conclusions.

(8) In accordance with Article 21(3) of Directive 2010/75/EU, within four years of publication of decisions on BAT conclusions, the competent authority is to reconsider and, if necessary, update all the permit conditions and ensure that the installation complies with those permit conditions.

(9) Commission Decision of 16 May 2011 establishing a forum for the exchange of information pursuant to Article 13 of the Directive 2010/75/EU on industrial emissions [2] established a forum composed of representatives of Member States, the industries concerned and non-governmental organisations promoting environmental protection.

[1] OJ L 334, 17.12.2010, p. 17.

[2] OJ C 146, 17.5.2011, p. 3.

(10) In accordance with Article 13(4) of Directive 2010/75/EU, the Commission obtained the opinion [1] of that forum on the proposed content of the BAT reference document for iron and steel production on 13 September 2011 and made it publicly available.

(11) The measures provided for in this Decision are in accordance with the opinion of the Committee established by Article 75(1) of Directive 2010/75/EU,

HAS ADOPTED THIS DECISION:

Article 1

The BAT conclusions for iron and steel production are set out in the Annex to this Decision.

Article 2

This Decision is addressed to the Member States.

Done at Brussels, 28 February 2012.

For the Commission
Janez POTOČNIK
Member of the Commission

ANNEX

BAT CONCLUSIONS FOR IRON AND STEEL PRODUCTION

SCOPE

These BAT conclusions concern the following activities specified in Annex I to Directive 2010/75/EU, namely:

— activity 1.3: coke production

— activity 2.1: metal ore (including sulphide ore) roasting and sintering

— activity 2.2: production of pig iron or steel (primary or secondary fusion) including continuous casting, with a capacity exceeding 2,5 tonnes per hour.

In particular, the BAT conclusions cover the following processes:

— the loading, unloading and handling of bulk raw materials

— the blending and mixing of raw materials

— the sintering and pelletisation of iron ore

— the production of coke from coking coal

— the production of hot metal by the blast furnace route, including slag processing

— the production and refining of steel using the basic oxygen process, including upstream ladle desulphurisation, downstream ladle metallurgy and slag processing

— the production of steel by electric arc furnaces, including downstream ladle metallurgy and slag processing

— continuous casting (thin slab/thin strip and direct sheet casting (near-shape))

These BAT conclusions do not address the following activities:

— production of lime in kilns, covered by the Cement, Lime and Magnesium Oxide Manufacturing Industries BREF (CLM)

— the treatment of dusts to recover non-ferrous metals (e.g. electric arc furnace dust) and the production of ferroalloys, covered by the Non-Ferrous Metals Industries BREF (NFM)

— sulphuric acid plants in coke ovens, covered by the Large Volume Inorganic Chemicals-Ammonia, Acids and Fertilisers Industries (LVIC-AAF BREF).

Other reference documents which are of relevance for the activities covered by these BAT conclusions are the following:

Reference documents	Activity
Large Combustion Plants BREF (LCP)	Combustion plants with a rated thermal input of 50 MW or more
Ferrous Metals Processing Industry BREF (FMP)	Downstream processes like rolling, pickling, coating, etc.
	Continuous casting to the thin slab/thin strip and direct sheet casting (near-shape)

Reference documents	Activity
Emissions from Storage BREF (EFS)	Storage and handling
Industrial Cooling Systems BREF (ICS)	Cooling systems
General Principles of Monitoring (MON)	Emissions and consumptions monitoring
Energy Efficiency BREF (ENE)	General energy efficiency
Economic and Cross-Media Effects (ECM)	Economic and cross-media effects of techniques

The techniques listed and described in these BAT conclusions are neither prescriptive nor exhaustive. Other techniques may be used that ensure at least an equivalent level of environmental protection.

GENERAL CONSIDERATIONS

The environmental performance levels associated with BAT are expressed as ranges, rather than as single values. A range may reflect the differences within a given type of installation (e.g. differences in the grade/purity and quality of the final product, differences in design, construction, size and capacity of the installation) that result in variations in the environmental performances achieved when applying BAT

EXPRESSION OF EMISSION LEVELS ASSOCIATED WITH THE BEST AVAILABLE TECHNIQUES (BAT-AELs)

In these BAT conclusions, BAT-AELs for air emissions are expressed as either:

— mass of emitted substances per volume of waste gas under standard conditions (273,15 K, 101,3 kPa), after deduction of water vapour content, expressed in the units g/Nm^3, mg/Nm^3, $\mu g/Nm^3$ or ng/Nm^3; or

— mass of emitted substances per unit of mass of products generated or processed (consumption or emission factors), expressed in the units kg/t, g/t, mg/t or µg/t.

and BAT-AELs for emissions to water are expressed as:

— mass of emitted substances per volume of waste water, expressed in the units g/l, mg/l or µg/l.

DEFINITIONS

For the purposes of these BAT conclusions:

— 'new plant' means: a plant introduced on the site of the installation following the publication of these BAT conclusions or a complete replacement of a plant on the existing foundations of the installation following the publication of these BAT conclusions

— 'existing plant' means: a plant which is not a new plant

— 'NO_X' means: the sum of nitrogen oxide (NO) and nitrogen dioxide (NO_2) expressed as NO_2

— 'SO_X' means: the sum of sulphur dioxide (SO_2) and sulphur trioxide (SO_3) expressed as SO_2

— 'HCl' means: all gaseous chlorides expressed as HCl

— 'HF' means: all gaseous fluorides expressed as HF

1.1. *General BAT Conclusions*

Unless otherwise stated, the BAT conclusions presented in this section are generally applicable.

The process specific BAT included in the Sections 1.2 – 1.7 apply in addition to the general BAT mentioned in this Section.

1.1.1. Environmental management systems

1. BAT is to implement and adhere to an environmental management system (EMS) that incorporates all of the following features:

I. commitment of management, including senior management;

II. definition of an environmental policy that includes continuous improvement for the installation by the management;

III. planning and establishing the necessary procedures, objectives and targets, in conjunction with financial planning and investment;

IV. implementation of the procedures paying particular attention to:

(i) structure and responsibility

(ii) training, awareness and competence

(iii) communication

(iv) employee involvement

(v) documentation

(vi) efficient process control

(vii) maintenance programmes

(viii) emergency preparedness and response

(ix) safeguarding compliance with environmental legislation;

V. checking performance and taking corrective action, paying particular attention to:

(i) monitoring and measurement (see also the Reference Document on the General Principles of Monitoring)

(ii) corrective and preventive action

(iii) maintenance of records

(iv) independent (where practicable) internal and external auditing in order to determine whether or not the EMS conforms to planned arrangements and has been properly implemented and maintained;

VI. review of the EMS and its continuing suitability, adequacy and effectiveness by senior management;

VII. following the development of cleaner technologies;

VIII. consideration for the environmental impacts from the eventual decommissioning of the installation at the stage of designing a new plant, and throughout its operating life;

IX. application of sectoral benchmarking on a regular basis.

Applicability

The scope (e.g. level of details) and nature of the EMS (e.g. standardised or non-standardised) will generally be related to the nature, scale and complexity of the installation, and the range of environmental impacts it may have.

1.1.2. Energy management

2. BAT is to reduce thermal energy consumption by using a combination of the following techniques:

I. improved and optimised systems to achieve smooth and stable processing, operating close to the process parameter set points by using

(i) process control optimisation including computer-based automatic control systems

(ii) modern, gravimetric solid fuel feed systems

(iii) preheating, to the greatest extent possible, considering the existing process configuration.

II. recovering excess heat from processes, especially from their cooling zones

III. an optimised steam and heat management

IV. applying process integrated reuse of sensible heat as much as possible.

In the context of energy management, see the Energy Efficiency BREF (ENE).

Description of BAT I.i

The following items are important for integrated steelworks in order to improve the overall energy efficiency:

— optimising energy consumption

— online monitoring for the most important energy flows and combustion processes at the site including the monitoring of all gas flares in order to prevent energy losses, enabling instant maintenance and achieving an undisrupted production process

— reporting and analysing tools to check the average energy consumption of each process

— defining specific energy consumption levels for relevant processes and comparing them on a long-term basis

— carrying out energy audits as defined in the Energy Efficiency BREF, e.g. to identify cost-effective energy savings opportunities.

Description of BAT II – IV

Process integrated techniques used to improve energy efficiency in steel manufacturing by improved heat recovery include:

— combined heat and power production with recovery of waste heat by heat exchangers and distribution either to other parts of the steelworks or to a district heating network

— the installation of steam boilers or adequate systems in large reheating furnaces (furnaces can cover a part of the steam demand)

— preheating of the combustion air in furnaces and other burning systems to save fuel, taking into consideration adverse effects, i.e. an increase of nitrogen oxides in the off-gas

— the insulation of steam pipes and hot water pipes

— recovery of heat from products, e.g. sinter

— where steel needs to be cooled, the use of both heat pumps and solar panels

— the use of flue-gas boilers in furnaces with high temperatures

— the oxygen evaporation and compressor cooling to exchange energy across standard heat exchangers

— the use of top recovery turbines to convert the kinetic energy of the gas produced in the blast furnace into electric power.

Applicability of BAT II – IV

Combined heat and power generation is applicable for all iron and steel plants close to urban areas with a suitable heat demand. The specific energy consumption depends on the scope of the process, the product quality and the type of installation (e.g. the amount of vacuum treatment at the basic oxygen furnace (BOF), annealing temperature, thickness of products, etc.).

3. BAT is to reduce primary energy consumption by optimisation of energy flows and optimised utilisation of the extracted process gases such as coke oven gas, blast furnace gas and basic oxygen gas.

Description

Process integrated techniques to improve energy efficiency in an integrated steelworks by optimising process gas utilisation include:

— the use of gas holders for all by-product gases or other adequate systems for short-term storage and pressure holding facilities

— increasing pressure in the gas grid if there are energy losses in the flares – in order to utilise more process gases with the resulting increase in the utilisation rate

— gas enrichment with process gases and different calorific values for different consumers

— heating fire furnaces with process gas

— use of a computer-controlled calorific value control system

— recording and using coke and flue-gas temperatures

— adequate dimensioning of the capacity of the energy recovery installations for the process gases, in particular with regard to the variability of process gases.

Applicability

The specific energy consumption depends on the scope of the process, the product quality and the type of installation (e.g. the amount of vacuum treatment at the BOF, annealing temperature, thickness of products, etc.).

4. BAT is to use desulphurised and dedusted surplus coke oven gas and dedusted blast furnace gas and basic oxygen gas (mixed or separate) in boilers or in combined heat and power plants to generate steam, electricity and/or heat using surplus waste heat for internal or external heating networks, if there is a demand from a third party.

Applicability

The cooperation and agreement of a third party may not be within the control of the operator, and therefore may not be within the scope of the permit.

5. BAT is to minimise electrical energy consumption by using one or a combination of the following techniques:

I. power management systems

II. grinding, pumping, ventilation and conveying equipment and other electricity-based equipment with high energy efficiency.

Applicability

Frequency controlled pumps cannot be used where the reliability of the pumps is of essential importance for the safety of the process.

1.1.3. Material management

6. BAT is to optimise the management and control of internal material flows in order to prevent pollution, prevent deterioration, provide adequate input quality, allow reuse and recycling and to improve the process efficiency and optimisation of the metal yield.

Description

Appropriate storage and handling of input materials and production residues can help to minimise the airborne dust emissions from stockyards and conveyor belts, including transfer points, and to avoid soil, groundwater and runoff water pollution (see also BAT 11).

The application of an adequate management of integrated steelworks and residues, including wastes, from other installations and sectors allows for a maximised internal and/or external use as raw materials (see also BAT 8, 9 and 10).

Material management includes the controlled disposal of small parts of the overall quantity of residues from an integrated steelworks which have no economic use.

7. In order to achieve low emission levels for relevant pollutants, BAT is to select appropriate scrap qualities and other raw materials. Regarding scrap, BAT is to undertake an appropriate inspection for visible contaminants which might contain heavy metals, in particular mercury, or might lead to the formation of polychlorinated dibenzodioxins/furans (PCDD/F) and polychlorinated biphenyls (PCB).

To improve the use of scrap, the following techniques can be used individually or in combination:

— specification of acceptance criteria suited to the production profile in purchase orders of scrap

— having a good knowledge of scrap composition by closely monitoring the origin of the scrap; in exceptional cases, a melt test might help characterise the composition of the scrap

— having adequate reception facilities and check deliveries

— having procedures to exclude scrap that is not suitable for use in the installation

— storing the scrap according to different criteria (e.g. size, alloys, degree of cleanliness); storing of scrap with potential release of contaminants to the soil on impermeable surfaces with a drainage and collection system; using a roof which can reduce the need for such a system

— putting together the scrap load for the different melts taking into account the knowledge of composition in order to use the most suitable scrap for the steel grade to be produced (this is essential in some cases to avoid the presence of undesired elements and in other cases to take advantage of alloy elements which are present in the scrap and needed for the steel grade to be produced)

— prompt return of all internally-generated scrap to the scrapyard for recycling

— having an operation and management plan

— scrap sorting to minimise the risk of including hazardous or non-ferrous contaminants, particularly polychlorinated biphenyls (PCB) and oil or grease. This is normally done by the scrap supplier but the operator inspects all scrap loads in sealed containers for safety reasons. Therefore, at the same time, it is possible to check, as far as practicable, for contaminants. Evaluation of the small quantities of plastic (e.g. as plastic coated components) may be required

— radioactivity control according to the United Nations Economic Commission for Europe (UNECE) Expert Group framework of recommendations

— implementation of the mandatory removal of components which contain mercury from End-of-Life Vehicles and Waste Electrical and Electronic Equipment (WEEE) by the scrap processors can be improved by:

— fixing the absence of mercury in scrap purchase contracts

— refusal of scrap which contains visible electronic components and assemblies.

Applicability

The selection and sorting of scrap might not be entirely within the control of the operator.

1.1.4. Management of process residues such as by-products and waste

8. BAT for solid residues is to use integrated techniques and operational techniques for waste minimisation by internal use or by application of specialised recycling processes (internally or externally).

Description

Techniques for the recycling of iron-rich residues include specialised recycling techniques such as the OxyCup® shaft furnace, the DK process, smelting reduction processes or cold bonded pelletting/briquetting as well as techniques for production residues mentioned in Sections 9.2 – 9.7.

Applicability

As the mentioned processes may be carried out by a third party, the recycling itself may not be within the control of the operator of the iron and steel plant, and therefore may not be within the scope of the permit.

9. BAT is to maximise external use or recycling for solid residues which cannot be used or recycled according to BAT 8, wherever this is possible and in line with waste regulations. BAT is to manage in a controlled manner residues which can neither be avoided nor recycled.

10. BAT is to use the best operational and maintenance practices for the collection, handling, storage and transport of all solid residues and for the hooding of transfer points to avoid emissions to air and water.

1.1.5. Diffuse dust emissions from materials storage, handling and transport of raw materials and (intermediate) products

11. BAT is to prevent or reduce diffuse dust emissions from materials storage, handling and transport by using one or a combination of the techniques mentioned below.

If abatement techniques are used, BAT is to optimise the capture efficiency and subsequent cleaning through appropriate techniques such as those mentioned below. Preference is given to the collection of the dust emissions nearest to the source.

I. General techniques include:

— the setting up within the EMS of the steelworks of an associated diffuse dust action plan;

— consideration of temporary cessation of certain operations where they are identified as a source of PM_{10} causing a high ambient reading; in order to do this, it will be necessary to have sufficient PM_{10} monitors, with associated wind direction and strength monitoring, to be able to triangulate and identify key sources of fine dust.

II. Techniques for the prevention of dust releases during the handling and transport of bulk raw materials include:

— orientation of long stockpiles in the direction of the prevailing wind

— installing wind barriers or using natural terrain to provide shelter

— controlling the moisture content of the material delivered

— careful attention to procedures to avoid the unnecessary handling of materials and long unenclosed drops

— adequate containment on conveyors and in hoppers, etc.

— the use of dust-suppressing water sprays, with additives such as latex, where appropriate

— rigorous maintenance standards for equipment

— high standards of housekeeping, in particular the cleaning and damping of roads

— the use of mobile and stationary vacuum cleaning equipment

— dust suppression or dust extraction and the use of a bag filter cleaning plant to abate sources of significant dust generation

— the application of emissions-reduced sweeping cars for carrying out the routine cleaning of hard surfaced roads.

III. Techniques for materials delivery, storage and reclamation activities include:

— total enclosure of unloading hoppers in a building equipped with filtered air extraction for dusty materials, or hoppers should be fitted with dust baffles and the unloading grids coupled to a dust extraction and cleaning system

— limiting the drop heights if possible to a maximum of 0,5 m

— the use of water sprays (preferably using recycled water) for dust suppression

— where necessary, the fitting of storage bins with filter units to control dust

— the use of totally enclosed devices for reclamation from bins

— where necessary, the storage of scrap in covered, and hard surfaced areas to reduce the risk of ground contamination (using just in time delivery to minimise the size of the yard and hence emissions)

— minimisation of the disturbance of stockpiles

— restriction of the height and a controlling of the general shape of stockpiles

— the use of in-building or in-vessel storage, rather than external stockpiles, if the scale of storage is appropriate

— the creation of windbreaks by natural terrain, banks of earth or the planting of long grass and evergreen trees in open areas to capture and absorb dust without suffering long-term harm

— hydro-seeding of waste tips and slag heaps

— implementation of a greening of the site by covering unused areas with top soil and planting grass, shrubs and other ground covering vegetation

— the moistening of the surface using durable dust-binding substances

— the covering of the surface with tarpaulins or coating (e.g. latex) stockpiles

— the application of storage with retaining walls to reduce the exposed surface

— when necessary, a measure could be to include impermeable surfaces with concrete and drainage.

IV. Where fuel and raw materials are delivered by sea and dust releases could be significant, some techniques include:

— use by operators of self-discharge vessels or enclosed continuous unloaders. Otherwise, dust generated by grab-type ship unloaders should be minimised through a combination of ensuring adequate moisture content of the material is delivered, by minimising drop heights and by using water sprays or fine water fogs at the mouth of the ship unloader hopper

— avoiding seawater in spraying ores or fluxes as this results in a fouling of sinter plant electrostatic precipitators with sodium chloride. Additional chlorine input in the raw materials may also lead to rising emissions (e.g. of polychlorinated dibenzodioxins/furans (PCDD/F)) and hamper filter dust recirculation

— storage of powdered carbon, lime and calcium carbide in sealed silos and conveying them pneumatically or storing and transferring them in sealed bags.

V. Train or truck unloading techniques include:

— if necessary due to dust emission formation, use of dedicated unloading equipment with a generally enclosed design.

VI. For highly drift-sensitive materials which may lead to significant dust release, some techniques include:

— use of transfer points, vibrating screens, crushers, hoppers and the like, which may be totally enclosed and extracted to a bag filter plant

— use of central or local vacuum cleaning systems rather than washing down for the removal of spillage, since the effects are restricted to one medium and the recycling of spilt material is simplified.

VII. Techniques for the handling and processing of slag include:

— keeping stockpiles of slag granulate damp for slag handling and processing since dried blast furnace slag and steel slag can give rise to dust

— use of enclosed slag-crushing equipment fitted with efficient extraction and bag filters to reduce dust emissions.

VIII. Techniques for handling scrap include:

— providing scrap storage under cover and/or on concrete floors to minimise dust lift-off caused by vehicle movements

IX. Techniques to consider during material transport include:

— the minimisation of points of access from public highways

— the employment of wheel-cleaning equipment to prevent the carryover of mud and dust onto public roads

— the application of hard surfaces to the transport roads (concrete or asphalt) to minimise the generation of dust clouds during materials transport and the cleaning of roads

— the restriction of vehicles to designated routes by fences, ditches or banks of recycled slag

— the damping of dusty routes by water sprays, e.g. at slag-handling operations

— ensuring that transport vehicles are not overfull, so as to prevent any spillage

— ensuring that transport vehicles are sheeted to cover the material carried

— the minimisation of numbers of transfers

— use of closed or enclosed conveyors

— use of tubular conveyors, where possible, to minimise material losses by changes of direction across sites usually provided by the discharge of materials from one belt onto another

— good practice techniques for molten metal transfer and ladle handling

— dedusting of conveyor transfer points.

1.1.6. Water and waste water management

12. BAT for waste water management is to prevent, collect and separate waste water types, maximising internal recycling and using an adequate treatment for each final flow. This includes techniques utilising, e.g. oil interceptors, filtration or sedimentation. In this context, the following techniques can be used where the prerequisites mentioned are present:

— avoiding the use of potable water for production lines

— increasing the number and/or capacity of water circulating systems when building new plants or modernising/revamping existing plants

— centralising the distribution of incoming fresh water

— using the water in cascades until single parameters reach their legal or technical limits

— using the water in other plants if only single parameters of the water are affected and further usage is possible

— keeping treated and untreated waste water separated; by this measure it is possible to dispose of waste water in different ways at a reasonable cost

— using rainwater whenever possible.

Applicability

The water management in an integrated steelworks will primarily be constrained by the availability and quality of fresh water and local legal requirements. In existing plants the existing configuration of the water circuits may limit applicability.

1.1.7. Monitoring

13. BAT is to measure or assess all relevant parameters necessary to steer the processes from control rooms by means of modern computer-based systems in order to adjust continuously and to optimise the processes online, to ensure stable and smooth processing, thus increasing energy efficiency and maximising the yield and improving maintenance practices.

14. BAT is to measure the stack emissions of pollutants from the main emission sources from all processes included in the Sections 1.2 – 1.7 whenever BAT-AELs are given and in process gas-fired power plants in iron and steel works.

BAT is to use continuous measurements at least for:

— primary emissions of dust, nitrogen oxides (NO_X) and sulphur dioxide (SO_2) from sinter strands

— nitrogen oxides (NO_X) and sulphur dioxide (SO_2) emissions from induration strands of pelletisation plants

— dust emissions from blast furnace cast houses

— secondary emissions of dust from basic oxygen furnaces

— emissions of nitrogen oxides (NO_X) from power plants

— dust emissions from large electric arc furnaces.

For other emissions, BAT is to consider using continuous emission monitoring depending on the mass flow and emission characteristics.

15. For relevant emission sources not mentioned in BAT 14, BAT is to measure the emissions of pollutants from all processes included in the Sections 1.2 – 1.7 and from process gas-fired power plants within iron and steel works as well as all relevant process gas components/pollutants periodically and discontinuously. This includes the discontinuous monitoring of process gases, stack emissions, polychlorinated dibenzodioxins/furans (PCDD/F) and monitoring the discharge of waste water, but excludes diffuse emissions (see BAT 16).

Description (relevant for BAT 14 and 15)

The monitoring of process gases provides information about the composition of process gases and about indirect emissions from the combustion of process gases, such as emissions of dust, heavy metals and SO_x.

Stack emissions can be measured by regular, periodic discontinuous measurements at relevant channelled emission sources over a sufficiently long period, to obtain representative emission values.

For monitoring the discharge of waste water a great variety of standardised procedures exist for sampling and analyzing water and waste water, including:

— a random sample which refers to a single sample taken from a waste water flow

— a composite sample, which refers to a sample taken continuously over a given period, or a sample consisting of several samples taken either continuously or discontinuously over a given period and blended

— a qualified random sample shall refer to a composite sample of at least five random samples taken over a maximum period of two hours at intervals of no less than two minutes, and blended.

Monitoring should be done according to the relevant EN or ISO standards. If EN or ISO standards are not available, national or other international standards should be used that ensure the provision of data of an equivalent scientific quality.

16. BAT is to determine the order of magnitude of diffuse emissions from relevant sources by the methods mentioned below. Whenever possible, direct measurement methods are preferred over indirect methods or evaluations based on calculations with emission factors.

— Direct measurement methods where the emissions are measured at the source itself. In this case, concentrations and mass streams can be measured or determined.

— Indirect measurement methods where the emission determination takes place at a certain distance from the source; a direct measurement of concentrations and mass stream is not possible.

— Calculation with emission factors.

Description

Direct or quasi-direct measurement

Examples for direct measurements are measurements in wind tunnels, with hoods or other methods like quasi-emissions measurements on the roof of an industrial installation. For the latter case, the wind velocity and the area of the roofline vent are measured and a flow rate is calculated. The cross-section of the measurement plane of the roofline vent is subdivided into sectors of identical surface area (grid measurement).

Indirect measurements

Examples of indirect measurements include the use of tracer gases, reverse dispersion modelling (RDM) methods and the mass balance method applying light detection and ranging (LIDAR).

Calculation of emissions with emission factors

Guidelines using emission factors for the estimation of diffuse dust emissions from storage and handling of bulk materials and for the suspension of dust from roadways due to traffic movements are:

— VDI 3790 Part 3

— US EPA AP 42

1.1.8. Decommissioning

17. BAT is to prevent pollution upon decommissioning by using necessary techniques as listed below.

Design considerations for end-of-life plant decommissioning:

I. giving consideration to the environmental impact from the eventual decommissioning of the installation at the stage of designing a new plant, as forethought makes decommissioning easier, cleaner and cheaper

II. decommissioning poses environmental risks for the contamination of land (and groundwater) and generates large quantities of solid waste; preventive techniques are process-specific but general considerations may include:

(i) avoiding underground structures

(ii) incorporating features that facilitate dismantling

(iii) choosing surface finishes that are easily decontaminated

(iv) using an equipment configuration that minimises trapped chemicals and facilitates drain-down or cleaning

(v) designing flexible, self-contained units that enable phased closure

(vi) using biodegradable and recyclable materials where possible.

1.1.9. Noise

18. BAT is to reduce noise emissions from relevant sources in the iron and steel manufacturing processes by using one or more of the following techniques depending on and according to local conditions:

— implementation of a noise-reduction strategy

— enclosure of the noisy operations/units

— vibration insulation of operations/units

— internal and external lining made of impact-absorbent material

— soundproofing buildings to shelter any noisy operations involving material transformation equipment

— building noise protection walls, e.g. the construction of buildings or natural barriers, such as growing trees and bushes between the protected area and the noisy activity

— outlet silencers on exhaust stacks

— lagging ducts and final blowers which are situated in soundproof buildings

— closing doors and windows of covered areas.

1.2. *BAT Conclusions For Sinter Plants*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all sinter plants.

Air emissions

19. BAT for blending/mixing is to prevent or reduce diffuse dust emissions by agglomerating fine materials by adjusting the moisture content (see also BAT 11).

20. BAT for primary emissions from sinter plants is to reduce dust emissions from the sinter strand waste gas by means of a bag filter.

BAT for primary emissions for existing plants is to reduce dust emissions from the sinter strand waste gas by using advanced electrostatic precipitators when bag filters are not applicable.

The BAT-associated emission level for dust is < 1 – 15 mg/Nm^3 for the bag filter and < 20 – 40 mg/Nm^3 for the advanced electrostatic precipitator (which should be designed and operated to achieve these values), both determined as a daily mean value.

Bag Filter

Description

Bag filters used in sinter plants are usually applied downstream of an existing electrostatic precipitator or cyclone but can also be operated as a standalone device.

Applicability

For existing plants requirements such as space for a downstream installation to the electrostatic precipitator can be relevant. Special regard should be given to the age and the performance of the existing electrostatic precipitator.

Advanced electrostatic precipitator

Description

Advanced electrostatic precipitators are characterised by one or a combination of the following features:

— good process control

— additional electrical fields

— adapted strength of the electric field

— adapted moisture content

— conditioning with additives

— higher or variably pulsed voltages

— rapid reaction voltage

— high energy pulse superimposition

— moving electrodes

— enlarging the electrode plate distance or other features which improves the abatement efficiency.

21. BAT for primary emissions from sinter strands is to prevent or reduce mercury emissions by selecting raw materials with a low mercury content (see BAT 7) or to treat waste gases in combination with activated carbon or activated lignite coke injection.

The BAT-associated emissions level for mercury is < 0,03 – 0,05 mg/Nm^3, as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

22. BAT for primary emissions from sinter strands is to reduce sulphur oxide (SO_X) emissions by using one or a combination of the following techniques:

I. lowering the sulphur input by using coke breeze with a low sulphur content

II. lowering the sulphur input by minimisation of coke breeze consumption

III. lowering the sulphur input by using iron ore with a low sulphur content

IV. injection of adequate adsorption agents into the waste gas duct of the sinter strand before dedusting by bag filter (see BAT 20)

V. wet desulphurisation or regenerative activated carbon (RAC) process (with particular consideration for the prerequisites for application).

The BAT-associated emission level for sulphur oxides (SO_X) using BAT I – IV is < 350 – 500 mg/Nm^3, expressed as sulphur dioxide (SO_2) and determined as a daily mean value, the lower value being associated with BAT IV.

The BAT-associated emission level for sulphur oxides (SO_X) using BAT V is < 100 mg/Nm^3, expressed as sulphur dioxide (SO_2) and determined as a daily mean value.

Description of the *RAC process* mentioned under BAT V

Dry desulphurisation techniques are based on an adsorption of SO_2 by activated carbon. When the SO_2-laden activated carbon is regenerated, the process is called regenerated activated carbon (RAC). In this case, a high quality, expensive activated carbon type may be used and sulphuric acid (H_2SO_4) is yielded as a by-product. The bed is regenerated either with water or thermally. In some cases, for 'fine-tuning' downstream of an existing desulphurisation unit, lignite-based activated carbon is used. In this case, the SO_2-laden activated carbon is usually incinerated under controlled conditions.

The RAC system can be developed as a single-stage or a two-stage process.

In the single-stage process, the waste gases are led through a bed of activated carbon and pollutants are adsorbed by the activated carbon. Additionally, NO_X removal occurs when ammonia (NH_3) is injected into the gas stream before the catalyst bed.

In the two-stage process, the waste gases are led through two beds of activated carbon. Ammonia can be injected before the bed to reduce NO_X emissions.

Applicability of techniques mentioned under BAT V

Wet desulphurisation: The requirements of space may be of significance and may restrict the applicability. High investment and operational costs and significant cross-media effects such as slurry generation and disposal and additional waste water treatment measures, have to be taken into account. This technique is not used in Europe at the time of writing, but might be an option where environmental quality standards are unlikely to be met through the application of other techniques.

RAC: Dust abatement should be installed prior to the RAC process to reduce the inlet dust concentration. Generally the layout of the plant and space requirements are important factors when considering this technique, but especially for a site with more than one sinter strand.

High investment and operational costs, in particular when high quality, expensive, activated carbon types may be used and a sulphuric acid plant is needed, have to be taken into account. This technique is not used in Europe at the time of writing, but might be an option in new plants targeting SO_X, NO_X, dust and PCDD/F simultaneously and in circumstances where environmental quality standards are unlikely to be met through the application of other techniques.

23. BAT for primary emissions from sinter strands is to reduce total nitrogen oxides (NO_X) emissions by using one or a combination of the following techniques:

I. process integrated measures which can include:

(i) waste gas recirculation

(ii) other primary measures, such as the use of anthracite or the use of low-NO_X burners for ignition

II. end-of-pipe techniques which can include

(i) the regenerative activated carbon (RAC) process

(ii) selective catalytic reduction (SCR).

The BAT-associated emission level for nitrogen oxides (NO_X) using process integrated measures is < 500 mg/Nm^3, expressed as nitrogen dioxide (NO_2) and determined as a daily mean value.

The BAT-associated emission level for nitrogen oxides (NO_X) using RAC is < 250 mg/Nm^3 and using SCR it is < 120 mg/Nm^3, expressed as nitrogen dioxide (NO_2), related to an oxygen content of 15 % and determined as daily mean values.

Description of *waste gas recirculation* under BAT I.i

In the partial recycling of waste gas, some portions of the sinter waste gas are recirculated to the sintering process. Partial recycling of waste gas from the whole strand was primarily developed to reduce waste gas flow and thus the mass emissions of major pollutants. Additionally it can lead to a decrease in energy consumption. The application of waste gas recirculation requires special efforts to ensure that the sinter quality and productivity are not affected negatively. Special attention needs to be paid to carbon monoxide (CO) in the recirculated waste gas in order to prevent carbon monoxide poisoning of employees. Various processes have been developed such as:

— partial recycling of waste gas from the whole strand

— recycling of waste gas from the end sinter strand combined with heat exchange

— recycling of waste gas from part of the end sinter strand and use of waste gas from the sinter cooler

— recycling of parts of waste gas to other parts of the sinter strand.

Applicability of BAT I.i

The applicability of this technique is site specific. Accompanying measures to ensure that sinter quality (cold mechanical strength) and strand productivity are not negatively affected must be considered. Depending on local conditions, these can be relatively minor and easy to implement or, on the contrary, they can be of a more fundamental nature and may be costly and difficult to introduce. In any case, the operating conditions of the strand should be reviewed when this technique is introduced.

In existing plants, it may not be possible to install a partial recycling of waste gas due to space restrictions.

Important considerations in determining the applicability of this technique include:

— initial configuration of the strand (e.g. dual or single wind-box ducts, space available for new equipment and, when required, lengthening of the strand)

— initial design of the existing equipment (e.g. fans, gas cleaning and sinter screening and cooling devices)

— initial operating conditions (e.g. raw materials, layer height, suction pressure, percentage of quick lime in the mix, specific flow rate, percentage of in-plant reverts returned in the feed)

— existing performance in terms of productivity and solid fuel consumption

— basicity index of the sinter and composition of the burden at the blast furnace (e.g. percentage of sinter versus pellet in the burden, iron content of these components).

Applicability of *other primary measures* under BAT I.ii

The use of anthracite depends on the availability of anthracites with a lower nitrogen content compared to coke breeze.

Description and applicability of the *RAC process* under BAT II.i see BAT 22.

Applicability of the *SCR* process under BAT II.ii

SCR can be applied within a high dust system, a low dust system and as a clean gas system. Until now, only clean gas systems (after dedusting and desulphurisation) have been applied at sinter plants. It is essential that the gas is low in dust (< 40 mg dust/Nm^3) and heavy metals, because they can make the surface of the catalyst ineffective. Additionally, desulphurisation prior to the catalyst might be required. Another prerequisite is a minimum off-gas temperature of about 300 °C. This requires an energy input.

The high investment and operational costs, the need for catalyst revitalisation, NH_3 consumption and slip, the accumulation of explosive ammonium nitrate (NH_4NO_3), the formation of corrosive SO_3 and the additional energy required for reheating which can reduce the possibilities for recovery of sensible heat from the sinter process, all may constrain the applicability. This technique might be an option where environmental quality standards are unlikely to be met through the application of other techniques.

24. BAT for primary emissions from sinter strands is to prevent and/or reduce emissions of polychlorinated dibenzodioxins/furans (PCDD/F) and polychlorinated biphenyls (PCB) by using one or a combination of the following techniques:

I. avoidance of raw materials which contain polychlorinated dibenzodioxins/furans (PCDD/F) and polychlorinated biphenyls (PCB) or their precursors as much as possible (see BAT 7)

II. suppression of polychlorinated dibenzodioxins/furans (PCDD/F) formation by addition of nitrogen compounds

III. waste gas recirculation (see BAT 23 for description and applicability).

25. BAT for primary emissions from sinter strands is to reduce emissions of polychlorinated dibenzodioxins/furans (PCDD/F) and polychlorinated biphenyls (PCB) by the injection of adequate adsorption agents into the waste gas duct of the sinter strand before dedusting with a bag filter or advanced electrostatic precipitators when bag filters are not applicable (see BAT 20).

The BAT- associated emission level for polychlorinated dibenzodioxins/furans (PCDD/F) is < 0,05 – 0,2 ng I-TEQ/Nm^3 for the bag filter and < 0,2 – 0,4 ng-I-TEQ/Nm^3 for the advanced electrostatic precipitator, both determined for a 6 – 8 hour random sample under steady-state conditions.

26. BAT for secondary emissions from sinter strand discharge, sinter crushing, cooling, screening and conveyor transfer points is to prevent dust emissions and/or to achieve an efficient extraction and subsequently to reduce dust emissions by using a combination of the following techniques:

I. hooding and/or enclosure

II. an electrostatic precipitator or a bag filter.

The BAT-associated emission level for dust is < 10 mg/Nm^3 for the bag filter and < 30 mg/Nm^3 for the electrostatic precipitator, both determined as a daily mean value.

Water and waste water

27. BAT is to minimise water consumption in sinter plants by recycling cooling water as much as possible unless once-through cooling systems are used.

28. BAT is to treat the effluent water from sinter plants where rinsing water is used or where a wet waste gas treatment system is applied, with the exception of cooling water prior to discharge by using a combination of the following techniques:

I. heavy metal precipitation

II. neutralisation

III. sand filtration.

The BAT-associated emission levels, based on a qualified random sample or a 24-hour composite sample, are:

— suspended solids	< 30 mg/l
— chemical oxygen demand (COD [1])	< 100 mg/l
— heavy metals	< 0,1 mg/l

(sum of arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), mercury (Hg), nickel (Ni), lead (Pb), and zinc (Zn)).

Production residues

29. BAT is to prevent waste generation within sinter plants by using one or a combination of the following techniques (see BAT 8):

I. selective on-site recycling of residues back to the sinter process by excluding heavy metals, alkali or chloride-enriched fine dust fractions (e.g. the dust from the last electrostatic precipitator field)

II. external recycling whenever on-site recycling is hampered.

BAT is to manage in a controlled manner sinter plant process residues which can neither be avoided nor recycled.

30. BAT is to recycle residues that may contain oil, such as dust, sludge and mill scale which contain iron and carbon from the sinter strand and other processes in the integrated steelworks, as much as possible back to the sinter strand, taking into account the respective oil content.

[1] In some cases, TOC is measured instead of COD (in order to avoid $HgCl_2$ used in the analysis for COD). The correlation between COD and TOC should be elaborated for each sinter plant case by case. The COD/TOC ratio may vary approximately between two and four.

31. BAT is to lower the hydrocarbon content of the sinter feed by appropriate selection and pretreatment of the recycled process residues.

In all cases, the oil content of the recycled process residues should be < 0,5 % and the content of the sinter feed < 0,1 %.

Description

The input of hydrocarbons can be minimised, especially by the reduction of the oil input. Oil enters the sinter feed mainly by addition of mill scale. The oil content of mill scales can vary significantly, depending on their origin.

Techniques to minimise oil input via dusts and mill scale include the following:

— limiting input of oil by segregating and then selecting only those dusts and mill scale with a low oil content

— the use of 'good housekeeping' techniques in the rolling mills can result in a substantial reduction in the contaminant oil content of mill scale

— de-oiling of mill scale by:

  — heating the mill scale to approximately 800 °C, the oil hydrocarbons are volatilised and clean mill scale is yielded; the volatilised hydrocarbons can be combusted.

  — extracting oil from the mill scale using a solvent.

Energy

32. BAT is to reduce thermal energy consumption within sinter plants by using one or a combination of the following techniques:

I. recovering sensible heat from the sinter cooler waste gas

II. recovering sensible heat, if feasible, from the sintering grate waste gas

III. maximising the recirculation of waste gases to use sensible heat (see BAT 23 for description and applicability).

Description

Two kinds of potentially reusable waste energies are discharged from the sinter plants:

— the sensible heat from the waste gases from the sintering machines

— the sensible heat of the cooling air from the sinter cooler.

Partial waste gas recirculation is a special case of heat recovery from waste gases from sintering machines and is dealt with in BAT 23. The sensible heat is transferred directly back to the sinter bed by the hot recirculated gases. At the time of writing (2010), this is the only practical method of recovering heat from the waste gases.

The sensible heat in the hot air from the sinter cooler can be recovered by one or more of the following ways:

— steam generation in a waste heat boiler for use in the iron and steel works

— hot water generation for district heating

— preheating combustion air in the ignition hood of the sinter plant

— preheating the sinter raw mix

— use of the sinter cooler gases in a waste gas recirculation system.

Applicability

At some plants, the existing configuration may make costs of heat recovery from the sinter waste gases or sinter cooler waste gas very high.

The recovery of heat from the waste gases by means of a heat exchanger would lead to unacceptable condensation and corrosion problems.

1.3. *BAT Conclusions For Pelletisation Plants*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all pelletisation plants.

Air emissions

33. BAT is to reduce the dust emissions in the waste gases from

— the raw materials pre-treatment, drying, grinding, wetting, mixing and the balling;

— from the induration strand; and

— from the pellet handling and screening

by using one or a combination of the following techniques:

I. an electrostatic precipitator

II. a bag filter

III. a wet scrubber

The BAT-associated emission level for dust is < 20 mg/Nm^3 for the crushing, grinding and drying and $< 10 - 15$ mg/Nm^3 for all other process steps or in cases where all waste gases are treated together, all determined as daily mean values.

34. BAT is to reduce the sulphur oxides (SO_X), hydrogen chloride (HCl) and hydrogen fluoride (HF) emissions from the induration strand waste gas by using one of the following techniques:

I. a wet scrubber

II. semi-dry absorption with a subsequent dedusting system

The BAT-associated emission levels, determined as daily mean values, for these compounds are:

— sulphur oxides (SO_X), expressed as sulphur dioxide (SO_2)	$< 30 - 50$ mg/Nm^3
— hydrogen fluoride (HF)	$< 1 - 3$ mg/Nm^3
— hydrogen chloride (HCl)	$< 1 - 3$ mg/Nm^3.

35. BAT is to reduce NO_X emissions from the drying and grinding section and induration strand waste gases by applying process-integrated techniques.

Description

Plant design through tailor-made solutions should be optimised for low nitrogen oxides (NO_X) emissions from all firing sections. The reduction of the formation of thermal NO_X can be achieved by lowering the (peak) temperature in the burners and reducing the excess oxygen in the combustion air. Additionally, lower NO_X emissions can be achieved by a combination of low energy use and low nitrogen content in the fuel (coal and oil).

36. BAT for existing plants is to reduce NO_X emissions from the drying and grinding section and induration strand waste gases by applying one of the following techniques:

I. selective catalytic reduction (SCR) as an end-of-pipe technique

II. any other technique with a NO_X reduction efficiency of at least 80 %.

Applicability

For existing plants, both straight grate and grate kiln systems, it is difficult to obtain the operating conditions necessary to suit an SCR reactor. Due to high costs, these end-of-pipe techniques should only be considered in circumstances where environmental quality standards are otherwise not likely to be met.

37. BAT for new plants is to reduce NO_X emissions from the drying and grinding section and induration strand waste gases by applying selective catalytic reduction (SCR) as an end-of-pipe technique.

Water and waste water

38. BAT for pelletisation plants is to minimise the water consumption and discharge of scrubbing, wet rinsing and cooling water and reuse it as much as possible.

39. BAT for pelletisation plants is to treat the effluent water prior to discharge by using a combination of the following techniques:

I. neutralisation

II. flocculation

III. sedimentation

IV. sand filtration

V. heavy metal precipitation.

The BAT-associated emission levels, based on a qualified random sample or a 24-hour composite sample, are:

— suspended solids	< 50 mg/l
— chemical oxygen demand (COD [1])	< 160 mg/l
— Kjeldahl nitrogen	< 45 mg/l
— heavy metals	< 0,55 mg/l

(sum of arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), mercury (Hg), nickel (Ni), lead (Pb), zinc (Zn)).

Production residues

40. BAT is to prevent waste generation from pelletisation plants by effective on-site recycling or the reuse of residues (i.e. undersized green and heat-treated pellets)

BAT is to manage in a controlled manner pellet plant process residues, i.e. sludge from waste water treatment, which can neither be avoided nor recycled.

Energy

41. BAT is to reduce/minimise thermal energy consumption in pelletisation plants by using one or a combination of the following techniques:

I. process integrated reuse of sensible heat as far as possible from the different sections of the induration strand

II. using surplus waste heat for internal or external heating networks if there is demand from a third party.

[1] In some cases, TOC is measured instead of COD (in order to avoid $HgCl_2$ used in the analysis for COD). The correlation between COD and TOC should be elaborated for each pelletisation plant case by case. The COD/TOC ratio may vary approximately between two and four.

Description

Hot air from the primary cooling section can be used as secondary combustion air in the firing section. In turn, the heat from the firing section can be used in the drying section of the induration strand. Heat from the secondary cooling section can also be used in the drying section.

Excess heat from the cooling section can be used in the drying chambers of the drying and grinding unit. The hot air is transported through an insulated pipeline called a 'hot air recirculation duct'.

Applicability

Recovery of sensible heat is a process integrated part of pelletisation plants. The 'hot air recirculation duct' can be applied at existing plants with a comparable design and a sufficient supply of sensible heat.

The cooperation and agreement of a third party may not be within the control of the operator, and therefore may not be within the scope of the permit.

1.4. *BAT Conclusions For Coke Oven Plants*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all coke oven plants.

Air emissions

42. BAT for coal grinding plants (coal preparation including crushing, grinding, pulverising and screening) is to prevent or reduce dust emissions by using one or a combination of the following techniques:

I. building and/or device enclosure (crusher, pulveriser, sieves) and

II. efficient extraction and use of a subsequent dry dedusting systems.

The BAT-associated emission level for dust is < 10 – 20 mg/Nm^3, as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

43. BAT for storage and handling of pulverised coal is to prevent or reduce diffuse dust emissions by using one or a combination of the following techniques:

I. storing pulverised materials in bunkers and warehouses

II. using closed or enclosed conveyors

III. minimising the drop heights depending on the plant size and construction

IV. reducing emissions from charging of the coal tower and the charging car

V. using efficient extraction and subsequent dedusting.

When using BAT V, the BAT-associated emission level for dust is < 10 – 20 mg/Nm^3, as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

44. BAT is to charge coke oven chambers with emission-reduced charging systems.

Description

From an integrated point of view, 'smokeless' charging or sequential charging with double ascension pipes or jumper pipes are the preferred types, because all gases and dust are treated as part of the coke oven gas treatment.

If, however, the gases are extracted and treated outside the coke oven, charging with a land-based treatment of the extracted gases is the preferred method. Treatment should consist of an efficient extraction of the emissions with subsequent combustion to reduce organic compounds and the use of a bag filter to reduce particulates.

The BAT-associated emission level for dust from coal charging systems with land-based treatment of extracted gases is < 5 g/t coke equivalent to < 50 mg/Nm^3, as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

The duration associated with BAT of visible emissions from charging is < 30 seconds per charge as a monthly average using a monitoring method described in BAT 46.

45. BAT for coking is to extract the coke oven gas (COG) during coking as much as possible.

46. BAT for coke plants is to reduce the emissions through achieving continuous undisrupted coke production by using the following techniques:

I. extensive maintenance of oven chambers, oven doors and frame seals, ascension pipes, charging holes and other equipment (a systematic programme should be carried out by specially-trained detection and maintenance personnel)

II. avoiding strong temperature fluctuations

III. comprehensive observation and monitoring of the coke oven

IV. cleaning of doors, frame seals, charging holes, lids and ascension pipes after handling (applicable at new and, in some cases, existing plants)

V. maintaining a free gas-flow in the coke ovens

VI. adequate pressure regulation during coking and application of spring-loaded flexible sealing doors or knife-edged doors (in cases of ovens ≤ 5 m high and in good working order)

VII. using water-sealed ascension pipes to reduce visible emissions from the whole apparatus which provides a passage from the coke oven battery to the collecting main, gooseneck and stationary jumper pipes

VIII. luting charging hole lids with a clay suspension (or other suitable sealing material), to reduce visible emissions from all holes

IX. ensuring complete coking (avoiding green coke pushes) by application of adequate techniques

X. installing larger coke oven chambers (applicable to new plants or in some cases of a complete replacement of the plant on the old foundations)

XI. where possible, using variable pressure regulation to oven chambers during coking (applicable to new plants and can be an option for existing plants; the possibility of installing this technique in existing plants should be assessed carefully and is subject to the individual situation of every plant).

The percentage of visible emissions from all doors associated with BAT is < 5 – 10 %.

The percentage of visible emissions for all source types associated with BAT VII and BAT VIII is < 1 %.

The percentages are related to the frequency of any leaks compared to the total number of doors, ascension pipes or charging hole lids as a monthly average using a monitoring method as described below.

For the estimation of diffuse emissions from coke ovens the following methods are in use:

— the EPA 303 method

— the DMT (Deutsche Montan Technologie GmbH) methodology

— the methodology developed by BCRA (British Carbonisation Research Association).

— the methodology applied in the Netherlands, based on counting visible leaks of the ascension pipes and charging holes, while excluding visible emissions due to normal operations (coal charging, coke pushing).

47. BAT for the gas treatment plant is to minimise fugitive gaseous emissions by using the following techniques:

I. minimising the number of flanges by welding piping connections wherever possible

II. using appropriate sealings for flanges and valves

III. using gas-tight pumps (e.g. magnetic pumps)

IV. avoiding emissions from pressure valves in storage tanks by:

— connecting the valve outlet to the coke oven gas (COG) collecting main or

— collecting the gases and subsequent combustion.

Applicability

The techniques can be applied to both new and existing plants. In new plants, a gas tight design might be easier to achieve than in existing plants.

48. BAT is to reduce the sulphur content of the coke oven gas (COG) by using one of the following techniques:

I. desulphurisation by absorption systems

II. wet oxidative desulphurisation.

The residual hydrogen sulphide (H_2S) concentrations associated with BAT, determined as daily mean averages, are < 300 – 1 000 mg/Nm^3 in the case of using BAT I (the higher values being associated with higher ambient temperature and the lower values being associated with lower ambient temperature) and < 10 mg/Nm^3 in the case of using BAT II.

49. BAT for the coke oven underfiring is to reduce the emissions by using the following techniques:

I. preventing leakage between the oven chamber and the heating chamber by means of regular coke oven operation

II. repairing leakage between the oven chamber and the heating chamber (only applicable to existing plants)

III. incorporating low-nitrogen oxides (NO_X) techniques in the construction of new batteries, such as staged combustion and the use of thinner bricks and refractory with a better thermal conductivity (only applicable to new plants)

IV. using desulphurised coke oven gas (COG) process gases.

The BAT-associated emission levels, determined as daily mean values and relating to an oxygen content of 5 % are:

— sulphur oxides (SO_X), expressed as sulphur dioxide (SO_2) < 200 – 500 mg/Nm^3

— dust < 1 – 20 mg/Nm^3 ([1])

— nitrogen oxides (NO_X), expressed as nitrogen dioxide (NO_2) < 350 – 500 mg/Nm^3 for new or substantially revamped plants (less than 10 years old) and 500 – 650 mg/Nm^3 for older plants with well maintained batteries and incorporated low- nitrogen oxides (NO_X) techniques.

50. BAT for coke pushing is to reduce dust emissions by using the following techniques:

I. extraction by means of an integrated coke transfer machine equipped with a hood

II. using land-based extraction gas treatment with a bag filter or other abatement systems

III. using a one point or a mobile quenching car.

The BAT-associated emission level for dust from coke pushing is < 10 mg/Nm^3 in the case of bag filters and of < 20 mg/Nm^3 in other cases, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

Applicability

At existing plants, lack of space may constrain the applicability.

([1]) The lower end of the range has been defined based on the performance of one specific plant achieved under real operating conditions by the BAT obtaining the best environmental performance.

51. BAT for coke quenching is to reduce dust emissions by using one of the following techniques:

I. using coke dry quenching (CDQ) with the recovery of sensible heat and the removal of dust from charging, handling and screening operations by means of a bag filter

II. using emission-minimised conventional wet quenching

III. using coke stabilisation quenching (CSQ).

The BAT-associated emission levels for dust, determined as the average over the sampling period, are:

— < 20 mg/Nm^3 in case of coke dry quenching

— < 25 g/t coke in case of emission minimised conventional wet quenching ([1])

— < 10 g/t coke in case of coke stabilisation quenching ([2]).

Description of BAT I

For the continuous operation of coke dry quenching plants, there are two options. In one case, the coke dry quenching unit comprises two to up to four chambers. One unit is always on stand by. Hence no wet quenching is necessary but the coke dry quenching unit needs an excess capacity against the coke oven plant with high costs. In the other case, an additional wet quenching system is necessary.

In case of modifying a wet quenching plant to a dry quenching plant, the existing wet quenching system can be retained for this purpose. Such a coke dry quenching unit has no excess processing capacity against the coke oven plant.

Applicability of BAT II

Existing quenching towers can be equipped with emissions reduction baffles. A minimum tower height of at least 30 m is necessary in order to ensure sufficient draught conditions.

Applicability of BAT III

As the system is larger than that necessary for conventional quenching, lack of space at the plant may be a constraint.

52. BAT for coke grading and handling is to prevent or reduce dust emissions by using the following techniques in combination:

I. use of building or device enclosures

II. efficient extraction and subsequent dry dedusting.

The BAT-associated emission level for dust is < 10 mg/Nm^3, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

Water and waste water

53. BAT is to minimise and reuse quenching water as much as possible.

54. BAT is to avoid the reuse of process water with a significant organic load (like raw coke oven waste water, waste water with a high content of hydrocarbons, etc.) as quenching water.

55. BAT is to pretreat waste water from the coking process and coke oven gas (COG) cleaning prior to discharge to a waste water treatment plant by using one or a combination of the following techniques:

I. using efficient tar and polycyclic aromatic hydrocarbons (PAH) removal by using flocculation and subsequent flotation, sedimentation and filtration individually or in combination

II. using efficient ammonia stripping by using alkaline and steam.

([1]) This level is based on the use of the non-isokinetic Mohrhauer method (former VDI 2303)
([2]) This level is based on the use of an isokinetic sampling method according to VDI 2066

56. BAT for pretreated waste water from the coking process and coke oven gas (COG) cleaning is to use biological waste water treatment with integrated denitrification/nitrification stages.

The BAT-associated emission levels, based on a qualified random sample or a 24-hour composite sample and referring only to single coke oven water treatment plants, are:

— chemical oxygen demand (COD [1])	< 220 mg/l
— biological oxygen demand for 5 days (BOD_5)	< 20 mg/l
— sulphides, easily released [2]	< 0,1 mg/l
— thiocyanate (SCN^-)	< 4 mg/l
— cyanide (CN^-), easily released [3]	< 0,1 mg/l
— polycyclic aromatic hydrocarbons (PAH) (sum of Fluoranthene, Benzo[b]fluoranthene, Benzo[k]fluoranthene, Benzo[a]pyrene, Indeno[1,2,3-cd]pyrene and Benzo[g,h,i]perylene)	< 0,05 mg/l
— phenols	< 0,5 mg/l
— sum of ammonia-nitrogen (NH_4^+-N), nitrate-nitrogen (NO_3^--N) and nitrite-nitrogen (NO_2^--N)	< 15 – 50 mg/l.

Regarding the sum of ammonia-nitrogen (NH_4^+-N), nitrate-nitrogen (NO_3^--N) and nitrite-nitrogen (NO_2^--N), values of < 35 mg/l are usually associated with the application of advanced biological waste water treatment plants with predenitrification/nitrification and post-denitrification.

Production residues

57. BAT is to recycle production residues such as tar from the coal water and still effluent, and surplus activated sludge from the waste water treatment plant back to the coal feed of the coke oven plant.

Energy

58. BAT is to use the extracted coke oven gas (COG) as a fuel or reducing agent or for the production of chemicals.

1.5. *BAT Conclusions For Blast Furnaces*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all blast furnaces.

Air emissions

59. BAT for displaced air during loading from the storage bunkers of the coal injection unit is to capture dust emissions and perform subsequent dry dedusting.

The BAT-associated emission level for dust is < 20 mg/Nm^3, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

60. BAT for burden preparation (mixing, blending) and conveying is to minimise dust emissions and, where relevant, extraction with subsequent dedusting by means of an electrostatic precipitator or bag filter.

(1) In some cases, TOC is measured instead of COD (in order to avoid $HgCl_2$ used in the analysis for COD). The correlation between COD and TOC should be elaborated for each coke oven plant case by case. The COD/TOC ratio may vary approximately between two and four.

(2) This level is based on the use of the DIN 38405 D 27 or any other national or international standard that ensures the provision of data of an equivalent scientific quality.

(3) This level is based on the use of the DIN 38405 D 13-2 or any other national or international standard that ensures the provision of data of an equivalent scientific quality.

61. BAT for casting house (tap holes, runners, torpedo ladles charging points, skimmers) is to prevent or reduce diffuse dust emissions by using the following techniques:

I. covering the runners

II. optimising the capture efficiency for diffuse dust emissions and fumes with subsequent off-gas cleaning by means of an electrostatic precipitator or bag filter

III. fume suppression using nitrogen while tapping, where applicable and where no collecting and dedusting system for tapping emissions is installed.

When using BAT II, the BAT-associated emission level for dust is < 1 – 15 mg/Nm^3, determined as a daily mean value.

62. BAT is to use tar-free runner linings.

63. BAT is to minimise the release of blast furnace gas during charging by using one or a combination of the following techniques:

I. bell-less top with primary and secondary equalising

II. gas or ventilation recovery system

III. use of blast furnace gas to pressurise the top bunkers.

Applicability of BAT II

Applicable for new plants. Applicable for existing plants only where the furnace has a bell-less charging system. It is not applicable to plants where gases other than blast furnace gas (e.g. nitrogen) are used to pressurise the furnace top bunkers.

64. BAT is to reduce dust emissions from the blast furnace gas by using one or a combination of the following techniques:

I. using dry prededusting devices such as:

(i) deflectors

(ii) dust catchers

(iii) cyclones

(iv) electrostatic precipitators.

II. subsequent dust abatement such as:

(i) hurdle-type scrubbers

(ii) venturi scrubbers

(iii) annular gap scrubbers

(iv) wet electrostatic precipitators

(v) disintegrators.

For cleaned blast furnace (BF) gas, the residual dust concentration associated with BAT is < 10 mg/Nm^3, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

65. BAT for hot blast stoves is to reduce emissions by using desulphurised and dedusted surplus coke oven gas, dedusted blast furnace gas, dedusted basic oxygen furnace gas and natural gas, individually or in combination.

The BAT-associated emission levels, determined as daily mean values related to an oxygen content of 3 %, are:

— sulphur oxides (SO_x) expressed as sulphur dioxide (SO_2) < 200 mg/Nm^3

— dust < 10 mg/Nm^3

— nitrogen oxides (NO_x), expressed as nitrogen dioxide (NO_2) < 100 mg/Nm^3.

Water and waste water

66. BAT for water consumption and discharge from blast furnace gas treatment is to minimise and to reuse scrubbing water as much as possible, e.g. for slag granulation, if necessary after treatment with a gravel-bed filter.

67. BAT for treating waste water from blast furnace gas treatment is to use flocculation (coagulation) and sedimentation and the reduction of easily released cyanide, if necessary.

The BAT-associated emission levels, based on a qualified random sample or a 24-hour composite sample, are:

— suspended solids	< 30 mg/l
— iron	< 5 mg/l
— lead	< 0,5 mg/l
— zinc	< 2 mg/l
— cyanide (CN^-), easily released [1]	< 0,4 mg/l.

Production residues

68. BAT is to prevent waste generation from blast furnaces by using one or a combination of the following techniques:

I. appropriate collection and storage to facilitate a specific treatment

II. on-site recycling of coarse dust from the blast furnace (BF) gas treatment and dust from the cast house dedusting, with due regard for the effect of emissions from the plant where it is recycled

III. hydrocyclonage of sludge with subsequent on-site recycling of the coarse fraction (applicable whenever wet dedusting is applied and where the zinc content distribution in the different grain sizes allows a reasonable separation)

IV. slag treatment, preferably by means of granulation (where market conditions allow for it), for the external use of slag (e.g. in the cement industry or for road construction).

BAT is to manage in a controlled manner blast furnace process residues which can neither be avoided nor recycled.

69. BAT for minimising slag treatment emissions is to condense fume if odour reduction is required.

Resource management

70. BAT for resource management of blast furnaces is to reduce coke consumption by directly injected reducing agents, such as pulverised coal, oil, heavy oil, tar, oil residues, coke oven gas (COG), natural gas and wastes such as metallic residues, used oils and emulsions, oily residues, fats and waste plastics individually or in combination.

Applicability

Coal injection: The method is applicable to all blast furnaces equipped with pulverised coal injection and oxygen enrichment.

Gas injection: Tuyère injection of coke oven gas (COG) is highly dependent upon the availability of the gas that may be effectively used elsewhere in the integrated steelworks.

[1] This level is based on the use of the DIN 38405 D 13-2 or any other national or international standard that ensures the provision of data of an equivalent scientific quality.

Plastic injection: It should be noted that this technique is highly dependent on the local circumstances and market conditions. Plastics can contain Cl and heavy metals like Hg, Cd, Pb and Zn. Depending on the composition of the wastes used (e.g. shredder light fraction), the amount of Hg, Cr, Cu, Ni and Mo in the BF gas may increase.

Direct injection of used oils, fats and emulsions as reducing agents and of solid iron residues: The continuous operation of this system is reliant on the logistical concept of delivery and the storage of residues. Also, the conveying technology applied is of particular importance for a successful operation.

Energy

71. BAT is to maintain a smooth, continuous operation of the blast furnace at a steady state to minimise releases and to reduce the likelihood of burden slips.

72. BAT is to use the extracted blast furnace gas as a fuel.

73. BAT is to recover the energy of top blast furnace gas pressure where sufficient top gas pressure and low alkali concentrations are present.

Applicability

Top gas pressure recovery can be applied at new plants and in some circumstances at existing plants, albeit with more difficulties and additional costs. Fundamental to the application of this technique is an adequate top gas pressure in excess of 1.5 bar gauge.

At new plants, the top gas turbine and the blast furnace (BF) gas cleaning facility can be adapted to each other in order to achieve a high efficiency of both scrubbing and energy recovery.

74. BAT is to preheat the hot blast stove fuel gases or combustion air using the waste gas of the hot blast stove and to optimise the hot blast stove combustion process.

Description

For optimisation of the energy efficiency of the hot stove, one or a combination of the following techniques can be applied:

— the use of a computer-aided hot stove operation

— preheating of the fuel or combustion air in conjunction with insulation of the cold blast line and waste gas flue

— use of more suitable burners to improve combustion

— rapid oxygen measurement and subsequent adaptation of combustion conditions.

Applicability

The applicability of fuel preheating depends on the efficiency of the stoves as this determines the waste gas temperature (e.g. at waste gas temperatures below 250 °C, heat recovery may not be a technically or economically viable option).

The implementation of computer-aided control could require the construction of a fourth stove in the case of blast furnaces with three stoves (if possible) in order to maximise benefits.

1.6. *BAT Conclusions For Basic Oxygen Steelmaking And Casting*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all basic oxygen steelmaking and casting.

Air emissions

75. BAT for basic oxygen furnace (BOF) gas recovery by suppressed combustion is to extract the BOF gas during blowing as much as possible and to clean it by using the following techniques in combination:

I. use of a suppressed combustion process

II. prededusting to remove coarse dust by means of dry separation techniques (e.g. deflector, cyclone) or wet separators

III. dust abatement by means of:

(i) dry dedusting (e.g. electrostatic precipitator) for new and existing plants

(ii) wet dedusting (e.g. wet electrostatic precipitator or scrubber) for existing plants.

The residual dust concentrations associated with BAT, after buffering the BOF gas, are:

— 10 – 30 mg/Nm^3 for BAT III.i

— < 50 mg/Nm^3 for BAT III.ii.

76. BAT for basic oxygen furnace (BOF) gas recovery during oxygen blowing in the case of full combustion is to reduce dust emissions by using one of the following techniques:

I. dry dedusting (e.g. ESP or bag filter) for new and existing plants

II. wet dedusting (e.g. wet ESP or scrubber) for existing plants.

The BAT-associated emission levels for dust, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour), are:

— 10 – 30 mg/Nm^3 for BAT I

— < 50 mg/Nm^3 for BAT II.

77. BAT is to minimise dust emissions from the oxygen lance hole by using one or a combination of the following techniques:

I. covering the lance hole during oxygen blowing

II. inert gas or steam injection into the lance hole to dissipate the dust

III. use of other alternative sealing designs combined with lance cleaning devices.

78. BAT for secondary dedusting, including the emissions from the following processes:

— reladling of hot metal from the torpedo ladle (or hot metal mixer) to the charging ladle

— hot metal pretreatment (i.e. the preheating of vessels, desulphurisation, dephosphorisation, deslagging, hot metal transfer processes and weighing)

— BOF-related processes like the preheating of vessels, slopping during oxygen blowing, hot metal and scrap charging, tapping of liquid steel and slag from BOF and

— secondary metallurgy and continuous casting,

is to minimise dust emissions by means of process integrated techniques, such as general techniques to prevent or control diffuse or fugitive emissions, and by using appropriate enclosures and hoods with efficient extraction and a subsequent off-gas cleaning by means of a bag filter or an ESP.

The overall average dust collection efficiency associated with BAT is > 90 %

The BAT-associated emission level for dust, as a daily mean value, for all dedusted off-gases is < 1 – 15 mg/Nm^3 in the case of bag filters and < 20 mg/Nm^3 in the case of electrostatic precipitators.

If the emissions from hot metal pretreatment and the secondary metallurgy are treated separately, the BAT-associated emission level for dust, as a daily mean value, is < 1 – 10 mg/Nm^3 for bag filters and < 20 mg/Nm^3 for electrostatic precipitators.

Description

General techniques to prevent diffuse and fugitive emissions from the relevant BOF process secondary sources include:

— independent capture and use of dedusting devices for each subprocess in the BOF shop

— correct management of the desulphurisation installation to prevent air emissions

— total enclosure of the desulphurisation installation

— maintaining the lid on when the hot metal ladle is not in use and the cleaning of hot metal ladles and removal of skulls on a regular basis or alternatively apply a roof extraction system

— maintaining the hot metal ladle in front of the converter for approximately two minutes after putting the hot metal into the converter if a roof extraction system is not applied

— computer control and optimisation of the steelmaking process, e.g. so that slopping (i.e. when the slag foams to such an extent that it flows out of the vessel) is prevented or reduced

— reduction of slopping during tapping by limiting elements that cause slopping and the use of anti-slopping agents

— closure of doors from the room around the converter during oxygen blowing

— continuous camera observation of the roof for visible emission

— the use of a roof extraction system.

Applicability

In existing plants, the design of the plant may restrict the possibilities for proper evacuation.

79. BAT for on-site slag processing is to reduce dust emissions by using one or a combination of the following techniques:

I. efficient extraction of the slag crusher and screening devices with subsequent off-gas cleaning, if relevant

II. transport of untreated slag by shovel loaders

III. extraction or wetting of conveyor transfer points for broken material

IV. wetting of slag storage heaps

V. use of water fogs when broken slag is loaded.

The BAT-associated emission level for dust in the case of using BAT I is < 10 – 20 mg/Nm^3, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

Water and waste water

80. BAT is to prevent or reduce water use and waste water emissions from primary dedusting of basic oxygen furnace (BOF) gas by using one of the following techniques as set out in BAT 75 and BAT 76:

— dry dedusting of basic oxygen furnace (BOF) gas;

— minimising scrubbing water and reusing it as much as possible(e.g. for slag granulation) in case wet dedusting is applied.

81. BAT is to minimise the waste water discharge from continuous casting by using the following techniques in combination:

I. the removal of solids by flocculation, sedimentation and/or filtration

II. the removal of oil in skimming tanks or any other effective device

III. the recirculation of cooling water and water from vacuum generation as much as possible.

The BAT-associated emission levels, based on a qualified random sample or a 24-hour composite sample, for waste water from continuous casting machines are:

— suspended solids < 20 mg/l

— iron < 5 mg/l

— zinc < 2 mg/l

— nickel < 0,5 mg/l

— total chromium < 0,5 mg/l

— total hydrocarbons < 5 mg/l.

Production residues

82. BAT is to prevent waste generation by using one or a combination of the following techniques (see BAT 8):

I. appropriate collection and storage to facilitate a specific treatment

II. on-site recycling of dust from basic oxygen furnace (BOF) gas treatment, dust from secondary dedusting and mill scale from continuous casting back to the steelmaking processes with due regard for the effect of emissions from the plant where they are recycled

III. on-site recycling of BOF slag and BOF slag fines in various applications

IV. slag treatment where market conditions allow for the external use of slag (e.g. as an aggregate in materials or for construction)

V. use of filter dusts and sludge for external recovery of iron and non-ferrous metals such as zinc in the non-ferrous metals industry

VI. use of a settling tank for sludge with the subsequent recycling of the coarse fraction in the sinter/blast furnace or cement industry when grain size distribution allows for a reasonable separation.

Applicability of BAT V

Dust hot briquetting and recycling with recovery of high zinc concentrated pellets for external reuse is applicable when a dry electrostatic precipitation is used to clean the BOF gas. Recovery of zinc by briquetting is not applicable in wet dedusting systems because of unstable sedimentation in the settling tanks caused by the formation of hydrogen (from a reaction of metallic zinc and water). Due to these safety reasons, the zinc content in the sludge should be limited to 8 – 10 %.

BAT is to manage in a controlled manner basic oxygen furnace process residues which can neither be avoided nor recycled.

Energy

83. BAT is to collect, clean and buffer BOF gas for subsequent use as a fuel.

Applicability

In some cases, it may not be economically feasible or, with regard to appropriate energy management, not feasible to recover the BOF gas by suppressed combustion. In these cases, the BOF gas may be combusted with the generation of steam. The kind of combustion (full or suppressed combustion) depends on local energy management.

84. BAT is to reduce energy consumption by using ladle-lid systems.

Applicability

The lids can be very heavy as they are made out of refractory bricks and therefore the capacity of the cranes and the design of the whole building may constrain the applicability in existing plants. There are different technical designs for implementing the system into the particular conditions of a steel plant.

85. BAT is to optimise the process and reduce energy consumption by using a direct tapping process after blowing.

Description

Direct tapping normally requires expensive facilities like sub-lance or DROP IN sensor-systems to tap without waiting for a chemical analysis of the samples taken (direct tapping). Alternatively, a new technique has been developed to achieve direct tapping without such facilities. This technique requires a lot of experience and developmental work. In practice, the carbon is directly blown down to 0,04 % and simultaneously the bath temperature decreases to a reasonably low target. Before tapping, both the temperature and oxygen activity are measured for further actions.

Applicability

A suitable hot metal analyser and slag stopping facilities are required and the availability of a ladle furnace facilitates implementation of the technique.

86. BAT is to reduce energy consumption by using continuous near net shape strip casting, if the quality and the product mix of the produced steel grades justify it.

Description

Near net shape strip casting means the continuous casting of steel to strips with thicknesses of less than 15 mm. The casting process is combined with the direct hot rolling, cooling and coiling of the strips without an intermediate reheating furnace used for conventional casting techniques, e.g. continuous casting of slabs or thin slabs. Therefore, strip casting represents a technique for producing flat steel strips of different widths and thicknesses of less than 2 mm.

Applicability

The applicability depends on the produced steel grades (e.g. heavy plates cannot be produced with this process) and on the product portfolio (product mix) of the individual steel plant. In existing plants, the applicability may be constrained by the layout and the available space as e.g. retrofitting with a strip caster requires approximately 100 m in length.

1.7. *BAT Conclusions For Electric Arc Furnace Steelmaking And Casting*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all electric arc furnace steelmaking and casting.

Air emissions

87. BAT for the electric arc furnace (EAF) process is to prevent mercury emissions by avoiding, as much as possible, raw materials and auxiliaries which contain mercury (see BAT 6 and 7).

88. BAT for the electric arc furnace (EAF) primary and secondary dedusting (including scrap preheating, charging, melting, tapping, ladle furnace and secondary metallurgy) is to achieve an efficient extraction of all emission sources by using one of the techniques listed below and to use subsequent dedusting by means of a bag filter:

I. a combination of direct off-gas extraction (4th or 2nd hole) and hood systems

II. direct gas extraction and doghouse systems

III. direct gas extraction and total building evacuation (low-capacity electric arc furnaces (EAF) may not require direct gas extraction to achieve the same extraction efficiency).

The overall average collection efficiency associated with BAT is > 98 %.

The BAT-associated emission level for dust is < 5 mg/Nm^3, determined as a daily mean value.

The BAT-associated emission level for mercury is < 0,05 mg/Nm^3, determined as the average over the sampling period (discontinuous measurement, spot samples for at least four hours).

89. BAT for the electric arc furnace (EAF) primary and secondary dedusting (including scrap preheating, charging, melting, tapping, ladle furnace and secondary metallurgy) is to prevent and reduce polychlorinated dibenzodioxins/furans (PCDD/F) and polychlorinated biphenyls (PCB) emissions by avoiding, as much as possible, raw materials which contain PCDD/F and PCB or their precursors (see BAT 6 and 7) and using one or a combination of the following techniques, in conjunction with an appropriate dust removal system:

I. appropriate post-combustion

II. appropriate rapid quenching

III. injection of adequate adsorption agents into the duct before dedusting.

The BAT-associated emission level for polychlorinated dibenzodioxins/furans (PCDD/F) is < 0,1 ng I-TEQ/Nm^3, based on a 6 – 8 hour random sample during steady-state conditions. In some cases, the BAT-associated emission level can be achieved with primary measures only.

Applicability of BAT I

In existing plants, circumstances like available space, given off-gas duct system, etc. need to be taken into consideration for assessing the applicability.

90. BAT for on-site slag processing is to reduce dust emissions by using one or a combination of the following techniques:

I. efficient extraction of the slag crusher and screening devices with subsequent off-gas cleaning, if relevant

II. transport of untreated slag by shovel loaders

III. extraction or wetting of conveyor transfer points for broken material

IV. wetting of slag storage heaps

V. use of water fogs when broken slag is loaded.

In the case of using BAT I, the BAT-associated emission level for dust is < 10 – 20 mg/Nm^3, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

Water and waste water

91. BAT is to minimise the water consumption from the electric arc furnace (EAF) process by the use of closed loop water cooling systems for the cooling of furnace devices as much as possible unless once-through cooling systems are used.

92. BAT is to minimise the waste water discharge from continuous casting by using the following techniques in combination:

I. the removal of solids by flocculation, sedimentation and/or filtration

II. the removal of oil in skimming tanks or in any other effective device

III. the recirculation of cooling water and water from vacuum generation as much as possible.

The BAT-associated emission levels, for waste water from continuous casting machines, based on a qualified random sample or a 24-hour composite sample, are:

— suspended solids < 20 mg/l

— iron < 5 mg/l

— zinc < 2 mg/l

— nickel < 0,5 mg/l

— total chromium < 0,5 mg/l

— total hydrocarbons < 5 mg/l

Production residues

93. BAT is to prevent waste generation by using one or a combination of the following techniques:

I. appropriate collection and storage to facilitate a specific treatment

II. recovery and on-site recycling of refractory materials from the different processes and use internally, i.e. for the substitution of dolomite, magnesite and lime

III. use of filter dusts for the external recovery of non-ferrous metals such as zinc in the non-ferrous metals industry, if necessary, after the enrichment of filter dusts by recirculation to the electric arc furnace (EAF)

IV. separation of scale from continuous casting in the water treatment process and recovery with subsequent recycling, e.g. in the sinter/blast furnace or cement industry

V. external use of refractory materials and slag from the electric arc furnace (EAF) process as a secondary raw material where market conditions allow for it.

BAT is to manage in a controlled manner EAF process residues which can neither be avoided nor recycled.

Applicability

The external use or recycling of production residues as mentioned under BAT III – V depend on the cooperation and agreement of a third party which may not be within the control of the operator, and therefore may not be within the scope of the permit.

Energy

94. BAT is to reduce energy consumption by using continuous near net shape strip casting, if the quality and the product mix of the produced steel grades justify it.

Description

Near net shape strip casting means the continuous casting of steel to strips with thicknesses of less than 15 mm. The casting process is combined with the direct hot rolling, cooling and coiling of the strips without an intermediate reheating furnace used for conventional casting techniques, e.g. continuous casting of slabs or thin slabs. Therefore, strip casting represents a technique for producing flat steel strips of different widths and thicknesses of less than 2 mm.

Applicability

The applicability depends on the produced steel grades (e.g. heavy plates cannot be produced with this process) and on the product portfolio (product mix) of the individual steel plant. In existing plants, the applicability may be constrained by the layout and the available space as e.g. retrofitting with a strip caster requires approximately 100 m in length.

Noise

95. BAT is to reduce noise emissions from electric arc furnace (EAF) installations and processes generating high sound energies by using a combination of the following constructional and operational techniques depending on and according to local conditions (in addition to using the techniques listed in BAT 18):

I. construct the electric arc furnace (EAF) building in such a way as to absorb noise from mechanical shocks resulting from the operation of the furnace

II. construct and install cranes destined to transport the charging baskets to prevent mechanical shocks

III. special use of acoustical insulation of the inside walls and roofs to prevent the airborne noise of the electric arc furnace (EAF) building

IV. separation of the furnace and the outside wall to reduce the structure-borne noise from the electric arc furnace (EAF) building

V. housing of processes generating high sound energies (i.e. electric arc furnace (EAF) and decarburisation units) within the main building.

2012 SUBSCRIPTION PRICES (excluding VAT, including normal transport charges)

EU Official Journal, L + C series, paper edition only	22 official EU languages	EUR 1 200 per year
EU Official Journal, L + C series, paper + annual DVD	22 official EU languages	EUR 1 310 per year
EU Official Journal, L series, paper edition only	22 official EU languages	EUR 840 per year
EU Official Journal, L + C series, monthly DVD (cumulative)	22 official EU languages	EUR 100 per year
Supplement to the Official Journal (S series), tendering procedures for public contracts, DVD, one edition per week	multilingual: 23 official EU languages	EUR 200 per year
EU Official Journal, C series — recruitment competitions	Language(s) according to competition(s)	EUR 50 per year

Subscriptions to the *Official Journal of the European Union*, which is published in the official languages of the European Union, are available for 22 language versions. The Official Journal comprises two series, L (Legislation) and C (Information and Notices).

A separate subscription must be taken out for each language version.

In accordance with Council Regulation (EC) No 920/2005, published in Official Journal L 156 of 18 June 2005, the institutions of the European Union are temporarily not bound by the obligation to draft all acts in Irish and publish them in that language. Irish editions of the Official Journal are therefore sold separately.

Subscriptions to the Supplement to the Official Journal (S Series — tendering procedures for public contracts) cover all 23 official language versions on a single multilingual DVD.

On request, subscribers to the *Official Journal of the European Union* can receive the various Annexes to the Official Journal. Subscribers are informed of the publication of Annexes by notices inserted in the *Official Journal of the European Union*.

Sales and subscriptions

Subscriptions to various priced periodicals, such as the subscription to the *Official Journal of the European Union*, are available from our sales agents. The list of sales agents is available at:

http://publications.europa.eu/others/agents/index_en.htm

EUR-Lex (http://eur-lex.europa.eu) offers direct access to European Union legislation free of charge. The *Official Journal of the European Union* can be consulted on this website, as can the Treaties, legislation, case-law and preparatory acts.

DECISIONS

COMMISSION IMPLEMENTING DECISION

of 28 February 2012

establishing the best available techniques (BAT) conclusions under Directive 2010/75/EU of the European Parliament and of the Council on industrial emissions for the manufacture of glass

(notified under document C(2012) 865)

(Text with EEA relevance)

(2012/134/EU)

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Having regard to Directive 2010/75/EU of the European Parliament and of the Council of 24 November 2010 on industrial emissions (integrated pollution prevention and control) ([1]) and in particular Article 13(5) thereof,

Whereas:

(1) Article 13(1) of Directive 2010/75/EU requires the Commission to organise an exchange of information on industrial emissions between it and Member States, the industries concerned and non-governmental organisations promoting environmental protection in order to facilitate the drawing up of best available techniques (BAT) reference documents as defined in Article 3(11) of that Directive.

(2) In accordance with Article 13(2) of Directive 2010/75/EU, the exchange of information is to address the performance of installations and techniques in terms of emissions, expressed as short- and long-term averages, where appropriate, and the associated reference conditions, consumption and nature of raw materials, water consumption, use of energy and generation of waste and the techniques used, associated monitoring, cross-media effects, economic and technical viability and developments therein and best available techniques and emerging techniques identified after considering the issues mentioned in points (a) and (b) of Article 13(2) of that Directive.

([1]) OJ L 334, 17.12.2010, p. 17.

(3) 'BAT conclusions' as defined in Article 3(12) of Directive 2010/75/EU are the key element of BAT reference documents and lay down the conclusions on best available techniques, their description, information to assess their applicability, the emission levels associated with the best available techniques, associated monitoring, associated consumption levels and, where appropriate, relevant site remediation measures.

(4) In accordance with Article 14(3) of Directive 2010/75/EU, BAT conclusions are to be the reference for setting permit conditions for installations covered by Chapter 2 of that Directive.

(5) Article 15(3) of Directive 2010/75/EU requires the competent authority to set emission limit values that ensure that, under normal operating conditions, emissions do not exceed the emission levels associated with the best available techniques as laid down in the decisions on BAT conclusions referred to in Article 13(5) of Directive 2010/75/EU.

(6) Article 15(4) of Directive 2010/75/EU provides for derogations from the requirement laid down in Article 15(3) only where the costs associated with the achievement of emissions levels disproportionately outweigh the environmental benefits due to the geographical location, the local environmental conditions or the technical characteristics of the installation concerned.

(7) Article 16(1) of Directive 2010/75/EU provides that the monitoring requirements in the permit referred to in point (c) of Article 14(1) of the Directive are to be based on the conclusions on monitoring as described in the BAT conclusions.

(8) In accordance with Article 21(3) of Directive 2010/75/EU, within 4 years of publication of decisions on BAT conclusions, the competent authority is to reconsider and, if necessary, update all the permit conditions and ensure that the installation complies with those permit conditions.

(9) Commission Decision of 16 May 2011 establishing a forum for the exchange of information pursuant to Article 13 of Directive 2010/75/EU on industrial emissions [1] established a forum composed of representatives of Member States, the industries concerned and non-governmental organisations promoting environmental protection.

(10) In accordance with Article 13(4) of Directive 2010/75/EU, the Commission obtained the opinion [2] of that forum on the proposed content of the BAT reference document for the manufacture of glass on 13 September 2011 and made it publicly available.

(11) The measures provided for in this Decision are in accordance with the opinion of the Committee established by Article 75(1) of Directive 2010/75/EU,

HAS ADOPTED THIS DECISION:

Article 1

The BAT conclusions for the manufacture of glass are set out in the Annex to this Decision.

Article 2

This Decision is addressed to the Member States.

Done at Brussels, 28 February 2012.

For the Commission
Janez POTOČNIK
Member of the Commission

ANNEX

BAT CONCLUSIONS FOR THE MANUFACTURE OF GLASS

SCOPE

These BAT conclusions concern the industrial activities specified in Annex I to Directive 2010/75/EU, namely:

— 3.3. Manufacture of glass including glass fibre with a melting capacity exceeding 20 tonnes per day;

— 3.4. Melting mineral substances including the production of mineral fibres with a melting capacity exceeding 20 tonnes per day.

These BAT conclusions do not address the following activities:

— Production of water glass, covered by the reference document Large Volume Inorganic Chemicals – Solids and Other Industry (LVIC-S)

— Production of polycrystalline wool

— Production of mirrors, covered by the reference document Surface Treatment Using Organic Solvents (STS)

Other reference documents which are of relevance for the activities covered by these BAT conclusions are the following:

Reference documents	Activity
Emissions from Storage (EFS)	Storage and handling of raw materials
Energy Efficiency (ENE)	General energy efficiency
Economic and Cross-Media Effects (ECM)	Economics and cross-media effects of techniques
General Principles of Monitoring (MON)	Emissions and consumption monitoring

The techniques listed and described in these BAT conclusions are neither prescriptive nor exhaustive. Other techniques may be used that ensure at least an equivalent level of environmental protection.

DEFINITIONS

For the purposes of these BAT conclusions, the following definitions apply:

Term used	Definition
New plant	A plant introduced on the site of the installation following the publication of these BAT conclusions or a complete replacement of a plant on the existing foundations of the installation following the publication of these BAT conclusions
Existing plant	A plant which is not a new plant
New furnace	A furnace introduced on the site of the installation following the publication of these BAT conclusions or a complete rebuild of a furnace following the publication of these BAT conclusions
Normal furnace rebuild	A rebuild between campaigns without a significant change in furnace requirements or technology and in which the furnace frame is not significantly adjusted and the furnace dimensions remain basically unchanged. The refractory of the furnace and, where appropriate, the regenerators are repaired by the full or partial replacement of the material.
Complete furnace rebuild	A rebuild involving a major change in the furnace requirements or technology and with major adjustment or replacement of the furnace and associated equipments.

GENERAL CONSIDERATIONS

Averaging periods and reference conditions for air emissions

Unless stated otherwise, emission levels associated with the best available techniques (BAT-AELs) for air emissions given in these BAT conclusions apply under the reference conditions shown in Table 1. All values for concentrations in waste gases refer to standard conditions: dry gas, temperature 273,15 K, pressure 101,3 kPa.

For discontinuous measurements	BAT-AELs refer to the average value of three spot samples of at least 30 minutes each; for regenerative furnaces the measuring period should cover a minimum of two firing reversals of the regenerator chambers
For continuous measurements	BAT-AELs refer to daily average values

Table 1

Reference conditions for BAT-AELs concerning air emissions

Activities		Unit	Reference conditions
Melting activities	Conventional melting furnace in continuous melters	mg/Nm^3	8 % oxygen by volume
	Conventional melting furnace in discontinuous melters	mg/Nm^3	13 % oxygen by volume
	Oxy-fuel-fired furnaces	kg/tonne melted glass	The expression of emission levels measured as mg/Nm^3 to a reference oxygen concentration is not applicable
	Electric furnaces	mg/Nm^3 or kg/tonne melted glass	The expression of emission levels measured as mg/Nm^3 to a reference oxygen concentration is not applicable
	Frit melting furnaces	mg/Nm^3 or kg/tonne melted frit	Concentrations refer to 15 % oxygen by volume. When air-gas firing is used, BAT AELs expressed as emission concentration (mg/Nm^3) apply. When only oxy-fuel firing is employed, BAT AELs expressed as specific mass emissions (kg/tonne melted frit) apply. When oxygen-enriched air-fuel firing is used, BAT AELs expressed as either emission concentration (mg/Nm^3) or as specific mass emissions (kg/tonne melted frit) apply
	All type of furnaces	kg/tonne melted glass	The specific mass emissions refer to 1 tonne of melted glass
Non-melting activities, including downstream processes	All processes	mg/Nm^3	No correction for oxygen
	All processes	kg/tonne glass	The specific mass emissions refer to 1 tonne of produced glass

Conversion to reference oxygen concentration

The formula for calculating the emissions concentration at a reference oxygen level (see Table 1) is shown below.

$$E_R = \frac{21 - O_R}{21 - O_M} \times E_M$$

Where:

E_R (mg/Nm^3): emissions concentration corrected to the reference oxygen level O_R

O_R (vol %): reference oxygen level

E_M (mg/Nm^3): emissions concentration referred to the measured oxygen level O_M

O_M (vol %): measured oxygen level.

Conversion from concentrations to specific mass emissions

BAT-AELs given in Sections 1.2 to 1.9 as specific mass emissions (kg/tonne melted glass) are based on the calculation reported below except for oxy-fuel fired furnaces and, in a limited number of cases, for electric melting where BAT-AELs given in kg/tonne melted glass were derived from specific reported data.

The calculation procedure used for the conversion from concentrations to specific mass emissions is shown below.

Specific mass emission (kg/tonne of melted glass) = conversion factor × emissions concentration (mg/Nm^3)

Where: conversion factor = $(Q/P) \times 10^{-6}$

with Q = waste gas volume in Nm^3/h

P = pull rate in tonnes of melted glass/h.

The waste gas volume (Q) is determined by the specific energy consumption, type of fuel, and the oxidant (air, air enriched by oxygen and oxygen with purity depending on the production process). The energy consumption is a complex function of (predominantly) the type of furnace, the type of glass and the cullet percentage.

However, a range of factors can influence the relationship between concentration and specific mass flow, including:

— type of furnace (air preheating temperature, melting technique)

— type of glass produced (energy requirement for melting)

— energy mix (fossil fuel/electric boosting)

— type of fossil fuel (oil, gas)

— type of oxidant (oxygen, air, oxygen-enriched air)

— cullet percentage

— batch composition

— age of the furnace

— furnace size.

The conversion factors given in Table 2 have been used for converting BAT-AELs from concentrations into specific mass emissions.

The conversion factors have been determined on the basis of energy efficient furnaces and relate only to full air/fuel-fired furnaces.

Table 2

Indicative factors used for converting mg/Nm^3 into kg/tonne of melted glass based on energy efficient fuel-air furnaces

Sectors		Factors to convert mg/Nm^3 into kg/tonne of melted glass
Flat glass		$2,5 \times 10^{-3}$
Container glass	General case	$1,5 \times 10^{-3}$
	Specific cases [1]	Case-by-case study (often $3,0 \times 10^{-3}$)
Continuous filament glass fibre		$4,5 \times 10^{-3}$

Sectors		Factors to convert mg/Nm^3 into kg/tonne of melted glass
Domestic glass	Soda lime	$2,5 \times 10^{-3}$
	Specific cases (2)	Case-by-case study (between 2,5 and > 10×10^{-3}; often $3,0 \times 10^{-3}$)
Mineral wool	Glass wool	2×10^{-3}
	Stone wool cupola	$2,5 \times 10^{-3}$
Special glass	TV glass (panels)	3×10^{-3}
	TV glass (funnel)	$2,5 \times 10^{-3}$
	Borosilicate (tube)	4×10^{-3}
	Glass ceramics	$6,5 \times 10^{-3}$
	Lighting glass (soda-lime)	$2,5 \times 10^{-3}$
Frits		Case-by-case study (between $5 - 7,5 \times 10^{-3}$)

(1) Specific cases correspond to less favourable cases (i.e. small special furnaces with a production of generally below 100 tonnes/day and a cullet rate of below 30 %). This category represents only 1 or 2 % of the container glass production.
(2) Specific cases corresponding to less favourable cases and/or non-soda-lime glasses: borosilicates, glass ceramic, crystal glass and, less frequently, lead crystal glass.

DEFINITIONS FOR CERTAIN AIR POLLUTANTS

For the purpose of these BAT conclusions and for the BAT-AELs reported in Sections 1.2 to 1.9, the following definitions apply:

NO_X expressed as NO_2	The sum of nitrogen oxide (NO) and nitrogen dioxide (NO_2) expressed as NO_2
SO_X expressed as SO_2	The sum of sulphur dioxide (SO_2) and sulphur trioxide (SO_3) expressed as SO_2
Hydrogen chloride expressed as HCl	All gaseous chlorides expressed as HCl
Hydrogen fluoride expressed as HF	All gaseous fluorides expressed as HF

AVERAGING PERIODS FOR WASTE WATER DISCHARGES

Unless stated otherwise, emission levels associated with the best available techniques (BAT-AELs) for waste water emissions given in these BAT conclusions refer to the average value of a composite sample taken over a period of 2 hours or 24 hours.

1.1. *General BAT conclusions for the manufacture of glass*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all installations.

The process-specific BAT included in Sections 1.2 – 1.9 apply in addition to the general BAT mentioned in this section.

1.1.1. Environmental management systems

1. BAT is to implement and adhere to an environmental management system (EMS) that incorporates all of the following features:

(i) commitment of the management, including senior management;

(ii) definition of an environmental policy that includes the continuous improvement for the installation by the management;

(iii) planning and establishing the necessary procedures, objectives and targets, in conjunction with financial planning and investment;

(iv) implementation of the procedures paying particular attention to:

(a) structure and responsibility

(b) training, awareness and competence

(c) communication

(d) employee involvement

(e) documentation

(f) efficient process control

(g) maintenance programmes

(h) emergency preparedness and response

(i) safeguarding compliance with environmental legislation.

(v) checking performance and taking corrective action, paying particular attention to:

(a) monitoring and measurement (see also the reference document on the General Principles of Monitoring)

(b) corrective and preventive action

(c) maintenance of records

(d) independent (where practicable) internal or external auditing in order to determine whether or not the EMS conforms to planned arrangements and has been properly implemented and maintained;

(vi) review of the EMS and its continuing suitability, adequacy and effectiveness by senior management;

(vii) following the development of cleaner technologies;

(viii) consideration for the environmental impacts from the eventual decommissioning of the installation at the stage of designing a new plant, and throughout its operating life;

(ix) application of sectoral benchmarking on a regular basis.

Applicability

The scope (e.g. level of details) and nature of the EMS (e.g. standardised or non-standardised) will generally be related to the nature, scale and complexity of the installation, and the range of environmental impacts it may have.

1.1.2. Energy efficiency

2. BAT is to reduce the specific energy consumption by using one or a combination of the following techniques:

Technique	Applicability
(i) Process optimisation, through the control of the operating parameters	The techniques are generally applicable
(ii) Regular maintenance of the melting furnace	
(iii) Optimisation of the furnace design and the selection of the melting technique	Applicable for new plants. For existing plants, the implementation requires a complete rebuild of the furnace
(iv) Application of combustion control techniques	Applicable to fuel/air and oxy-fuel fired furnaces

Technique	Applicability
(v) Use of increasing levels of cullet, where available and economically and technically viable	Not applicable to the continuous filament glass fibre, high temperature insulation wool and frits sectors
(vi) Use of a waste heat boiler for energy recovery, where technically and economically viable	Applicable to fuel/air and oxy-fuel fired furnaces. The applicability and economic viability of the technique is dictated by the overall efficiency that may be obtained, including the effective use of the steam generated
(vii) Use of batch and cullet preheating, where technically and economically viable	Applicable to fuel/air and oxy-fuel fired furnaces. The applicability is normally restricted to batch compositions with more than 50 % cullet

1.1.3. Materials storage and handling

3. BAT is to prevent, or where that is not practicable, to reduce diffuse dust emissions from the storage and handling of solid materials by using one or a combination of the following techniques:

I. Storage of raw materials

(i) Store bulk powder materials in enclosed silos equipped with a dust abatement system (e.g. fabric filter)

(ii) Store fine materials in enclosed containers or sealed bags

(iii) Store under cover stockpiles of coarse dusty materials

(iv) Use of road cleaning vehicles and water damping techniques

II. Handling of raw materials

Technique	Applicability
(i) For materials which are transported by above ground, use enclosed conveyors to prevent material loss	The techniques are generally applicable
(ii) Where pneumatic conveying is used, apply a sealed system equipped with a filter to clean the transport air before release	
(iii) Moistening of the batch	The use of this technique is limited by the negative consequences on the furnace energy efficiency. Restrictions may apply to some batch formulations, in particular for borosilicate glass production
(iv) Application of a slightly negative pressure within the furnace	Applicable only as an inherent aspect of operation (i.e. melting furnaces for frits production) due to a detrimental impact on furnace energy efficiency
(v) Use of raw materials that do not cause decrepitation phenomena (mainly dolomite and limestone). These phenomena consist of minerals that 'crackle' when exposed to heat, with a consequent potential increase of dust emissions	Applicable within the constraints associated with the availability of raw materials
(vi) Use of an extraction which vents to a filter system in processes where dust is likely to be generated (e.g. bag opening, frits batch mixing, fabric filter dust disposal, cold-top melters)	The techniques are generally applicable
(vii) Use of enclosed screw feeders	
(viii) Enclosure of feed pockets	Generally applicable. Cooling may be necessary to avoid damage to the equipment

4. BAT is to prevent, or where that is not practicable, to reduce diffuse gaseous emissions from the storage and handling of volatile raw materials by using one or a combination of the following techniques:

(i) Use of tank paint with low solar absorbency for bulk storage subject to temperature changes due to solar heating.

(ii) Control of temperature in the storage of volatile raw materials.

(iii) Tank insulation in the storage of volatile raw materials.

(iv) Inventory management

(v) Use of floating roof tanks in the storage of large quantities of volatile petroleum products.

(vi) Use of vapour return transfer systems in the transfer of volatile fluids (e.g. from tank trucks to storage tank).

(vii) Use of bladder roof tanks in the storage of liquid raw materials.

(viii) Use of pressure/vacuum valves in tanks designed to withstand pressure fluctuations.

(ix) Application of a release treatment (e.g. adsorption, absorption, condensation) in the storage of hazardous materials.

(x) Application of subsurface filling in the storage of liquids that tend to foam.

1.1.4. General primary techniques

5. BAT is to reduce energy consumption and emissions to air by carrying out a constant monitoring of the operational parameters and a programmed maintenance of the melting furnace.

Technique	Applicability
The technique consists of a series of monitoring and maintenance operations which can be used individually or in combination appropriate to the type of furnace, with the aim of minimising the ageing effects on the furnace, such as sealing the furnace and burner blocks, keep the maximum insulation, control the stabilised flame conditions, control the fuel/air ratio, etc.	Applicable to regenerative, recuperative, and oxy-fuel fired furnaces. The applicability to other types of furnaces requires an installation-specific assessment

6. BAT is to carry out a careful selection and control of all substances and raw materials entering the melting furnace in order to reduce or prevent emissions to air by using one or a combination of the following techniques.

Technique	Applicability
(i) Use of raw materials and external cullet with low levels of impurities (e.g. metals, chlorides, fluorides)	Applicable within the constraints of the type of glass produced at the installation and the availability of raw materials and fuels
(ii) Use of alternative raw materials (e.g. less volatile)	
(iii) Use of fuels with low metal impurities	

7. BAT is to carry out monitoring of emissions and/or other relevant process parameters on a regular basis, including the following:

Technique	Applicability
(i) Continuous monitoring of critical process parameters to ensure process stability, e.g. temperature, fuel feed and airflow	The techniques are generally applicable
(ii) Regular monitoring of process parameters to prevent/reduce pollution, e.g. O_2 content of the combustion gases to control the fuel/air ratio.	
(iii) Continuous measurements of dust, NO_X and SO_2 emissions or discontinuous measurements at least twice per year, associated with the control of surrogate parameters to ensure that the treatment system is working properly between measurements	
(iv) Continuous or regular periodic measurements of NH_3 emissions, when selective catalytic reduction (SCR) or selective non-catalytic reduction (SNCR) techniques are applied	The techniques are generally applicable
(v) Continuous or regular periodic measurements of CO emissions when primary techniques or chemical reduction by fuel techniques are applied for NO_X emissions reductions or partial combustion may occur.	
(vi) Regular periodic measurements of emissions of HCl, HF, CO and metals, in particular when raw materials containing such substances are used or partial combustion may occur	The techniques are generally applicable
(vii) Continuous monitoring of surrogate parameters to ensure that the waste gas treatment system is working properly and that the emission levels are maintained between discontinuous measurements. The monitoring of surrogate parameters includes: reagent feed, temperature, water feed, voltage, dust removal, fan speed, etc.	

8. BAT is to operate the waste gas treatment systems during normal operating conditions at optimal capacity and availability in order to prevent or reduce emissions

Applicability

Special procedures can be defined for specific operating conditions, in particular:

(i) during start-up and shutdown operations

(ii) during other special operations which could affect the proper functioning of the systems (e.g. regular and extra-ordinary maintenance work and cleaning operations of the furnace and/or of the waste gas treatment system, or severe production change)

(iii) in the case of insufficient waste gas flow or temperature which prevents the use of the system at full capacity.

9. BAT is to limit carbon monoxide (CO) emissions from the melting furnace, when applying primary techniques or chemical reduction by fuel, for the reduction of NO_X emissions

Technique	Applicability
Primary techniques for the reduction of NO_X emissions are based on combustion modifications (e.g. reduction of air/fuel ratio, staged combustion low-NO_X burners, etc.). Chemical reduction by fuel consists of the addition of hydrocarbon fuel to the waste gas stream to reduce the NO_X formed in the furnace. The increase in CO emissions due to the application of these techniques can be limited by a careful control of the operational parameters	Applicable to conventional air/fuel fired furnaces.

Table 3

BAT-AELs for carbon monoxide emissions from melting furnaces

Parameter	BAT-AEL
Carbon monoxide, expressed as CO	< 100 mg/Nm^3

10. BAT is to limit ammonia (NH_3) emissions, when applying selective catalytic reduction (SCR) or selective non-catalytic reduction (SNCR) techniques for a high efficiency NO_X emissions reduction

Technique	Applicability
The technique consists of adopting and maintaining suitable operating conditions of the SCR or SNCR waste gas treatment systems, with the aim of limiting emissions of unreacted ammonia	Applicable to melting furnaces fitted with SCR or SNCR

Table 4

BAT-AELs for ammonia emissions, when SCR or SNCR techniques are applied

Parameter	BAT-AELs ([1])
Ammonia, expressed as NH_3	< 5 – 30 mg/Nm^3

([1]) The higher levels are associated with higher inlet NO_X concentrations, higher reduction rates and the ageing of the catalyst.

11. BAT is to reduce boron emissions from the melting furnace, when boron compounds are used in the batch formulation, by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Operation of a filtration system at a suitable temperature for enhancing the separation of boron compounds in the solid state, taking into account that some boric acid species may be present in the flue-gas as gaseous compounds at temperatures below 200 °C, but also as low as 60 °C	The applicability to existing plants may be limited by technical constraints associated with the position and characteristics of the existing filter system
(ii) Use of dry or semi-dry scrubbing in combination with a filtration system	The applicability may be limited by a decreased removal efficiency of other gaseous pollutants (SO_X, HCl, HF) caused by the deposition of boron compounds on the surface of the dry alkaline reagent
(iii) Use of wet scrubbing	The applicability to existing plants may be limited by the need of a specific waste water treatment

([1]) A description of the techniques is given in Sections 1.10.1, 1.10.4 and 1.10.6.

Monitoring

The monitoring of boron emissions should be carried out according to a specific methodology which allows measurement of both solid and gaseous forms and to determine the effective removal of these species from the flue gases.

1.1.5. Emissions to water from glass manufacturing processes

12. BAT is to reduce water consumption by using one or a combination of the following techniques:

Technique	Applicability
(i) Minimisation of spillages and leaks	The technique is generally applicable
(ii) Reuse of cooling and cleaning waters after purging	The technique is generally applicable. Recirculation of scrubbing water is applicable to most scrubbing systems; however, periodic discharge and replacement of the scrubbing medium may be necessary

Technique	Applicability
(iii) Operate a quasi-closed loop water system as far as technically and economically feasible	The applicability of this technique may be limited by the constraints associated with the safety management of the production process. In particular: — open circuit cooling may be used when safety issues require for it (e.g. incidents when large quantities of glass need to be cooled) — water used in some specific process (e.g. downstream activities in the continuous filament glass fibre sector, acid polishing in the domestic and special glass sectors, etc.) may have to be discharged in total or in part to the waste water treatment system

13. BAT is to reduce the emission load of pollutants in the waste water discharges by using one or a combination of the following waste water treatment systems:

Technique	Applicability
(i) Standard pollution control techniques, such as settlement, screening, skimming, neutralisation, filtration, aeration, precipitation, coagulation and flocculation, etc. Standard good practice techniques to control emissions from storage of liquid raw materials and intermediates, such as containments, inspection/testing of tanks, overfill protection, etc.	The techniques are generally applicable
(ii) Biological treatment systems, such as activated sludge, biofiltration to remove/degrade the organic compounds	The applicability is limited to the sectors which use organic substances in the production process (e.g. continuous filament glass fibre and mineral wool sectors)
(iii) Discharge to municipal waste water treatment Plants	Applicable to installations where further reduction of pollutants is necessary
(iv) External reuse of waste waters	The applicability is generally limited to the frits sector (possible reuse in the ceramic industry)

Table 5

BAT-AELs for waste water discharges to surface waters from the manufacture of glass

Parameter [1]	Unit	BAT-AEL [2] (composite sample)
pH	—	6,5 – 9
Total suspended solids	mg/l	< 30
Chemical oxygen demand (COD)	mg/l	< 5 – 130 [3]
Sulphates, expressed as SO_4^{2-}	mg/l	< 1 000
Fluorides, expressed as F^-	mg/l	< 6 [4]
Total hydrocarbons	mg/l	< 15 [5]
Lead, expressed as Pb	mg/l	< 0,05 – 0,3 [6]
Antimony, expressed as Sb	mg/l	< 0,5
Arsenic, expressed as As	mg/l	< 0,3
Barium, expressed as Ba	mg/l	< 3,0

Parameter (1)	Unit	BAT-AEL (2) (composite sample)
Zinc, expressed as Zn	mg/l	< 0,5
Copper, expressed as Cu	mg/l	< 0,3
Chromium, expressed as Cr	mg/l	< 0,3
Cadmium, expressed as Cd	mg/l	< 0,05
Tin, expressed as Sn	mg/l	< 0,5
Nickel, expressed as Ni	mg/l	< 0,5
Ammonia, expressed as NH_4	mg/l	< 10
Boron, expressed as B	mg/l	< 1 – 3
Phenol	mg/l	< 1

(1) The relevance of the pollutants listed in the table depends on the sector of the glass industry and on the different activities carried out at the plant.
(2) The levels refer to a composite sample taken over a time period of 2 hours or 24 hours.
(3) For the continuous filament glass fibre sector, BAT-AEL is < 200 mg/l.
(4) The level refers to treated water coming from activities involving acid polishing.
(5) In general, total hydrocarbons are composed of mineral oils.
(6) The higher level of the range is associated with downstream processes for the production of lead crystal glass.

1.1.6. Waste from the glass manufacturing processes

14. BAT is to reduce the production of solid waste to be disposed of by using one or a combination of the following techniques:

Technique	Applicability
(i) Recycling of waste batch materials, where quality requirements allow for it	The applicability may be limited by the constraints associated with the quality of the final glass product
(ii) Minimising material losses during the storage and handling of raw materials	The technique is generally applicable
(iii) Recycling of internal cullet from rejected production	Generally, not applicable to the continuous filament glass fibre, high temperature insulation wool and frits sectors
(iv) Recycling of dust in the batch formulation where quality requirements allow for it	The applicability may be limited by different factors: — quality requirements of the final glass product — cullet percentage used in the batch formulation — potential carryover phenomena and corrosion of the refractory materials — sulphur balance constraints
(v) Valorisation of solid waste and/or sludge through appropriate use on-site (e.g. sludge from water treatment) or in other industries	Generally applicable to the domestic glass sector (for lead crystal cutting sludge) and to the container glass sector (fine particles of glass mixed with oil). Limited applicability to other glass manufacturing sectors due to unpredictable, contaminated composition, low volumes and economic viability
(vi) Valorisation of end-of-life refractory materials for possible use in other industries	The applicability is limited by the constraints imposed by the refractory manufacturers and potential end-users
(vii) Applying cement bonded briquetting of waste for recycling into hot blast cupola furnaces where quality requirements allow for it	The applicability of cement bonded briquetting of waste is limited to the stone wool sector. A trade-off approach between air emissions and the generation of solid waste stream should be undertaken

1.1.7. Noise from the glass manufacturing processes

15. BAT is to reduce noise emissions by using one or a combination of the following techniques:

(i) Make an environmental noise assessment and formulate a noise management plan as appropriate to the local environment

(ii) Enclose noisy equipment/operation in a separate structure/unit

(iii) Use embankments to screen the source of noise

(iv) Carry out noisy outdoor activities during the day

(v) Use noise protection walls or natural barriers (trees, bushes) between the installation and the protected area, on the basis of local conditions.

1.2. *BAT conclusions for container glass manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all container glass manufacturing installations.

1.2.1. Dust emissions from melting furnaces

16. BAT is to reduce dust emissions from the waste gases of the melting furnace by applying a flue-gas cleaning system such as an electrostatic precipitator or a bag filter.

Technique ([1])	Applicability
The flue-gas cleaning systems consist of end-of-pipe techniques based on the filtration of all materials that are solid at the point of measurement	The technique is generally applicable

([1]) A description of filtration systems (i.e. electrostatic precipitator, bag filter) is given in Section 1.10.1.

Table 6

BAT-AELs for dust emissions from the melting furnace in the container glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass ([1])
Dust	< 10 – 20	< 0,015 – 0,06

([1]) The conversion factors of $1,5 \times 10^{-3}$ and 3×10^{-3} have been used for the determination of the lower and higher value of the range respectively.

1.2.2. Nitrogen oxides (NO_X) from melting furnaces

17. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

I. primary techniques, such as:

Technique ([1])	Applicability
(i) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	Applicable only under installation-specific circumstances due to a lower furnace efficiency and higher fuel demand (i.e. use of recuperative furnaces in place of regenerative furnaces)

Technique [1]	Applicability
(c) Staged combustion: — Air staging — Fuel staging	Fuel staging is applicable to most conventional air/fuel furnaces. Air staging has very limited applicability due to its technical complexity
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. The achieved environmental benefits are generally lower for applications to cross-fired, gas-fired furnaces due to technical constraints and a lower degree of flexibility of the furnace. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State
(ii) Special furnace design	The applicability is limited to batch formulations that contain high levels of external cullet (> 70 %). The application requires a complete rebuild of the melting furnace. The shape of the furnace (long and narrow) may pose space restrictions
(iii) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day). Not applicable for productions requiring large pull variations. The implementation requires a complete furnace rebuild
(iv) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

[1] A description of the techniques is given in Section 1.10.2.

II. secondary techniques, such as:

Technique [1]	Applicability
(i) Selective catalytic reduction (SCR)	The application may require an upgrade of the dust abatement system in order to guarantee a dust concentration of below 10 – 15 mg/Nm^3 and a desulphurisation system for the removal of SO_X emissions. Due to the optimum operating temperature window, the applicability is limited to the use of electrostatic precipitators. In general, the technique is not used with a bag filter system because the low operating temperature, in the range of 180 – 200 °C, would require reheating of the waste gases. The implementation of the technique may require significant space availability
(ii) Selective non-catalytic reduction(SNCR)	The technique is applicable to recuperative furnaces. Very limited applicability to conventional regenerative furnaces, where the correct temperature window is difficult to access or does not allow a good mixing of the flue-gases with the reagent. It may be applicable to new regenerative furnaces equipped with split regenerators; however, the temperature window is difficult to maintain due to the reversal of fire between the chambers that causes a cyclical temperature change

[1] A description of the techniques is given in Section 1.10.2.

Table 7

BAT-AELs for NO_X emissions from the melting furnace in the container glass sector

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
NO_X expressed as NO_2	Combustion modifications, special furnace designs (2) (3)	500 – 800	0,75 – 1,2
	Electric melting	< 100	< 0,3
	Oxy-fuel melting (4)	Not applicable	< 0,5 – 0,8
	Secondary techniques	< 500	< 0,75

(1) The conversion factor reported in Table 2 for general cases ($1,5 \times 10^{-3}$) has been applied, with the exception of electric melting (specific cases: 3×10^{-3}).
(2) The lower value refers to the use of special furnace designs, where applicable.
(3) These values should be reconsidered in the occasion of a normal or complete rebuild of the melting furnace.
(4) The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).

18. When nitrates are used in the batch formulation and/or special oxidising combustion conditions are required in the melting furnace for ensuring the quality of the final product, BAT is to reduce NO_X emissions by minimising the use of these raw materials, in combination with primary or secondary techniques

The BAT-AELs are set out in Table 7.

If nitrates are used in the batch formulation for short campaigns or for melting furnaces with a capacity of < 100 t/day, the BAT-AEL is set out in Table 8.

Technique (1)	Applicability
Primary techniques: — Minimising the use of nitrates in the batch formulation The use of nitrates is applied for very high quality products (i.e. flacconage, perfume bottles and cosmetic containers). Effective alternative materials are sulphates, arsenic oxides, cerium oxide. The application of process modifications (e.g. special oxidising combustion conditions) represents an alternative to the use of nitrates	The substitution of nitrates in the batch formulation may be limited by the high costs and/or higher environmental impact of the alternative materials

(1) A description of the techniques is given in Section 1.10.2.

Table 8

BAT-AEL for NO_X emissions from the melting furnace in the container glass sector, when nitrates are used in the batch formulation and/or special oxidising combustion conditions in cases of short campaigns or for melting furnaces with a capacity of < 100 t/day

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
NO_X expressed as NO_2	Primary techniques	< 1 000	< 3

(1) The conversion factor reported in Table 2 for specific cases (3×10^{-3}) has been applied.

1.2.3. Sulphur oxides (SO_X) from melting furnaces

19. BAT is to reduce SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable
(ii) Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	The minimisation of the sulphur content in the batch formulation is generally applicable within the constraints of quality requirements of the final glass product. The application of sulphur balance optimisation requires a trade-off approach between the removal of SO_X emissions and the management of the solid waste (filter dust). The effective reduction of SO_X emissions depends on the retention of sulphur compounds in the glass which may vary significantly depending on the glass type
(iii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State

(1) A description of the techniques is given in Section 1.10.3.

Table 9

BAT-AELs for SO_X emissions from the melting furnace in the container glass sector

Parameter	Fuel	BAT-AEL (1) (2)	
		mg/Nm^3	kg/tonne melted glass (3)
SO_X expressed as SO_2	Natural gas	< 200 – 500	< 0,3 – 0,75
	Fuel oil (4)	< 500 – 1 200	< 0,75 – 1,8

(1) For special types of coloured glasses (e.g. reduced green glasses), concerns related to the achievable emission levels may require investigating the sulphur balance. Values reported in the table may be difficult to achieve in combination with filter dust recycling and the rate of recycling of external cullet.
(2) The lower levels are associated with conditions where the reduction of SO_X is a high priority over a lower production of solid waste corresponding to the sulphate-rich filter dust.
(3) The conversion factor reported in Table 2 for general cases ($1,5 \times 10^{-3}$) has been applied.
(4) The associated emission levels are related to the use of 1 % sulphur fuel oil in combination with secondary abatement techniques.

1.2.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

20. BAT is to reduce HCl and HF emissions from the melting furnace (possibly combined with flue-gases from hot-end coating activities) by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The applicability may be limited by the constraints of the type of glass produced at the installation and the availability of raw materials
(ii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

(1) A description of the techniques is given in Section 1.10.4.

Table 10

BAT-AELs for HCl and HF emissions from the melting furnace in the container glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Hydrogen chloride, expressed as HCl (2)	< 10 – 20	< 0,02 – 0,03
Hydrogen fluoride, expressed as HF	< 1 – 5	< 0,001 – 0,008

(1) The conversion factor for general cases, reported in Table 2 ($1,5 \times 10^{-3}$) has been applied.
(2) The higher levels are associated with the simultaneous treatment of flue-gases from hot-end coating operations.

1.2.5. Metals from melting furnaces

21. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The applicability may be limited by the constraints imposed by the type of glass produced at the installation and the availability of the raw materials
(ii) Minimising the use of metal compounds in the batch formulation, where colouring and decolourising of glass is needed, subject to consumer glass quality requirements	
(iii) Applying a filtration system (bag filter or electrostatic precipitator)	The techniques are generally applicable
(iv) Applying a dry or semi-dry scrubbing, in combination with a filtration system	

(1) A description of the techniques is given in Section 1.10.5.

Table 11

BAT-AELs for metal emissions from the melting furnace in the container glass sector

Parameter	BAT-AEL (1) (2) (3)	
	mg/Nm^3	kg/tonne melted glass (4)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 0,2 – 1 (5)	$< 0,3 – 1,5 \times 10^{-3}$
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 1 – 5	$< 1,5 – 7,5 \times 10^{-3}$

(1) The levels refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) The lower levels are BAT-AELs when metal compounds are not intentionally used in the batch formulation.
(3) The upper levels are associated with the use of metals for colouring or decolourising the glass, or when the flue-gases from the hot-end coating operations are treated together with the melting furnace emissions.
(4) The conversion factor for general cases, reported in Table 2 ($1,5 \times 10^{-3}$) has been applied.
(5) In specific cases, when high quality flint glass is produced requiring higher amounts of selenium for decolourising (depending on the raw materials), higher values are reported, up to 3 mg/Nm^3.

1.2.6. Emissions from downstream processes

22. When tin, organotin or titanium compounds are used for hot-end coating operations, BAT is to reduce emissions by using one or a combination of the following techniques:

Technique	Applicability
(i) Minimising the losses of the coating product by ensuring a good sealing of the application system and applying an effective extracting hood. A good construction and sealing of the application system is essential for minimising losses of unreacted product into the air	The technique is generally applicable

Technique	Applicability
(ii) Combining the flue-gas from the coating operations with the waste gas from the melting furnace or with the combustion air of the furnace, when a secondary treatment system is applied (filter and dry or semi-dry scrubber). Based on the chemical compatibility, the waste gases from the coating operations may be combined with other flue-gases before treatment. These two options may be applied: — combination with the flue gases from the melting furnace, upstream of a secondary abatement system (dry or semi-dry scrubbing plus filtration system) — combination with combustion air before entering the regenerator, followed by secondary abatement treatment of the waste gases generated during the melting process (dry or semi-dry scrubbing + filtration system)	The combination with flue gases from the melting furnace is generally applicable. The combination with combustion air may be affected by technical constraints due to some potential effects on the glass chemistry and on the regenerator materials
(iii) Applying a secondary technique, e.g. wet scrubbing, dry scrubbing plus filtration ([1])	The techniques are generally applicable

([1]) A description of the techniques is given in Sections 1.10.4 and 1.10.7.

Table 12

BAT-AELs for air emissions from hot-end coating activities in the container glass sector when the flue-gases from downstream operations are treated separately

Parameter	BAT-AEL
	mg/Nm^3
Dust	< 10
Titanium compounds expressed as Ti	< 5
Tin compounds, including organotin, expressed as Sn	< 5
Hydrogen chloride, expressed as HCl	< 30

23. When SO_3 is used for surface treatment operations, BAT is to reduce SO_X emissions by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Minimising the product losses by ensuring a good sealing of the application system A good construction and maintenance of the application system is essential for minimising the losses of unreacted product into the air	The techniques are generally applicable
(ii) Applying a secondary technique, e.g. wet scrubbing	

([1]) A description of the techniques is given in Section 1.10.6.

Table 13

BAT-AEL for SO_X emissions from downstream activities when SO_3 is used for surface treatment operations in the container glass sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
SO_x, expressed as SO_2	< 100 – 200

1.3. *BAT conclusions for flat glass manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all flat glass manufacturing installations.

1.3.1. Dust emissions from melting furnaces

24. BAT is to reduce dust emissions from the waste gases of the melting furnace by applying an electrostatic precipitator or a bag filter system

A description of the techniques is given in Section 1.10.1.

Table 14

BAT-AELs for dust emissions from the melting furnace in the flat glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass ([1])
Dust	< 10 – 20	< 0,025 – 0,05

([1]) The conversion factor reported in Table 2 ($2,5 \times 10^{-3}$) has been applied.

1.3.2. Nitrogen oxides (NO_X) from melting furnaces

25. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

I. primary techniques, such as:

Technique ([1])	Applicability
(i) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	The applicability is restricted to small capacity furnaces for the production of specialty flat glass and under installation-specific circumstances, due to a lower furnace efficiency and higher fuel demand (i.e. use of recuperative furnaces in place of regenerative furnaces)
(c) Staged combustion: — Air staging — Fuel staging	Fuel staging is applicable to most conventional air/fuel furnaces. Air staging has very limited applicability due to its technical complexity
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. The achieved environmental benefits are generally lower for applications to cross-fired, gas-fired furnaces due to technical constraints and a lower degree of flexibility of the furnace. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State

Technique [1]	Applicability
(ii) Fenix process Based on the combination of a number of primary techniques for the optimisation of the combustion of cross-fired regenerative float furnaces. The main features are: — reduction of excess air — suppression of hotspots and homogenisation of the flame temperatures — controlled mixing of the fuel and combustion air	The applicability is limited to cross-fired regenerative furnaces. Applicable to new furnaces. For existing furnaces, the technique requires being directly integrated during the design and construction of the furnace, at a complete furnace rebuild
(iii) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

[1] A description of the techniques is given in Section 1.10.2.

II. secondary techniques, such as:

Technique [1]	Applicability
(i) Chemical reduction by fuel	Applicable to regenerative furnaces. The applicability is limited by an increased fuel consumption and consequent environmental and economic impact
(ii) Selective catalytic reduction (SCR)	The application may require an upgrade of the dust abatement system in order to guarantee a dust concentration of below 10 – 15 mg/Nm^3 and a desulphurisation system for the removal of SO_X emissions Due to the optimum operating temperature window, the applicability is limited to the use of electrostatic precipitators. In general, the technique is not used with a bag filter system because the low operating temperature, in the range of 180 – 200 °C, would require reheating of the waste gases. The implementation of the technique may require significant space availability

[1] A description of the techniques is given in Section 1.10.2.

Table 15

BAT-AELs for NO_X emissions from the melting furnace in the flat glass sector

Parameter	BAT	BAT-AEL [1]	
		mg/Nm^3	kg/tonne melted glass [2]
NO_X expressed as NO_2	Combustion modifications, Fenix process [3]	700 – 800	1,75 – 2,0
	Oxy-fuel melting [4]	Not applicable	< 1,25 – 2,0
	Secondary techniques [5]	400 – 700	1,0 – 1,75

[1] Higher emission levels are expected when nitrates are used occasionally for the production of special glasses.
[2] The conversion factor reported in Table 2 (2,5 × 10^{-3}) has been applied.
[3] The lower levels of the range are associated with the application of the Fenix process.
[4] The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).
[5] The higher levels of the range are associated with existing plants until a normal or complete rebuild of the melting furnace. The lower levels are associated with newer/retrofitted plants.

26. When nitrates are used in the batch formulation, BAT is to reduce NO_X emissions by minimising the use of these raw materials, in combination with primary or secondary techniques. If secondary techniques are applied, the BAT-AELs reported in Table 15 are applicable.

If nitrates are used in the batch formulation for the production of special glasses in a limited number of short campaigns, the BAT-AELs are set out in Table 16.

Technique [1]	Applicability
Primary techniques: minimising the use of nitrates in the batch formulation The use of nitrates is applied for special productions (i.e. coloured glass). Effective alternative materials are sulphates, arsenic oxides, cerium oxide	The substitution of nitrates in the batch formulation may be limited by the high costs and/or higher environmental impact of the alternative materials

[1] A description of the technique is given in Section 1.10.2.

Table 16

BAT-AEL for NO_X emissions from the melting furnace in the flat glass sector, when nitrates are used in the batch formulation for the production of special glasses in a limited number of short campaigns

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass [1]
NO_X expressed as NO_2	Primary techniques	< 1 200	< 3

[1] The conversion factor reported in Table 2 for specific cases ($2,5 \times 10^{-3}$) has been applied

1.3.3. Sulphur oxides (SO_X) from melting furnaces

27. BAT is to reduce SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique [1]	Applicability
(i) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable
(ii) Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	The minimisation of the sulphur content in the batch formulation is generally applicable within the constraints of quality requirements of the final glass product. The application of sulphur balance optimisation requires a trade-off approach between the removal of SO_X emissions and the management of the solid waste (filter dust)
(iii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State

[1] A description of the techniques is given in Section 1.10.3.

Table 17

BAT-AELs for SO_X emissions from the melting furnace in the flat glass sector

Parameter	Fuel	BAT-AEL [1]	
		mg/Nm^3	kg/tonne melted glass [2]
SO_x expressedas SO_2	Natural gas	< 300 – 500	< 0,75 – 1,25
	Fuel oil [3] [4]	500 – 1 300	1,25 – 3,25

[1] The lower levels are associated with conditions where the reduction of SO_X has a high priority over a lower production of solid waste corresponding to the sulphate-rich filter dust.
[2] The conversion factor reported in Table 2 ($2,5 \times 10^{-3}$) has been applied.
[3] The associated emission levels are related to the use of 1 % sulphur fuel oil in combination with secondary abatement techniques.
[4] For large flat glass furnaces, concerns related to the achievable emission levels may require investigating the sulphur balance. Values reported in the table may be difficult to achieve in combination with filter dust recycling.

1.3.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

28. BAT is to reduce HCl and HF emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The applicability may be limited by the constraints of the type of glass produced at the installation and the availability of raw materials
(ii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

(1) A description of the techniques is given in Section 1.10.4.

Table 18

BAT-AELs for HCl and HF emissions from the melting furnace in the flat glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Hydrogen chloride, expressed as HCl (2)	< 10 – 25	< 0,025 – 0,0625
Hydrogen fluoride, expressed as HF	< 1 – 4	< 0,0025 – 0,010

(1) The conversion factor reported in Table 2 ($2,5 \times 10^{-3}$) has been applied.
(2) The higher levels of the range are associated with the recycling of filter dust in the batch formulation

1.3.5. Metals from melting furnaces

29. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The applicability may be limited by the constraints imposed by the type of glass produced at the installation and the availability of the raw materials.
(ii) Applying a filtration system	The technique is generally applicable
(iii) Applying a dry or semi-dry scrubbing, in combination with a filtration system	

(1) A description of the techniques is given in Section 1.10.5.

Table 19

BAT-AELs for metal emissions from the melting furnace in the flat glass sector, with the exception of selenium coloured glasses

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 0,2 – 1	$< 0,5 – 2,5 \times 10^{-3}$
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 1 – 5	$< 2,5 – 12,5 \times 10^{-3}$

(1) The ranges refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) The conversion factor reported in Table 2 ($2,5 \times 10^{-3}$) has been applied

30. When selenium compounds are used for colouring the glass, BAT is to reduce selenium emissions from the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Minimising the evaporation of selenium from the batch composition by selecting raw materials with a higher retention efficiency in the glass and reduced volatilisation	The applicability may be limited by the constraints imposed by the type of glass produced at the installation and the availability of the raw materials
(ii) Applying a filtration system	The technique is generally applicable
(iii) Applying a dry or semi-dry scrubbing, in combination with a filtration system	

([1]) A description of the techniques is given in Section 1.10.5.

Table 20

BAT-AELs for selenium emissions from the melting furnace in the flat glass sector for the production of coloured glass

Parameter	BAT-AEL ([1]) ([2])	
	mg/Nm^3	kg/tonne melted glass ([3])
Selenium compounds, expressed as Se	1 – 3	$2,5 – 7,5 \times 10^{-3}$

([1]) The values refer to the sum of selenium present in the flue-gases in both solid and gaseous phases.
([2]) The lower levels correspond to conditions where the reduction of Se emissions is a priority over a lower production of solid waste from filter dust. In this case, a high stoichiometric ratio (reagent/pollutant) is applied and a significant solid waste stream is generated.
([3]) The conversion factor reported in Table 2 ($2,5 \times 10^{-3}$) has been applied.

1.3.6. Emissions from downstream processes

31. BAT is to reduce emissions to air from the downstream processes by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Minimising the losses of coating products applied to the flat glass by ensuring a good sealing of the application system	The techniques are generally applicable
(ii) Minimising the losses of SO_2 from the annealing lehr, by operating the control system in an optimum manner	
(iii) Combining the SO_2 emissions from the lehr with the waste gas from the melting furnace, when technically feasible, and where a secondary treatment system is applied (filter and dry or semi-dry scrubber)	
(iv) Applying a secondary technique, e.g. wet scrubbing, or dry scrubbing and filtration	The techniques are generally applicable. The selection of the technique and its performance will depend on the inlet waste gas composition

([1]) A description of the secondary treatment systems is given in Sections 1.10.3 and 1.10.6.

Table 21

BAT-AELs for air emissions from downstream processes in the flat glass sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Dust	< 15 – 20

Parameter	BAT-AEL
	mg/Nm^3
Hydrogen chloride, expressed as HCl	< 10
Hydrogen fluoride, expressed as HF	< 1 – 5
SO_X, expressed as SO_2	< 200
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 1
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 5

1.4. *BAT conclusions for continuous filament glass fibre manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all continuous filament glass fibre manufacturing installations.

1.4.1. Dust emissions from melting furnaces

The BAT-AELs reported in this section for dust refer to all materials that are solid at the point of measurement, including solid boron compounds. Gaseous boron compounds at the point of measurement are not included.

32. BAT is to reduce dust emissions from the waste gases of the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Reduction of the volatile components by raw material modifications The formulation of batch compositions without boron compounds or with low levels of boron is a primary measure for reducing dust emissions which are mainly generated by volatilisation phenomena. Boron is the main constituent of particulate matter emitted from the melting furnace	The application of the technique is limited by proprietary issues, since the boron-free or low-boron batch formulations are covered by a patent
(ii) Filtration system: electrostatic precipitator or bag filter	The technique is generally applicable. The maximum environmental benefits are achieved for applications on new plants where the positioning and characteristics of the filter may be decided without restrictions
(iii) Wet scrubbing system	The application to existing plants may be limited by technical constraints; i.e. need for a specific waste water treatment plant

([1]) A description of the secondary treatment systems is given in Sections 1.10.1 and 1.10.7.

Table 22

BAT-AELs for dust emissions from the melting furnace in the continuous filament glass fibre sector

Parameter	BAT-AEL ([1])	
	mg/Nm^3	kg/tonne melted glass ([2])
Dust	< 10 – 20	< 0,045 – 0,09

([1]) Values at levels of < 30 mg/Nm^3 (< 0,14 kg/tonne melted glass) have been reported for boron-free formulations, with the application of primary techniques.
([2]) The conversion factor reported in Table 2 ($4{,}5 \times 10^{-3}$) has been applied.

1.4.2. Nitrogen oxides (NO_X) from melting furnaces

33. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique [1]	Applicability
(i) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	Applicable to air/fuel conventional furnaces within the constraints of the furnace energy efficiency and higher fuel demand. Most furnaces are already of the recuperative type.
(c) Staged combustion: (d) Air staging (e) Fuel staging	Fuel staging is applicable to most air/fuel, oxy-fuel furnaces. Air staging has very limited applicability due to its technical complexity
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State
(ii) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

[1] A description of the techniques is given in Section 1.10.2.

Table 23

BAT-AELs for NO_X emissions from the melting furnace in the continuous filament glass fibre sector

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass
NO_X expressed as NO_2	Combustion modifications	< 600 – 1 000	< 2,7 – 4,5 [1]
	Oxy-fuel melting [2]	Not applicable	< 0,5 – 1,5

[1] The conversion factor reported in Table 2 ($4,5 \times 10^{-3}$) has been applied.
[2] The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).

1.4.3. Sulphur oxides (SO_X) from melting furnaces

34. BAT is to reduce SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique [1]	Applicability
(i) Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	The technique is generally applicable within the constraints of quality requirements of the final glass product. The application of sulphur balance optimisation requires a trade-off approach between the removal of SO_X emissions and the management of the solid waste (filter dust), which needs to be disposed of

Technique (1)	Applicability
(ii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable. The presence of high concentrations of boron compounds in the flue-gases may limit the abatement efficiency of the reagent used in the dry or semi-dry scrubbing systems
(iv) Use of wet scrubbing	The technique is generally applicable within technical constraints; i.e. need for a specific waste water treatment plant

(1) A description of the techniques is given in Sections 1.10.3 and 1.10.6.

Table 24

BAT-AELs for SO_X emissions from the melting furnace in the continuous filament glass fibre sector

Parameter	Fuel	BAT-AEL (1)	
		mg/Nm^3	kg/tonne melted glass (2)
SO_x expressed as SO_2	Natural gas (3)	< 200 – 800	< 0,9 – 3,6
	Fuel oil (4) (5)	< 500 – 1 000	< 2,25 – 4,5

(1) The higher levels of the range are associated with the use of sulphates in the batch formulation for refining the glass.
(2) The conversion factor reported in Table 2 ($4,5 \times 10^{-3}$) has been applied.
(3) For oxy-fuel furnaces with the application of wet scrubbing, the BAT-AEL is reported to be < 0,1 kg/tonne melted glass of SO_X, expressed as SO_2.
(4) The associated emission levels are related to the use of 1 % sulphur fuel oil in combination with secondary abatement techniques.
(5) The lower levels correspond to conditions where the reduction of SO_X is a priority over a lower production of solid waste corresponding to the sulphate-rich filter dust. In this case, the lower levels are associated with the use of a bag filter.

1.4.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

35. BAT is to reduce HCl and HF emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The technique is generally applicable within the constraints of the batch formulation and the availability of raw materials
(ii) Minimisation of the fluorine content in the batch formulation The minimisation of fluorine emissions from the melting process may be achieved as follows: — minimising/reducing the quantity of fluorine compounds (e.g. fluorspar) used in the batch formulation to the minimum commensurate with the quality of the final product. Fluorine compounds are used to optimise the melting process, help fiberisation and minimise filament breakage — substituting fluorine compounds with alternative materials (e.g. sulphates)	The substitution of fluorine compounds with alternative materials is limited by quality requirements of the product
(iii) dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable
(iv) wet scrubbing	The technique is generally applicable within technical constraints; i.e. need for a specific waste water treatment plant.

(1) A description of the techniques is given in Sections 1.10.4 and 1.10.6.

Table 25

BAT-AELs for HCl and HF emissions from the melting furnace in the continuous filament glass fibre sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Hydrogen chloride, expressed as HCl	< 10	< 0,05
Hydrogen fluoride, expressed as HF (2)	< 5 – 15	< 0,02 – 0,07

(1) The conversion factor reported in Table 2 ($4,5 \times 10^{-3}$) has been applied.
(2) The higher levels of the range are associated with the use of fluorine compounds in the batch formulation.

1.4.5. Metals from melting furnaces

36. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The technique is generally applicable within the constraints of the availability of raw materials
(ii) Applying a dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable
(iii) Applying wet scrubbing	The technique is generally applicable within technical constraints; i.e. need for a specific waste water treatment plant.

(1) A description of the techniques is given in Sections 1.10.5 and 1.10.6.

Table 26

BAT-AELs for metal emissions from the melting furnace in the continuous filament glass fibre sector

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 0,2 – 1	$< 0,9 – 4,5 \times 10^{-3}$
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 1 – 3	$< 4,5 – 13,5 \times 10^{-3}$

(1) The levels refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) The conversion factor reported in Table 2 ($4,5 \times 10^{-3}$) has been applied.

1.4.6. Emissions from downstream processes

37. BAT is to reduce emissions from downstream processes by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Wet scrubbing systems	The techniques are generally applicable for the treatment of waste gases from the forming process (application of the coating to the fibres) or secondary processes which involve the use of binder that must be cured or dried
(ii) Wet electrostatic precipitator	
(iii) Filtration system (bag filter)	The technique is generally applicable for the treatment of waste gases from cutting and milling operations of the products

(1) A description of the techniques is given in Sections 1.10.7 and 1.10.8.

Table 27

BAT-AELs for air emissions from downstream processes in the continuous filament glass fibre sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Emissions from forming and coating	
Dust	< 5 – 20
Formaldehyde	< 10
Ammonia	< 30
Total volatile organic compounds, expressed as C	< 20
Emissions from cutting and milling	
Dust	< 5 – 20

1.5. *BAT conclusions for domestic glass manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all domestic glass manufacturing installations.

1.5.1. Dust emissions from melting furnaces

38. BAT is to reduce dust emissions from the waste gases of the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Reduction of the volatile components by raw material modifications. The formulation of the batch composition may contain very volatile components (e.g. boron, fluorides) which significantly contribute to the formation of dust emissions from the melting furnace	The technique is generally applicable within the constraints of the type of glass produced and the availability of substitute raw materials
(ii) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day). Not applicable for productions requiring large pull variations The implementation requires a complete furnace rebuild
(iii) Oxy-fuel melting	The maximum environmental benefits are achieved for applications made at the time of a complete furnace rebuild
(iv) Filtration system: electrostatic precipitator or bag filter	The techniques are generally applicable
(v) Wet scrubbing system	The applicability is limited to specific cases, in particular to electric melting furnaces, where flue-gas volumes and dust emissions are generally low and related to carryover of the batch formulation

([1]) A description of the techniques is given in Sections 1.10.5 and 1.10.7.

Table 28

BAT-AELs for dust emissions from the melting furnace in the domestic glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Dust	< 10 – 20 (2)	< 0,03 – 0,06
	< 1 – 10 (3)	< 0,003 – 0,03

(1) A conversion factor of 3×10^{-3} has been applied (see Table 2). However, a case by case conversion factor may have to be applied for specific productions.
(2) Considerations concerning the economic viability for achieving the BAT-AELs in the case of furnaces with a capacity of < 80 t/d, producing soda-lime glass, are reported.
(3) This BAT-AEL applies to batch formulations containing significant amounts of constituents meeting the criteria as dangerous substances, in accordance with Regulation (EC) No 1272/2008 of the European Parliament and of the Council.

1.5.2. Nitrogen oxides (NO_X) from melting furnaces

39. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	Applicable only under installation-specific circumstances due to a lower furnace efficiency and higher fuel demand (i.e. use of recuperative furnaces in place of regenerative furnaces)
(c) Staged combustion: (f) Air staging (g) Fuel staging	Fuel staging is applicable to most conventional air/fuel furnaces. Air staging has very limited applicability due to its technical complexity
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. The achieved environmental benefits are generally lower for applications to cross-fired, gas-fired furnaces due to technical constraints and a lower degree of flexibility of the furnace. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State
(ii) Special furnace design	The applicability is limited to batch formulations that contain high levels of external cullet (> 70 %). The application requires a complete rebuild of the melting furnace. The shape of the furnace (long and narrow) may pose space restrictions

Technique (1)	Applicability
(iii) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day). Not applicable for productions requiring large pull variations. The implementation requires a complete furnace rebuild
(iv) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

(1) A description of the techniques is given in Section 1.10.2.

Table 29

BAT-AELs for NO_X emissions from the melting furnace in the domestic glass sector

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
NO_x expressed as NO_2	Combustion modifications, special furnace designs	< 500 – 1 000	< 1,25 – 2,5
	Electric melting	< 100	< 0,3
	Oxy-fuel melting (2)	Not applicable	< 0,5 – 1,5

(1) A conversion factor of $2,5 \times 10^{-3}$ has been applied for combustion modifications and special furnace designs and a conversion factor of 3×10^{-3} has been applied for electric melting (see Table 2). However, a case-by-case conversion factor may have to be applied for specific productions.
(2) The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).

40. When nitrates are used in the batch formulation, BAT is to reduce NO_X emissions by minimising the use of these raw materials, in combination with primary or secondary techniques.

The BAT-AELs are set out in Table 29.

If nitrates are used in the batch formulation for a limited number of short campaigns or for melting furnaces with a capacity < 100 t/day producing special types of soda-lime glasses (clear/ultra-clear glass or coloured glass using selenium) and other special glasses (i.e. borosilicate, glass ceramics, opal glass, crystal and lead crystal), the BAT-AELs are set out in Table 30.

Technique (1)	Applicability
Primary techniques:	
— Minimising the use of nitrates in the batch formulation The use of nitrates is applied for very high quality products, where a very colourless (clear) glass is required or special glasses are produced. Effective alternative materials are sulphates, arsenic oxides, cerium oxide	The substitution of nitrates in the batch formulation may be limited by the high costs and/or higher environmental impact of the alternative materials

(1) A description of the technique is given in Section 1.10.2.

Table 30

BAT-AELs for NO_X emissions from the melting furnace in the domestic glass sector, when nitrates are used in the batch formulation for a limited number of short campaigns or for melting furnaces with a capacity < 100 t/day producing special types of soda-lime glasses (clear/ultra-clear glass or coloured glass using selenium) and other special glasses (i.e. borosilicate, glass ceramics, opal glass, crystal and lead crystal

Parameter	Type of furnace	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass
NO_X expressed as NO_2	Fuel/air conventional furnaces	< 500 – 1 500	< 1,25 – 3,75 ([1])
	Electric melting	< 300 – 500	< 8 – 10

([1]) The conversion factor reported in Table 2 for soda-lime glass ($2,5 \times 10^{-3}$) has been applied.

1.5.3. Sulphur oxides (SO_X) from melting furnaces

41. BAT is to reduce SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	The minimisation of the sulphur content in the batch formulation is generally applicable within the constraints of quality requirements of the final glass product. The application of sulphur balance optimisation requires a trade-off approach between the removal of SO_X emissions and the management of the solid waste (filter dust)
(ii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

([1]) A description of the techniques is given in Section 1.10.3.

Table 31

BAT-AELs for SO_X emissions from the melting furnace in the domestic glass sector

Parameter	Fuel/melting technique	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass ([1])
SO_x expressed as SO_2	Natural gas	< 200 – 300	< 0,5 – 0,75
	Fuel oil ([2])	< 1 000	< 2,5
	Electric melting	< 100	< 0,25

([1]) A conversion factor of $2,5 \times 10^{-3}$ has been applied (see Table 2). However, a case-by-case conversion factor may have to be applied for specific productions.
([2]) The levels are related to the use of 1 % sulphur fuel oil in combination with secondary abatement techniques.

1.5.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

42. BAT is to reduce HCl and HF emissions from the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The applicability may be limited by the constraints of the batch formulation for the type of glass produced at the installation and the availability of raw materials

Technique (1)	Applicability
(ii) Minimisation of the fluorine content in the batch formulation and optimisation of the fluorine mass balance The minimisation of fluorine emissions from the melting process may be achieved by minimising/reducing the quantity of fluorine compounds (e.g. fluorspar) used in the batch formulation to the minimum commensurate with the quality of the final product. Fluorine compounds are added to the batch formulation to give an opaque or cloudy appearance to the glass	The technique is generally applicable within the constraints of the quality requirements for the final product
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable
(iv) Wet scrubbing	The technique is generally applicable within technical constraints; i.e. need for a specific waste water treatment plant. High costs, waste water treatment aspects, including restrictions in the recycle of sludge or solid residues from the water treatment, may limit the applicability of this technique

(1) A description of the techniques is given in Sections 1.10.4 and 1.10.6.

Table 32

BAT-AELs for HCl and HF emissions from the melting furnace in the domestic glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Hydrogen chloride, expressed as HCl (2) (3)	< 10 – 20	< 0,03 – 0,06
Hydrogen fluoride, expressed as HF (4)	< 1 – 5	< 0,003 – 0,015

(1) A conversion factor of 3×10^{-3} has been applied (see Table 2). However, a case-by-case conversion factor may have to be applied for specific productions.
(2) The lower levels are associated with the use of electric melting.
(3) In cases where KCl or NaCl are used as a refining agents, the BAT-AEL is < 30 mg/Nm^3 or < 0,09 kg/tonne melted glass.
(4) The lower levels are associated with the use of electric melting. The higher levels are associated with the production of opal glass, the recycling of filter dust or where high levels of external cullet are used in the batch formulation.

1.5.5. Metals from melting furnaces

43. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The applicability may be limited by the constraints imposed by the type of glass produced at the installation and the availability of raw materials
(ii) Minimising the use of metal compounds in the batch formulation, through a suitable selection of the raw materials where colouring and decolourising of glass is needed or where specific characteristics are conferred to the glass	For the production of crystal and lead crystal glasses the minimisation of metal compounds in the batch formulation is restricted by the limits defined in Directive 69/493/EEC which classifies the chemical composition of the final glass products.
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

(1) A description of the techniques is given in Section 1.10.5.

Table 33

BAT-AELs for metal emissions from the melting furnace in the domestic glass sector with the exception of glasses where selenium is used for decolourising

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 0,2 – 1	$< 0,6 – 3 \times 10^{-3}$
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 1 – 5	$< 3 – 15 \times 10^{-3}$

(1) The levels refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) A conversion factor of 3×10^{-3} has been applied (see Table 2). However, a case-by-case conversion factor may have to be applied for specific productions.

44. When selenium compounds are used for decolourising the glass, BAT is to reduce selenium emissions from the melting furnace by using one or a combination of the following techniques

Technique (1)	Applicability
(i) Minimising the use of selenium compounds in the batch formulation, through a suitable selection of the raw materials	The applicability may be limited by the constraints imposed by the type of glass produced at the installation and the availability of raw materials
(ii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

(1) A description of the techniques is given in Section 1.10.5.

Table 34

BAT-AELs for selenium emissions from the melting furnace in the domestic glass sector when selenium compounds are used for decolourising the glass

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Selenium compounds, as Se	< 1	$< 3 \times 10^{-3}$

(1) The values refer to the sum of selenium present in the flue-gases in both solid and gaseous phases.
(2) A conversion factor of 3×10^{-3} has been applied (see Table 2). However, a case-by-case conversion factor may have to be applied for specific productions.

45. When lead compounds are used for the manufacturing of lead crystal glass, BAT is to reduce lead emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day). Not applicable for productions requiring large pull variations. The implementation requires a complete furnace rebuild
(ii) Bag filter	The technique is generally applicable
(iii) Electrostatic precipitator	
(iv) Dry or semi-dry scrubbing, in combination with a filtration system	

(1) A description of the technique is given in Sections 1.10.1 and 1.10.5.

Table 35

BAT-AELs for lead emissions from the melting furnace in the domestic glass sector when lead compounds are used for manufacturing lead crystal glass

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Lead compounds, expressed as Pb	< 0,5 – 1	$< 1 - 3 \times 10^{-3}$

(1) The values refer to the sum of lead present in the flue-gases in both solid and gaseous phases.
(2) A conversion factor of 3×10^{-3} has been applied (see Table 2). However, a case-by-case conversion factor may have to be applied for specific productions.

1.5.6. Emissions from downstream processes

46. For downstream dusty processes, BAT is to reduce emissions of dust and metals by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Performing dusty operations (e.g. cutting, grinding, polishing) under liquid	The techniques are generally applicable
(ii) Applying a bag filter system	

(1) A description of the techniques is given in Section 1.10.8.

Table 36

BAT-AELs for air emissions from dusty downstream processes in the domestic glass sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Dust	< 1 – 10
Σ (As, Co, Ni, Cd, Se, Cr_{VI}) (1)	< 1
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn) (1)	< 1 – 5
Lead compounds, expressed as Pb (2)	< 1 – 1,5

(1) The levels refer to the sum of metals present in the waste gas.
(2) The levels refer to downstream operations on lead crystal glass.

47. For acid polishing processes, BAT is to reduce HF emissions by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Minimising the losses of polishing product by ensuring a good sealing of the application system	The techniques are generally applicable
(ii) Applying a secondary technique, e.g. wet scrubbing.	

(1) A description of the techniques is given in Section 1.10.6.

Table 37

BAT-AELs for HF emissions from acid polishing processes in the domestic glass sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Hydrogen fluoride, expressed as HF	< 5

1.6. *BAT conclusions for special glass manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all special glass manufacturing installations.

1.6.1. Dust emissions from melting furnaces

48. BAT is to reduce dust emissions from the waste gases of the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Reduction of the volatile components by raw material modifications The formulation of the batch composition may contain very volatile components (e.g. boron, fluorides) which represent the main constituents of dust emitted from the melting furnace	The technique is generally applicable within the constraints of the quality of the glass produced
(ii) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day) Not applicable for productions requiring large pull variations The implementation requires a complete furnace rebuild
(iii) Filtration system: electrostatic precipitator or bag filter	The technique is generally applicable

([1]) A description of the techniques is given in Section 1.10.1.

Table 38

BAT-AELs for dust emissions from the melting furnace in the special glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass ([1])
Dust	< 10 – 20	< 0,03 – 0,13
	< 1 – 10 ([2])	< 0,003 – 0,065

([1]) The conversions factors of 2,5 × 10^{-3} and 6,5 × 10^{-3} have been used for the determination of the lower and upper value of the BAT-AELs range (see Table 2), with some values being approximated. However, a-case-by-case conversion factor needs to be applied, depending on the type of glass produced (see Table 2).

([2]) The BAT-AELs apply to batch formulations containing significant amounts of constituents meeting the criteria as dangerous substances, in accordance with Regulation (EC) No 1272/2008.

1.6.2. Nitrogen oxides (NO_X) from melting furnaces

49. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

I. primary techniques, such as:

Technique ([1])	Applicability
(i) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	Applicable only under installation-specific circumstances due to a lower furnace efficiency and higher fuel demand (i.e. use of recuperative furnaces in place of regenerative furnaces)
(c) Staged combustion: — Air staging — Fuel staging	Fuel staging is applicable to most conventional air/fuel furnaces. Air staging has very limited applicability due to the technical complexity
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. The achieved environmental benefits are generally lower for applications to cross-fired, gas-fired furnaces due to technical constraints and a lower degree of flexibility of the furnace. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State
(ii) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day). Not applicable for productions requiring large pull variations. The implementation requires a complete furnace rebuild
(iii) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

([1]) A description of the techniques is given in Section 1.10.2.

II. secondary techniques, such as:

Technique ([1])	Applicability
(i) Selective catalytic reduction (SCR)	The application may require an upgrade of the dust abatement system in order to guarantee a dust concentration of below 10 – 15 mg/Nm^3 and a desulphurisation system for the removal of SO_X emissions Due to the optimum operating temperature window, the applicability is limited to the use of electrostatic precipitators. In general, the technique is not used with a bag filter system because the low operating temperature, in the range of 180 – 200 °C, would require reheating of the waste gases. The implementation of the technique may require significant space availability

Technique (1)	Applicability
(ii) Selective non-catalytic reduction (SNCR)	Very limited applicability to conventional regenerative furnaces, where the correct temperature window is difficult to access or does not allow a good mixing of the flue-gases with the reagent It may be applicable to new regenerative furnaces equipped with split regenerators; however, the temperature window is difficult to maintain due to the reversal of fire between the chambers that causes a cyclical temperature change

(1) A description of the techniques is given in Section 1.10.2.

Table 39

BAT-AELs for NO_X emissions from the melting furnace in the special glass sector

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
NO_X expressed as NO_2	Combustion modifications	600 – 800	1,5 – 3,2
	Electric melting	< 100	< 0,25 – 0,4
	Oxy-fuel melting (2) (3)	Not applicable	< 1 – 3
	Secondary techniques	< 500	< 1 – 3

(1) The conversion factors of 2,5 × 10^{-3} and 4 × 10^{-3} have been used for the determination of the lower and upper value of the BAT-AEL range (see Table 2), with some values being approximated. However, a case-by-case conversion factor needs to be applied based on the type of production (see Table 2).
(2) The higher values are related to a special production of borosilicate glass tubes for pharmaceutical use.
(3) The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).

50. When nitrates are used in the batch formulation, BAT is to reduce NO_X emissions by minimising the use of these raw materials, in combination with either primary or secondary techniques

Technique (1)	Applicability
Primary techniques — minimising the use of nitrates in the batch formulation The use of nitrates is applied for very high quality products, where special characteristics of the glass are required. Effective alternative materials are sulphates, arsenic oxides, cerium oxide	The substitution of nitrates in the batch formulation may be limited by the high costs and/or higher environmental impact of the alternative materials

(1) A description of the technique is given in Section 1.10.2.

Table 40

BAT-AELs for NO_X emissions from the melting furnace in the special glass sector when nitrates are used in the batch formulation

Parameter	BAT	BAT-AEL (1)	
		mg/Nm^3	kg/tonne melted glass (2)
NO_X expressed as NO_2	Minimisation of nitrate input in the batch formulation combined with primary or secondary techniques	< 500 – 1 000	< 1 – 6

(1) The lower levels are associated with the use of electric melting.
(2) The conversion factors of 2,5 × 10^{-3} and 6,5 × 10^{-3} have been used for the determination of the lower and upper value of the BAT-AEL range respectively, with values being approximated. A case-by-case conversion factor may have to be applied based on the type of production (see Table 2).

1.6.3. Sulphur oxides (SO_X) from melting furnaces

51. BAT is to reduce SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique [1]	Applicability
(i) Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	The technique is generally applicable within the constraints of quality requirements of the final glass product
(ii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

[1] A description of the techniques is given in Section 1.10.3.

Table 41

BAT-AELs for SO_X emissions from the melting furnace in the special glass sector

Parameter	Fuel/melting technique	BAT-AEL [1]	
		mg/Nm^3	kg/tonne melted glass [2]
SO_X expressed as SO_2	Natural gas, electric melting [3]	< 30 – 200	< 0,08 – 0,5
	Fuel oil [4]	500 – 800	1,25 – 2

[1] The ranges take into account the variable sulphur balances associated with the type of glass produced.
[2] The conversion factor of $2,5 \times 10^{-3}$ (see Table 2) has been used. However, a case-by-case conversion factor may have to be applied based on the type of production.
[3] The lower levels are associated with the use of electric melting and batch formulations without sulphates.
[4] The associated emission levels are related to the use of 1 % sulphur fuel oil in combination with secondary abatement techniques.

1.6.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

52. BAT is to reduce HCl and HF emissions from the melting furnace by using one or a combination of the following techniques:

Technique [1]	Applicability
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The applicability may be limited by the constraints of the batch formulation for the type of glass produced at the installation and the availability of raw materials
(ii) Minimisation of the fluorine and/or chlorine compounds in the batch formulation and optimisation of the fluorine and/or chlorine mass balance Fluorine compounds are used to confer particular characteristics to special glasses (i.e. opaque lighting glass, optical glass). Chlorine compounds may be used as fining agents for borosilicate glass production	The technique is generally applicable within the constraints of the quality requirements for the final product.
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

[1] A description of the techniques is given in Section 1.10.4.

Table 42

BAT-AELs for HCl and HF emissions from the melting furnace in the special glass sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Hydrogen chloride, expressed as HCl (2)	< 10 – 20	< 0,03 – 0,05
Hydrogen fluoride, expressed as HF	< 1 – 5	< 0,003 – 0,04 (3)

(1) The conversion factor of 2,5 × 10^{-3} (see Table 2) has been used; with some values being approximated. A case-by-case conversion factor may have to be applied based on the type of production.
(2) The higher levels are associated with the use of materials containing chlorine in the batch formulation.
(3) The upper value of the range has been derived from specific reported data.

1.6.5. Metals from melting furnaces

53. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The applicability may be limited by the constraints imposed by the type of glass produced at the installation and the availability of raw materials
(ii) Minimising the use of metal compounds in the batch formulation, through a suitable selection of the raw materials where colouring and decolourising of glass is needed or where specific characteristics are conferred to the glass	The techniques are generally applicable
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	

(1) A description of the techniques is given in Section 1.10.5.

Table 43

BAT-AELs for metal emissions from the melting furnace in the special glass sector

Parameter	BAT-AEL (1) (2)	
	mg/Nm^3	kg/tonne melted glass (3)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 0,1 – 1	< 0,3 – 3 × 10^{-3}
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 1 – 5	< 3 – 15 × 10^{-3}

(1) The levels refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) The lower levels are BAT-AELs when metal compounds are not intentionally used in the batch formulation.
(3) The conversion factor of 2,5 × 10^{-3} (see Table 2) has been used, with some values indicated in the table having been approximated. A case-by-case conversion factor may have to be applied based on the type of production.

1.6.6. Emissions from downstream processes

54. For downstream dusty processes, BAT is to reduce emissions of dust and metals by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Performing dusty operations (e.g. cutting, grinding, polishing) under liquid	The techniques are generally applicable
(ii) Applying a bag filter system	

(1) A description of the techniques is given in Section 1.10.8.

Table 44

BAT-AELs for dust and metal emissions from downstream processes in the special glass sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Dust	1 – 10
Σ (As, Co, Ni, Cd, Se, Cr_{VI}) (1)	< 1
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn) (1)	< 1 – 5

(1) The levels refer to the sum of metals present in the waste gas.

55. For acid polishing processes, BAT is to reduce HF emissions by using one or a combination of the following techniques:

Technique (1)	Description
(i) Minimising the losses of polishing product by ensuring a good sealing of the application system	The techniques are generally applicable
(ii) Applying a secondary technique, e.g. wet scrubbing	

(1) A description of the techniques is given in Section 1.10.6.

Table 45

BAT-AELs for HF emissions from acid polishing processes in the special glass sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Hydrogen fluoride, expressed as HF	< 5

1.7. *BAT conclusions for mineral wool manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all mineral wool manufacturing installations.

1.7.1. Dust emissions from melting furnaces

56. BAT is to reduce dust emissions from the waste gases of the melting furnace by applying an electrostatic precipitator or a bag filter system

Technique (1)	Applicability
Filtration system: electrostatic precipitator or bag filter	The technique is generally applicable. Electrostatic precipitators are not applicable to cupola furnaces for stone wool production, due to the risk of explosion from the ignition of carbon monoxide produced within the furnace

(1) A description of the techniques is given in Section 1.10.1.

Table 46

BAT-AELs for dust emissions from the melting furnace in the mineral wool sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Dust	< 10 – 20	< 0,02 – 0,050

(1) The conversion factors of 2×10^{-3} and $2{,}5 \times 10^{-3}$ have been used for the determination of the lower and upper value of the BAT-AELs range (see Table 2), in order to cover both the production of glass wool and stone wool.

1.7.2. Nitrogen oxides (NO_X) from melting furnaces

57. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique [1]	Applicability
(i) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	Applicable only under installation-specific circumstances due to a lower furnace efficiency and higher fuel demand (i.e. use of recuperative furnaces in place of regenerative furnaces)
(c) Staged combustion: — Air staging — Fuel staging	Fuel staging is applicable to most conventional air/fuel furnaces. Air staging has very limited applicability due to the technical complexity
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. The achieved environmental benefits are generally lower for applications to cross-fired, gas-fired furnaces due to technical constraints and a lower degree of flexibility of the furnace. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State
(ii) Electric melting	Not applicable for large volume glass productions (> 300 tonnes/day). Not applicable for productions requiring large pull variations. The implementation requires a complete furnace rebuild
(iii) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

[1] A description of the techniques is given in Section 1.10.2.

Table 47

BAT-AELs for NO_X emissions from the melting furnace in the mineral wool sector

Parameter	Product	Melting technique	BAT-AEL	
			mg/Nm^3	kg/tonne melted glass [1]
NO_X expressed as NO_2	Glass wool	Fuel/air and electric furnaces	< 200 – 500	< 0,4 – 1,0
		Oxy-fuel melting [2]	Not applicable	< 0,5
	Stone wool	All types of furnaces	< 400 – 500	< 1,0 – 1,25

[1] The conversion factors of 2×10^{-3} for glass wool and $2,5 \times 10^{-3}$ for stone wool have been used (see Table 2).
[2] The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).

58. When nitrates are used in the batch formulation for glass wool production, BAT is to reduce NO_X emissions by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Minimising the use of nitrates in the batch formulation The use of nitrates is applied as an oxidising agent in batch formulations with high levels of external cullet to compensate for the presence of organic material contained in the cullet	The technique is generally applicable within the constraints of the quality requirements for the final product
(ii) Electric melting	The technique is generally applicable. The implementation of electric melting requires a complete furnace rebuild
(iii) Oxy-fuel melting	The technique is generally applicable. The maximum environmental benefits are achieved for applications made at the time of a complete furnace rebuild

(1) A description of the techniques is given in Section 1.10.2.

Table 48

BAT-AELs for NO_X emissions from the melting furnace in glass wool production when nitrates are used in the batch formulation

Parameter	BAT	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
NO_X expressed as NO_2	Minimisation of nitrate input in the batch formulation, combined with primary techniques	< 500 – 700	< 1,0 – 1,4 (2)

(1) The conversion factor of 2×10^{-3} has been used (see Table 2).
(2) The lower levels of the ranges are associated with the application of oxy-fuel melting.

1.7.3. Sulphur oxides (SO_X) from melting furnaces

59. BAT is to reduce SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	In glass wool production, the technique is generally applicable within the constraints of the availability of low-sulphur raw materials, in particular external cullet. High levels of external cullet in the batch formulation limit the possibility of optimising the sulphur balance due to a variable sulphur content. In the stone wool production, the optimisation of the sulphur balance may require a trade-off approach between the removal of SO_X emissions from the flue-gases and the management of the solid waste, deriving from the treatment of the flue-gases (filter dust) and/or from the fiberising process, which may be recycled into the batch formulation (cement briquettes) or may need to be disposed of
(ii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	Electrostatic precipitators are not applicable to cupola furnaces for stone wool production (see BAT 56)
(iv) Use of wet scrubbing	The technique is generally applicable within technical constraints; i.e. need for a specific waste water treatment plant

(1) A description of the techniques is given in Sections 1.10.3 and 1.10.6.

Table 49

BAT-AELs for SO_X emissions from the melting furnace in the mineral wool sector

Parameter	Product/conditions	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
SO_X expressed as SO_2	***Glass wool***		
	Gas-fired and electric furnaces (2)	< 50 – 150	< 0,1 – 0,3
	Stone wool		
	Gas-fired and electric furnaces	< 350	< 0,9
	Cupola furnaces, no briquettes or slag recycling (3)	< 400	< 1,0
	Cupola furnaces, with cement briquettes or slag recycling (4)	< 1 400	< 3,5

(1) The conversion factors of 2×10^{-3} for glass wool and $2,5 \times 10^{-3}$ for stone wool have been used (see Table 2).
(2) The lower levels of the ranges are associated with the use of electric melting. The higher levels are associated with high levels of cullet recycling.
(3) The BAT-AEL is associated with conditions where the reduction of SO_X emissions has a high priority over a lower production of solid waste.
(4) When reduction of waste has a high priority over SO_X emissions, higher emission values may be expected. The achievable levels should be based on a sulphur balance.

1.7.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

60. BAT is to reduce HCl and HF emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Description
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The technique is generally applicable within the constraints of the batch formulation and the availability of raw materials
(ii) Dry or semi-dry scrubbing, in combination with a filtration system	Electrostatic precipitators are not applicable to cupola furnaces for stone wool production (see BAT 56)

(1) A description of the techniques is given in Section 1.10.4.

Table 50

BAT-AELs for HCl and HF emissions from the melting furnace in the mineral wool sector

Parameter	Product	BAT-AEL	
		mg/Nm^3	kg/tonne melted glass (1)
Hydrogen chloride, expressed as HCl	Glass wool	< 5 – 10	< 0,01 – 0,02
	Stone wool	< 10 – 30	< 0,025 – 0,075
Hydrogen fluoride, expressed as HF	All products	< 1 – 5	< 0,002 – 0,013 (2)

(1) The conversion factors of 2×10^{-3} for glass wool and $2,5 \times 10^{-3}$ for stone wool have been used (see Table 2).
(2) The conversion factors of 2×10^{-3} and $2,5 \times 10^{-3}$ have been used for the determination of the lower and upper values of the BAT-AELs range (see Table 2).

1.7.5. Hydrogen sulphide (H_2S) from stone wool melting furnaces

61. BAT is to reduce H_2S emissions from the melting furnace by applying a waste gas incineration system to oxidise hydrogen sulphide to SO_2

Technique (1)	Applicability
Waste gas incinerator system	The technique is generally applicable to stone wool cupola furnaces

(1) A description of the technique is given in Section 1.10.9.

Table 51

BAT-AELs for H_2S emissions from the melting furnace in stone wool production

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Hydrogen sulphide, expressed as H_2S	< 2	< 0,005

(1) The conversion factor of $2,5 \times 10^{-3}$ for stone wool has been applied (see Table 2).

1.7.6. Metals from melting furnaces

62. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The technique is generally applicable within the constraints of the availability of raw materials. In glass wool production, the use of manganese in the batch formulation as an oxidising agent depends on the quantity and quality of external cullet employed in the batch formulation and may be minimised accordingly
(ii) Application of a filtration system	Electrostatic precipitators are not applicable to cupola furnaces for stone wool production (see BAT 56)

(1) A description of the techniques is given in Section 1.10.5.

Table 52

BAT-AELs for metal emissions from the melting furnace in the mineral wool sector

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 0,2 – 1 (3)	$< 0,4 – 2,5 \times 10^{-3}$
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 1 – 2 (3)	$< 2 – 5 \times 10^{-3}$

(1) The ranges refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) The conversion factors of 2×10^{-3} and $2,5 \times 10^{-3}$ have been used for the determination of the lower and upper values of the BAT-AELs range (see Table 2).
(3) Higher values are associated with the use of cupola furnaces for the production of stone wool.

1.7.7. Emissions from downstream processes

63. BAT is to reduce emissions from downstream processes by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Impact jets and cyclones The technique is based on the removal of particles and droplets from waste gases by impaction/impingement, as well as gaseous substances by partial absorption with water. Process water is normally used for impact jets. The recycling process water is filtered before it is reapplied	The technique is generally applicable to the mineral wool sector, in particular to glass wool processes for the treatment of emissions from the forming area (application of the coating to the fibres). Limited applicability to stone wool processes since it could adversely affect other abatement techniques being used.
(ii) Wet scrubbers	The technique is generally applicable for the treatment of waste gases from the forming process (application of the coating to the fibres) or for combined waste gases (forming plus curing)
(iii) Wet electrostatic precipitators	The technique is generally applicable for the treatment of waste gases from the forming process (application of the coating to the fibres), from curing ovens or for combined waste gases (forming plus curing)
(iv) Stone wool filters It consists of a steel or concrete structure in which stone wool slabs are mounted and act as a filter medium. The filtering medium needs to be cleaned or exchanged periodically. This filter is suitable for waste gases with a high moisture content and particulate matter with an adhesive nature	The applicability is mainly limited to stone wool processes for waste gases from the forming area and/or curing ovens
(v) Waste gas incineration	The technique is generally applicable for the treatment of waste gases from curing ovens, in particular in the stone wool processes. The application to combined waste gases (forming plus curing) is not economically viable because of the high volume, low concentration, low temperature of the waste gases

([1]) A description of the techniques is given in Sections 1.10.7 and 1.10.9.

Table 53

BAT-AELs for air emissions from downstream processes in the mineral wool sector, when treated separately

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne finished product
Forming area – Combined forming and curing emissions-Combined forming, curing and cooling emissions		
Total particulate matter	< 20 – 50	—
Phenol	< 5 – 10	—
Formaldehyde	< 2 – 5	—
Ammonia	30 – 60	—

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne finished product
Amines	< 3	—
Total volatile organic compounds expressed as C	10 – 30	—
Curing oven emissions (1) (2)		
Total particulate matter	< 5 – 30	< 0,2
Phenol	< 2 – 5	< 0,03
Formaldehyde	< 2 – 5	< 0,03
Ammonia	< 20 – 60	< 0,4
Amines	< 2	< 0,01
Total volatile organic compounds expressed as C	< 10	< 0,065
NO_X, expressed as NO_2	< 100 – 200	< 1

(1) Emission levels expressed in kg/tonne of finished product are not affected by the thickness of the mineral wool mat produced nor by extreme concentration or dilution of the flue-gases. A conversion factor of $6,5 \times 10^{-3}$ has been used.
(2) If high density or high binder content mineral wools are produced, the emission levels associated with the techniques listed as BAT for the sector could be significantly higher than these BAT-AELs. If these types of products represent the majority of the production from a given installation, then consideration should be given to other techniques.

1.8. *BAT conclusions for high temperature insulation wools (HTIW) manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all HTIW manufacturing installations.

1.8.1. Dust emissions from melting and downstream processes

64. BAT is to reduce dust emissions from the waste gases of the melting furnace by applying a filtration system.

Technique (1)	Applicability
The filtration system usually consists of a bag filter	The technique is generally applicable

(1) A description of the technique is given in Section 1.10.1.

Table 54

BAT-AELs for dust emissions from the melting furnace in the HTIW sector

Parameter	BAT	BAT-AEL
		mg/Nm^3
Dust	Flue-gas cleaning by filtration systems	< 5 – 20 (1)

(1) The values are associated with the use of a bag filter system.

65. For downstream dusty processes, BAT is to reduce emissions using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Minimising the losses of product by ensuring a good sealing of the production line, where technically applicable. The potential sources of dust and fibre emissions are: — fiberisation and collection — mat formation (needling) — lubricant burn-off — cutting, trimming and packaging of the finished product A good construction, sealing and maintenance of the downstream processing systems are essential for minimising the losses of product into the air	The techniques are generally applicable
(ii) Cutting, trimming and packaging under vacuum, by applying an efficient extraction system in conjunction with a fabric filter. A negative pressure is applied to the workstation (i.e. cutting machine, cardboard box for packaging) in order to extract particulate and fibrous releases and convey it to a fabric filter	
(iii) Applying a fabric filter system ([1]) Waste gases from downstream operations (e.g. fiberising, mat formation, lubricant burn-off) are conveyed to a treatment system consisting of a bag filter	

([1]) A description of the technique is given in Section 1.10.1.

Table 55

BAT-AELs from dusty downstream processes in the HTIW sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Dust ([1])	1 – 5

([1]) The lower level of the range is associated with emissions of aluminium silicate glass wool/refractory ceramic fibres (ASW/RCF).

1.8.2. Nitrogen oxides (NO_X) from melting and downstream processes

66. BAT is to reduce NO_X emissions from the lubricant burn-off oven by applying combustion control and/or modifications

Technique	Applicability
Combustion control and/or modifications Techniques to reduce the formation of thermal NO_X emissions include a control of the main combustion parameters: — air/fuel ratio (oxygen content in the reaction zone) — flame temperature — residence time in the high temperature zone. A good combustion control consists of generating those conditions which are least favourable for NO_X formation	The technique is generally applicable

Table 56

BAT-AELs for NO_X from the lubricant burn-off oven in the HTIW sector

Parameter	BAT	BAT-AEL
		mg/Nm^3
NO_X expressed as NO_2	Combustion control and/or modifications	100 – 200

1.8.3. Sulphur oxides (SO_X) from melting and downstream processes

67. BAT is to reduce SO_X emissions from the melting furnaces and downstream processes by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Selection of raw materials for the batch formulation with a low content of sulphur	The technique is generally applicable within the constraints of the availability of raw materials
(ii) Use of low sulphur content fuel	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State

([1]) A description of the technique is given in Section 1.10.3.

Table 57

BAT-AELs for SO_X emissions from the melting furnaces and downstream processes in the HTIW sector

Parameter	BAT	BAT-AEL
		mg/Nm^3
SO_x expressed as SO_2	Primary techniques	< 50

1.8.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

68. BAT is to reduce HCl and HF emissions from the melting furnace by selecting raw materials for the batch formulation with a low content of chlorine and fluorine

Technique ([1])	Applicability
Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The technique is generally applicable

([1]) A description of the technique is given in Section 1.10.4.

Table 58

BAT-AELs for HCl and HF emissions from the melting furnace in the HTIW sector

Parameter	BAT-AEL
	mg/Nm^3
Hydrogen chloride, expressed as HCl	< 10
Hydrogen fluoride, expressed as HF	< 5

1.8.5. Metals from melting furnaces and downstream processes

69. BAT is to reduce metal emissions from the melting furnace and/or downstream processes by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The techniques are generally applicable
(ii) Applying a filtration system	

([1]) A description of the technique is given in Section 1.10.5.

Table 59

BAT-AELs for metal emissions from the melting furnace and/or downstream processes in the HTIW sector

Parameter	BAT-AEL ([1])
	mg/Nm^3
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 1
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 5

([1]) The levels refer to the sum of metals present in the flue-gases in both solid and gaseous phases.

1.8.6. Volatile organic compounds from downstream processes

70. BAT is to reduce volatile organic compound (VOC) emissions from the lubricant burn-off oven by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Combustion control, including monitoring the associated emissions of CO. The technique consists of the control of combustion parameters (e.g. oxygen content in the reaction zone, flame temperature) in order to ensure a complete combustion of the organic components (i.e. poly-ethylene glycol) in the waste gas. The monitoring of carbon monoxide emissions allows for controlling the presence of uncombusted organic materials	The technique is generally applicable
(ii) Waste gas incineration	The economic viability may limit the applicability of these techniques because of low waste gas volumes and VOC concentrations
(iii) Wet scrubbers	

([1]) A description of the techniques is given in Sections 1.10.6 and 1.10.9.

Table 60

BAT-AELs for VOC emissions from the lubricant burn-off oven in the HTIW sector, when treated separately

Parameter	BAT	BAT-AEL
		mg/Nm^3
Volatile organic compounds expressed as C	Primary and/or secondary techniques	10 – 20

1.9. *BAT conclusions for frits manufacturing*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all frits glass manufacturing installations.

1.9.1. Dust emissions from melting furnaces

71. BAT is to reduce dust emissions from the waste gases of the melting furnace by means of an electrostatic precipitator or a bag filter system.

Technique (1)	Applicability
Filtration system: electrostatic precipitator or bag filter	The technique is generally applicable

(1) A description of the technique is given in Section 1.10.1.

Table 61

BAT-AELs for dust emissions from the melting furnace in the frits sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass (1)
Dust	< 10 – 20	< 0,05 – 0,15

(1) The conversion factors of 5×10^{-3} and $7,5 \times 10^{-3}$ have been used for the determination of the lower and upper value of the BAT-AELs range (see Table 2). However, a case-by-case conversion factor may have to be applied based on the type of combustion.

1.9.2. Nitrogen oxides (NO_X) from melting furnaces

72. BAT is to reduce NO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Minimising the use of nitrates in the batch formulation In the frits production, nitrates are used in the batch formulation of many products in order to obtain the required characteristics	The substitution of nitrates in the batch formulation may be limited by the high costs and/or higher environmental impact of the alternative materials and/or the quality requirements of the final product
(ii) Reduction of the parasitic air entering the furnace The technique consists of preventing the ingress of air into the furnace by sealing the burner blocks, the batch material feeder and any other opening of the melting furnace	The technique is generally applicable
(iii) Combustion modifications	
(a) Reduction of air/fuel ratio	Applicable to air/fuel conventional furnaces. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(b) Reduced combustion air temperature	Applicable only under installation-specific circumstances due to a lower furnace efficiency and higher fuel demand
(c) Staged combustion: — Air staging — Fuel staging	Fuel staging is applicable to most conventional air/fuel furnaces. Air staging has very limited applicability due to its technical complexity

Technique (1)	Applicability
(d) Flue-gas recirculation	The applicability of this technique is limited to the use of special burners with automatic recirculation of the waste gas
(e) Low-NO_X burners	The technique is generally applicable. Full benefits are achieved at normal or complete furnace rebuild, when combined with optimum furnace design and geometry
(f) Fuel choice	The applicability is limited by the constraints associated with the availability of different types of fuel, which may be impacted by the energy policy of the Member State
(iv) Oxy-fuel melting	The maximum environmental benefits are achieved for applications at the time of a complete furnace rebuild

(1) A description of the technique is given in Section 1.10.2.

Table 62

BAT-AELs for NO_X emissions from the melting furnace in the frits glass sector

Parameter	BAT	Operating conditions	BAT-AEL (1)	
			mg/Nm^3	kg/tonne melted glass (2)
NO_X expressed as NO_2	Primary techniques	Oxy-fuel firing, without nitrates (3)	Not applicable	< 2,5 – 5
		Oxy-fuel firing, with use of nitrates	Not applicable	5 – 10
		Fuel/air, fuel/oxygen-enriched air combustion, without nitrates	500 – 1 000	2,5 – 7,5
		Fuel/air, fuel/oxygen-enriched air combustion, with use of nitrates	< 1 600	< 12

(1) The ranges take into account the combination of flue-gases from furnaces applying different melting techniques and producing a variety of frit types, with or without nitrates in the batch formulations, which may be conveyed to a single stack, precluding the possibility of characterising each applied melting technique and the different products.
(2) The conversion factors of 5×10^{-3} and $7,5 \times 10^{-3}$ have been used for the determination of the lower and higher values of the range. However, a case-by-case conversion factor may have to be applied based on the type of combustion (see Table 2).
(3) The achievable levels depend on the quality of the natural gas and oxygen available (nitrogen content).

1.9.3. Sulphur oxides (SO_X) from melting furnaces

73. BAT is to control SO_X emissions from the melting furnace by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Selection of raw materials for the batch formulation with a low content of sulphur	The technique is generally applicable within the constraints of the availability of raw materials
(ii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable
(iii) Use of low sulphur content fuels	The applicability may be limited by the constraints associated with the availability of low sulphur fuels, which may be impacted by the energy policy of the Member State

(1) A description of the techniques is given in Section 1.10.3.

Table 63

BAT-AELs for SO_X emissions from the melting furnace in the frits sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass ([1])
SO_X, expressed as SO_2	< 50 – 200	< 0,25 – 1,5

([1]) The conversion factors of 5 × 10^{-3} and 7,5 × 10^{-3} have been used; however, the values indicated in the table may have been approximated. A case-by-case conversion factor may have to be applied based on the type of combustion (see Table 2).

1.9.4. Hydrogen chloride (HCl) and hydrogen fluoride (HF) from melting furnaces

74. BAT is to reduce HCl and HF emissions from the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The technique is generally applicable within the constraints of the batch formulation and the availability of raw materials
(ii) Minimisation of the fluorine compounds in the batch formulation when used to ensure the quality of the final product Fluorine compounds are used to confer particular characteristics to the frits (i.e. thermal and chemical resistance)	The minimisation or substitution of fluorine compounds with alternative materials is limited by quality requirements of the product
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	The technique is generally applicable

([1]) A description of the techniques is given in Section 1.10.4.

Table 64

BAT-AELs for HCl and HF emissions from the melting furnace in the frits sector

Parameter	BAT-AEL	
	mg/Nm^3	kg/tonne melted glass ([1])
Hydrogen chloride, expressed as HCl	< 10	< 0,05
Hydrogen fluoride, expressed as HF	< 5	< 0,03

([1]) The conversion factor of 5 × 10^{-3} has been used with some values being approximated. A case-by-case conversion factor may have to be applied based on the type of combustion (see Table 2).

1.9.5. Metals from melting furnaces

75. BAT is to reduce metal emissions from the melting furnace by using one or a combination of the following techniques:

Technique ([1])	Applicability
(i) Selection of raw materials for the batch formulation with a low content of metals	The technique is generally applicable within the constraints of the type of frit produced at the installation and the availability of raw materials

Technique (1)	Applicability
(ii) Minimising of the use of metal compounds in the batch formulation, where colouring is required or other specific characteristics are conferred to the frit	The techniques are generally applicable
(iii) Dry or semi-dry scrubbing, in combination with a filtration system	

(1) A description of the techniques is given in Section 1.10.5.

Table 65

BAT-AELs for metal emissions from the melting furnace in the frits sector

Parameter	BAT-AEL (1)	
	mg/Nm^3	kg/tonne melted glass (2)
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 1	$< 7,5 \times 10^{-3}$
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 5	$< 37 \times 10^{-3}$

(1) The levels refer to the sum of metals present in the flue-gases in both solid and gaseous phases.
(2) The conversion factor of $7,5 \times 10^{-3}$ has been used. A case-by-case conversion factor may have to be applied based on the type of combustion (see Table 2).

1.9.6. Emissions from downstream processes

76. For downstream dusty processes, BAT is to reduce emissions by using one or a combination of the following techniques:

Technique (1)	Applicability
(i) Applying wet milling techniques The technique consists of grinding the frit to the desired particle size distribution with sufficient liquid to form a slurry. The process is generally carried out in alumina ball mills with water	The techniques are generally applicable
(ii) Operating dry milling and dry product packaging under an efficient extraction system in conjunction with a fabric filter A negative pressure is applied to the milling equipment or to the work station where packaging is carried out in order to convey dust emissions to a fabric filter	
(iii) Applying a filtration system	

(1) A description of the techniques is given in Section 1.10.1.

Table 66

BAT-AELs for air emissions from downstream processes in the frits sector, when treated separately

Parameter	BAT-AEL
	mg/Nm^3
Dust	5 – 10
Σ (As, Co, Ni, Cd, Se, Cr_{VI})	< 1 (1)
Σ (As, Co, Ni, Cd, Se, Cr_{VI}, Sb, Pb, Cr_{III}, Cu, Mn, V, Sn)	< 5 (1)

(1) The levels refer to the sum of metals present in the waste gas.

Glossary

1.10. *Description of techniques*

1.10.1. Dust emissions

Technique	Description
Electrostatic precipitator	Electrostatic precipitators operate such that particles are charged and separated under the influence of an electrical field. Electrostatic precipitators are capable of operating over a wide range of conditions
Bag filter	Bag filters are constructed from porous woven or felted fabric through which gases are flowed to remove particles. The use of a bag filter requires a fabric material selection adequate to the characteristics of the waste gases and the maximum operating temperature
Reduction of the volatile components by raw material modifications	The formulation of batch compositions might contain very volatile components (e.g. boron compounds) which could be minimised or substituted for reducing dust emissions mainly generated by volatilisation phenomena
Electric melting	The technique consists of a melting furnace where the energy is provided by resistive heating. In the cold-top furnaces (where the electrodes are generally inserted at the bottom of the furnace) the batch blanket covers the surface of the melt with a consequent, significant reduction of the volatilisation of batch components (i.e. lead compounds)

1.10.2. NO_X emissions

Technique	Description
Combustion modifications	
(i) Reduction of air/fuel ratio	The technique is mainly based on the following features: — minimisation of air leakages into the furnace — careful control of air used for combustion — modified design of the furnace combustion chamber
(ii) Reduced combustion air temperature	The use of recuperative furnaces, in place of regenerative furnaces, results in a reduced air preheat temperature and, consequently, a lower flame temperature. However, this is associated with a lower furnace efficiency (lower specific pull), lower fuel efficiency and higher fuel demand, resulting in potentially higher emissions (kg/tonne of glass)
(iii) Staged combustion	— Air staging – involves substoichiometric firing and the addition of the remaining air or oxygen into the furnace to complete combustion. — Fuel staging – a low impulse primary flame is developed in the port neck (10 % of total energy); a secondary flame covers the root of the primary flame reducing its core temperature
(iv) Flue-gas recirculation	Implies the reinjection of waste gas from the furnace into the flame to reduce the oxygen content and therefore the temperature of the flame. The use of special burners is based on internal recirculation of combustion gases which cool the root of the flames and reduce the oxygen content in the hottest part of the flames
(v) Low-NO_X burners	The technique is based on the principles of reducing peak flame temperatures, delaying but completing the combustion and increasing the heat transfer (increased emissivity of the flame). It may be associated with a modified design of the furnace combustion chamber

Technique	Description
(vi) Fuel choice	In general, oil-fired furnaces show lower NO_X emissions than gas-fired furnaces due to better thermal emissivity and lower flame temperatures
Special furnace design	Recuperative type furnace that integrates various features, allowing for lower flame temperatures. The main features are: — specific type of burners (number and positioning) — modified geometry of the furnace (height and size) — two-stage raw material preheating with waste gases passing over the raw materials entering the furnace and an external cullet preheater downstream of the recuperator used for preheating the combustion air
Electric melting	The technique consists of a melting furnace where the energy is provided by resistive heating. The main features are: — electrodes are generally inserted at the bottom of the furnace (cold-top) — nitrates are often required in the batch composition of cold-top electric furnaces to provide the necessary oxidising conditions for a stable, safe and efficient manufacturing process
Oxy-fuel melting	The technique involves the replacement of the combustion air with oxygen (> 90 % purity), with consequent elimination/reduction of thermal NO_X formation from nitrogen entering the furnace. The residual nitrogen content in the furnace depends on the purity of the oxygen supplied, on the quality of the fuel (% N_2 in natural gas) and on the potential air inlet
Chemical reduction by fuel	The technique is based on the injection of fossil fuel to the waste gas with chemical reduction of NO_X to N_2 through a series of reactions. In the 3R process, the fuel (natural gas or oil) is injected at the regenerator entrance. The technology is designed for use in regenerative furnaces
Selective catalytic reduction (SCR)	The technique is based on the reduction of NO_X to nitrogen in a catalytic bed by reaction with ammonia (in general aqueous solution) at an optimum operating temperature of around 300 – 450 °C. One or two layers of catalyst may be applied. A higher NO_X reduction is achieved with the use of higher amounts of catalyst (two layers)
Selective non-catalytic reduction (SNCR)	The technique is based on the reduction of NO_X to nitrogen by reaction with ammonia or urea at a high temperature. The operating temperature window must be maintained between 900 and 1 050 °C
Minimising the use of nitrates in the batch formulation	The minimisation of nitrates is used to reduce NO_X emissions deriving from the decomposition of these raw materials when applied as an oxidising agent for very high quality products where a very colourless (clear) glass is required or for other glasses to provide the required characteristics. The following options may be applied: — Reduce the presence of nitrates in the batch formulation to the minimum commensurate with the product and melting requirements. — Substitute nitrates with alternative materials. Effective alternatives are sulphates, arsenic oxides, cerium oxide. — Apply process modifications (e.g. special oxidising combustion conditions)

1.10.3. SO_X emissions

Technique	Description
Dry or semi-dry scrubbing, in combination with a filtration system	Dry powder or a suspension/solution of alkaline reagent are introduced and dispersed in the waste gas stream. The material reacts with the sulphur gaseous species to form a solid which has to be removed by filtration (bag filter or electrostatic precipitator). In general, the use of a reaction tower improves the removal efficiency of the scrubbing system
Minimisation of the sulphur content in the batch formulation and optimisation of the sulphur balance	The minimisation of sulphur content in the batch formulation is applied to reduce SO_X emissions deriving from the decomposition of sulphur-containing raw materials (in general, sulphates) used as fining agents. The effective reduction of SO_X emissions depends on the retention of sulphur compounds in the glass, which may vary significantly depending on the glass type, and on the optimisation of the sulphur balance
Use of low sulphur content fuels	The use of natural gas or low sulphur fuel oil is applied to reduce the amount of SO_X emissions deriving from the oxidation of sulphur contained in the fuel during combustion

1.10.4. HCl, HF emissions

Technique	Description
Selection of raw materials for the batch formulation with a low content of chlorine and fluorine	The technique consists of a careful selection of raw materials that may contain chlorides and fluorides as impurities (e.g. synthetic soda ash, dolomite, external cullet, recycled filter dust) in order to reduce at source HCl and HF emissions which arise from the decomposition of these materials during the melting process
Minimisation of the fluorine and/or chlorine compounds in the batch formulation and optimisation of the fluorine and/or chlorine mass balance	The minimisation of fluorine and/or chlorine emissions from the melting process may be achieved by minimising/reducing the quantity of these substances used in the batch formulation to the minimum commensurate with the quality of the final product. Fluorine compounds (e.g. fluorspar, cryolite, fluorsilicate) are used to confer particular characteristics to special glasses (e.g. opaque glass, optical glass). Chlorine compounds may be used as fining agents
Dry or semi-dry scrubbing, in combination with a filtration system	Dry powder or a suspension/solution of alkaline reagent are introduced and dispersed in the waste gas stream. The material reacts with the gaseous chlorides and fluorides to form a solid which has to be removed by filtration (electrostatic precipitator or bag filter)

1.10.5. Metal emissions

Technique	Description
Selection of raw materials for the batch formulation with a low content of metals	The technique consists of a careful selection of batch materials that may contain metals as impurities (e.g. external cullet), in order to reduce at source metal emissions which arise from the decomposition of these materials during the melting process
Minimising the use of metal compounds in the batch formulation, where colouring and decolourising of glass is needed, subject to consumer glass quality requirements	The minimisation of metal emissions from the melting process may be achieved as follows: — minimising the quantity of metal compounds in the batch formulation (e.g. iron, chromium, cobalt, copper, manganese compounds) in the production of coloured glasses — minimising the quantity of selenium compounds and cerium oxide used as decolourising agents for the production of clear glass

Technique	Description
Minimising the use of selenium compounds in the batch formulation, through a suitable selection of the raw materials	The minimisation of selenium emissions from the melting process may be achieved by: — minimising/reducing the quantity of selenium in the batch formulation to the minimum commensurate with the product requirements — selecting selenium raw materials with a lower volatility, in order to reduce the volatilisation phenomena during the melting process
Application of a filtration system	Dust abatement systems (bag filter and electrostatic precipitator) can reduce both dust and metal emissions since the emissions to air of metals from glass melting processes are largely contained in particulate form. However, for some metals presenting extremely volatile compounds (e.g. selenium) the removal efficiency may vary significantly with the filtration temperature
Dry or semi-dry scrubbing, in combination with a filtration system	Gaseous metals can be substantially reduced by the use of a dry or semi-dry scrubbing technique with an alkaline reagent. The alkaline reagent reacts with the gaseous species to form a solid which has to be removed by filtration (bag filter or electrostatic precipitator)

1.10.6. Combined gaseous emissions (e.g. SO_X, HCl, HF, boron compounds)

Wet scrubbing	In the wet scrubbing process, gaseous compounds are dissolved in a suitable liquid (water or alkaline solution). Downstream of the wet scrubber, the flue-gases are saturated with water and a separation of the droplets is required before discharging the flue-gases. The resulting liquid has to be treated by a waste water process and the insoluble matter is collected by sedimentation or filtration

1.10.7. Combined emissions (solid + gaseous)

Technique	Description
Wet scrubbing	In a wet scrubbing process (by a suitable liquid: water or alkaline solution), the simultaneous removal of solid and gaseous compounds may be achieved. The design criteria for particulate or gas removal are different; therefore, the design is often a compromise between the two options. The resulting liquid has to be treated by a waste water process and the insoluble matter (solid emissions and products from chemical reactions) is collected by sedimentation or filtration. In the mineral wool and continuous filament glass fibre sector, the most common systems applied are: — packed bed scrubbers with impact jets upstream — venturi scrubbers
Wet electrostatic precipitator	The technique consists of an electrostatic precipitator in which the collected material is removed from the plates of the collectors by flushing with a suitable liquid, usually water. Some mechanism is usually installed to remove water droplets before discharge of the waste gas (demister or a last dry field)

1.10.8. Emissions from cutting, grinding, polishing operations

Technique	Description
Performing dusty operations (e.g. cutting, grinding, polishing) under liquid	Water is generally used as a coolant for cutting, grinding and polishing operations and for preventing dust emissions. An extraction system equipped with a mist eliminator may be necessary

Technique	Description
Applying a bag filter system	The use of bag filters is suitable for the reduction of both dust and metal emissions since metals from downstream processes are largely contained in particulate form
Minimising the losses of polishing product by ensuring a good sealing of the application system	Acid polishing is performed by immersion of the glass articles in a polishing bath of hydrofluoric and sulphuric acids. The release of fumes may be minimised by a good design and maintenance of the application system in order to minimise losses
Applying a secondary technique, e.g. wet scrubbing	Wet scrubbing with water is used for the treatment of waste gases, due to the acidic nature of the emissions and the high solubility of the gaseous pollutants to be removed

1.10.9. H_2S, VOC emissions

Waste gas incineration	The technique consists of an afterburner system which oxidises the hydrogen sulphide (generated by strong reducing conditions in the melting furnace) to sulphur dioxide and carbon monoxide to carbon dioxide. Volatile organic compounds are thermally incinerated with consequent oxidation to carbon dioxide, water and other combustion products (e.g. NO_X, SO_X)

COMMISSION IMPLEMENTING DECISION

of 28 February 2012

establishing the best available techniques (BAT) conclusions under Directive 2010/75/EU of the European Parliament and of the Council on industrial emissions for iron and steel production

(notified under document C(2012) 903)

(Text with EEA relevance)

(2012/135/EU)

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Having regard to Directive 2010/75/EU of the European Parliament and of the Council of 24 November 2010 on industrial emissions (integrated pollution prevention and control) [1], and in particular Article 13(5) thereof,

Whereas:

(1) Article 13(1) of Directive 2010/75/EU requires the Commission to organise an exchange of information on industrial emissions between it and Member States, the industries concerned and non-governmental organisations promoting environmental protection in order to facilitate the drawing up of best available techniques (BAT) reference documents as defined in Article 3(11) of that Directive.

(2) In accordance with Article 13(2) of Directive 2010/75/EU, the exchange of information is to address the performance of installations and techniques in terms of emissions, expressed as short- and long-term averages, where appropriate, and the associated reference conditions, consumption and nature of raw materials, water consumption, use of energy and generation of waste and the techniques used, associated monitoring, cross-media effects, economic and technical viability and developments therein and also the best available techniques and emerging techniques identified after considering the issues mentioned in points (a) and (b) of Article 13(2) of that Directive.

(3) 'BAT conclusions' as defined in Article 3(12) of Directive 2010/75/EU are the key element of BAT reference documents and lay down the conclusions on best available techniques, their description, information to assess their applicability, the emission levels associated with the best available techniques, associated monitoring, associated consumption levels and, where appropriate, relevant site remediation measures.

(4) In accordance with Article 14(3) of Directive 2010/75/EU, BAT conclusions are to be the reference for setting the permit conditions for installations covered by Chapter 2 of that Directive.

(5) Article 15(3) of Directive 2010/75/EU requires the competent authority to set emission limit values that ensure that, under normal operating conditions, emissions do not exceed the emission levels associated with the best available techniques as laid down in the decisions on BAT conclusions referred to in Article 13(5) of that Directive.

(6) Article 15(4) of Directive 2010/75 provides for derogations from the requirement laid down in Article 15(3) only where the costs associated with the achievement of emissions levels disproportionately outweigh the environmental benefits due to the geographical location, the local environmental conditions or the technical characteristics of the installation concerned.

(7) Article 16(1) of Directive 2010/75/EU provides that the monitoring requirements in the permit referred to in point (c) of Article 14(1) are to be based on the conclusions on monitoring as described in the BAT conclusions.

(8) In accordance with Article 21(3) of Directive 2010/75/EU, within four years of publication of decisions on BAT conclusions, the competent authority is to reconsider and, if necessary, update all the permit conditions and ensure that the installation complies with those permit conditions.

(9) Commission Decision of 16 May 2011 establishing a forum for the exchange of information pursuant to Article 13 of the Directive 2010/75/EU on industrial emissions [2] established a forum composed of representatives of Member States, the industries concerned and non-governmental organisations promoting environmental protection.

[1] OJ L 334, 17.12.2010, p. 17.

[2] OJ C 146, 17.5.2011, p. 3.

(10) In accordance with Article 13(4) of Directive 2010/75/EU, the Commission obtained the opinion [1] of that forum on the proposed content of the BAT reference document for iron and steel production on 13 September 2011 and made it publicly available.

(11) The measures provided for in this Decision are in accordance with the opinion of the Committee established by Article 75(1) of Directive 2010/75/EU,

HAS ADOPTED THIS DECISION:

Article 1

The BAT conclusions for iron and steel production are set out in the Annex to this Decision.

Article 2

This Decision is addressed to the Member States.

Done at Brussels, 28 February 2012.

For the Commission
Janez POTOČNIK
Member of the Commission

ANNEX

BAT CONCLUSIONS FOR IRON AND STEEL PRODUCTION

SCOPE

These BAT conclusions concern the following activities specified in Annex I to Directive 2010/75/EU, namely:

— activity 1.3: coke production

— activity 2.1: metal ore (including sulphide ore) roasting and sintering

— activity 2.2: production of pig iron or steel (primary or secondary fusion) including continuous casting, with a capacity exceeding 2,5 tonnes per hour.

In particular, the BAT conclusions cover the following processes:

— the loading, unloading and handling of bulk raw materials

— the blending and mixing of raw materials

— the sintering and pelletisation of iron ore

— the production of coke from coking coal

— the production of hot metal by the blast furnace route, including slag processing

— the production and refining of steel using the basic oxygen process, including upstream ladle desulphurisation, downstream ladle metallurgy and slag processing

— the production of steel by electric arc furnaces, including downstream ladle metallurgy and slag processing

— continuous casting (thin slab/thin strip and direct sheet casting (near-shape))

These BAT conclusions do not address the following activities:

— production of lime in kilns, covered by the Cement, Lime and Magnesium Oxide Manufacturing Industries BREF (CLM)

— the treatment of dusts to recover non-ferrous metals (e.g. electric arc furnace dust) and the production of ferroalloys, covered by the Non-Ferrous Metals Industries BREF (NFM)

— sulphuric acid plants in coke ovens, covered by the Large Volume Inorganic Chemicals-Ammonia, Acids and Fertilisers Industries (LVIC-AAF BREF).

Other reference documents which are of relevance for the activities covered by these BAT conclusions are the following:

Reference documents	Activity
Large Combustion Plants BREF (LCP)	Combustion plants with a rated thermal input of 50 MW or more
Ferrous Metals Processing Industry BREF (FMP)	Downstream processes like rolling, pickling, coating, etc.
	Continuous casting to the thin slab/thin strip and direct sheet casting (near-shape)

Reference documents	Activity
Emissions from Storage BREF (EFS)	Storage and handling
Industrial Cooling Systems BREF (ICS)	Cooling systems
General Principles of Monitoring (MON)	Emissions and consumptions monitoring
Energy Efficiency BREF (ENE)	General energy efficiency
Economic and Cross-Media Effects (ECM)	Economic and cross-media effects of techniques

The techniques listed and described in these BAT conclusions are neither prescriptive nor exhaustive. Other techniques may be used that ensure at least an equivalent level of environmental protection.

GENERAL CONSIDERATIONS

The environmental performance levels associated with BAT are expressed as ranges, rather than as single values. A range may reflect the differences within a given type of installation (e.g. differences in the grade/purity and quality of the final product, differences in design, construction, size and capacity of the installation) that result in variations in the environmental performances achieved when applying BAT

EXPRESSION OF EMISSION LEVELS ASSOCIATED WITH THE BEST AVAILABLE TECHNIQUES (BAT-AELs)

In these BAT conclusions, BAT-AELs for air emissions are expressed as either:

— mass of emitted substances per volume of waste gas under standard conditions (273,15 K, 101,3 kPa), after deduction of water vapour content, expressed in the units g/Nm^3, mg/Nm^3, $\mu g/Nm^3$ or ng/Nm^3; or

— mass of emitted substances per unit of mass of products generated or processed (consumption or emission factors), expressed in the units kg/t, g/t, mg/t or µg/t.

and BAT-AELs for emissions to water are expressed as:

— mass of emitted substances per volume of waste water, expressed in the units g/l, mg/l or µg/l.

DEFINITIONS

For the purposes of these BAT conclusions:

— 'new plant' means: a plant introduced on the site of the installation following the publication of these BAT conclusions or a complete replacement of a plant on the existing foundations of the installation following the publication of these BAT conclusions

— 'existing plant' means: a plant which is not a new plant

— 'NO_X' means: the sum of nitrogen oxide (NO) and nitrogen dioxide (NO_2) expressed as NO_2

— 'SO_X' means: the sum of sulphur dioxide (SO_2) and sulphur trioxide (SO_3) expressed as SO_2

— 'HCl' means: all gaseous chlorides expressed as HCl

— 'HF' means: all gaseous fluorides expressed as HF

1.1. *General BAT Conclusions*

Unless otherwise stated, the BAT conclusions presented in this section are generally applicable.

The process specific BAT included in the Sections 1.2 – 1.7 apply in addition to the general BAT mentioned in this Section.

1.1.1. Environmental management systems

1. BAT is to implement and adhere to an environmental management system (EMS) that incorporates all of the following features:

I. commitment of management, including senior management;

II. definition of an environmental policy that includes continuous improvement for the installation by the management;

III. planning and establishing the necessary procedures, objectives and targets, in conjunction with financial planning and investment;

IV. implementation of the procedures paying particular attention to:

(i) structure and responsibility

(ii) training, awareness and competence

(iii) communication

(iv) employee involvement

(v) documentation

(vi) efficient process control

(vii) maintenance programmes

(viii) emergency preparedness and response

(ix) safeguarding compliance with environmental legislation;

V. checking performance and taking corrective action, paying particular attention to:

(i) monitoring and measurement (see also the Reference Document on the General Principles of Monitoring)

(ii) corrective and preventive action

(iii) maintenance of records

(iv) independent (where practicable) internal and external auditing in order to determine whether or not the EMS conforms to planned arrangements and has been properly implemented and maintained;

VI. review of the EMS and its continuing suitability, adequacy and effectiveness by senior management;

VII. following the development of cleaner technologies;

VIII. consideration for the environmental impacts from the eventual decommissioning of the installation at the stage of designing a new plant, and throughout its operating life;

IX. application of sectoral benchmarking on a regular basis.

Applicability

The scope (e.g. level of details) and nature of the EMS (e.g. standardised or non-standardised) will generally be related to the nature, scale and complexity of the installation, and the range of environmental impacts it may have.

1.1.2. Energy management

2. BAT is to reduce thermal energy consumption by using a combination of the following techniques:

I. improved and optimised systems to achieve smooth and stable processing, operating close to the process parameter set points by using

(i) process control optimisation including computer-based automatic control systems

(ii) modern, gravimetric solid fuel feed systems

(iii) preheating, to the greatest extent possible, considering the existing process configuration.

II. recovering excess heat from processes, especially from their cooling zones

III. an optimised steam and heat management

IV. applying process integrated reuse of sensible heat as much as possible.

In the context of energy management, see the Energy Efficiency BREF (ENE).

Description of BAT I.i

The following items are important for integrated steelworks in order to improve the overall energy efficiency:

— optimising energy consumption

— online monitoring for the most important energy flows and combustion processes at the site including the monitoring of all gas flares in order to prevent energy losses, enabling instant maintenance and achieving an undisrupted production process

— reporting and analysing tools to check the average energy consumption of each process

— defining specific energy consumption levels for relevant processes and comparing them on a long-term basis

— carrying out energy audits as defined in the Energy Efficiency BREF, e.g. to identify cost-effective energy savings opportunities.

Description of BAT II – IV

Process integrated techniques used to improve energy efficiency in steel manufacturing by improved heat recovery include:

— combined heat and power production with recovery of waste heat by heat exchangers and distribution either to other parts of the steelworks or to a district heating network

— the installation of steam boilers or adequate systems in large reheating furnaces (furnaces can cover a part of the steam demand)

— preheating of the combustion air in furnaces and other burning systems to save fuel, taking into consideration adverse effects, i.e. an increase of nitrogen oxides in the off-gas

— the insulation of steam pipes and hot water pipes

— recovery of heat from products, e.g. sinter

— where steel needs to be cooled, the use of both heat pumps and solar panels

— the use of flue-gas boilers in furnaces with high temperatures

— the oxygen evaporation and compressor cooling to exchange energy across standard heat exchangers

— the use of top recovery turbines to convert the kinetic energy of the gas produced in the blast furnace into electric power.

Applicability of BAT II – IV

Combined heat and power generation is applicable for all iron and steel plants close to urban areas with a suitable heat demand. The specific energy consumption depends on the scope of the process, the product quality and the type of installation (e.g. the amount of vacuum treatment at the basic oxygen furnace (BOF), annealing temperature, thickness of products, etc.).

3. BAT is to reduce primary energy consumption by optimisation of energy flows and optimised utilisation of the extracted process gases such as coke oven gas, blast furnace gas and basic oxygen gas.

Description

Process integrated techniques to improve energy efficiency in an integrated steelworks by optimising process gas utilisation include:

— the use of gas holders for all by-product gases or other adequate systems for short-term storage and pressure holding facilities

— increasing pressure in the gas grid if there are energy losses in the flares – in order to utilise more process gases with the resulting increase in the utilisation rate

— gas enrichment with process gases and different calorific values for different consumers

— heating fire furnaces with process gas

— use of a computer-controlled calorific value control system

— recording and using coke and flue-gas temperatures

— adequate dimensioning of the capacity of the energy recovery installations for the process gases, in particular with regard to the variability of process gases.

Applicability

The specific energy consumption depends on the scope of the process, the product quality and the type of installation (e.g. the amount of vacuum treatment at the BOF, annealing temperature, thickness of products, etc.).

4. BAT is to use desulphurised and dedusted surplus coke oven gas and dedusted blast furnace gas and basic oxygen gas (mixed or separate) in boilers or in combined heat and power plants to generate steam, electricity and/or heat using surplus waste heat for internal or external heating networks, if there is a demand from a third party.

Applicability

The cooperation and agreement of a third party may not be within the control of the operator, and therefore may not be within the scope of the permit.

5. BAT is to minimise electrical energy consumption by using one or a combination of the following techniques:

I. power management systems

II. grinding, pumping, ventilation and conveying equipment and other electricity-based equipment with high energy efficiency.

Applicability

Frequency controlled pumps cannot be used where the reliability of the pumps is of essential importance for the safety of the process.

1.1.3. Material management

6. BAT is to optimise the management and control of internal material flows in order to prevent pollution, prevent deterioration, provide adequate input quality, allow reuse and recycling and to improve the process efficiency and optimisation of the metal yield.

Description

Appropriate storage and handling of input materials and production residues can help to minimise the airborne dust emissions from stockyards and conveyor belts, including transfer points, and to avoid soil, groundwater and runoff water pollution (see also BAT 11).

The application of an adequate management of integrated steelworks and residues, including wastes, from other installations and sectors allows for a maximised internal and/or external use as raw materials (see also BAT 8, 9 and 10).

Material management includes the controlled disposal of small parts of the overall quantity of residues from an integrated steelworks which have no economic use.

7. In order to achieve low emission levels for relevant pollutants, BAT is to select appropriate scrap qualities and other raw materials. Regarding scrap, BAT is to undertake an appropriate inspection for visible contaminants which might contain heavy metals, in particular mercury, or might lead to the formation of polychlorinated dibenzodioxins/furans (PCDD/F) and polychlorinated biphenyls (PCB).

To improve the use of scrap, the following techniques can be used individually or in combination:

— specification of acceptance criteria suited to the production profile in purchase orders of scrap

— having a good knowledge of scrap composition by closely monitoring the origin of the scrap; in exceptional cases, a melt test might help characterise the composition of the scrap

— having adequate reception facilities and check deliveries

— having procedures to exclude scrap that is not suitable for use in the installation

— storing the scrap according to different criteria (e.g. size, alloys, degree of cleanliness); storing of scrap with potential release of contaminants to the soil on impermeable surfaces with a drainage and collection system; using a roof which can reduce the need for such a system

— putting together the scrap load for the different melts taking into account the knowledge of composition in order to use the most suitable scrap for the steel grade to be produced (this is essential in some cases to avoid the presence of undesired elements and in other cases to take advantage of alloy elements which are present in the scrap and needed for the steel grade to be produced)

— prompt return of all internally-generated scrap to the scrapyard for recycling

— having an operation and management plan

— scrap sorting to minimise the risk of including hazardous or non-ferrous contaminants, particularly polychlorinated biphenyls (PCB) and oil or grease. This is normally done by the scrap supplier but the operator inspects all scrap loads in sealed containers for safety reasons. Therefore, at the same time, it is possible to check, as far as practicable, for contaminants. Evaluation of the small quantities of plastic (e.g. as plastic coated components) may be required

— radioactivity control according to the United Nations Economic Commission for Europe (UNECE) Expert Group framework of recommendations

— implementation of the mandatory removal of components which contain mercury from End-of-Life Vehicles and Waste Electrical and Electronic Equipment (WEEE) by the scrap processors can be improved by:

— fixing the absence of mercury in scrap purchase contracts

— refusal of scrap which contains visible electronic components and assemblies.

Applicability

The selection and sorting of scrap might not be entirely within the control of the operator.

1.1.4. Management of process residues such as by-products and waste

8. BAT for solid residues is to use integrated techniques and operational techniques for waste minimisation by internal use or by application of specialised recycling processes (internally or externally).

Description

Techniques for the recycling of iron-rich residues include specialised recycling techniques such as the OxyCup® shaft furnace, the DK process, smelting reduction processes or cold bonded pelletting/briquetting as well as techniques for production residues mentioned in Sections 9.2 – 9.7.

Applicability

As the mentioned processes may be carried out by a third party, the recycling itself may not be within the control of the operator of the iron and steel plant, and therefore may not be within the scope of the permit.

9. BAT is to maximise external use or recycling for solid residues which cannot be used or recycled according to BAT 8, wherever this is possible and in line with waste regulations. BAT is to manage in a controlled manner residues which can neither be avoided nor recycled.

10. BAT is to use the best operational and maintenance practices for the collection, handling, storage and transport of all solid residues and for the hooding of transfer points to avoid emissions to air and water.

1.1.5. Diffuse dust emissions from materials storage, handling and transport of raw materials and (intermediate) products

11. BAT is to prevent or reduce diffuse dust emissions from materials storage, handling and transport by using one or a combination of the techniques mentioned below.

If abatement techniques are used, BAT is to optimise the capture efficiency and subsequent cleaning through appropriate techniques such as those mentioned below. Preference is given to the collection of the dust emissions nearest to the source.

I. General techniques include:

— the setting up within the EMS of the steelworks of an associated diffuse dust action plan;

— consideration of temporary cessation of certain operations where they are identified as a source of PM_{10} causing a high ambient reading; in order to do this, it will be necessary to have sufficient PM_{10} monitors, with associated wind direction and strength monitoring, to be able to triangulate and identify key sources of fine dust.

II. Techniques for the prevention of dust releases during the handling and transport of bulk raw materials include:

— orientation of long stockpiles in the direction of the prevailing wind

— installing wind barriers or using natural terrain to provide shelter

— controlling the moisture content of the material delivered

— careful attention to procedures to avoid the unnecessary handling of materials and long unenclosed drops

— adequate containment on conveyors and in hoppers, etc.

— the use of dust-suppressing water sprays, with additives such as latex, where appropriate

— rigorous maintenance standards for equipment

— high standards of housekeeping, in particular the cleaning and damping of roads

— the use of mobile and stationary vacuum cleaning equipment

— dust suppression or dust extraction and the use of a bag filter cleaning plant to abate sources of significant dust generation

— the application of emissions-reduced sweeping cars for carrying out the routine cleaning of hard surfaced roads.

III. Techniques for materials delivery, storage and reclamation activities include:

— total enclosure of unloading hoppers in a building equipped with filtered air extraction for dusty materials, or hoppers should be fitted with dust baffles and the unloading grids coupled to a dust extraction and cleaning system

— limiting the drop heights if possible to a maximum of 0,5 m

— the use of water sprays (preferably using recycled water) for dust suppression

— where necessary, the fitting of storage bins with filter units to control dust

— the use of totally enclosed devices for reclamation from bins

— where necessary, the storage of scrap in covered, and hard surfaced areas to reduce the risk of ground contamination (using just in time delivery to minimise the size of the yard and hence emissions)

— minimisation of the disturbance of stockpiles

— restriction of the height and a controlling of the general shape of stockpiles

— the use of in-building or in-vessel storage, rather than external stockpiles, if the scale of storage is appropriate

— the creation of windbreaks by natural terrain, banks of earth or the planting of long grass and evergreen trees in open areas to capture and absorb dust without suffering long-term harm

— hydro-seeding of waste tips and slag heaps

— implementation of a greening of the site by covering unused areas with top soil and planting grass, shrubs and other ground covering vegetation

— the moistening of the surface using durable dust-binding substances

— the covering of the surface with tarpaulins or coating (e.g. latex) stockpiles

— the application of storage with retaining walls to reduce the exposed surface

— when necessary, a measure could be to include impermeable surfaces with concrete and drainage.

IV. Where fuel and raw materials are delivered by sea and dust releases could be significant, some techniques include:

— use by operators of self-discharge vessels or enclosed continuous unloaders. Otherwise, dust generated by grab-type ship unloaders should be minimised through a combination of ensuring adequate moisture content of the material is delivered, by minimising drop heights and by using water sprays or fine water fogs at the mouth of the ship unloader hopper

— avoiding seawater in spraying ores or fluxes as this results in a fouling of sinter plant electrostatic precipitators with sodium chloride. Additional chlorine input in the raw materials may also lead to rising emissions (e.g. of polychlorinated dibenzodioxins/furans (PCDD/F)) and hamper filter dust recirculation

— storage of powdered carbon, lime and calcium carbide in sealed silos and conveying them pneumatically or storing and transferring them in sealed bags.

V. Train or truck unloading techniques include:

— if necessary due to dust emission formation, use of dedicated unloading equipment with a generally enclosed design.

VI. For highly drift-sensitive materials which may lead to significant dust release, some techniques include:

— use of transfer points, vibrating screens, crushers, hoppers and the like, which may be totally enclosed and extracted to a bag filter plant

— use of central or local vacuum cleaning systems rather than washing down for the removal of spillage, since the effects are restricted to one medium and the recycling of spilt material is simplified.

VII. Techniques for the handling and processing of slag include:

— keeping stockpiles of slag granulate damp for slag handling and processing since dried blast furnace slag and steel slag can give rise to dust

— use of enclosed slag-crushing equipment fitted with efficient extraction and bag filters to reduce dust emissions.

VIII. Techniques for handling scrap include:

— providing scrap storage under cover and/or on concrete floors to minimise dust lift-off caused by vehicle movements

IX. Techniques to consider during material transport include:

— the minimisation of points of access from public highways

— the employment of wheel-cleaning equipment to prevent the carryover of mud and dust onto public roads

— the application of hard surfaces to the transport roads (concrete or asphalt) to minimise the generation of dust clouds during materials transport and the cleaning of roads

— the restriction of vehicles to designated routes by fences, ditches or banks of recycled slag

— the damping of dusty routes by water sprays, e.g. at slag-handling operations

— ensuring that transport vehicles are not overfull, so as to prevent any spillage

— ensuring that transport vehicles are sheeted to cover the material carried

— the minimisation of numbers of transfers

— use of closed or enclosed conveyors

— use of tubular conveyors, where possible, to minimise material losses by changes of direction across sites usually provided by the discharge of materials from one belt onto another

— good practice techniques for molten metal transfer and ladle handling

— dedusting of conveyor transfer points.

1.1.6. Water and waste water management

12. BAT for waste water management is to prevent, collect and separate waste water types, maximising internal recycling and using an adequate treatment for each final flow. This includes techniques utilising, e.g. oil interceptors, filtration or sedimentation. In this context, the following techniques can be used where the prerequisites mentioned are present:

— avoiding the use of potable water for production lines

— increasing the number and/or capacity of water circulating systems when building new plants or modernising/revamping existing plants

— centralising the distribution of incoming fresh water

— using the water in cascades until single parameters reach their legal or technical limits

— using the water in other plants if only single parameters of the water are affected and further usage is possible

— keeping treated and untreated waste water separated; by this measure it is possible to dispose of waste water in different ways at a reasonable cost

— using rainwater whenever possible.

Applicability

The water management in an integrated steelworks will primarily be constrained by the availability and quality of fresh water and local legal requirements. In existing plants the existing configuration of the water circuits may limit applicability.

1.1.7. Monitoring

13. BAT is to measure or assess all relevant parameters necessary to steer the processes from control rooms by means of modern computer-based systems in order to adjust continuously and to optimise the processes online, to ensure stable and smooth processing, thus increasing energy efficiency and maximising the yield and improving maintenance practices.

14. BAT is to measure the stack emissions of pollutants from the main emission sources from all processes included in the Sections 1.2 – 1.7 whenever BAT-AELs are given and in process gas-fired power plants in iron and steel works.

BAT is to use continuous measurements at least for:

— primary emissions of dust, nitrogen oxides (NO_X) and sulphur dioxide (SO_2) from sinter strands

— nitrogen oxides (NO_X) and sulphur dioxide (SO_2) emissions from induration strands of pelletisation plants

— dust emissions from blast furnace cast houses

— secondary emissions of dust from basic oxygen furnaces

— emissions of nitrogen oxides (NO_X) from power plants

— dust emissions from large electric arc furnaces.

For other emissions, BAT is to consider using continuous emission monitoring depending on the mass flow and emission characteristics.

15. For relevant emission sources not mentioned in BAT 14, BAT is to measure the emissions of pollutants from all processes included in the Sections 1.2 – 1.7 and from process gas-fired power plants within iron and steel works as well as all relevant process gas components/pollutants periodically and discontinuously. This includes the discontinuous monitoring of process gases, stack emissions, polychlorinated dibenzodioxins/furans (PCDD/F) and monitoring the discharge of waste water, but excludes diffuse emissions (see BAT 16).

Description (relevant for BAT 14 and 15)

The monitoring of process gases provides information about the composition of process gases and about indirect emissions from the combustion of process gases, such as emissions of dust, heavy metals and SO_x.

Stack emissions can be measured by regular, periodic discontinuous measurements at relevant channelled emission sources over a sufficiently long period, to obtain representative emission values.

For monitoring the discharge of waste water a great variety of standardised procedures exist for sampling and analyzing water and waste water, including:

— a random sample which refers to a single sample taken from a waste water flow

— a composite sample, which refers to a sample taken continuously over a given period, or a sample consisting of several samples taken either continuously or discontinuously over a given period and blended

— a qualified random sample shall refer to a composite sample of at least five random samples taken over a maximum period of two hours at intervals of no less than two minutes, and blended.

Monitoring should be done according to the relevant EN or ISO standards. If EN or ISO standards are not available, national or other international standards should be used that ensure the provision of data of an equivalent scientific quality.

16. BAT is to determine the order of magnitude of diffuse emissions from relevant sources by the methods mentioned below. Whenever possible, direct measurement methods are preferred over indirect methods or evaluations based on calculations with emission factors.

— Direct measurement methods where the emissions are measured at the source itself. In this case, concentrations and mass streams can be measured or determined.

— Indirect measurement methods where the emission determination takes place at a certain distance from the source; a direct measurement of concentrations and mass stream is not possible.

— Calculation with emission factors.

Description

Direct or quasi-direct measurement

Examples for direct measurements are measurements in wind tunnels, with hoods or other methods like quasi-emissions measurements on the roof of an industrial installation. For the latter case, the wind velocity and the area of the roofline vent are measured and a flow rate is calculated. The cross-section of the measurement plane of the roofline vent is subdivided into sectors of identical surface area (grid measurement).

Indirect measurements

Examples of indirect measurements include the use of tracer gases, reverse dispersion modelling (RDM) methods and the mass balance method applying light detection and ranging (LIDAR).

Calculation of emissions with emission factors

Guidelines using emission factors for the estimation of diffuse dust emissions from storage and handling of bulk materials and for the suspension of dust from roadways due to traffic movements are:

— VDI 3790 Part 3

— US EPA AP 42

1.1.8. Decommissioning

17. BAT is to prevent pollution upon decommissioning by using necessary techniques as listed below.

Design considerations for end-of-life plant decommissioning:

I. giving consideration to the environmental impact from the eventual decommissioning of the installation at the stage of designing a new plant, as forethought makes decommissioning easier, cleaner and cheaper

II. decommissioning poses environmental risks for the contamination of land (and groundwater) and generates large quantities of solid waste; preventive techniques are process-specific but general considerations may include:

(i) avoiding underground structures

(ii) incorporating features that facilitate dismantling

(iii) choosing surface finishes that are easily decontaminated

(iv) using an equipment configuration that minimises trapped chemicals and facilitates drain-down or cleaning

(v) designing flexible, self-contained units that enable phased closure

(vi) using biodegradable and recyclable materials where possible.

1.1.9. Noise

18. BAT is to reduce noise emissions from relevant sources in the iron and steel manufacturing processes by using one or more of the following techniques depending on and according to local conditions:

— implementation of a noise-reduction strategy

— enclosure of the noisy operations/units

— vibration insulation of operations/units

— internal and external lining made of impact-absorbent material

— soundproofing buildings to shelter any noisy operations involving material transformation equipment

— building noise protection walls, e.g. the construction of buildings or natural barriers, such as growing trees and bushes between the protected area and the noisy activity

— outlet silencers on exhaust stacks

— lagging ducts and final blowers which are situated in soundproof buildings

— closing doors and windows of covered areas.

1.2. *BAT Conclusions For Sinter Plants*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all sinter plants.

Air emissions

19. BAT for blending/mixing is to prevent or reduce diffuse dust emissions by agglomerating fine materials by adjusting the moisture content (see also BAT 11).

20. BAT for primary emissions from sinter plants is to reduce dust emissions from the sinter strand waste gas by means of a bag filter.

BAT for primary emissions for existing plants is to reduce dust emissions from the sinter strand waste gas by using advanced electrostatic precipitators when bag filters are not applicable.

The BAT-associated emission level for dust is < 1 – 15 mg/Nm^3 for the bag filter and < 20 – 40 mg/Nm^3 for the advanced electrostatic precipitator (which should be designed and operated to achieve these values), both determined as a daily mean value.

Bag Filter

Description

Bag filters used in sinter plants are usually applied downstream of an existing electrostatic precipitator or cyclone but can also be operated as a standalone device.

Applicability

For existing plants requirements such as space for a downstream installation to the electrostatic precipitator can be relevant. Special regard should be given to the age and the performance of the existing electrostatic precipitator.

Advanced electrostatic precipitator

Description

Advanced electrostatic precipitators are characterised by one or a combination of the following features:

— good process control

— additional electrical fields

— adapted strength of the electric field

— adapted moisture content

— conditioning with additives

— higher or variably pulsed voltages

— rapid reaction voltage

— high energy pulse superimposition

— moving electrodes

— enlarging the electrode plate distance or other features which improves the abatement efficiency.

21. BAT for primary emissions from sinter strands is to prevent or reduce mercury emissions by selecting raw materials with a low mercury content (see BAT 7) or to treat waste gases in combination with activated carbon or activated lignite coke injection.

The BAT-associated emissions level for mercury is < 0,03 – 0,05 mg/Nm^3, as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

22. BAT for primary emissions from sinter strands is to reduce sulphur oxide (SO_X) emissions by using one or a combination of the following techniques:

I. lowering the sulphur input by using coke breeze with a low sulphur content

II. lowering the sulphur input by minimisation of coke breeze consumption

III. lowering the sulphur input by using iron ore with a low sulphur content

IV. injection of adequate adsorption agents into the waste gas duct of the sinter strand before dedusting by bag filter (see BAT 20)

V. wet desulphurisation or regenerative activated carbon (RAC) process (with particular consideration for the prerequisites for application).

The BAT-associated emission level for sulphur oxides (SO_X) using BAT I – IV is < 350 – 500 mg/Nm^3, expressed as sulphur dioxide (SO_2) and determined as a daily mean value, the lower value being associated with BAT IV.

The BAT-associated emission level for sulphur oxides (SO_X) using BAT V is < 100 mg/Nm^3, expressed as sulphur dioxide (SO_2) and determined as a daily mean value.

Description of the *RAC process* mentioned under BAT V

Dry desulphurisation techniques are based on an adsorption of SO_2 by activated carbon. When the SO_2-laden activated carbon is regenerated, the process is called regenerated activated carbon (RAC). In this case, a high quality, expensive activated carbon type may be used and sulphuric acid (H_2SO_4) is yielded as a by-product. The bed is regenerated either with water or thermally. In some cases, for 'fine-tuning' downstream of an existing desulphurisation unit, lignite-based activated carbon is used. In this case, the SO_2-laden activated carbon is usually incinerated under controlled conditions.

The RAC system can be developed as a single-stage or a two-stage process.

In the single-stage process, the waste gases are led through a bed of activated carbon and pollutants are adsorbed by the activated carbon. Additionally, NO_X removal occurs when ammonia (NH_3) is injected into the gas stream before the catalyst bed.

In the two-stage process, the waste gases are led through two beds of activated carbon. Ammonia can be injected before the bed to reduce NO_X emissions.

Applicability of techniques mentioned under BAT V

Wet desulphurisation: The requirements of space may be of significance and may restrict the applicability. High investment and operational costs and significant cross-media effects such as slurry generation and disposal and additional waste water treatment measures, have to be taken into account. This technique is not used in Europe at the time of writing, but might be an option where environmental quality standards are unlikely to be met through the application of other techniques.

RAC: Dust abatement should be installed prior to the RAC process to reduce the inlet dust concentration. Generally the layout of the plant and space requirements are important factors when considering this technique, but especially for a site with more than one sinter strand.

High investment and operational costs, in particular when high quality, expensive, activated carbon types may be used and a sulphuric acid plant is needed, have to be taken into account. This technique is not used in Europe at the time of writing, but might be an option in new plants targeting SO_X, NO_X, dust and PCDD/F simultaneously and in circumstances where environmental quality standards are unlikely to be met through the application of other techniques.

23. BAT for primary emissions from sinter strands is to reduce total nitrogen oxides (NO_X) emissions by using one or a combination of the following techniques:

I. process integrated measures which can include:

(i) waste gas recirculation

(ii) other primary measures, such as the use of anthracite or the use of low-NO_X burners for ignition

II. end-of-pipe techniques which can include

(i) the regenerative activated carbon (RAC) process

(ii) selective catalytic reduction (SCR).

The BAT-associated emission level for nitrogen oxides (NO_X) using process integrated measures is < 500 mg/Nm^3, expressed as nitrogen dioxide (NO_2) and determined as a daily mean value.

The BAT-associated emission level for nitrogen oxides (NO_X) using RAC is < 250 mg/Nm^3 and using SCR it is < 120 mg/Nm^3, expressed as nitrogen dioxide (NO_2), related to an oxygen content of 15 % and determined as daily mean values.

Description of *waste gas recirculation* under BAT I.i

In the partial recycling of waste gas, some portions of the sinter waste gas are recirculated to the sintering process. Partial recycling of waste gas from the whole strand was primarily developed to reduce waste gas flow and thus the mass emissions of major pollutants. Additionally it can lead to a decrease in energy consumption. The application of waste gas recirculation requires special efforts to ensure that the sinter quality and productivity are not affected negatively. Special attention needs to be paid to carbon monoxide (CO) in the recirculated waste gas in order to prevent carbon monoxide poisoning of employees. Various processes have been developed such as:

— partial recycling of waste gas from the whole strand

— recycling of waste gas from the end sinter strand combined with heat exchange

— recycling of waste gas from part of the end sinter strand and use of waste gas from the sinter cooler

— recycling of parts of waste gas to other parts of the sinter strand.

Applicability of BAT I.i

The applicability of this technique is site specific. Accompanying measures to ensure that sinter quality (cold mechanical strength) and strand productivity are not negatively affected must be considered. Depending on local conditions, these can be relatively minor and easy to implement or, on the contrary, they can be of a more fundamental nature and may be costly and difficult to introduce. In any case, the operating conditions of the strand should be reviewed when this technique is introduced.

In existing plants, it may not be possible to install a partial recycling of waste gas due to space restrictions.

Important considerations in determining the applicability of this technique include:

— initial configuration of the strand (e.g. dual or single wind-box ducts, space available for new equipment and, when required, lengthening of the strand)

— initial design of the existing equipment (e.g. fans, gas cleaning and sinter screening and cooling devices)

— initial operating conditions (e.g. raw materials, layer height, suction pressure, percentage of quick lime in the mix, specific flow rate, percentage of in-plant reverts returned in the feed)

— existing performance in terms of productivity and solid fuel consumption

— basicity index of the sinter and composition of the burden at the blast furnace (e.g. percentage of sinter versus pellet in the burden, iron content of these components).

Applicability of *other primary measures* under BAT I.ii

The use of anthracite depends on the availability of anthracites with a lower nitrogen content compared to coke breeze.

Description and applicability of the *RAC process* under BAT II.i see BAT 22.

Applicability of the *SCR* process under BAT II.ii

SCR can be applied within a high dust system, a low dust system and as a clean gas system. Until now, only clean gas systems (after dedusting and desulphurisation) have been applied at sinter plants. It is essential that the gas is low in dust (< 40 mg dust/Nm^3) and heavy metals, because they can make the surface of the catalyst ineffective. Additionally, desulphurisation prior to the catalyst might be required. Another prerequisite is a minimum off-gas temperature of about 300 °C. This requires an energy input.

The high investment and operational costs, the need for catalyst revitalisation, NH_3 consumption and slip, the accumulation of explosive ammonium nitrate (NH_4NO_3), the formation of corrosive SO_3 and the additional energy required for reheating which can reduce the possibilities for recovery of sensible heat from the sinter process, all may constrain the applicability. This technique might be an option where environmental quality standards are unlikely to be met through the application of other techniques.

24. BAT for primary emissions from sinter strands is to prevent and/or reduce emissions of polychlorinated dibenzodioxins/furans (PCDD/F) and polychlorinated biphenyls (PCB) by using one or a combination of the following techniques:

I. avoidance of raw materials which contain polychlorinated dibenzodioxins/furans (PCDD/F) and polychlorinated biphenyls (PCB) or their precursors as much as possible (see BAT 7)

II. suppression of polychlorinated dibenzodioxins/furans (PCDD/F) formation by addition of nitrogen compounds

III. waste gas recirculation (see BAT 23 for description and applicability).

25. BAT for primary emissions from sinter strands is to reduce emissions of polychlorinated dibenzodioxins/furans (PCDD/F) and polychlorinated biphenyls (PCB) by the injection of adequate adsorption agents into the waste gas duct of the sinter strand before dedusting with a bag filter or advanced electrostatic precipitators when bag filters are not applicable (see BAT 20).

The BAT- associated emission level for polychlorinated dibenzodioxins/furans (PCDD/F) is < 0,05 – 0,2 ng I-TEQ/Nm^3 for the bag filter and < 0,2 – 0,4 ng-I-TEQ/Nm^3 for the advanced electrostatic precipitator, both determined for a 6 – 8 hour random sample under steady-state conditions.

26. BAT for secondary emissions from sinter strand discharge, sinter crushing, cooling, screening and conveyor transfer points is to prevent dust emissions and/or to achieve an efficient extraction and subsequently to reduce dust emissions by using a combination of the following techniques:

I. hooding and/or enclosure

II. an electrostatic precipitator or a bag filter.

The BAT-associated emission level for dust is < 10 mg/Nm^3 for the bag filter and < 30 mg/Nm^3 for the electrostatic precipitator, both determined as a daily mean value.

Water and waste water

27. BAT is to minimise water consumption in sinter plants by recycling cooling water as much as possible unless once-through cooling systems are used.

28. BAT is to treat the effluent water from sinter plants where rinsing water is used or where a wet waste gas treatment system is applied, with the exception of cooling water prior to discharge by using a combination of the following techniques:

I. heavy metal precipitation

II. neutralisation

III. sand filtration.

The BAT-associated emission levels, based on a qualified random sample or a 24-hour composite sample, are:

— suspended solids	< 30 mg/l
— chemical oxygen demand (COD [1])	< 100 mg/l
— heavy metals	< 0,1 mg/l

(sum of arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), mercury (Hg), nickel (Ni), lead (Pb), and zinc (Zn)).

Production residues

29. BAT is to prevent waste generation within sinter plants by using one or a combination of the following techniques (see BAT 8):

I. selective on-site recycling of residues back to the sinter process by excluding heavy metals, alkali or chloride-enriched fine dust fractions (e.g. the dust from the last electrostatic precipitator field)

II. external recycling whenever on-site recycling is hampered.

BAT is to manage in a controlled manner sinter plant process residues which can neither be avoided nor recycled.

30. BAT is to recycle residues that may contain oil, such as dust, sludge and mill scale which contain iron and carbon from the sinter strand and other processes in the integrated steelworks, as much as possible back to the sinter strand, taking into account the respective oil content.

[1] In some cases, TOC is measured instead of COD (in order to avoid $HgCl_2$ used in the analysis for COD). The correlation between COD and TOC should be elaborated for each sinter plant case by case. The COD/TOC ratio may vary approximately between two and four.

31. BAT is to lower the hydrocarbon content of the sinter feed by appropriate selection and pretreatment of the recycled process residues.

In all cases, the oil content of the recycled process residues should be < 0,5 % and the content of the sinter feed < 0,1 %.

Description

The input of hydrocarbons can be minimised, especially by the reduction of the oil input. Oil enters the sinter feed mainly by addition of mill scale. The oil content of mill scales can vary significantly, depending on their origin.

Techniques to minimise oil input via dusts and mill scale include the following:

— limiting input of oil by segregating and then selecting only those dusts and mill scale with a low oil content

— the use of 'good housekeeping' techniques in the rolling mills can result in a substantial reduction in the contaminant oil content of mill scale

— de-oiling of mill scale by:

  — heating the mill scale to approximately 800 °C, the oil hydrocarbons are volatilised and clean mill scale is yielded; the volatilised hydrocarbons can be combusted.

  — extracting oil from the mill scale using a solvent.

Energy

32. BAT is to reduce thermal energy consumption within sinter plants by using one or a combination of the following techniques:

I. recovering sensible heat from the sinter cooler waste gas

II. recovering sensible heat, if feasible, from the sintering grate waste gas

III. maximising the recirculation of waste gases to use sensible heat (see BAT 23 for description and applicability).

Description

Two kinds of potentially reusable waste energies are discharged from the sinter plants:

— the sensible heat from the waste gases from the sintering machines

— the sensible heat of the cooling air from the sinter cooler.

Partial waste gas recirculation is a special case of heat recovery from waste gases from sintering machines and is dealt with in BAT 23. The sensible heat is transferred directly back to the sinter bed by the hot recirculated gases. At the time of writing (2010), this is the only practical method of recovering heat from the waste gases.

The sensible heat in the hot air from the sinter cooler can be recovered by one or more of the following ways:

— steam generation in a waste heat boiler for use in the iron and steel works

— hot water generation for district heating

— preheating combustion air in the ignition hood of the sinter plant

— preheating the sinter raw mix

— use of the sinter cooler gases in a waste gas recirculation system.

Applicability

At some plants, the existing configuration may make costs of heat recovery from the sinter waste gases or sinter cooler waste gas very high.

The recovery of heat from the waste gases by means of a heat exchanger would lead to unacceptable condensation and corrosion problems.

1.3. *BAT Conclusions For Pelletisation Plants*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all pelletisation plants.

Air emissions

33. BAT is to reduce the dust emissions in the waste gases from

— the raw materials pre-treatment, drying, grinding, wetting, mixing and the balling;

— from the induration strand; and

— from the pellet handling and screening

by using one or a combination of the following techniques:

I. an electrostatic precipitator

II. a bag filter

III. a wet scrubber

The BAT-associated emission level for dust is < 20 mg/Nm^3 for the crushing, grinding and drying and $< 10 - 15$ mg/Nm^3 for all other process steps or in cases where all waste gases are treated together, all determined as daily mean values.

34. BAT is to reduce the sulphur oxides (SO_X), hydrogen chloride (HCl) and hydrogen fluoride (HF) emissions from the induration strand waste gas by using one of the following techniques:

I. a wet scrubber

II. semi-dry absorption with a subsequent dedusting system

The BAT-associated emission levels, determined as daily mean values, for these compounds are:

— sulphur oxides (SO_X), expressed as sulphur dioxide (SO_2)	$< 30 - 50$ mg/Nm^3
— hydrogen fluoride (HF)	$< 1 - 3$ mg/Nm^3
— hydrogen chloride (HCl)	$< 1 - 3$ mg/Nm^3.

35. BAT is to reduce NO_X emissions from the drying and grinding section and induration strand waste gases by applying process-integrated techniques.

Description

Plant design through tailor-made solutions should be optimised for low nitrogen oxides (NO_X) emissions from all firing sections. The reduction of the formation of thermal NO_X can be achieved by lowering the (peak) temperature in the burners and reducing the excess oxygen in the combustion air. Additionally, lower NO_X emissions can be achieved by a combination of low energy use and low nitrogen content in the fuel (coal and oil).

36. BAT for existing plants is to reduce NO_X emissions from the drying and grinding section and induration strand waste gases by applying one of the following techniques:

I. selective catalytic reduction (SCR) as an end-of-pipe technique

II. any other technique with a NO_X reduction efficiency of at least 80 %.

Applicability

For existing plants, both straight grate and grate kiln systems, it is difficult to obtain the operating conditions necessary to suit an SCR reactor. Due to high costs, these end-of-pipe techniques should only be considered in circumstances where environmental quality standards are otherwise not likely to be met.

37. BAT for new plants is to reduce NO_X emissions from the drying and grinding section and induration strand waste gases by applying selective catalytic reduction (SCR) as an end-of-pipe technique.

Water and waste water

38. BAT for pelletisation plants is to minimise the water consumption and discharge of scrubbing, wet rinsing and cooling water and reuse it as much as possible.

39. BAT for pelletisation plants is to treat the effluent water prior to discharge by using a combination of the following techniques:

I. neutralisation

II. flocculation

III. sedimentation

IV. sand filtration

V. heavy metal precipitation.

The BAT-associated emission levels, based on a qualified random sample or a 24-hour composite sample, are:

— suspended solids	< 50 mg/l
— chemical oxygen demand (COD [1])	< 160 mg/l
— Kjeldahl nitrogen	< 45 mg/l
— heavy metals	< 0,55 mg/l

(sum of arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), mercury (Hg), nickel (Ni), lead (Pb), zinc (Zn)).

Production residues

40. BAT is to prevent waste generation from pelletisation plants by effective on-site recycling or the reuse of residues (i.e. undersized green and heat-treated pellets)

BAT is to manage in a controlled manner pellet plant process residues, i.e. sludge from waste water treatment, which can neither be avoided nor recycled.

Energy

41. BAT is to reduce/minimise thermal energy consumption in pelletisation plants by using one or a combination of the following techniques:

I. process integrated reuse of sensible heat as far as possible from the different sections of the induration strand

II. using surplus waste heat for internal or external heating networks if there is demand from a third party.

[1] In some cases, TOC is measured instead of COD (in order to avoid $HgCl_2$ used in the analysis for COD). The correlation between COD and TOC should be elaborated for each pelletisation plant case by case. The COD/TOC ratio may vary approximately between two and four.

Description

Hot air from the primary cooling section can be used as secondary combustion air in the firing section. In turn, the heat from the firing section can be used in the drying section of the induration strand. Heat from the secondary cooling section can also be used in the drying section.

Excess heat from the cooling section can be used in the drying chambers of the drying and grinding unit. The hot air is transported through an insulated pipeline called a 'hot air recirculation duct'.

Applicability

Recovery of sensible heat is a process integrated part of pelletisation plants. The 'hot air recirculation duct' can be applied at existing plants with a comparable design and a sufficient supply of sensible heat.

The cooperation and agreement of a third party may not be within the control of the operator, and therefore may not be within the scope of the permit.

1.4. *BAT Conclusions For Coke Oven Plants*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all coke oven plants.

Air emissions

42. BAT for coal grinding plants (coal preparation including crushing, grinding, pulverising and screening) is to prevent or reduce dust emissions by using one or a combination of the following techniques:

I. building and/or device enclosure (crusher, pulveriser, sieves) and

II. efficient extraction and use of a subsequent dry dedusting systems.

The BAT-associated emission level for dust is < 10 – 20 mg/Nm^3, as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

43. BAT for storage and handling of pulverised coal is to prevent or reduce diffuse dust emissions by using one or a combination of the following techniques:

I. storing pulverised materials in bunkers and warehouses

II. using closed or enclosed conveyors

III. minimising the drop heights depending on the plant size and construction

IV. reducing emissions from charging of the coal tower and the charging car

V. using efficient extraction and subsequent dedusting.

When using BAT V, the BAT-associated emission level for dust is < 10 – 20 mg/Nm^3, as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

44. BAT is to charge coke oven chambers with emission-reduced charging systems.

Description

From an integrated point of view, 'smokeless' charging or sequential charging with double ascension pipes or jumper pipes are the preferred types, because all gases and dust are treated as part of the coke oven gas treatment.

If, however, the gases are extracted and treated outside the coke oven, charging with a land-based treatment of the extracted gases is the preferred method. Treatment should consist of an efficient extraction of the emissions with subsequent combustion to reduce organic compounds and the use of a bag filter to reduce particulates.

The BAT-associated emission level for dust from coal charging systems with land-based treatment of extracted gases is < 5 g/t coke equivalent to < 50 mg/Nm^3, as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

The duration associated with BAT of visible emissions from charging is < 30 seconds per charge as a monthly average using a monitoring method described in BAT 46.

45. BAT for coking is to extract the coke oven gas (COG) during coking as much as possible.

46. BAT for coke plants is to reduce the emissions through achieving continuous undisrupted coke production by using the following techniques:

I. extensive maintenance of oven chambers, oven doors and frame seals, ascension pipes, charging holes and other equipment (a systematic programme should be carried out by specially-trained detection and maintenance personnel)

II. avoiding strong temperature fluctuations

III. comprehensive observation and monitoring of the coke oven

IV. cleaning of doors, frame seals, charging holes, lids and ascension pipes after handling (applicable at new and, in some cases, existing plants)

V. maintaining a free gas-flow in the coke ovens

VI. adequate pressure regulation during coking and application of spring-loaded flexible sealing doors or knife-edged doors (in cases of ovens ≤ 5 m high and in good working order)

VII. using water-sealed ascension pipes to reduce visible emissions from the whole apparatus which provides a passage from the coke oven battery to the collecting main, gooseneck and stationary jumper pipes

VIII. luting charging hole lids with a clay suspension (or other suitable sealing material), to reduce visible emissions from all holes

IX. ensuring complete coking (avoiding green coke pushes) by application of adequate techniques

X. installing larger coke oven chambers (applicable to new plants or in some cases of a complete replacement of the plant on the old foundations)

XI. where possible, using variable pressure regulation to oven chambers during coking (applicable to new plants and can be an option for existing plants; the possibility of installing this technique in existing plants should be assessed carefully and is subject to the individual situation of every plant).

The percentage of visible emissions from all doors associated with BAT is < 5 – 10 %.

The percentage of visible emissions for all source types associated with BAT VII and BAT VIII is < 1 %.

The percentages are related to the frequency of any leaks compared to the total number of doors, ascension pipes or charging hole lids as a monthly average using a monitoring method as described below.

For the estimation of diffuse emissions from coke ovens the following methods are in use:

— the EPA 303 method

— the DMT (Deutsche Montan Technologie GmbH) methodology

— the methodology developed by BCRA (British Carbonisation Research Association).

— the methodology applied in the Netherlands, based on counting visible leaks of the ascension pipes and charging holes, while excluding visible emissions due to normal operations (coal charging, coke pushing).

47. BAT for the gas treatment plant is to minimise fugitive gaseous emissions by using the following techniques:

I. minimising the number of flanges by welding piping connections wherever possible

II. using appropriate sealings for flanges and valves

III. using gas-tight pumps (e.g. magnetic pumps)

IV. avoiding emissions from pressure valves in storage tanks by:

— connecting the valve outlet to the coke oven gas (COG) collecting main or

— collecting the gases and subsequent combustion.

Applicability

The techniques can be applied to both new and existing plants. In new plants, a gas tight design might be easier to achieve than in existing plants.

48. BAT is to reduce the sulphur content of the coke oven gas (COG) by using one of the following techniques:

I. desulphurisation by absorption systems

II. wet oxidative desulphurisation.

The residual hydrogen sulphide (H_2S) concentrations associated with BAT, determined as daily mean averages, are < 300 – 1 000 mg/Nm^3 in the case of using BAT I (the higher values being associated with higher ambient temperature and the lower values being associated with lower ambient temperature) and < 10 mg/Nm^3 in the case of using BAT II.

49. BAT for the coke oven underfiring is to reduce the emissions by using the following techniques:

I. preventing leakage between the oven chamber and the heating chamber by means of regular coke oven operation

II. repairing leakage between the oven chamber and the heating chamber (only applicable to existing plants)

III. incorporating low-nitrogen oxides (NO_X) techniques in the construction of new batteries, such as staged combustion and the use of thinner bricks and refractory with a better thermal conductivity (only applicable to new plants)

IV. using desulphurised coke oven gas (COG) process gases.

The BAT-associated emission levels, determined as daily mean values and relating to an oxygen content of 5 % are:

— sulphur oxides (SO_X), expressed as sulphur dioxide (SO_2) < 200 – 500 mg/Nm^3

— dust < 1 – 20 mg/Nm^3 ([1])

— nitrogen oxides (NO_X), expressed as nitrogen dioxide (NO_2) < 350 – 500 mg/Nm^3 for new or substantially revamped plants (less than 10 years old) and 500 – 650 mg/Nm^3 for older plants with well maintained batteries and incorporated low- nitrogen oxides (NO_X) techniques.

50. BAT for coke pushing is to reduce dust emissions by using the following techniques:

I. extraction by means of an integrated coke transfer machine equipped with a hood

II. using land-based extraction gas treatment with a bag filter or other abatement systems

III. using a one point or a mobile quenching car.

The BAT-associated emission level for dust from coke pushing is < 10 mg/Nm^3 in the case of bag filters and of < 20 mg/Nm^3 in other cases, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

Applicability

At existing plants, lack of space may constrain the applicability.

([1]) The lower end of the range has been defined based on the performance of one specific plant achieved under real operating conditions by the BAT obtaining the best environmental performance.

51. BAT for coke quenching is to reduce dust emissions by using one of the following techniques:

I. using coke dry quenching (CDQ) with the recovery of sensible heat and the removal of dust from charging, handling and screening operations by means of a bag filter

II. using emission-minimised conventional wet quenching

III. using coke stabilisation quenching (CSQ).

The BAT-associated emission levels for dust, determined as the average over the sampling period, are:

— < 20 mg/Nm^3 in case of coke dry quenching

— < 25 g/t coke in case of emission minimised conventional wet quenching ([1])

— < 10 g/t coke in case of coke stabilisation quenching ([2]).

Description of BAT I

For the continuous operation of coke dry quenching plants, there are two options. In one case, the coke dry quenching unit comprises two to up to four chambers. One unit is always on stand by. Hence no wet quenching is necessary but the coke dry quenching unit needs an excess capacity against the coke oven plant with high costs. In the other case, an additional wet quenching system is necessary.

In case of modifying a wet quenching plant to a dry quenching plant, the existing wet quenching system can be retained for this purpose. Such a coke dry quenching unit has no excess processing capacity against the coke oven plant.

Applicability of BAT II

Existing quenching towers can be equipped with emissions reduction baffles. A minimum tower height of at least 30 m is necessary in order to ensure sufficient draught conditions.

Applicability of BAT III

As the system is larger than that necessary for conventional quenching, lack of space at the plant may be a constraint.

52. BAT for coke grading and handling is to prevent or reduce dust emissions by using the following techniques in combination:

I. use of building or device enclosures

II. efficient extraction and subsequent dry dedusting.

The BAT-associated emission level for dust is < 10 mg/Nm^3, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

Water and waste water

53. BAT is to minimise and reuse quenching water as much as possible.

54. BAT is to avoid the reuse of process water with a significant organic load (like raw coke oven waste water, waste water with a high content of hydrocarbons, etc.) as quenching water.

55. BAT is to pretreat waste water from the coking process and coke oven gas (COG) cleaning prior to discharge to a waste water treatment plant by using one or a combination of the following techniques:

I. using efficient tar and polycyclic aromatic hydrocarbons (PAH) removal by using flocculation and subsequent flotation, sedimentation and filtration individually or in combination

II. using efficient ammonia stripping by using alkaline and steam.

([1]) This level is based on the use of the non-isokinetic Mohrhauer method (former VDI 2303)
([2]) This level is based on the use of an isokinetic sampling method according to VDI 2066

56. BAT for pretreated waste water from the coking process and coke oven gas (COG) cleaning is to use biological waste water treatment with integrated denitrification/nitrification stages.

The BAT-associated emission levels, based on a qualified random sample or a 24-hour composite sample and referring only to single coke oven water treatment plants, are:

— chemical oxygen demand (COD [1])	< 220 mg/l
— biological oxygen demand for 5 days (BOD_5)	< 20 mg/l
— sulphides, easily released [2]	< 0,1 mg/l
— thiocyanate (SCN^-)	< 4 mg/l
— cyanide (CN^-), easily released [3]	< 0,1 mg/l
— polycyclic aromatic hydrocarbons (PAH) (sum of Fluoranthene, Benzo[b]fluoranthene, Benzo[k]fluoranthene, Benzo[a]pyrene, Indeno[1,2,3-cd]pyrene and Benzo[g,h,i]perylene)	< 0,05 mg/l
— phenols	< 0,5 mg/l
— sum of ammonia-nitrogen (NH_4^+-N), nitrate-nitrogen (NO_3^--N) and nitrite-nitrogen (NO_2^--N)	< 15 – 50 mg/l.

Regarding the sum of ammonia-nitrogen (NH_4^+-N), nitrate-nitrogen (NO_3^--N) and nitrite-nitrogen (NO_2^--N), values of < 35 mg/l are usually associated with the application of advanced biological waste water treatment plants with predenitrification/nitrification and post-denitrification.

Production residues

57. BAT is to recycle production residues such as tar from the coal water and still effluent, and surplus activated sludge from the waste water treatment plant back to the coal feed of the coke oven plant.

Energy

58. BAT is to use the extracted coke oven gas (COG) as a fuel or reducing agent or for the production of chemicals.

1.5. *BAT Conclusions For Blast Furnaces*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all blast furnaces.

Air emissions

59. BAT for displaced air during loading from the storage bunkers of the coal injection unit is to capture dust emissions and perform subsequent dry dedusting.

The BAT-associated emission level for dust is < 20 mg/Nm^3, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

60. BAT for burden preparation (mixing, blending) and conveying is to minimise dust emissions and, where relevant, extraction with subsequent dedusting by means of an electrostatic precipitator or bag filter.

(1) In some cases, TOC is measured instead of COD (in order to avoid $HgCl_2$ used in the analysis for COD). The correlation between COD and TOC should be elaborated for each coke oven plant case by case. The COD/TOC ratio may vary approximately between two and four.

(2) This level is based on the use of the DIN 38405 D 27 or any other national or international standard that ensures the provision of data of an equivalent scientific quality.

(3) This level is based on the use of the DIN 38405 D 13-2 or any other national or international standard that ensures the provision of data of an equivalent scientific quality.

61. BAT for casting house (tap holes, runners, torpedo ladles charging points, skimmers) is to prevent or reduce diffuse dust emissions by using the following techniques:

I. covering the runners

II. optimising the capture efficiency for diffuse dust emissions and fumes with subsequent off-gas cleaning by means of an electrostatic precipitator or bag filter

III. fume suppression using nitrogen while tapping, where applicable and where no collecting and dedusting system for tapping emissions is installed.

When using BAT II, the BAT-associated emission level for dust is < 1 – 15 mg/Nm^3, determined as a daily mean value.

62. BAT is to use tar-free runner linings.

63. BAT is to minimise the release of blast furnace gas during charging by using one or a combination of the following techniques:

I. bell-less top with primary and secondary equalising

II. gas or ventilation recovery system

III. use of blast furnace gas to pressurise the top bunkers.

Applicability of BAT II

Applicable for new plants. Applicable for existing plants only where the furnace has a bell-less charging system. It is not applicable to plants where gases other than blast furnace gas (e.g. nitrogen) are used to pressurise the furnace top bunkers.

64. BAT is to reduce dust emissions from the blast furnace gas by using one or a combination of the following techniques:

I. using dry prededusting devices such as:

(i) deflectors

(ii) dust catchers

(iii) cyclones

(iv) electrostatic precipitators.

II. subsequent dust abatement such as:

(i) hurdle-type scrubbers

(ii) venturi scrubbers

(iii) annular gap scrubbers

(iv) wet electrostatic precipitators

(v) disintegrators.

For cleaned blast furnace (BF) gas, the residual dust concentration associated with BAT is < 10 mg/Nm^3, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

65. BAT for hot blast stoves is to reduce emissions by using desulphurised and dedusted surplus coke oven gas, dedusted blast furnace gas, dedusted basic oxygen furnace gas and natural gas, individually or in combination.

The BAT-associated emission levels, determined as daily mean values related to an oxygen content of 3 %, are:

— sulphur oxides (SO_x) expressed as sulphur dioxide (SO_2) < 200 mg/Nm^3

— dust < 10 mg/Nm^3

— nitrogen oxides (NO_x), expressed as nitrogen dioxide (NO_2) < 100 mg/Nm^3.

Water and waste water

66. BAT for water consumption and discharge from blast furnace gas treatment is to minimise and to reuse scrubbing water as much as possible, e.g. for slag granulation, if necessary after treatment with a gravel-bed filter.

67. BAT for treating waste water from blast furnace gas treatment is to use flocculation (coagulation) and sedimentation and the reduction of easily released cyanide, if necessary.

The BAT-associated emission levels, based on a qualified random sample or a 24-hour composite sample, are:

— suspended solids	< 30 mg/l
— iron	< 5 mg/l
— lead	< 0,5 mg/l
— zinc	< 2 mg/l
— cyanide (CN^-), easily released [1]	< 0,4 mg/l.

Production residues

68. BAT is to prevent waste generation from blast furnaces by using one or a combination of the following techniques:

I. appropriate collection and storage to facilitate a specific treatment

II. on-site recycling of coarse dust from the blast furnace (BF) gas treatment and dust from the cast house dedusting, with due regard for the effect of emissions from the plant where it is recycled

III. hydrocyclonage of sludge with subsequent on-site recycling of the coarse fraction (applicable whenever wet dedusting is applied and where the zinc content distribution in the different grain sizes allows a reasonable separation)

IV. slag treatment, preferably by means of granulation (where market conditions allow for it), for the external use of slag (e.g. in the cement industry or for road construction).

BAT is to manage in a controlled manner blast furnace process residues which can neither be avoided nor recycled.

69. BAT for minimising slag treatment emissions is to condense fume if odour reduction is required.

Resource management

70. BAT for resource management of blast furnaces is to reduce coke consumption by directly injected reducing agents, such as pulverised coal, oil, heavy oil, tar, oil residues, coke oven gas (COG), natural gas and wastes such as metallic residues, used oils and emulsions, oily residues, fats and waste plastics individually or in combination.

Applicability

Coal injection: The method is applicable to all blast furnaces equipped with pulverised coal injection and oxygen enrichment.

Gas injection: Tuyère injection of coke oven gas (COG) is highly dependent upon the availability of the gas that may be effectively used elsewhere in the integrated steelworks.

[1] This level is based on the use of the DIN 38405 D 13-2 or any other national or international standard that ensures the provision of data of an equivalent scientific quality.

Plastic injection: It should be noted that this technique is highly dependent on the local circumstances and market conditions. Plastics can contain Cl and heavy metals like Hg, Cd, Pb and Zn. Depending on the composition of the wastes used (e.g. shredder light fraction), the amount of Hg, Cr, Cu, Ni and Mo in the BF gas may increase.

Direct injection of used oils, fats and emulsions as reducing agents and of solid iron residues: The continuous operation of this system is reliant on the logistical concept of delivery and the storage of residues. Also, the conveying technology applied is of particular importance for a successful operation.

Energy

71. BAT is to maintain a smooth, continuous operation of the blast furnace at a steady state to minimise releases and to reduce the likelihood of burden slips.

72. BAT is to use the extracted blast furnace gas as a fuel.

73. BAT is to recover the energy of top blast furnace gas pressure where sufficient top gas pressure and low alkali concentrations are present.

Applicability

Top gas pressure recovery can be applied at new plants and in some circumstances at existing plants, albeit with more difficulties and additional costs. Fundamental to the application of this technique is an adequate top gas pressure in excess of 1.5 bar gauge.

At new plants, the top gas turbine and the blast furnace (BF) gas cleaning facility can be adapted to each other in order to achieve a high efficiency of both scrubbing and energy recovery.

74. BAT is to preheat the hot blast stove fuel gases or combustion air using the waste gas of the hot blast stove and to optimise the hot blast stove combustion process.

Description

For optimisation of the energy efficiency of the hot stove, one or a combination of the following techniques can be applied:

— the use of a computer-aided hot stove operation

— preheating of the fuel or combustion air in conjunction with insulation of the cold blast line and waste gas flue

— use of more suitable burners to improve combustion

— rapid oxygen measurement and subsequent adaptation of combustion conditions.

Applicability

The applicability of fuel preheating depends on the efficiency of the stoves as this determines the waste gas temperature (e.g. at waste gas temperatures below 250 °C, heat recovery may not be a technically or economically viable option).

The implementation of computer-aided control could require the construction of a fourth stove in the case of blast furnaces with three stoves (if possible) in order to maximise benefits.

1.6. *BAT Conclusions For Basic Oxygen Steelmaking And Casting*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all basic oxygen steelmaking and casting.

Air emissions

75. BAT for basic oxygen furnace (BOF) gas recovery by suppressed combustion is to extract the BOF gas during blowing as much as possible and to clean it by using the following techniques in combination:

I. use of a suppressed combustion process

II. prededusting to remove coarse dust by means of dry separation techniques (e.g. deflector, cyclone) or wet separators

III. dust abatement by means of:

(i) dry dedusting (e.g. electrostatic precipitator) for new and existing plants

(ii) wet dedusting (e.g. wet electrostatic precipitator or scrubber) for existing plants.

The residual dust concentrations associated with BAT, after buffering the BOF gas, are:

— 10 – 30 mg/Nm^3 for BAT III.i

— < 50 mg/Nm^3 for BAT III.ii.

76. BAT for basic oxygen furnace (BOF) gas recovery during oxygen blowing in the case of full combustion is to reduce dust emissions by using one of the following techniques:

I. dry dedusting (e.g. ESP or bag filter) for new and existing plants

II. wet dedusting (e.g. wet ESP or scrubber) for existing plants.

The BAT-associated emission levels for dust, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour), are:

— 10 – 30 mg/Nm^3 for BAT I

— < 50 mg/Nm^3 for BAT II.

77. BAT is to minimise dust emissions from the oxygen lance hole by using one or a combination of the following techniques:

I. covering the lance hole during oxygen blowing

II. inert gas or steam injection into the lance hole to dissipate the dust

III. use of other alternative sealing designs combined with lance cleaning devices.

78. BAT for secondary dedusting, including the emissions from the following processes:

— reladling of hot metal from the torpedo ladle (or hot metal mixer) to the charging ladle

— hot metal pretreatment (i.e. the preheating of vessels, desulphurisation, dephosphorisation, deslagging, hot metal transfer processes and weighing)

— BOF-related processes like the preheating of vessels, slopping during oxygen blowing, hot metal and scrap charging, tapping of liquid steel and slag from BOF and

— secondary metallurgy and continuous casting,

is to minimise dust emissions by means of process integrated techniques, such as general techniques to prevent or control diffuse or fugitive emissions, and by using appropriate enclosures and hoods with efficient extraction and a subsequent off-gas cleaning by means of a bag filter or an ESP.

The overall average dust collection efficiency associated with BAT is > 90 %

The BAT-associated emission level for dust, as a daily mean value, for all dedusted off-gases is < 1 – 15 mg/Nm^3 in the case of bag filters and < 20 mg/Nm^3 in the case of electrostatic precipitators.

If the emissions from hot metal pretreatment and the secondary metallurgy are treated separately, the BAT-associated emission level for dust, as a daily mean value, is < 1 – 10 mg/Nm^3 for bag filters and < 20 mg/Nm^3 for electrostatic precipitators.

Description

General techniques to prevent diffuse and fugitive emissions from the relevant BOF process secondary sources include:

— independent capture and use of dedusting devices for each subprocess in the BOF shop

— correct management of the desulphurisation installation to prevent air emissions

— total enclosure of the desulphurisation installation

— maintaining the lid on when the hot metal ladle is not in use and the cleaning of hot metal ladles and removal of skulls on a regular basis or alternatively apply a roof extraction system

— maintaining the hot metal ladle in front of the converter for approximately two minutes after putting the hot metal into the converter if a roof extraction system is not applied

— computer control and optimisation of the steelmaking process, e.g. so that slopping (i.e. when the slag foams to such an extent that it flows out of the vessel) is prevented or reduced

— reduction of slopping during tapping by limiting elements that cause slopping and the use of anti-slopping agents

— closure of doors from the room around the converter during oxygen blowing

— continuous camera observation of the roof for visible emission

— the use of a roof extraction system.

Applicability

In existing plants, the design of the plant may restrict the possibilities for proper evacuation.

79. BAT for on-site slag processing is to reduce dust emissions by using one or a combination of the following techniques:

I. efficient extraction of the slag crusher and screening devices with subsequent off-gas cleaning, if relevant

II. transport of untreated slag by shovel loaders

III. extraction or wetting of conveyor transfer points for broken material

IV. wetting of slag storage heaps

V. use of water fogs when broken slag is loaded.

The BAT-associated emission level for dust in the case of using BAT I is < 10 – 20 mg/Nm^3, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

Water and waste water

80. BAT is to prevent or reduce water use and waste water emissions from primary dedusting of basic oxygen furnace (BOF) gas by using one of the following techniques as set out in BAT 75 and BAT 76:

— dry dedusting of basic oxygen furnace (BOF) gas;

— minimising scrubbing water and reusing it as much as possible(e.g. for slag granulation) in case wet dedusting is applied.

81. BAT is to minimise the waste water discharge from continuous casting by using the following techniques in combination:

I. the removal of solids by flocculation, sedimentation and/or filtration

II. the removal of oil in skimming tanks or any other effective device

III. the recirculation of cooling water and water from vacuum generation as much as possible.

The BAT-associated emission levels, based on a qualified random sample or a 24-hour composite sample, for waste water from continuous casting machines are:

— suspended solids < 20 mg/l

— iron < 5 mg/l

— zinc < 2 mg/l

— nickel < 0,5 mg/l

— total chromium < 0,5 mg/l

— total hydrocarbons < 5 mg/l.

Production residues

82. BAT is to prevent waste generation by using one or a combination of the following techniques (see BAT 8):

I. appropriate collection and storage to facilitate a specific treatment

II. on-site recycling of dust from basic oxygen furnace (BOF) gas treatment, dust from secondary dedusting and mill scale from continuous casting back to the steelmaking processes with due regard for the effect of emissions from the plant where they are recycled

III. on-site recycling of BOF slag and BOF slag fines in various applications

IV. slag treatment where market conditions allow for the external use of slag (e.g. as an aggregate in materials or for construction)

V. use of filter dusts and sludge for external recovery of iron and non-ferrous metals such as zinc in the non-ferrous metals industry

VI. use of a settling tank for sludge with the subsequent recycling of the coarse fraction in the sinter/blast furnace or cement industry when grain size distribution allows for a reasonable separation.

Applicability of BAT V

Dust hot briquetting and recycling with recovery of high zinc concentrated pellets for external reuse is applicable when a dry electrostatic precipitation is used to clean the BOF gas. Recovery of zinc by briquetting is not applicable in wet dedusting systems because of unstable sedimentation in the settling tanks caused by the formation of hydrogen (from a reaction of metallic zinc and water). Due to these safety reasons, the zinc content in the sludge should be limited to 8 – 10 %.

BAT is to manage in a controlled manner basic oxygen furnace process residues which can neither be avoided nor recycled.

Energy

83. BAT is to collect, clean and buffer BOF gas for subsequent use as a fuel.

Applicability

In some cases, it may not be economically feasible or, with regard to appropriate energy management, not feasible to recover the BOF gas by suppressed combustion. In these cases, the BOF gas may be combusted with the generation of steam. The kind of combustion (full or suppressed combustion) depends on local energy management.

84. BAT is to reduce energy consumption by using ladle-lid systems.

Applicability

The lids can be very heavy as they are made out of refractory bricks and therefore the capacity of the cranes and the design of the whole building may constrain the applicability in existing plants. There are different technical designs for implementing the system into the particular conditions of a steel plant.

85. BAT is to optimise the process and reduce energy consumption by using a direct tapping process after blowing.

Description

Direct tapping normally requires expensive facilities like sub-lance or DROP IN sensor-systems to tap without waiting for a chemical analysis of the samples taken (direct tapping). Alternatively, a new technique has been developed to achieve direct tapping without such facilities. This technique requires a lot of experience and developmental work. In practice, the carbon is directly blown down to 0,04 % and simultaneously the bath temperature decreases to a reasonably low target. Before tapping, both the temperature and oxygen activity are measured for further actions.

Applicability

A suitable hot metal analyser and slag stopping facilities are required and the availability of a ladle furnace facilitates implementation of the technique.

86. BAT is to reduce energy consumption by using continuous near net shape strip casting, if the quality and the product mix of the produced steel grades justify it.

Description

Near net shape strip casting means the continuous casting of steel to strips with thicknesses of less than 15 mm. The casting process is combined with the direct hot rolling, cooling and coiling of the strips without an intermediate reheating furnace used for conventional casting techniques, e.g. continuous casting of slabs or thin slabs. Therefore, strip casting represents a technique for producing flat steel strips of different widths and thicknesses of less than 2 mm.

Applicability

The applicability depends on the produced steel grades (e.g. heavy plates cannot be produced with this process) and on the product portfolio (product mix) of the individual steel plant. In existing plants, the applicability may be constrained by the layout and the available space as e.g. retrofitting with a strip caster requires approximately 100 m in length.

1.7. *BAT Conclusions For Electric Arc Furnace Steelmaking And Casting*

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all electric arc furnace steelmaking and casting.

Air emissions

87. BAT for the electric arc furnace (EAF) process is to prevent mercury emissions by avoiding, as much as possible, raw materials and auxiliaries which contain mercury (see BAT 6 and 7).

88. BAT for the electric arc furnace (EAF) primary and secondary dedusting (including scrap preheating, charging, melting, tapping, ladle furnace and secondary metallurgy) is to achieve an efficient extraction of all emission sources by using one of the techniques listed below and to use subsequent dedusting by means of a bag filter:

I. a combination of direct off-gas extraction (4th or 2nd hole) and hood systems

II. direct gas extraction and doghouse systems

III. direct gas extraction and total building evacuation (low-capacity electric arc furnaces (EAF) may not require direct gas extraction to achieve the same extraction efficiency).

The overall average collection efficiency associated with BAT is > 98 %.

The BAT-associated emission level for dust is < 5 mg/Nm^3, determined as a daily mean value.

The BAT-associated emission level for mercury is < 0,05 mg/Nm^3, determined as the average over the sampling period (discontinuous measurement, spot samples for at least four hours).

89. BAT for the electric arc furnace (EAF) primary and secondary dedusting (including scrap preheating, charging, melting, tapping, ladle furnace and secondary metallurgy) is to prevent and reduce polychlorinated dibenzodioxins/furans (PCDD/F) and polychlorinated biphenyls (PCB) emissions by avoiding, as much as possible, raw materials which contain PCDD/F and PCB or their precursors (see BAT 6 and 7) and using one or a combination of the following techniques, in conjunction with an appropriate dust removal system:

I. appropriate post-combustion

II. appropriate rapid quenching

III. injection of adequate adsorption agents into the duct before dedusting.

The BAT-associated emission level for polychlorinated dibenzodioxins/furans (PCDD/F) is < 0,1 ng I-TEQ/Nm^3, based on a 6 – 8 hour random sample during steady-state conditions. In some cases, the BAT-associated emission level can be achieved with primary measures only.

Applicability of BAT I

In existing plants, circumstances like available space, given off-gas duct system, etc. need to be taken into consideration for assessing the applicability.

90. BAT for on-site slag processing is to reduce dust emissions by using one or a combination of the following techniques:

I. efficient extraction of the slag crusher and screening devices with subsequent off-gas cleaning, if relevant

II. transport of untreated slag by shovel loaders

III. extraction or wetting of conveyor transfer points for broken material

IV. wetting of slag storage heaps

V. use of water fogs when broken slag is loaded.

In the case of using BAT I, the BAT-associated emission level for dust is < 10 – 20 mg/Nm^3, determined as the average over the sampling period (discontinuous measurement, spot samples for at least half an hour).

Water and waste water

91. BAT is to minimise the water consumption from the electric arc furnace (EAF) process by the use of closed loop water cooling systems for the cooling of furnace devices as much as possible unless once-through cooling systems are used.

92. BAT is to minimise the waste water discharge from continuous casting by using the following techniques in combination:

I. the removal of solids by flocculation, sedimentation and/or filtration

II. the removal of oil in skimming tanks or in any other effective device

III. the recirculation of cooling water and water from vacuum generation as much as possible.

The BAT-associated emission levels, for waste water from continuous casting machines, based on a qualified random sample or a 24-hour composite sample, are:

— suspended solids < 20 mg/l

— iron < 5 mg/l

— zinc < 2 mg/l

— nickel < 0,5 mg/l

— total chromium < 0,5 mg/l

— total hydrocarbons < 5 mg/l

Production residues

93. BAT is to prevent waste generation by using one or a combination of the following techniques:

I. appropriate collection and storage to facilitate a specific treatment

II. recovery and on-site recycling of refractory materials from the different processes and use internally, i.e. for the substitution of dolomite, magnesite and lime

III. use of filter dusts for the external recovery of non-ferrous metals such as zinc in the non-ferrous metals industry, if necessary, after the enrichment of filter dusts by recirculation to the electric arc furnace (EAF)

IV. separation of scale from continuous casting in the water treatment process and recovery with subsequent recycling, e.g. in the sinter/blast furnace or cement industry

V. external use of refractory materials and slag from the electric arc furnace (EAF) process as a secondary raw material where market conditions allow for it.

BAT is to manage in a controlled manner EAF process residues which can neither be avoided nor recycled.

Applicability

The external use or recycling of production residues as mentioned under BAT III – V depend on the cooperation and agreement of a third party which may not be within the control of the operator, and therefore may not be within the scope of the permit.

Energy

94. BAT is to reduce energy consumption by using continuous near net shape strip casting, if the quality and the product mix of the produced steel grades justify it.

Description

Near net shape strip casting means the continuous casting of steel to strips with thicknesses of less than 15 mm. The casting process is combined with the direct hot rolling, cooling and coiling of the strips without an intermediate reheating furnace used for conventional casting techniques, e.g. continuous casting of slabs or thin slabs. Therefore, strip casting represents a technique for producing flat steel strips of different widths and thicknesses of less than 2 mm.

Applicability

The applicability depends on the produced steel grades (e.g. heavy plates cannot be produced with this process) and on the product portfolio (product mix) of the individual steel plant. In existing plants, the applicability may be constrained by the layout and the available space as e.g. retrofitting with a strip caster requires approximately 100 m in length.

Noise

95. BAT is to reduce noise emissions from electric arc furnace (EAF) installations and processes generating high sound energies by using a combination of the following constructional and operational techniques depending on and according to local conditions (in addition to using the techniques listed in BAT 18):

I. construct the electric arc furnace (EAF) building in such a way as to absorb noise from mechanical shocks resulting from the operation of the furnace

II. construct and install cranes destined to transport the charging baskets to prevent mechanical shocks

III. special use of acoustical insulation of the inside walls and roofs to prevent the airborne noise of the electric arc furnace (EAF) building

IV. separation of the furnace and the outside wall to reduce the structure-borne noise from the electric arc furnace (EAF) building

V. housing of processes generating high sound energies (i.e. electric arc furnace (EAF) and decarburisation units) within the main building.

2012 SUBSCRIPTION PRICES (excluding VAT, including normal transport charges)

EU Official Journal, L + C series, paper edition only	22 official EU languages	EUR 1 200 per year
EU Official Journal, L + C series, paper + annual DVD	22 official EU languages	EUR 1 310 per year
EU Official Journal, L series, paper edition only	22 official EU languages	EUR 840 per year
EU Official Journal, L + C series, monthly DVD (cumulative)	22 official EU languages	EUR 100 per year
Supplement to the Official Journal (S series), tendering procedures for public contracts, DVD, one edition per week	multilingual: 23 official EU languages	EUR 200 per year
EU Official Journal, C series — recruitment competitions	Language(s) according to competition(s)	EUR 50 per year

Subscriptions to the *Official Journal of the European Union*, which is published in the official languages of the European Union, are available for 22 language versions. The Official Journal comprises two series, L (Legislation) and C (Information and Notices).

A separate subscription must be taken out for each language version.

In accordance with Council Regulation (EC) No 920/2005, published in Official Journal L 156 of 18 June 2005, the institutions of the European Union are temporarily not bound by the obligation to draft all acts in Irish and publish them in that language. Irish editions of the Official Journal are therefore sold separately.

Subscriptions to the Supplement to the Official Journal (S Series — tendering procedures for public contracts) cover all 23 official language versions on a single multilingual DVD.

On request, subscribers to the *Official Journal of the European Union* can receive the various Annexes to the Official Journal. Subscribers are informed of the publication of Annexes by notices inserted in the *Official Journal of the European Union*.

Sales and subscriptions

Subscriptions to various priced periodicals, such as the subscription to the *Official Journal of the European Union*, are available from our sales agents. The list of sales agents is available at:

http://publications.europa.eu/others/agents/index_en.htm

EUR-Lex (http://eur-lex.europa.eu) offers direct access to European Union legislation free of charge. The *Official Journal of the European Union* can be consulted on this website, as can the Treaties, legislation, case-law and preparatory acts.

DECISIONS

COMMISSION IMPLEMENTING DECISION

of 11 February 2013

establishing the best available techniques (BAT) conclusions under Directive 2010/75/EU of the European Parliament and of the Council on industrial emissions for the tanning of hides and skins

(notified under document C(2013) 618)

(Text with EEA relevance)

(2013/84/EU)

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Having regard to Directive 2010/75/EU of the European Parliament and of the Council of 24 November 2010 on industrial emissions (integrated pollution prevention and control) [1], and in particular Article 13(5) thereof,

Whereas:

(1) Article 13(1) of Directive 2010/75/EU requires the Commission to organise an exchange of information on industrial emissions between it and Member States, the industries concerned and non-governmental organisations promoting environmental protection in order to facilitate the drawing up of best available techniques (BAT) reference documents as defined in Article 3(11) of that Directive.

(2) In accordance with Article 13(2) of Directive 2010/75/EU, the exchange of information is to address the performance of installations and techniques in terms of emissions, expressed as short- and long-term averages, where appropriate, and the associated reference conditions, consumption and nature of raw materials, water consumption, use of energy and generation of waste and the techniques used, associated monitoring, cross-media effects, economic and technical viability and developments therein and best available techniques and emerging techniques identified after considering the issues mentioned in points (a) and (b) of Article 13(2) of that Directive.

(3) 'BAT conclusions' as defined in Article 3(12) of Directive 2010/75/EU are the key element of BAT reference documents and lay down the conclusions on best available techniques, their description, information to assess their applicability, the emission levels associated with the best available techniques, associated monitoring, associated consumption levels and, where appropriate, relevant site remediation measures.

(4) In accordance with Article 14(3) of Directive 2010/75/EU, BAT conclusions are to be the reference for setting permit conditions for installations covered by Chapter II of that Directive.

(5) Article 15(3) of Directive 2010/75/EU requires the competent authority to set emission limit values that ensure that, under normal operating conditions, emissions do not exceed the emission levels associated with the best available techniques as laid down in the decisions on BAT conclusions referred to in Article 13(5) of Directive 2010/75/EU.

(6) Article 15(4) of Directive 2010/75/EU provides for derogations from the requirement laid down in Article 15(3) only where the costs associated with the achievement of the emission levels associated with the BAT disproportionately outweigh the environmental benefits due to the geographical location, the local environmental conditions or the technical characteristics of the installation concerned.

(7) Article 16(1) of Directive 2010/75/EU provides that the monitoring requirements in the permit referred to in point (c) of Article 14(1) of the Directive are to be based on the conclusions on monitoring as described in the BAT conclusions.

(8) In accordance with Article 21(3) of Directive 2010/75/EU, within four years of publication of decisions on BAT conclusions, the competent authority is to reconsider and, if necessary, update all the permit conditions and ensure that the installation complies with those permit conditions.

[1] OJ L 334, 17.12.2010, p. 17.

(9) Commission Decision of 16 May 2011 establishing a forum for the exchange of information pursuant to Article 13 of Directive 2010/75/EU on industrial emissions [1] established a forum composed of representatives of Member States, the industries concerned and non-governmental organisations promoting environmental protection.

(10) In accordance with Article 13(4) of Directive 2010/75/EU, the Commission obtained the opinion [2] of that forum on the proposed content of the BAT reference document for the tanning of hides and skins on 13 September 2012 and made it publicly available.

(11) The measures provided for in this Decision are in accordance with the opinion of the Committee established by Article 75(1) of Directive 2010/75/EU,

HAS ADOPTED THIS DECISION:

Article 1

The BAT conclusions for the tanning of hides and skins are set out in the Annex to this Decision.

Article 2

This Decision is addressed to the Member States.

Done at Brussels, 11 February 2013.

For the Commission
Janez POTOČNIK
Member of the Commission

[1] OJ C 146, 17.5.2011, p. 3.

ANNEX

BAT CONCLUSIONS FOR THE TANNING OF HIDES AND SKINS

SCOPE

These BAT conclusions concern the following activities specified in Annex I to Directive 2010/75/EU, namely:

— 6.3 *Tanning of hides and skins where the treatment capacity exceeds 12 tonnes of finished products per day,*

— 6.11 *Independently operated treatment of waste water not covered by Council Directive 91/271/EEC* [1] *and discharged by an installation* undertaking activities covered under 6.3 above.

Unless stated otherwise the BAT conclusions presented can be applied to all installations subject to these BAT conclusions.

Other reference documents which are relevant for the activities covered by these BAT conclusions are the following:

Reference document	Subject
Energy Efficiency (ENE)	General energy efficiency
Economics and Cross-Media Effects (ECM)	Economics and cross-media effects of techniques
General Principles of Monitoring (MON)	Emissions and consumption monitoring
Emissions from storage (EFS)	Emissions from tanks, pipework and stored chemicals
Waste Incineration (WI)	Waste incineration
Waste Treatments Industries (WT)	Waste treatment

The techniques listed and described in these BAT conclusions are neither prescriptive nor exhaustive. Other techniques may be used that ensure at least an equivalent level of environmental protection.

DEFINITIONS

For the purposes of these BAT conclusions, the following definitions apply:

Beamhouse/Limeyard	That portion of the tannery where the hides are soaked, limed, fleshed, and unhaired, when necessary, prior to the tanning process.
By-product	Object or substance meeting the requirements of Article 5 of Directive 2008/98/EC of the European Parliament and of the Council [1].
Existing plant	A plant that is not a new plant.
Existing processing vessel	A processing vessel that is not a new processing vessel.
New plant	A plant first operated at the installation following the publication of these BAT conclusions or a complete replacement of a plant on the existing foundations of the installation following the publication of these BAT conclusions.
New processing vessel	A processing vessel first operated at the plant following the publication of these BAT conclusions or a complete rebuild of a processing vessel following the publication of these BAT conclusions.
Tannery	An installation that carries out the activity 'Tanning of hides and skins where the treatment capacity exceeds 12 tonnes of finished products per day' (Activity 6.3 of Annex I to Directive 2010/75/EU).
Tanyard	The part of the tannery where the processes of pickling and tanning are carried out.
Urban waste water treatment plant	A plant subject to Directive 91/271/EEC.

[1] OJ L 312, 22.11.2008, p. 3.

[1] OJ L 135, 30.5.1991, p. 40.

1.1. *General BAT conclusions for the tanning of hides and skins*

1.1.1. Environmental management systems

1. In order to improve the overall environmental performance of a tannery, BAT is to implement and adhere to an environmental management system (EMS) that incorporates all of the following features:

(i) commitment of the management, including senior management;

(ii) definition of an environmental policy that includes the continuous improvement of the installation by the management;

(iii) planning and establishing the necessary procedures, objectives and targets, in conjunction with financial planning and investment;

(iv) implementation of procedures paying particular attention to:

(a) structure and responsibility;

(b) training, awareness and competence;

(c) communication;

(d) employee involvement;

(e) documentation;

(f) efficient process control;

(g) maintenance programmes;

(h) emergency preparedness and response;

(i) safeguarding compliance with environmental legislation;

(v) checking performance and taking corrective action, paying particular attention to:

(a) monitoring and measurement (see also the reference document on the general principles of monitoring);

(b) corrective and preventive action;

(c) maintenance of records;

(d) independent (where practicable) internal and external auditing in order to determine whether or not the EMS conforms to planned arrangements and has been properly implemented and maintained;

(vi) review of the EMS and its continuing suitability, adequacy and effectiveness by senior management;

(vii) following the development of cleaner technologies;

(viii) consideration for the environmental impacts from the eventual decommissioning of the installation at the stage of designing a new plant, and throughout its operating life;

(ix) application of sectoral benchmarking on a regular basis.

Specifically for the tanning of hides and skins, it is also important to consider the following potential features of the EMS:

(x) to facilitate decommissioning, the maintenance of records of the locations on the site where particular process steps are carried out;

(xi) other items listed under BAT conclusion 2.

Applicability

The scope (e.g. level of details) and nature of the EMS (e.g. standardised or non-standardised) will generally be related to the nature, scale and complexity of the installation, and the range of environmental impacts it may have.

1.1.2. Good housekeeping

2. In order to minimise the environmental impact of the production process, BAT is to apply the principles of good housekeeping by applying the following techniques in combination:

(i) careful selection and control of substances and raw materials (e.g. quality of hides, quality of chemicals);

(ii) input-output analysis with a chemical inventory, including quantities and toxicological properties;

(iii) minimisation of the use of chemicals to the minimum level required by the quality specifications of the final product;

(iv) careful handling and storage of raw materials and finished products in order to reduce spills, accidents and water wastage;

(v) segregation of waste streams, where practicable, in order to allow for the recycling of certain waste streams;

(vi) monitoring of critical process parameters to ensure stability of the production process;

(vii) regular maintenance of the systems for the treatment of effluents;

(viii) review of options for the reuse of process/washing water;

(ix) review of waste disposal options.

1.2. *Monitoring*

3. BAT is to monitor emissions and other relevant process parameters, including those indicated below, with the given associated frequency and to monitor emissions according to EN standards. If EN standards are not available, BAT is to use ISO, national or other international standards that ensure the provision of data of an equivalent scientific quality.

	Parameter	Frequency	Applicability
a	**Measurement of water consumption in the two process stages: up to tanning and post-tanning, and recording of production in the same period.**	At least monthly.	Applicable to plants carrying out wet processing.
b	**Recording of the quantities of process chemicals used in each process step and recording of production in the same period.**	At least yearly.	Generally applicable.
c	**Monitoring of the sulphide concentration and total chromium concentration in the final effluent after treatment for direct discharge to receiving water, by using flow proportional 24-hour composite samples.** **Monitoring of the sulphide concentration and total chromium concentration after chromium precipitation for indirect discharge, by using flow proportional 24-hour composite samples.**	On a weekly or monthly basis.	The monitoring of chromium concentration is applicable to on-site or off-site plants which undertake chromium precipitation. Where economically viable, the monitoring of sulphide concentration is applicable to plants carrying out some part of effluent treatment on site or off site for treating waste waters from tanneries.
d	**Monitoring of chemical oxygen demand (COD), biochemical oxygen demand (BOD) and ammoniacal nitrogen after on-site or off-site effluent treatment for direct discharges to receiving water, by using flow-proportional 24-hour composite samples.** **Monitoring of total suspended solids after on-site or off-site effluent treatment for direct discharges to receiving water.**	On a weekly or monthly basis. More frequent measurements in case process changes are needed.	Applicable to plants carrying out some part of effluent treatment on-site or off-site for treating waste waters from tanneries.

	Parameter	Frequency	Applicability
e	**Monitoring of halogenated organic compounds after on-site or off-site effluent treatment for direct discharges to receiving water.**	On a regular basis.	Applicable to plants where halogenated organic compounds are used in the production process and are susceptible to being released into receiving water.
f	**Measurement of pH or redox potential at the liquid outlet of wet scrubbers.**	Continuously.	Applicable to plants using wet scrubbing to abate hydrogen sulphide or ammonia emissions to the air.
g	**The keeping of a solvent inventory on an annual basis, and recording of production in the same period.**	On an annual basis.	Applicable to plants carrying out finishing using solvents and using water-borne coatings or similar materials to limit the solvent input.
h	**Monitoring of volatile organic compound emissions at the outlet of abatement equipment, and recording of production.**	Continuously or periodically.	Applicable to plants carrying out finishing using solvents and employing abatement.
i	**Indicative monitoring of the pressure drop across bag filters.**	On a regular basis.	Applicable to plants using bag filters to abate particulate matter emissions, where there is a direct discharge to the atmosphere.
j	**Testing of the capture efficiency of wet scrubbing systems.**	Annually.	Applicable to plants using wet scrubbing to abate particulate matter emissions, where there is a direct discharge to the atmosphere.
k	**Recording of the quantities of process residues sent for recovery, reuse, recycling, and disposal.**	On a regular basis.	Generally applicable.
l	**Recording of all forms of energy use and of production in the same period.**	On a regular basis.	Generally applicable.

1.3. *Minimising water consumption*

4. In order to minimise water consumption, BAT is to use one or both of the techniques given below.

	Technique	Description	Applicability
a	**The optimisation of water use in all wet process steps, including the use of batch washing instead of running water washes**	Optimisation of water use is achieved by determining the optimum quantity required for each process step and introducing the correct quantity using measuring equipment. Batch washing involves washing of hides and skins during processing by introducing the required quantity of clean water into the processing vessel and using the action of the vessel to achieve the required agitation, as opposed to running water washes which use the inflow and outflow of large quantities of water.	Applies to all plants carrying out wet processing.
b	**The use of short floats**	Short floats are reduced amounts of process water in proportion to the amount of hides or skins being processed as compared to traditional practices. There is a lower limit to this reduction because the water also functions as a lubricant and coolant for the hides or skins during processing. The rotation of process vessels containing a limited amount of water requires more robust geared drives because the mass being rotated is uneven.	This technique cannot be applied in the dyeing process step and for the processing of calfskins. Applicability is also limited to: — new processing vessels, — existing processing vessels that allow the use of, or can be modified to use, short floats.

The review of options for the reuse of process/washing water is part of an Environmental Management System (see BAT 1) and of the principles of good housekeeping (see BAT 2).

The BAT-associated consumption levels for water

See Table 1 (for bovine hides) and Table 2 (for sheepskins).

Table 1

BAT-associated consumption levels for water for the processing of bovine hides

Process stages	Water consumption per tonne of raw hide [1] (m^3/t)	
	Unsalted hides	Salted hides
Raw to wet blue/white	10 to 15	13 to 18
Post-tanning processes and finishing	6 to 10	6 to 10
Total consumption.	16 to 25	19 to 28

[1] Monthly average values. Processing of calfskins and vegetable tanning may require a higher water

Table 2

BAT-associated consumption levels for water for the processing of sheepskins

Process stages	Specific water consumption [1]
	litres per skin
Raw to pickle	65 to 80
Pickle to wet blue	30 to 55
Post-tanning processes and finishing	15 to 45
Total	110 to 180

[1] Monthly average values. Wool-on sheepskins may require a higher water consumption.

1.4. *Reduction of emissions in waste water*

1.4.1. Reduction of emissions in waste water from beamhouse process steps

5. In order to reduce the pollutant load in the waste water before effluent treatment arising from the beamhouse process steps, BAT is to use an appropriate combination of the techniques given below.

	Technique	Description	Applicability
a	**The use of short floats**	Short floats are reduced amounts of process water. When less water is present, the quantity of process chemicals which are discarded unreacted, is reduced.	The technique cannot be applied for the processing of calfskins. Applicability is also limited to: — new processing vessels, — existing processing vessels that allow the use of, or can be modified to use, short floats.

	Technique	Description	Applicability
b	**The use of clean hides or skins**	Use of hides or skins which have less manure adhering to the exterior, possibly through a formal 'clean hides scheme'.	Applicable subject to the constraints of the availability of clean hides.
c	**Processing fresh hides or skins**	Unsalted hides or skins are used. Rapid post-mortem cooling combined with either short delivery times or temperature-controlled transport and storage are used to prevent their deterioration.	Applicability is limited by the availability of fresh hides or skins. Cannot be applied when a supply chain longer than two days is involved.
d	**Shaking off loose salt from hides by mechanical means**	Salted hides are opened out for processing in a manner which shakes or tumbles them, so that loose salt crystals fall off and are not taken into the soaking process.	Applicability is limited to tanneries processing salted hides.
e	**Hair-save unhairing**	Unhairing is carried out by dissolving the hair root rather than the whole hair. The remaining hair is filtered out of the effluent. The concentration of hair breakdown products in the effluent is reduced.	The technique is not applicable where facilities for the processing of hair for use are not available within a reasonable transport distance or when the hair use is not possible. Applicability is also limited to: — new processing vessels, — existing processing vessels that allow the use of, or can be modified to use, the technique.
f	**Using organic sulphur compounds or enzymes in the unhairing of bovine hides**	The amount of inorganic sulphide used in unhairing is reduced by partially replacing it by organic sulphur compounds or by additional use of appropriate enzymes.	Additional use of enzymes is not applicable to tanneries producing leather with a visible grain (e.g. aniline leather).
g	**Reduced ammonium use during deliming**	The use of ammonium compounds in deliming is partially or completely replaced by the injection of carbon dioxide gas and/or the use of other substitute deliming agents.	The complete replacement of ammonium compounds by CO_2 during deliming cannot be applied to the processing of materials whose thickness is over 1,5 mm. The applicability of partial or complete replacement of ammonium compounds by CO_2 during deliming is also limited to: — new processing vessels, — existing processing vessels that allow the use of, or can be modified to use, CO_2 during deliming.

1.4.2. Reduction of emissions in waste water from tanyard process steps

6. In order to reduce the pollutant load in the waste water before effluent treatment arising from the tanyard process steps, BAT is to use an appropriate combination of the techniques given below.

	Technique	Description	Applicability
a	**The use of short floats**	Short floats are reduced amounts of process water. When less water is present, the quantity of process chemicals which is discarded unreacted is reduced.	This technique cannot be applied for the processing of calfskins. Applicability is also limited to: — new processing vessels, — existing processing vessels that allow the use of, or can be modified to use, short floats.
b	**Maximising the uptake of chromium tanning agents**	Optimisation of the operating parameters (e.g. pH, float, temperature, time, and drum speed) and the use of chemicals to increase the proportion of the chromium-tanning agent taken up by the hides or skins.	Generally applicable.
c	**Optimised vegetable-tanning methods**	Use of drum tanning for part of the process. Use of pretanning agents to aid penetration of vegetable tannins.	Cannot be applied in the production of vegetable-tanned sole leather.

1.4.3. Reduction of emissions in waste water from post-tanning process steps

7. In order to reduce the pollutant load in the waste water before effluent treatment arising from the post-tanning process steps, BAT is to use an appropriate combination of the techniques given below.

	Technique	Description	Applicability
a	**The use of short floats**	Short floats are reduced amounts of process water. When less water is present, the quantity of process chemicals which is discarded unreacted is reduced.	This technique cannot be applied in the dyeing process step and for the processing of calfskins. Applicability is also limited to: — new processing vessels, — existing processing vessels that allow the use of, or can be modified to use, short floats.
b	**Optimisation of retanning, dyeing, and fatliquoring**	Optimisation of process parameters to ensure the maximum uptake of process chemicals.	Generally applicable.

1.4.4. Other reductions of emissions in waste water

8. In order to prevent the emission of specific pesticides in waste water, BAT is to only process hides or skins which have not been treated with those materials.

Description

The technique consists in the specification in supply contracts of materials free from pesticides that are:

— listed in Directive 2008/105/EC of the European Parliament and of the Council of 16 December 2008 on environmental quality standards in the field of water policy [1],

— listed in Regulation (EC) No 850/2004 of the European Parliament and of the Council of 29 April 2004 on persistent organic pollutants [2],

— classified as carcinogen, mutagen or reprotoxic according to Regulation (EC) No 1272/2008 of the European Parliament and of the Council of 16 December 2008 on classification, labelling and packaging of substances and mixtures [3].

Examples include DDT, cyclodiene pesticides (aldrin, dieldrin, endrin, isodrin), and HCH including lindane.

Applicability

Generally applicable to tanneries within the constraints of controlling the specifications given to non-EU hides and skins suppliers.

9. In order to minimise the emissions of biocides in waste water, BAT is to process hides or skins only with biocidal products approved in accordance with the dispositions given by Regulation (EU) No 528/2012 of the European Parliament and of the Council of 22 May 2012 concerning the making available on the market and use of biocidal products [4].

1.5. *Treatment of emissions to water*

10. In order to reduce emissions to receiving waters, BAT is to apply waste water treatment comprising an appropriate on-site and/or off-site combination of the following techniques:

(i) mechanical treatment;

(ii) physico-chemical treatment;

(iii) biological treatment;

(iv) biological nitrogen elimination.

Description

The application of an appropriate combination of the techniques described below. The combination of techniques can be implemented on site and/or off site, in two or three stages.

Technique		Description	Applicability
a	**Mechanical treatment**	Screening of gross solids, skimming of fats, oils, and greases and removal of solids by sedimentation.	Generally applicable for on-site and/or off-site treatment.
b	**Physico-chemical treatment**	Sulphide oxidation and/or precipitation, COD and suspended solids removal by, e.g., coagulation and flocculation. Chromium precipitation by increasing pH to 8 or above using an alkali (e.g. calcium hydroxide, magnesium oxide, sodium carbonate, sodium hydroxide, sodium aluminate).	Generally applicable for on-site and/or off-site treatment.
c	**Biological treatment**	Aerobic biological waste water treatment using aeration, including the removal of suspended solids by, e.g., sedimentation, secondary flotation.	Generally applicable for on-site and/or off-site treatment.
d	**Biological nitrogen elimination**	Nitrification of ammoniacal nitrogen compounds to nitrates, followed by the reduction of nitrates to gaseous nitrogen.	Applicable to plants with direct discharge to receiving water. Difficult implementation into existing plants where there are space limitations.

[1] OJ L 348, 24.12.2008, p. 84.
[2] OJ L 158, 30.4.2004, p. 7.
[3] OJ L 353, 31.12.2008, p. 1.
[4] OJ L 167, 27.6.2012, p. 1.

BAT-associated emission levels

See Table 3. BAT-AELs apply for:

(i) direct waste water discharges from tanneries on-site waste water treatment plants;

(ii) direct waste water discharges from independently operated waste water treatment plants covered under Section 6.11 in Annex I to Directive 2010/75/EU treating waste water mostly from tanneries.

Table 3

BAT-AELs for direct discharges of waste water after treatment

Parameter	BAT-AELs
	mg/l (monthly average values based on the average of the 24-hour representative composite samples taken over a month)
COD	200-500 ([1])
BOD_5	15-25
Suspended solids	< 35
Ammoniacal nitrogen NH_4-N (as N)	< 10
Total chromium (as Cr)	< 0,3-1
Sulphide (as S)	< 1

([1]) The upper level is associated with COD inlet concentrations of ≥ 8 000 mg/l.

11. In order to reduce the chromium content of waste water discharges, BAT is to apply on-site or off-site chromium precipitation.

Description

See BAT 10, technique b.

The efficiency of chromium precipitation is higher in the case of segregated, concentrated chromium-bearing streams.

Applicability

Generally applicable for on-site and/or off-site treatment of waste water effluents of tanneries carrying out chromium tanning and/or retanning.

BAT-associated emission levels

See Table 3 for chromium BAT-AELs for direct discharges to receiving water, and Table 4 for chromium BAT-AELs for indirect discharges into urban waste water treatment plants.

12. In order to reduce total chromium and sulphide emissions through indirect discharges of waste water from tanneries into urban waste water treatment plants, BAT is to apply chromium precipitation and sulphide oxidation.

Description

See BAT 10, technique b.

The removal efficiency is higher in the case of segregated, concentrated chromium/sulphide-bearing streams.

Sulphide oxidation consists of a catalytic oxidation (aeration in the presence of manganese salts).

Applicability

Chromium precipitation is generally applicable for on-site and/or off-site treatment of waste water effluents of tanneries carrying out chromium tanning and/or retanning.

BAT-associated emissions levels

See Table 4 for chromium and sulphide BAT-AELs for indirect discharges into urban waste water treatment plants.

Table 4

BAT-AELs for total chromium and sulphide emissions through indirect discharges of waste water from tanneries into urban waste water treatment plants

Parameter	BAT-AELs
	mg/l (monthly average values based on the average of the 24-hour representative composite samples taken over a month)
Total chromium (as Cr)	< 0,3-1
Sulphide (as S)	< 1

1.6. *Airborne emissions*

1.6.1. Odour

13. In order to reduce the generation of ammonia odours from processing, BAT is to partially or completely replace ammonium compounds in deliming.

Applicability

The complete replacement of ammonium compounds by CO_2 during deliming cannot be applied to the processing of materials whose thickness is over 1,5 mm.

The applicability of partial or complete replacement of ammonium compounds by CO_2 during deliming is also limited to both new and existing processing vessels that allow the use of, or can be modified to use, CO_2 during deliming.

14. In order to reduce the emission of odours from process steps and effluent treatment, BAT is to abate ammonia and hydrogen sulphide by the scrubbing and/or biofiltration of extracted air in which odour of these gases are noticeable.

15. In order to prevent the production of odours from the decomposition of raw hides or skins, BAT is to use curing and storage designed to prevent decomposition, and rigorous stock rotation.

Description

Correct salt curing or temperature control, both combined with rigorous stock rotation to eliminate decomposition odours.

16. In order to reduce the emission of odours from waste, BAT is to use handling and storage procedures designed to reduce waste decomposition.

Description

Control of waste storage and methodical removal of putrescible waste from the installation before its decomposition causes odour problems.

Applicability

Applies only to plants which produce putrescible wastes.

17. In order to reduce the emission of odours from the beamhouse effluent, BAT is to use pH control followed by treatments to remove the sulphide content.

Description

Maintaining the pH of effluents containing sulphide from the beamhouse above 9,5 until the sulphide has been treated (on or off site) by one of the following techniques:

(i) catalytic oxidation (using manganese salts as a catalyst);

(ii) biological oxidation;

(iii) precipitation; or

(iv) by mixing in an enclosed vessel system fitted with an exhaust scrubber or a carbon filter.

Applicability

Applies only to plants carrying out sulphide unhairing.

1.6.2. Volatile organic compounds

18. In order to reduce the airborne emissions of halogenated volatile organic compounds, BAT is to replace halogenated volatile organic compounds used in the process with substances that are not halogenated.

Description

Replacement of halogenated solvents by non-halogenated solvents.

Applicability

Does not apply to the dry degreasing of sheepskins carried out in closed cycle machines.

19. In order to reduce airborne emissions of volatile organic compounds (VOC) from finishing, BAT is to use one or a combination of the techniques given below, priority being given to the first one.

Technique		Description
a	**The use of water-borne coatings in combination with an efficient application system**	Limiting emissions of volatile organic compounds by the use of water-borne coatings, with each coat applied by one of the following: curtain coating or roller coating or improved spraying techniques.
b	**The use of extraction ventilation and an abatement system**	Treating the exhaust air by the use of an extraction system fitted with one or more of the following: wet scrubbing, adsorption, bio-filtration or incineration.

BAT-associated solvent use levels and BAT-associated emission levels for VOC

Both the solvent use rates associated with the use of water-borne coatings in combination with an efficient application system and the BAT-AEL range for specific VOC emissions where an extraction ventilation and abatement system is used as an alternative to the use of water-borne finishing materials are given in Table 5.

Table 5

BAT-associated solvent use levels and BAT-AELs for VOC emissions

Parameter	Type of production		BAT-associated levels
			g/m^2 (annual average values per unit of finished leather)
Solvent use levels	Where water-borne coatings are used in combination with an efficient application system	Upholstery and automotive leather	10-25
		Footwear, garment, and leathergoods leathers	40-85
		Coated leathers (coating thickness > 0,15 mm)	115-150

Parameter	Type of production	BAT-associated levels
		g/m^2 (annual average values per unit of finished leather)
VOC emissions	Where an extraction ventilation and abatement system is used as an alternative to the use of water-borne finishing materials	9-23 ([1])

([1]) BAT-AEL range expressed as total carbon.

1.6.3. Particulate matter

20. In order to reduce the airborne particulate matter emissions from the dry finishing stages of production, BAT is to use an extraction ventilation system fitted with bag filters or wet scrubbers.

BAT-associated emission levels

The BAT-AEL for particulate matter is 3 to 6 mg per normal m^3 of exhausted air expressed as a 30-minute mean.

1.7. *Waste management*

21. In order to limit the quantities of wastes sent for disposal, BAT is to organise operations on the site so as to maximise the proportion of process residues, which arise as by-products, including the following:

Process residue	Uses as a by-product
Hair and wool	— Filling material — Wool textiles
Limed trimmings	— Collagen production
Untanned splits	— Processed to leather — Production of sausage casings — Collagen production — Dog chews
Tanned splits and trimmings	— Finished for use in patchwork, small leather goods, etc. — Collagen production

22. In order to limit the quantities of wastes sent for disposal, BAT is to organise operations on the site so as to facilitate waste reuse, or failing that, waste recycling, or failing that, 'other recovery', including the following:

Waste	Reuse after preparation	Recycling as	Other recovery
Hair and Wool	— Manufacture of protein hydrolysate	— Fertiliser	— Energy recovery
Raw trimmings		— Hide glue	— Energy recovery
Limed trimmings	— Tallow — Manufacture of technical gelatine	— Hide glue	
Fleshings	— Manufacture of protein hydrolysate — Tallow	— Hide glue	— Production of substitute fuel — Energy recovery

Waste	Reuse after preparation	Recycling as	Other recovery
Untanned splits	— Manufacture of technical gelatine — Manufacture of protein hydrolysate	— Hide glue	— Energy recovery
Tanned splits and trimmings	— Leather fibreboard production from non-finished trimmings — Manufacture of protein hydrolysate		— Energy recovery
Tanned shavings	— Leather fibreboard production — Manufacture of protein hydrolysate		— Energy recovery
Sludges from waste water treatment			— Energy recovery

23. In order to reduce the chemical consumption and reduce the amount of leather waste containing chromium-tanning agents sent for disposal, BAT is to use lime splitting.

Description

Carrying out the splitting operation at an earlier stage of processing, so as to produce an untanned by-product.

Applicability

Applies only to plants using chromium tanning.

Not applicable:

— when hides or skins are being processed for full substance (i.e. unsplit) products,

— when a firmer leather has to be produced (e.g. shoe leather),

— when a more uniform thickness is needed in the final product,

— where tanned splits are produced as a product or co-product.

24. In order to reduce the amount of chromium in sludge sent for disposal, BAT is to use one or a combination of the techniques given below.

	Technique	Description	Applicability
a	**Recovery of chromium for reuse in the tannery**	Re-solution of the chromium precipitated from the tanning float, using sulphuric acid for use as a partial substitute for fresh chromium salts.	Applicability is restricted by the need to produce leather properties which meet customers specification, in particular related to dyeing (reduced fastness and less brightness of colours) and fogging.
b	**Recovery of chromium for reuse in another industry**	Use of the chromium sludge as a raw material by another industry.	Applies only where an industrial user for the recovered waste can be found.

25. In order to reduce energy, chemical and handling capacity requirements of sludge for its subsequent treatment, BAT is to reduce the water content of sludges by using sludge dewatering.

Applicability

Applies to all plants carrying out wet processing.

1.8. *Energy*

26. In order to reduce energy consumed in drying, BAT is to optimise the preparation for drying by samming or any other mechanical dewatering.

27. In order to reduce energy consumption for wet processes, BAT is to use short floats.

Description

Reducing the energy used to heat water by reducing hot water use.

Applicability

The technique cannot be applied in the dyeing process step and for the processing of calfskins.

Applicability is also limited to:

— new processing vessels,

— existing processing vessels that allow the use of, or can be modified to use, short floats.

BAT-associated energy consumption rates

See Table 6.

Table 6

Specific energy consumption associated with BAT

Activity stages	Specific energy consumption per unit of raw material [1]
	GJ/t
Processing bovine hides from raw to wet blue or wet white	< 3
Processing bovine hides from raw to finished leather	< 14
Processing sheepskins from raw to finished leather	< 6

[1] The energy consumption values (expressed as an annual average not corrected to primary energy) cover the energy use in the production process including electricity and the total heating for indoor spaces, but excluding the energy use for waste water treatment.

DECISIONS

COMMISSION IMPLEMENTING DECISION

of 26 March 2013

establishing the best available techniques (BAT) conclusions under Directive 2010/75/EU of the European Parliament and of the Council on industrial emissions for the production of cement, lime and magnesium oxide

(notified under document C(2013) 1728)

(Text with EEA relevance)

(2013/163/EU)

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Having regard to Directive 2010/75/EU of the European Parliament and of the Council of 24 November 2010 on industrial emissions (integrated pollution prevention and control) ([1]), and in particular Article 13(5) thereof,

Whereas:

(1) Article 13(1) of Directive 2010/75/EU requires the Commission to organise an exchange of information on industrial emissions between it and Member States, the industries concerned and non-governmental organisations promoting environmental protection in order to facilitate the drawing up of best available techniques (BAT) reference documents as defined in Article 3(11) of that Directive.

(2) In accordance with Article 13(2) of Directive 2010/75/EU, the exchange of information is to address the performance of installations and techniques in terms of emissions, expressed as short- and long-term averages, where appropriate, and the associated reference conditions, consumption and nature of raw materials, water consumption, use of energy and generation of waste and the techniques used, associated monitoring, cross-media effects, economic and technical viability and developments therein and best available techniques and emerging techniques identified after considering the issues mentioned in points (a) and (b) of Article 13(2) of that Directive.

(3) 'BAT conclusions' as defined in Article 3(12) of Directive 2010/75/EU are the key element of BAT reference documents and lay down the conclusions on best available techniques, their description, information to assess their applicability, the emission levels associated with the best available techniques, associated monitoring, associated consumption levels and, where appropriate, relevant site remediation measures.

(4) In accordance with Article 14(3) of Directive 2010/75/EU, BAT conclusions are to be the reference for setting permit conditions for installations covered by Chapter II of that Directive.

(5) Article 15(3) of Directive 2010/75/EU requires the competent authority to set emission limit values that ensure that, under normal operating conditions, emissions do not exceed the emission levels associated with the best available techniques as laid down in the decisions on BAT conclusions referred to in Article 13(5) of Directive 2010/75/EU.

(6) Article 15(4) of Directive 2010/75/EU provides for derogations from the requirement laid down in Article 15(3) only where the costs associated with the achievement of the emission levels associated with the BAT disproportionately outweigh the environmental benefits due to the geographical location, the local environmental conditions or the technical characteristics of the installation concerned.

(7) Article 16(1) of Directive 2010/75/EU provides that the monitoring requirements in the permit referred to in point (c) of Article 14(1) of the Directive are to be based on the conclusions on monitoring as described in the BAT conclusions.

(8) In accordance with Article 21(3) of Directive 2010/75/EU, within 4 years of publication of decisions on BAT conclusions, the competent authority is to reconsider and, if necessary, update all the permit conditions and ensure that the installation complies with those permit conditions.

([1]) OJ L 334, 17.12.2010, p. 17.

(9) Commission Decision of 16 May 2011 establishing a forum for the exchange of information pursuant to Article 13 of Directive 2010/75/EU on industrial emissions [1] established a forum composed of representatives of Member States, the industries concerned and non-governmental organisations promoting environmental protection.

(10) In accordance with Article 13(4) of Directive 2010/75/EU, the Commission obtained the opinion [2] of that forum on the proposed content of the BAT reference document for the production of cement, lime and magnesium oxide on 13 September 2012 and made it publicly available.

(11) The measures provided for in this Decision are in accordance with the opinion of the Committee established by Article 75(1) of Directive 2010/75/EU,

HAS ADOPTED THIS DECISION:

Article 1

The BAT conclusions for the production of cement, lime and magnesium oxide are set out in the Annex to this Decision.

Article 2

This Decision is addressed to the Member States.

Done at Brussels, 26 March 2013.

For the Commission
Janez POTOČNIK
Member of the Commission

ANNEX

BAT CONCLUSIONS FOR THE PRODUCTION OF CEMENT, LIME AND MAGNESIUM OXIDE

SCOPE

These BAT conclusions concern the following industrial activities specified in Section 3.1 of Annex I to Directive 2010/75/EU, namely:

'3.1. Production of cement, lime and magnesium oxide', which involve:

(a) production of cement clinker in rotary kilns with a production capacity exceeding 500 tonnes per day or in other kilns with a production capacity exceeding 50 tonnes per day;

(b) production of lime in kilns with a production capacity exceeding 50 tonnes per day;

(c) production of magnesium oxide in kilns with a production capacity exceeding 50 tonnes per day.

Regarding point 3.1(c) above, these BAT conclusions only address the production of MgO using the dry process route based on mined natural magnesite (magnesium carbonate - $MgCO_3$).

In particular, concerning the above-mentioned activities, these BAT conclusions cover the following:

— production of cement, lime and magnesium oxide (dry process route)

— raw materials – storage and preparation

— fuels – storage and preparation

— use of waste as raw materials and/or fuels – quality requirements, control and preparation

— products – storage and preparation

— packaging and dispatch.

These BAT conclusions do not address the following activities:

— the production of magnesium oxide using the wet process route using magnesium chloride as the starting material, covered by the Reference Document on Best Available Techniques for Large Volume Inorganic Chemicals – Solids and Others Industry (LVIC-S)

— the production of ultra low-carbon dolime (i.e. a mixture of calcium and magnesium oxides produced by the nearly full decarbonation of dolomite ($CaCO_3.MgCO_3$). The residual CO_2 content of the product is below 0,25 % and the bulk density well below 3,05 g/cm^3)

— shaft kilns for cement clinker production

— activities which are not directly associated with the primary activity such as quarrying.

Other reference documents which are of relevance for the activities covered by these BAT conclusions are the following:

Reference documents	Activity
Emissions from Storage (EFS)	Storage and handling of raw materials and products
General Principles of Monitoring (MON)	Emissions monitoring
Waste Treatments Industries (WT)	Waste treatment
Energy Efficiency (ENE)	General energy efficiency
Economic and Cross-media Effects (ECM)	Economics and cross-media effects of techniques

The techniques listed and described in these BAT conclusions are neither prescriptive nor exhaustive. Other techniques may be used that ensure at least an equivalent level of environmental protection.

Where these BAT conclusions address waste co-incineration plants, this is without prejudice to the provisions of Chapter IV of and Annex VI to Directive 2010/75/EU.

Where these BAT conclusions address energy efficiency, this is without prejudice to the provisions of the new Directive 2012/27/EU of the European Parliament and of the Council [1] on Energy Efficiency.

NOTE ON THE EXCHANGE OF INFORMATION

The exchange of information on BAT for the Cement, Lime and Magnesium Oxide sectors ended in 2008. The information available then, complemented by additional information concerning the emissions from magnesium oxide production, was used for reaching these BAT conclusions.

DEFINITIONS

For the purposes of these BAT conclusions, the following definitions apply:

Term used	Definition
New plant	A plant introduced on the site of the installation following the publication of these BAT conclusions or a complete replacement of a plant on the existing foundations of the installation following the publication of these BAT conclusions
Existing plant	A plant which is not a new plant
Major upgrade	An upgrade of the plant/kiln involving a major change in the kiln requirements or technology, or replacement of the kiln
'Use of waste as fuel and/or raw material'	The term covers the use of: — waste fuels with significant calorific value; and — waste materials without significant calorific value but with mineral components used as raw materials that contribute to the intermediate product clinker; and — waste materials that have both a significant calorific value and mineral components

Definition for certain products

Term used	Definition
White cement	Cement falling under the following PRODCOM 2007 code: 26.51.12.10 – White Portland cement
Special cement	Special cements falling under the following PRODCOM 2007 codes: — 26.51.12.50 – Aluminous cement — 26.51.12.90 – Other hydraulic cements
Dolime or calcinated dolime	A mixture of calcium and magnesium oxides produced by the decarbonation of dolomite ($CaCO_3.MgCO_3$) with a residual CO_2 content of the product exceeding 0,25 % and the bulk density of the commercial product well below 3,05 g/cm^3. The free content as MgO is usually between 25 % and 40 %.
Sintered dolime	A mixture of calcium and magnesium oxides used solely for the production of refractory bricks and other refractory products, with a minimum bulk density of 3,05 g/cm^3

[1] OJ L 315, 14.11.2012, p. 1.

Definition for certain air pollutants

Term used	Definition
NO_x expressed as NO_2	The sum of nitrogen oxide (NO) and nitrogen dioxide (NO_2) expressed as NO_2
SO_x expressed as SO_2	The sum of sulphur dioxide (SO_2) and sulphur trioxide (SO_3) expressed as SO_2
Hydrogen chloride expressed as HCl	All gaseous chlorides expressed as HCl
Hydrogen fluoride expressed as HF	All gaseous fluorides expressed as HF

Abbreviations

ASK	Annular shaft kiln
DBM	Dead burned magnesia
I-TEQ	International toxicity equivalent
LRK	Long rotary kiln
MFSK	Mixed feed shaft kiln
OK	Other kilns For the lime industry this covers: — double-inclined shaft kilns — multi-chamber shaft kilns — central burner shaft kilns — external chamber shaft kilns — beam burner shaft kilns — internal arch shaft kilns — travelling grate kilns — 'top-shaped' kilns — flash calciner kilns — rotating hearth kilns
OSK	Other shaft kiln (shaft kilns other than ASK and MFSK)
PCDD	Polychlorinated dibenzo-p-dioxin
PCDF	Polychlorinated dibenzofuran
PFRK	Parallel flow regenerative kiln
PRK	Rotary kiln with preheater

GENERAL CONSIDERATIONS

Averaging periods and reference conditions for air emissions

Emission levels associated with the best available techniques (BAT-AELs) given in these BAT conclusions refer to standard conditions: dry gas at a temperature of 273 K, and a pressure of 1 013 hPa.

Values given in concentrations apply under the following reference conditions:

Activities		Reference conditions
Kiln activities	Cement industry	10 % oxygen by volume
	Lime industry (1)	11 % oxygen by volume
	Magnesium oxide industry (dry process route) (2)	10 % oxygen by volume
Non-kiln activities	All processes	No correction for oxygen
	Lime hydrating plants	As emitted (no correction for oxygen and for dry gas)

(1) For sintered dolime produced by the 'double-pass process', the correction for oxygen does not apply.
(2) For dead burned magnesia (DBM) produced by the 'double-pass process', the correction for oxygen does not apply.

For averaging periods the following definitions apply:

Daily average value	Average value over a period of 24 hours measured by the continuous monitoring of emissions
Average over the sampling period	Average value of spot measurements (periodic) of at least 30 minutes each, unless otherwise stated

Conversion to reference oxygen concentration

The formula for calculating the emissions concentration at a reference oxygen level is shown below:

$$E_R = \frac{21 - O_R}{21 - O_M} * E_M$$

Where:

E_R (mg/Nm^3): emissions concentration related to the reference oxygen level O_R

O_R (vol %): reference oxygen level

E_M (mg/Nm^3): emissions concentration related to the measured oxygen level O_M

O_M (vol %): measured oxygen level

BAT CONCLUSIONS

1.1 **General BAT conclusions**

The BAT mentioned in this section apply to all installations covered by these BAT conclusions (cement, lime and magnesium oxide industry).

The process-specific BAT included in Sections 1.2 - 1.4 apply in addition to the general BAT mentioned in this section.

1.1.1 *Environmental management systems (EMS)*

1. In order to improve the overall environmental performance of the plants/installations producing cement, lime and magnesium oxide, production BAT is to implement and adhere to an environmental management system (EMS) that incorporates all of the following features:

i. commitment of the management, including senior management;

ii. definition of an environmental policy that includes the continuous improvement of the installation by the management;

iii. planning and establishing the necessary procedures, objectives and targets, in conjunction with financial planning and investment;

iv. implementation of procedures paying particular attention to:

(a) structure and responsibility

(b) training, awareness and competence

(c) communication

(d) employee involvement

(e) documentation

(f) efficient process control

(g) maintenance programmes

(h) emergency preparedness and response

(i) safeguarding compliance with environmental legislation;

v. checking performance and taking corrective action, paying particular attention to:

(a) monitoring and measurement (see also the Reference Document on the General Principles of Monitoring)

(b) corrective and preventive action

(c) maintenance of records

(d) independent (where practicable) internal and external auditing in order to determine whether or not the EMS conforms to planned arrangements and has been properly implemented and maintained;

vi. review of the EMS and its continuing suitability, adequacy and effectiveness by senior management;

vii. following the development of cleaner technologies;

viii. consideration for the environmental impacts from the eventual decommissioning of the installation at the stage of designing a new plant, and throughout its operating life;

ix. application of sectoral benchmarking on a regular basis.

Applicability

The scope (e.g. level of details) and nature of the EMS (e.g. standardised or non-standardised) will generally be related to the nature, scale and complexity of the installation, and the range of environmental impacts it may have.

1.1.2 *Noise*

2. In order to reduce/minimise noise emissions during the manufacturing processes for cement, lime and magnesium oxide, BAT is to use a combination of the following techniques:

	Technique
a	Select an appropriate location for noisy operations
b	Enclose noisy operations/units

	Technique
c	Use vibration insulation of operations/units
d	Use internal and external lining made of impact-absorbent material
e	Use soundproofed buildings to shelter any noisy operations involving material transformation equipment
f	Use noise protection walls and/or natural noise barriers
g	Use outlet silencers to exhaust stacks
h	Lag ducts and final blowers which are situated in soundproofed buildings
i	Close doors and windows of covered areas
j	Use sound insulation of machine buildings
k	Use sound insulation of wall breaks, e.g. by installation of a sluice at the entrance point of a belt conveyor
l	Install sound absorbers at air outlets, e.g. the clean gas outlet of dedusting units
m	Reduce flow rates in ducts
n	Use sound insulation of ducts
o	Apply the decoupled arrangement of noise sources and potentially resonant components, e.g. of compressors and ducts
p	Use silencers for filter fans
q	Use soundproofed modules for technical devices (e.g. compressors)
r	Use rubber shields for mills (avoiding the contact of metal against metal)
s	Construct buildings or growing trees and bushes between the protected area and the noisy activity

1.2 **BAT conclusions for the cement industry**

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all installations in the cement industry.

1.2.1 *General primary techniques*

3. In order to reduce emissions from the kiln and use energy efficiently, BAT is to achieve a smooth and stable kiln process, operating close to the process parameter set points by using the following techniques:

	Technique
a	Process control optimisation, including computer-based automatic control
b	Using modern, gravimetric solid fuel feed systems

4. In order to prevent and/or reduce emissions, BAT is to carry out a careful selection and control of all substances entering the kiln.

Description

Careful selection and control of substances entering the kiln can reduce emissions. The chemical composition of the substances and the way they are fed in the kiln are factors that should be taken into account during the selection. Substances of concern may include the substances mentioned in BAT 11 and in BAT 24 to 28.

1.2.2 *Monitoring*

5. BAT is to carry out the monitoring and measurements of process parameters and emissions on a regular basis and to monitor emissions in accordance with the relevant EN standards or, if EN standards are not available, ISO, national or other international standards that ensure the provision of data of an equivalent scientific quality, including the following:

	Technique	Applicability
a	Continuous measurements of process parameters demonstrating the process stability, such as temperature, O_2 content, pressure and flowrate	Generally applicable
b	Monitoring and stabilising critical process parameters, i.e. homogenous raw material mix and fuel feed, regular dosage and excess oxygen	Generally applicable
c	Continuous measurements of NH_3 emissions when SNCR is applied	Generally applicable
d	Continuous measurements of dust, NO_x, SO_x, and CO emissions	Applicable to kiln processes
e	Periodic measurements of PCDD/F and metal emissions	
f	Continuous or periodic measurements of HCl, HF and TOC emissions.	
g	Continuous or periodic measurements of dust	Applicable to non-kiln activities. For small sources (< 10 000 Nm^3/h) from dusty operations other than cooling and the main milling processes, the frequency of measurements or performance checks should be based on a maintenance management system.

Description

The selection between continuous or periodic measurements mentioned in BAT 5(f) is based on the emission source and the type of pollutant expected.

1.2.3 *Energy consumption and process selection*

1.2.3.1 Process selection

6. In order to reduce energy consumption, BAT is to use a dry process kiln with multistage preheating and precalcination.

Description

In this type of kiln system, exhaust gases and recovered waste heat from the cooler can be used to preheat and precalcine the raw material feed before entering the kiln, providing significant savings in energy consumption.

Applicability

Applicable to new plants and major upgrades, subject to raw materials moisture content.

BAT-associated energy consumption levels

See Table 1.

Table 1

BAT-associated energy consumption levels for new plants and major upgrades using dry process kiln with multistage preheating and precalcination

Process	Unit	BAT-associated energy consumption levels (1)
Dry process with multistage preheating and precalcination	MJ/tonne clinker	2 900 – 3 300 (2) (3)

(1) Levels do not apply to plants producing special cement or white cement clinker that require significantly higher process temperatures due to product specifications.
(2) Under normal (excluding, e.g. start-ups and shutdowns) and optimised operational conditions.
(3) The production capacity has an influence on the energy demand, with higher capacities providing energy savings and smaller capacities requiring more energy. Energy consumption also depends on the number of cyclone preheater stages, with more cyclone preheater stages leading to lower energy consumption of the kiln process. The appropriate number of cyclone preheater stages is mainly determined by the moisture content of raw materials.

1.2.3.2 Energy consumption

7. In order to reduce/minimise thermal energy consumption, BAT is to use a combination of the following techniques:

	Technique	Applicability
a	Applying improved and optimised kiln systems and a smooth and stable kiln process, operating close to the process parameter set points by applying: I. process control optimisation, including computer-based automatic control systems II. modern, gravimetric solid fuel feed systems III. preheating and precalcination to the extent possible, considering the existing kiln system configuration	Generally applicable. For existing kilns, the applicability of preheating and precalcination is subject to the kiln system configuration
b	Recovering excess heat from kilns, especially from their cooling zone. In particular, the kiln excess heat from the cooling zone (hot air) or from the preheater can be used for drying raw materials	Generally applicable in the cement industry. Recovery of excess heat from the cooling zone is applicable when grate coolers are used. Limited recovery efficiency can be achieved on rotary coolers
c	Applying the appropriate number of cyclone stages related to the characteristics and properties of raw material and fuels used	Cyclone preheater stages are applicable to new plants and major upgrades.
d	Using fuels with characteristics which have a positive influence on the thermal energy consumption	The technique is generally applicable to the cement kilns subject to fuel availability and for existing kilns subject to the technical possibilities of injecting the fuel into the kiln
e	When replacing conventional fuels by waste fuels, using optimised and suitable cement kiln systems for burning wastes	Generally applicable to all cement kiln types
f	Minimising bypass flows	Generally applicable to the cement industry

Description

Several factors affect the energy consumption of modern kiln systems such as raw materials properties (e.g. moisture content, burnability), the use of fuels, with different properties, as well as the use of a gas bypass system. Furthermore, the production capacity of the kiln has an influence on the energy demand.

Technique 7c: the appropriate number of cyclone stages for preheating is determined by the throughput and the moisture content of raw materials and fuels which have to be dried by the remaining flue-gas heat because local raw materials vary widely regarding their moisture content or burnability

Technique 7d: conventional and waste fuels can be used in the cement industry. The characteristics of the fuels used, such as adequate calorific value and low moisture content, have a positive influence on the specific energy consumption of the kiln.

Technique 7f: the removal of hot raw material and hot gas leads to a higher specific energy consumption of about 6 – 12 MJ/tonne clinker per percentage point of removed kiln inlet gas. Hence, minimising the use of gas bypass has a positive effect on energy consumption.

8. In order to reduce primary energy consumption, BAT is to consider the reduction of the clinker content of cement and cement products.

Description

The reduction of the clinker content of cement and cement products can be achieved by adding fillers and/or additions, such as blast furnace slag, limestone, fly ash and pozzolana in the grinding step in accordance with the relevant cement standards.

Applicability

Generally applicable to the cement industry, subject to (local) availability of fillers and/or additions and local market specificities.

9. In order to reduce primary energy consumption, BAT is to consider cogeneration/combined heat and power plants.

Description

The employment of cogeneration plants for the production of steam and electricity or combined heat and power plants can be applied in the cement industry by recovering waste heat from the clinker cooler or kiln flue-gases using the conventional steam cycle processes or other techniques. Furthermore, excess heat can be recovered from the clinker cooler or kiln flue-gases for district heating or industrial applications.

Applicability

The technique is applicable in all cement kilns if sufficient excess heat is available, if appropriate process parameters can be met, and if economic viability is ensured.

10. In order to reduce/minimise electrical energy consumption, BAT is to use one or a combination of the following techniques:

	Technique
a	Using power management systems
b	Using grinding equipment and other electricity based equipment with high energy efficiency
c	Using improved monitoring systems
d	Reducing air leaks into the system
e	Process control optimisation

1.2.4 *Use of waste*

1.2.4.1 Waste quality control

11. In order to guarantee the characteristics of the wastes to be used as fuels and/or raw materials in a cement kiln and reduce emissions, BAT is to apply the following techniques:

	Technique
a	Apply quality assurance systems to guarantee the characteristics of wastes and to analyse any waste that is to be used as raw material and/or fuel in a cement kiln for: I. constant quality II. physical criteria, e.g. emissions formation, coarseness, reactivity, burnability, calorific value III. chemical criteria, e.g. chlorine, sulphur, alkali and phosphate content and relevant metals content
b	Control the amount of relevant parameters for any waste that is to be used as raw material and/or fuel in a cement kiln, such as chlorine, relevant metals (e.g. cadmium, mercury, thallium), sulphur, total halogen content
c	Apply quality assurance systems for each waste load

Description

Different types of waste materials can replace primary raw materials and/or fossil fuels in cement manufacturing and will contribute to saving natural resources.

1.2.4.2 Waste feeding into the kiln

12. In order to ensure appropriate treatment of the wastes used as fuel and/or raw materials in the kiln, BAT is to use the following techniques:

	Technique
a	Use appropriate points to feed the waste into the kiln in terms of temperature and residence time depending on kiln design and kiln operation
b	To feed waste materials containing organic components that can be volatilised before the calcining zone into the adequately high temperature zones of the kiln system
c	To operate in such a way that the gas resulting from the co-incineration of waste is raised in a controlled and homogeneous fashion, even under the most unfavourable conditions, to a temperature of 850 °C for 2 seconds
d	To raise the temperature to 1 100 °C, if hazardous waste with a content of more than 1 % of halogenated organic substances, expressed as chlorine, are co-incinerated
e	To feed wastes continuously and constantly
f	Delay or stop co-incinerating waste for operations such as start-ups and/or shutdowns when appropriate temperatures and residence times cannot be reached, as noted in a) to d) above

1.2.4.3 Safety management for the use of hazardous waste materials

13. BAT is to apply safety management for the storage, handling and feeding of hazardous waste materials, such as using a risk-based approach according to the source and type of waste, for the labelling, checking, sampling and testing of waste to be handled.

1.2.5 *Dust emissions*

1.2.5.1 Diffuse dust emissions

14. In order to minimise/prevent diffuse dust emissions from dusty operations, BAT is to use one or a combination of the following techniques:

	Technique	Applicability
a	Use a simple and linear site layout of the installation	Applicable to new plants only

	Technique	Applicability
b	Enclose/encapsulate dusty operations, such as grinding, screening and mixing	Generally applicable
c	Cover conveyors and elevators, which are constructed as closed systems, if diffuse dust emissions are likely to be released from dusty material	
d	Reduce air leakages and spillage points	
e	Use automatic devices and control systems	
f	Ensure trouble-free operations	
g	Ensure proper and complete maintenance of the installation using mobile and stationary vacuum cleaning. — During maintenance operations or in cases of trouble with conveying systems, spillage of materials can take place. To prevent the formation of diffuse dust during removal operations, vacuum systems should be used. New buildings can easily be equipped with stationary vacuum cleaning piping, while existing buildings are normally better fitted with mobile systems and flexible connections — In specific cases, a circulation process could be favoured for pneumatic conveying systems	
h	Ventilate and collect dust in fabric filters: — As far as possible, all material handling should be conducted in closed systems maintained under negative pressure. The suction air for this purpose is then dedusted by a fabric filter before being emitted into the air	
i	Use closed storage with an automatic handling system: — Clinker silos and closed fully automated raw material storage areas are considered the most efficient solution to the problem of diffuse dust generated by high volume stocks. These types of storage are equipped with one or more fabric filters to prevent diffuse dust formation in loading and unloading operations — Use storage silos with adequate capacities, level indicators with cut out switches and with filters to deal with dust-bearing air displaced during filling operations	
j	Use flexible filling pipes for dispatch and loading processes, equipped with a dust extraction system for loading cement, which are positioned towards the loading floor of the lorry	

15. In order to minimise/prevent diffuse dust emissions from bulk storage areas, BAT is to use one or a combination of the following techniques:

	Technique
a	Cover bulk storage areas or stockpiles or enclose them with screening, walling or an enclosure consisting of vertical greenery (artificial or natural wind barriers for open pile wind protection)
b	Use open pile wind protection: — Outdoor storage piles of dusty materials should be avoided, but when they do exist it is possible to reduce diffuse dust by using properly designed wind barriers
c	Use water spray and chemical dust suppressors: — When the point source of diffuse dust is well localised, a water spray injection system can be installed. The humidification of dust particles aids agglomeration and so helps dust settle. A wide variety of agents is also available to improve the overall efficiency of the water spray

	Technique
d	Ensure paving, road wetting and housekeeping: — Areas used by lorries should be paved when possible and the surface should be kept as clean as possible. Wetting the roads can reduce diffuse dust emissions, especially during dry weather. They also can be cleaned with road sweepers. Good housekeeping practices should be used in order to keep diffuse dust emissions to a minimum
e	Ensure humidification of stockpiles: — Diffuse dust emissions at stockpiles can be reduced by using sufficient humidification of the charging and discharging points, and by using conveyor belts with adjustable heights
f	Match the discharge height to the varying height of the heap, automatically if possible or by reduction of the unloading velocity, when diffuse dust emissions at the charging or discharging points of storage sites cannot be avoided

1.2.5.2 Channelled dust emissions from dusty operations

This section concerns dust emissions arising from dusty operations other than those from kiln firing, cooling and the main milling processes. This covers processes such as the crushing of raw materials; raw material conveyors and elevators; the storage of raw materials, clinker and cement; the storage of fuels and the dispatch of cement.

16. In order to reduce channelled dust emissions, BAT is to apply a maintenance management system which especially addresses the performance of filters applied to dusty operations, other than those from kiln firing, cooling and main milling processes. Taking this management system into account, BAT is to use dry flue-gas cleaning with a filter.

Description

For dusty operations, dry flue-gas cleaning with a filter usually consists of a fabric filter. A description of fabric filters is provided in Section 1.5.1.

BAT-associated emission levels

The BAT-AEL for channelled dust emissions from dusty operations (other than those from kiln firing, cooling and the main milling processes) is < 10 mg/Nm^3, as the average over the sampling period (spot measurement, for at least half an hour).

It should be noted that for small sources (< 10 000 Nm^3/h) a priority approach, based on the maintenance management system, regarding the frequency for checking the performance of the filter has to be taken into account (see also BAT 5).

1.2.5.3 Dust emissions from kiln firing processes

17. In order to reduce dust emissions from flue-gases of kiln firing processes, BAT is to use dry flue-gas cleaning with a filter.

	Technique [1]	Applicability
a	Electrostatic precipitators (ESPs)	Applicable to all kiln systems
b	Fabric filters	
c	Hybrid filters	

[1] A description of the techniques is given in Section 1.5.1.

BAT-associated emission levels

The BAT-AEL for dust emissions from flue-gases of kiln firing processes is <10 – 20 mg/Nm^3, as the daily average value. When applying fabric filters or new or upgraded ESPs, the lower level is achieved.

1.2.5.4 Dust emissions from cooling and milling processes

18. In order to reduce dust emissions from the flue-gases of cooling and milling processes, BAT is to use dry flue-gas cleaning with a filter.

	Technique (1)	Applicability
a	Electrostatic precipitators (ESPs)	Generally applicable to clinker coolers and cement mills.
b	Fabric filters	Generally applicable to clinker coolers and mills
c	Hybrid filters	Applicable to clinker coolers and cement mills.

(1) A description of the techniques is given in Section 1.5.1

BAT-associated emission levels

The BAT-AEL for dust emissions from the flue-gases of cooling and milling processes is <10 – 20 mg/Nm^3, as the daily average value or average over the sampling period (spot measurements for at least half an hour). When applying fabric filters or new or upgraded ESPs, the lower level is achieved.

1.2.6 *Gaseous compounds*

1.2.6.1 NO_x emissions

19. In order to reduce the emissions of NO_x from the flue-gases of kiln firing and/or preheating/precalcining processes, BAT is to use one or a combination of the following techniques:

	Technique (1)	Applicability
a	Primary techniques	
	I. Flame cooling	Applicable to all types of kilns used for cement manufacturing. The degree of applicability can be limited by product quality requirements and potential impacts on process stability
	II. Low NO_x burners	Applicable to all rotary kilns, in the main kiln as well as in the precalciner
	III. Mid-kiln firing	Generally applicable to long rotary kilns
	IV. Addition of mineralisers to improve the burnability of the raw meal (mineralised clinker)	Generally applicable to rotary kilns subject to final product quality requirements
	V. Process optimisation	Generally applicable to all kilns
b	Staged combustion (conventional or waste fuels), also in combination with a precalciner and the use of optimised fuel mix	In general, can only be applied in kilns equipped with a precalciner. Substantial plant modifications are necessary in cyclone preheater systems without a precalciner. In kilns without precalciner, lump fuels firing might have a positive effect on NO_x reduction depending on the ability to produce a controlled reduction atmosphere and to control the related CO emissions
c	Selective non-catalytic reduction (SNCR)	In principle, applicable to rotary cement kilns. The injection zones vary with the type of kiln process. In long wet and long dry process kilns it may be difficult to obtain the right temperature and retention time needed. See also BAT 20
d	Selective catalytic reduction (SCR)	Applicability is subject to appropriate catalyst and process development in the cement industry

(1) A description of the techniques is provided in Section 1.5.2.

BAT-associated emission levels

See Table 2.

Table 2

BAT-associated emission levels for NO_x from the flue-gases of kiln firing and/or preheating/precalcining processes in the cement industry

Kiln type	Unit	BAT-AEL (daily average value)
Preheater kilns	mg/Nm^3	< 200 – 450 (1) (2)
Lepol and long rotary kilns	mg/Nm^3	400 – 800 (3)

(1) The upper level of the BAT-AEL range is 500 mg/Nm^3, if the initial NO_x level after primary techniques is > 1 000 mg/Nm^3.
(2) Existing kiln system design, fuel mix properties including waste and raw material burnability (e.g. special cement or white cement clinker) can influence the ability to be within the range. Levels below 350 mg/Nm^3 are achieved at kilns with favourable conditions when using SNCR. In 2008, the lower value of 200 mg/Nm^3 has been reported as a monthly average for three plants (easy burning mix used) using SNCR.
(3) Depending on initial levels and NH_3 slip.

20. When SNCR is used, BAT is to achieve efficient NO_x reduction, while keeping the ammonia slip as low as possible, by using the following technique:

	Technique
a	To apply an appropriate and sufficient NO_x reduction efficiency along with a stable operating process
b	To apply a good stoichiometric distribution of ammonia in order to achieve the highest efficiency of NO_x reduction and to reduce the NH_3 slip
c	To keep the emissions of NH_3 slip (due to unreacted ammonia) from the flue-gases as low as possible taking into account the correlation between the NO_x abatement efficiency and the NH_3 slip

Applicability

SNCR is generally applicable to rotary cement kilns. The injection zones vary with the type of kiln process. In long wet and long dry process kilns it may be difficult to obtain the right temperature and retention time needed. See also BAT 19.

BAT-associated emission levels

See Table 3.

Table 3

BAT-associated emission levels for NH_3 slip in the flue-gases when SNCR is applied

Parameter	Unit	BAT-AEL (daily average value)
NH_3 slip	mg/Nm^3	< 30 – 50 (1)

(1) The ammonia slip depends on the initial NO_x level and on the NO_x abatement efficiency. For Lepol and long rotary kilns, the level may be even higher.

1.2.6.2 SO_x emissions

21. In order to reduce/minimise the emissions of SO_x from the flue-gases of kiln firing and/or preheating/precalcining processes, BAT is to use one of the following techniques:

	Technique [1]	Applicability
a	Absorbent addition	Absorbent addition is, in principle, applicable to all kiln systems, although it is mostly used in suspension preheaters. Lime addition to the kiln feed reduces the quality of the granules/nodules and causes flow problems in Lepol kilns. For preheater kilns it has been found that direct injection of slaked lime into the flue-gas is less efficient than adding slaked lime to the kiln feed
b	Wet scrubber	Applicable to all cement kiln types with appropriate (sufficient) SO_2 levels for manufacturing the gypsum

[1] A description of the techniques is provided in Section 1.5.3

Description

Depending on the raw materials and the fuel quality, levels of SO_x emissions can be kept low not requiring the use of an abatement technique.

If necessary, primary techniques and/or abatement techniques such as absorbent addition or wet scrubber can be used to reduce SO_x emissions.

Wet scrubbers have already been operated in plants with initial unabated SO_x levels higher than 800 – 1 000 mg/Nm^3.

BAT-associated emission levels

See Table 4.

Table 4

BAT-associated emission levels for SO_x from the flue-gases of kiln firing and/or preheating/precalcining processes in the cement industry

Parameter	Unit	BAT-AEL [1] [2] (daily average value)
SO_x expressed as SO_2	mg/Nm^3	< 50 – 400

[1] The range takes into account the sulphur content in the raw materials.
[2] For white cement and special cement clinker production, the ability of clinker to retain fuel sulphur might be significantly lower leading to higher SO_X emissions.

22. In order to reduce SO_2 emissions from the kiln, BAT is to optimise the raw milling processes.

Description

The technique consists of optimising the raw milling process so that the raw mill can be operated to act as SO_2 abatement for the kiln. This can be achieved by adjusting factors such as:

— raw material moisture

— mill temperature

— retention time in the mill

— fineness of the ground material.

Applicability

Applicable if the dry milling process is used in compound mode.

1.2.6.3 CO emissions and CO trips

1.2.6.3.1 Reduction of CO trips

23. In order to minimise the frequency of CO trips and keep their total duration to below 30 minutes annually, when using electrostatic precipitators (ESPs) or hybrid filters, BAT is to use the following techniques in combination:

	Technique
a	Manage CO trips in order to reduce the ESP downtime
b	Continuous automatic CO measurements by means of monitoring equipment with a short response time and situated close to the CO source

Description

For safety reasons, due to the risk of explosions, ESPs will have to shut down during elevated CO levels in the flue-gases. The following techniques prevent CO trips and, therefore, reduce ESP shutdown times:

— control of the combustion process

— control of the organic load of raw materials

— control of the quality of the fuels and fuel feeding system.

Disruptions predominantly happen during the start-up operation phase. For safe operation, the gas analysers for ESP protection have to be on-line during all operational phases and the ESP downtime can be reduced by using a backup monitoring system maintained in operation.

The continuous CO monitoring system needs to be optimised for reaction time and should be located close to the CO source, e.g. at a preheater tower outlet, or at a kiln inlet in the case of a wet kiln application.

When hybrid filters are used, the grounding of the bag support cage with the cell plate is recommended.

1.2.6.4 Total organic carbon emissions (TOC)

24. In order to keep the emissions of TOC from the flue-gases of the kiln firing processes low, BAT is to avoid feeding raw materials with a high content of volatile organic compounds (VOC) into the kiln system via the raw material feeding route.

1.2.6.5 Hydrogen chloride (HCl) and hydrogen fluoride (HF) emissions

25. In order prevent/reduce the emissions of HCl from flue-gases of the kiln firing processes, BAT is to use one or a combination of the following primary techniques:

	Technique
a	Using raw materials and fuels with a low chlorine content
b	Limiting the amount of chlorine content for any waste that is to be used as raw material and/or fuel in a cement kiln

BAT-associated emission levels

The BAT-AEL for the emissions of HCl is <10 mg/Nm^3, as the daily average value or average over the sampling period (spot measurements, for at least half an hour).

26. In order to prevent/reduce the emissions of HF from the flue-gases of the kiln firing processes, BAT is to use one or a combination of the following primary techniques:

	Technique
a	Using raw materials and fuels with a low fluorine content
b	Limiting the amount of fluorine content for any waste that is to be used as raw material and/or fuel in a cement kiln

BAT-associated emission levels

The BAT-AEL for the emissions of HF is <1 mg/Nm^3, as the daily average value or average over the sampling period (spot measurements, for at least half an hour).

1.2.7 *PCDD/F emissions*

27. In order to prevent emissions of PCDD/F or to keep the emissions of PCDD/F from the flue-gases of the kiln firing processes low, BAT is to use one or a combination of the following techniques:

	Technique	Applicability
a	Carefully selecting and controlling of kiln inputs (raw materials), i.e. chlorine, copper and volatile organic compounds	Generally applicable
b	Carefully selecting and controlling kiln inputs (fuels), i.e. chlorine and copper	Generally applicable
c	Limiting/avoiding the use of wastes which contain chlorinated organic materials	Generally applicable
d	Avoid feeding fuels with a high content of halogens (e.g. chlorine) in secondary firing	Generally applicable
e	Quick cooling of kiln flue-gases to lower than 200 °C and minimising residence time of flue-gases and oxygen content in zones where the temperatures range between 300 and 450 °C	Applicable to long wet kilns and long dry kilns without preheating. In modern preheater and precalciner kilns, this feature is already inherent
f	Stop co-incinerating waste for operations such as start-ups and/or shutdowns	Generally applicable

BAT-associated emission levels

The BAT-AEL for the emissions of PCDD/F from the flue-gases of the kiln firing processes is <0,05 – 0,1 ng PCDD/F I-TEQ/Nm^3, as the average over the sampling period (6 – 8 hours).

1.2.8 *Metal emissions*

28. In order to minimise the emissions of metals from the flue-gases of the kiln firing processes, BAT is to use one or a combination of the following techniques:

	Technique
a	Selecting materials with a low content of relevant metals and limiting the content of relevant metals in materials, especially mercury
b	Using a quality assurance system to guarantee the characteristics of the waste materials used
c	Using effective dust removal techniques as set out in BAT 17

BAT-associated emission levels

See Table 5.

Table 5

BAT-associated emission levels for metals from the flue-gases of kiln firing processes

Metals	Unit	BAT-AEL (average over the sampling period (spot measurements, for at least half an hour))
Hg	mg/Nm^3	< 0,05 (2)
Σ (Cd, Tl)	mg/Nm^3	< 0,05 (1)
Σ (As, Sb, Pb, Cr, Co, Cu, Mn, Ni, V)	mg/Nm^3	< 0,5 (1)

(1) Low levels have been reported based on the quality of the raw materials and the fuels.
(2) Low levels have been reported based on the quality of the raw materials and the fuels. Values higher than 0,03 mg/Nm^3 have to be further investigated. Values close to 0,05 mg/Nm^3 require consideration of additional techniques (e.g. lowering of the flue-gas temperature, activated carbon).

1.2.9 *Process losses/waste*

29. In order to reduce solid waste from the cement manufacturing process along with raw material savings, BAT is to:

	Technique	Applicability
a	Reuse collected dusts in the process, wherever practicable	Generally applicable but subject to dust chemical composition
b	Utilise these dusts in other commercial products, when possible	The utilisation of the dusts in other commercial products may not be within the control of the operator

Description

Collected dust can be recycled back into the production processes whenever practicable. This recycling may take place directly into the kiln or kiln feed (the alkali metal content being the limiting factor) or by blending with finished cement products. A quality assurance procedure might be required when the collected dusts are recycled back into the production processes. Alternative uses may be found for material that cannot be recycled (e.g. additive for flue-gas desulphurisation in combustion plants).

1.3 **BAT conclusions for the lime industry**

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all installations in the lime industry.

1.3.1 *General primary techniques*

30. In order to reduce all kiln emissions and use energy efficiently, BAT is to achieve a smooth and stable kiln process, operating close to the process parameter set points by using the following techniques:

	Technique
a	Process control optimisation, including computer-based automatic control
b	Using modern, gravimetric solid fuel feed systems and/or gas flow meters

Applicability

Process control optimisation is applicable to all lime plants to varying degrees. Complete process automation is generally not achievable due to the uncontrollable variables, i.e. quality of the limestone.

31. In order to prevent and/or reduce emissions, BAT is to carry out a careful selection and control of the raw materials entering the kiln.

Description

Raw materials entering the kiln have a significant effect on air emissions due to their impurities content; hence, a careful selection of raw materials may reduce these emissions at source. For example, the variations of sulphur and chlorine contents in the limestone/dolomite have an effect on the range of the SO_2 and HCl emissions in the flue-gas, while the presence of organic matter has an influence on TOC and CO emissions.

Applicability

The applicability depends on the (local) availability of raw materials with low impurities content. The type of final product and the type of kiln used may represent an additional constraint.

1.3.2 *Monitoring*

32. BAT is to carry out monitoring and measurements of process parameters and emissions on a regular basis and to monitor emissions in accordance with the relevant EN standards or, if EN standards are not available, ISO, national or other international standards that ensure the provision of data of an equivalent scientific quality, including the following:

	Technique	Applicability
a	Continuous measurements of process parameters demonstrating the process stability, such as temperature, O_2 content, pressure, flow rate and CO emissions	Applicable to kiln processes
b	Monitoring and stabilising of critical process parameters, e.g. fuel feed, regular dosage and excess oxygen	
c	Continuous or periodic measurements of dust, NO_x, SO_x, CO emissions and NH_3 emissions when SNCR is applied	Applicable to kiln processes
d	Continuous or periodic measurements of HCl and HF emissions in case wastes are co-incinerated	Applicable to kiln processes
e	Continuous or periodic measurements of TOC emissions or continuous measurements in case wastes are co-incinerated	Applicable to kiln processes
f	Periodic measurements of PCDD/F and metal emissions	Applicable to kiln processes
g	Continuous or periodic measurements of dust emissions	Applicable to non-kiln processes For small sources (<10 000 Nm^3/h) the frequency of the measurements should be based on a maintenance management system

Description

The selection between continuous or periodic measurements mentioned in BAT 32(c) to 32(f) is based on the emission source and the type of pollutant expected.

For periodic measurements of dust, NO_x, SO_x and CO emissions, a frequency of once a month and up to once a year at the time of normal operating conditions is given as an indication.

For periodic measurements of PCDD/F, TOC, HCl, HF, metal emissions, a frequency appropriate to the raw materials and fuels that are used in the process should be applied.

1.3.3 *Energy consumption*

33. In order to reduce/minimise thermal energy consumption, BAT is to use a combination of the following techniques:

	Technique	Description	Applicability
a	Applying improved and optimised kiln systems and a smooth and stable kiln process, operating close to the process parameter set points, through: I. process control optimisation II. heat recovery from flue-gases (e.g. use of surplus heat from rotary kilns to dry limestone for other processes such as limestone milling) III. modern, gravimetric solid fuel feed systems IV. maintenance of the equipment (e.g. air tightness, erosion of refractory) V. the use of optimised grain size of stone	Maintaining kiln control parameters close to their optimum values has the effect of reducing all consumption parameters due to, among other things, reduced numbers of shutdowns and upset conditions. The use of optimised grain size of stone is subject to raw material availability	Technique (a) II is applicable only to long rotary kilns (LRK)
b	Using fuels with characteristics which have a positive influence on thermal energy consumption	The characteristics of fuels, e.g. high calorific value and low moisture content can have a positive effect on the thermal energy consumption	The applicability depends on the technical possibility to feed the selected fuel into the kiln and on the availability of suitable fuels (e.g. high calorific value and low humidity) which may be impacted by the energy policy of the Member State
c	Limiting excess air	A decrease of excess air used for combustion has a direct effect on fuel consumption since high percentages of air require more thermal energy to heat up the excess volume. Only in LRK and PRK the limitation of excess air has an impact on thermal energy consumption. The technique has a potential of increasing TOC and CO emission	Applicable to LRK and PRK within the limits of a potential overheating of some areas in the kiln with consequent deterioration of the refractory lifetime

BAT-associated consumption levels

See Table 6.

Table 6

BAT-associated levels for thermal energy consumption in the lime and dolime industry

Kiln type	Thermal energy consumption [1] GJ/tonne of product
Long rotary kilns (LRK)	6,0 – 9,2
Rotary kilns with preheater (PRK)	5,1 – 7,8
Parallel flow regenerative kilns (PFRK)	3,2 – 4,2
Annular shaft kilns (ASK)	3,3 – 4,9

Kiln type	Thermal energy consumption [1] GJ/tonne of product
Mixed feed shaft kilns (MFSK)	3,4 – 4,7
Other kilns (OK)	3,5 – 7,0

[1] Energy consumption depends on the type of product, the product quality, the process conditions and the raw materials

34. In order to minimise electrical energy consumption, BAT is to use one or a combination of the following techniques:

	Technique
a	Using power management systems
b	Using optimised grain size of limestone
c	Using grinding equipment and other electricity based equipment with high energy efficiency

Description – Technique (b)

Vertical kilns can usually burn only coarse limestone pebbles. However, rotary kilns with higher energy consumption can also valorise small fractions and new vertical kilns can burn small granules from 10 mm. The larger granules of kiln feed stone are used more in vertical kilns than in rotary kilns.

1.3.4 *Consumption of limestone*

35. In order to minimise limestone consumption, BAT is to use one or a combination of the following techniques:

	Technique	Applicability
a	Specific quarrying, crushing and well directed use of limestone (quality, grain size)	Generally applicable in the lime industry; however, stone processing is dependent on the limestone quality
b	Selecting kilns applying optimised techniques which allow for operating with a wider range of limestone grain sizes to make optimum use of quarried limestone	Applicable to new plants and major upgrades of kiln. Vertical kilns can in principle only burn coarse limestone pebbles. Fine lime PFRK and/or rotary kilns can operate with smaller limestone grain sizes

1.3.5 *Selection of fuels*

36. In order to prevent/reduce emissions, BAT is to carry out a careful selection and control of fuels entering the kiln.

Description

Fuels entering the kiln may have a significant effect on air emissions due to their impurities content. The content of sulphur (for long rotary kilns in particular), nitrogen and chlorine have an effect on the range of the SO_x, NO_x and HCl emissions in the flue-gas. Depending on the chemical composition of the fuel and the type of kiln used, the choice of appropriate fuels or a fuel mix can lead to emissions reductions.

Applicability

Except for mixed feed shaft kilns, all types of kilns can operate with all types of fuels and fuel mixtures subject to fuels availability which may be impacted by the energy policy of the Member State. The selection of fuel also depends on the desired quality of the final product, the technical possibility to feed the fuel into the selected kiln, and economic considerations.

1.3.5.1 Use of waste fuels

1.3.5.1.1 Waste quality control

37. In order to guarantee the characteristics of waste to be used as fuel in a lime kiln, BAT is to apply the following techniques:

	Technique
a	Apply a quality assurance system to guarantee and control the characteristics of wastes and to analyse any waste that is to be used as fuel in the kiln for: I. constant quality II. physical criteria, e.g. emissions formation, coarseness, reactivity, burnability, calorific value III. chemical criteria, e.g. total chlorine content, sulphur, alkali, and phosphate content and relevant metals content (e.g. total chromium, lead, cadmium, mercury, thallium)
b	Control the amount of relevant components for any waste that is to be used as fuel, such as total halogen content, metals (e.g. total chromium, lead, cadmium, mercury, thallium) and sulphur

1.3.5.1.2 Waste feeding into the kiln

38. In order to prevent/reduce emissions occurring from the use of waste fuels into the kiln, BAT is to use the following techniques:

	Technique
a	To use appropriate burners for feeding suitable wastes depending on kiln design and kiln operation
b	To operate in such a way that the gas resulting from the co-incineration of waste is raised in a controlled and homogeneous fashion and even under the most unfavourable conditions, to a temperature of 850 °C for 2 seconds
c	To raise the temperature to 1 100 °C if hazardous wastes with a content of more than 1 % of halogenated organic substances, expressed as chlorine, are co-incinerated
d	To feed wastes continuously and constantly
e	To stop feeding waste for operations such as start-ups and/or shutdowns when appropriate temperatures and residence times cannot be reached, as mentioned in (b) and (c) above

1.3.5.1.3 Safety management for the use of hazardous waste materials

39. In order to prevent accidental emissions, BAT is to use safety management for the storage, handling and feeding into the kiln of hazardous waste materials.

Description

The use of a safety management for the storage, handling and feeding of hazardous waste materials consists of a risk-based approach according to the source and type of waste, for the labelling, checking, sampling and testing of waste to be handled.

1.3.6 *Dust emissions*

1.3.6.1 Diffuse dust emissions

40. In order to minimise/prevent diffuse dust emissions from dusty operations, BAT is to use one or a combination of the following techniques:

	Technique
a	Enclosure/encapsulation of dusty operations, such as grinding, screening and mixing
b	Use of covered conveyors and elevators, which are constructed as closed systems, if dust emissions are likely to be released from dusty material
c	Use of storage silos with adequate capacity, level indicators with cut out switches and with filters to deal with dust-bearing air displaced during filling operations
d	Use of a circulation process which is favoured for pneumatic conveying systems

	Technique
e	Material handling in closed systems maintained under negative pressure and dedusting of the suction air by a fabric filter before being emitted into the air
f	Reduction of air leakage and spillage points, completion of installation
g	Proper and complete maintenance of the installation
h	Use of automatic devices and control systems
i	Use of continuous trouble-free operations
j	Use of flexible filling pipes equipped with a dust extraction system for loading lime which are positioned at the loading floor of the lorry

Applicability

In raw material preparation operations, like crushing and sieving, dust separation is not normally needed, because of the moisture content of the raw material.

41. In order to minimise/prevent diffuse dust emissions from bulk storage areas, BAT is to use one or a combination of the following techniques:

	Technique
a	Enclose storage locations using screening, walling or vertical greenery (artificial or natural wind barriers for open pile wind protection)
b	Use product silos and closed, fully-automated raw material storages. These types of storage are equipped with one or more fabric filters to prevent diffuse dust formation in loading and unloading operations
c	Reduce diffuse dust emissions at stockpiles by using sufficient humidification of stockpile charging and discharging points and the use of conveyor belts with adjustable height. When using humidification or spraying measures/techniques, the ground can be sealed and the surplus water can be gathered, and if necessary this can be treated and used in closed cycles
d	Reduce diffuse dust emissions at charging or discharging points of storage sites if they cannot be avoided, by matching the discharge height to the varying height of the heap, if possible automatically, or by reduction of the unloading velocity
e	Keep the locations wet, especially dry areas, using spraying devices and clean them by cleaning lorries
f	Use vacuum systems during removal operations. New buildings can easily be equipped with stationary vacuum cleaning systems, while existing buildings are normally better fitted with mobile systems and flexible connections
g	Reduce diffuse dust emissions arising in areas used by lorries, by paving these areas when possible and keeping the surface as clean as possible. Wetting the roads can reduce diffuse dust emissions, especially during dry weather. Good housekeeping practices can be used in order to keep diffuse dust emissions to a minimum

1.3.6.2 Channelled dust emissions from dusty operations other than those from kiln firing processes

42. In order to reduce channelled dust emissions from dusty operations other than those from kiln firing processes, BAT is to use one of the following techniques and to use a maintenance management system which specifically addresses the performance of filters:

	Technique (1) (2)	Applicability
a	Fabric filter	Generally applicable to milling and grinding plants and subsidiary processes in the lime industry; material transport; and storage and loading facilities. The applicability of fabric filters in hydrating lime plants may be limited by the high moisture and low temperature of the flue-gases
b	Wet scrubbers	Mainly applicable to hydrating lime plants

(1) A description of the techniques is provided in Section 1.6.1.
(2) If necessary, centrifugal separators/cyclones can be used as pretreatment of the flue-gases.

BAT-associated emission levels

See Table 7.

Table 7

BAT-associated emission levels for channelled dust emissions from dusty operations other than those from kiln firing processes

Technique	Unit	BAT-AEL (daily average or average over the sampling period (spot measurements for at least half an hour))
Fabric filter	mg/Nm^3	< 10
Wet scrubber	mg/Nm^3	< 10 – 20

It should be noted that for small sources (< 10 000 Nm^3/h) a priority approach regarding the frequency for checking the performance of the filter has to be taken into account (see BAT 32).

1.3.6.3 Dust emissions from kiln firing processes

43. In order to reduce dust emissions from the flue-gases of kiln firing processes, BAT is to use flue-gas cleaning with a filter. One or a combination of the following techniques can be used:

	Technique (1)	Applicability
a	ESP	Applicable to all kiln systems
b	Fabric filter	Applicable to all kiln systems
c	Wet dust separator	Applicable to all kiln systems
d	Centrifugal separator/cyclone	Centrifugal separators are only suitable as pre-separators and can be used to pre-clean the flue-gases from all kiln systems

(1) A description of the techniques is provided in Section 1.6.1.

BAT-associated emission levels

See Table 8.

Table 8

BAT-associated emission levels for dust emissions from the flue-gases of kiln firing processes

Technique	Unit	BAT-AEL (daily average value or average over the sampling period (spot measurements for at least half an hour))
Fabric filter	mg/Nm^3	< 10
ESP or other filters	mg/Nm^3	< 20 (*)

(*) In exceptional cases where the resistivity of dust is high, the BAT-AEL could be higher, up to 30 mg/Nm^3, as the daily average value.

1.3.7 *Gaseous compounds*

1.3.7.1 Primary techniques for reducing emissions of gaseous compounds

44. In order to reduce the emissions of gaseous compounds (i.e. NO_x, SO_x, HCl, CO, TOC/VOC, volatile metals) from the flue-gases of kiln firing processes, BAT is to use one or a combination of the following techniques:

	Technique	Applicability
a	Careful selection and control of substances entering the kiln	Generally applicable
b	Reducing the pollutant precursors in fuels and, if possible, in raw materials, i.e. I. selecting fuels, where available, with low contents of sulphur (for long rotary kilns in particular), nitrogen and chlorine II. selecting raw materials, if possible, with low contents of organic matter III. selecting suitable waste fuels for the process and the burner	Generally applicable in the lime industry subject to local availability of raw materials and fuels, the type of kiln used, the desired product qualities and the technical possibility of feeding the fuels into the selected kiln
c	Using process optimisation techniques to ensure an efficient absorption of sulphur dioxide (e.g. efficient contact between the kiln gases and the quicklime)	Applicable to all lime plants. In general, complete process automation is not achievable due to uncontrollable variables, i.e. quality of the limestone

1.3.7.2 NO_x emissions

45. In order to reduce the emissions of NO_X from the flue-gases of kiln firing processes, BAT is to use one or a combination of the following techniques:

	Technique	Applicability
a	Primary techniques	
	I. Appropriate fuel selection along with limitation of nitrogen content in the fuel	Generally applicable in the lime industry subject to fuel availability which may be impacted by the energy policy of the Member State and to the technical possibility to feed a certain type of fuel into the selected kiln
	II. Process optimisation including flame shaping and temperature profile	Optimisation of process and process control can be applied in lime manufacturing but is subject to the final product quality
	III. Burner design (low NO_X burner) ([1])	Low NO_X burners are applicable to rotary kilns and to annular shaft kilns presenting conditions of high primary air. PFRKs and other shaft kilns have flameless combustion, thus rendering low NO_X burners not applicable to this kiln type
	IV. Air staging ([1])	Not applicable to shaft kilns. Applicable only to PRK but not when hard burned lime is produced. The applicability may be limited by constraints imposed by the type of final product, due to possible overheating in some areas of the kiln and consequent deterioration of the refractory lining
b	SNCR ([1])	Applicable to Lepol rotary kilns. See also BAT 46

([1]) A description of the techniques is provided in Section 1.6.2

BAT-associated emission levels

See Table 9.

Table 9

BAT-associated emission levels for NO_x from flue-gases of kiln firing processes in the lime industry

Kiln type	Unit	BAT-AEL (daily average value or average over the sampling period (spot measurements for at least half an hour), stated as NO_2)
PFRK, ASK, MFSK, OSK	mg/Nm^3	100 – 350 (1) (3)
LRK, PRK	mg/Nm^3	< 200 – 500 (1) (2)

(1) The higher ends of the ranges are related to the production of dolime and hard burned lime. Higher levels than the upper end of the range may be associated with the production of sintered dolime.
(2) For LRK and PRK with shaft producing hard burned lime, the upper level is up to 800 mg/Nm^3
(3) Where primary techniques as indicated in BAT 45 (a)I are not sufficient to reach this level and where secondary techniques are not applicable to reduce the NO_x emissions to 350 mg/Nm^3, the upper level is 500 mg/Nm^3, especially for hard burned lime and for the use of biomass as fuel.

46. When SNCR is used, BAT is to achieve efficient NO_x reduction, while keeping the ammonia slip as low as possible, by using the following technique:

	Technique
a	To apply an appropriate and sufficient reduction efficiency along with a stable operating process
b	To apply a good stoichiometric ratio and distribution of ammonia in order to achieve the highest efficiency of NO_x reduction and to reduce the ammonia slip
c	To keep the emissions of NH_3 slip (due to unreacted ammonia) from the flue-gases as low as possible, taking into account the correlation between the NO_x abatement efficiency and the NH_3 slip.

Applicability

Applicable only to Lepol rotary kilns, where the ideal temperature range of 850 to 1 020 °C is accessible. See also BAT 45, technique (b).

BAT-associated emission levels

The BAT-AEL for the emissions of NH_3 slip from the flue-gases is <30 mg/Nm^3, as the daily average value or average over the sampling period (spot measurements for at least half an hour).

1.3.7.3 SO_x emissions

47. In order to reduce the emissions of SO_x from the flue-gases of kiln firing processes, BAT is to use one or a combination of the following techniques:

	Technique	Applicability
a	Process optimisation to ensure an efficient absorption of sulphur dioxide (e.g. efficient contact between the kiln gases and the quicklime)	Process control optimisation is applicable to all lime plants
b	Selecting fuels with a low sulphur content	Generally applicable, subject to fuel availability in particular for use in long rotary kilns (LRK), due to high SO_x emissions
c	Using absorbent addition techniques (e.g. absorbent addition, dry flue-gas cleaning with a filter, wet scrubber, or activated carbon injection) (1)	Absorbent addition techniques are, in principle, applicable in the lime industry; however, this technique had not yet been applied in the lime sector in 2007. Particularly for rotary lime kilns further investigation is required in order to assess its applicability

(1) A description of the techniques is provided in Section 1.6.3

BAT-associated emission levels

See Table 10.

Table 10

BAT-associated emission levels for SO_x from flue-gases of kiln firing processes in the lime industry

Kiln type	Unit	BAT-AEL (1) (2) (daily average value or average over the sampling period (spot measurements for at least half an hour), SO_x expressed as SO_2)
PFRK, ASK, MFSK, OSK, PRK	mg/Nm^3	< 50 – 200
LRK	mg/Nm^3	< 50 – 400

(1) The level depends on the initial SO_x level in the flue-gas and on the reduction technique used.
(2) For the production of sintered dolime using the 'double- pass process', SO_x emissions might be higher than the upper end of the range.

1.3.7.4 CO emissions and CO trips

1.3.7.4.1 CO emissions

48. In order to reduce the emissions of CO from the flue-gases of kiln firing processes, BAT is to use one or a combination of the following techniques:

	Technique	Applicability
a	Selecting, raw materials with a low content of organic matter	Generally applicable to the lime industry within the constraints of the local availability and composition of raw materials, the type of kiln used and the quality of the final product
b	Using process optimisation techniques to achieve a stable and complete combustion	Applicable to all lime plants. In general, complete process automation is not achievable due to uncontrollable variables, i.e. quality of the limestone

In this context, see also BAT 30 and 31 in Section 1.3.1 and BAT 32 in Section 1.3.2.

BAT-associated emission levels

See Table 11.

Table 11

BAT-associated emission levels for CO from the flue-gas of kiln firing processes

Kiln type	Unit	BAT-AEL (1) (2) (daily average value or average over the sampling period (spot measurements for at least half an hour))
PFRK, OSK, LRK, PRK	mg/Nm^3	< 500

(1) Emissions can be higher depending on raw materials used and/or type of lime produced, e.g. hydraulic lime.
(2) BAT-AEL does not apply to MFSK and ASK.

1.3.7.4.2 Reduction of CO trips

49. In order to minimise the frequency of CO trips when using electrostatic precipitators, BAT is to use the following techniques:

	Technique
a	Manage CO trips in order to reduce the ESP downtime
b	Continuous automatic CO measurements by means of monitoring equipment with a short response time and situated close to the CO source

Description

For safety reasons, due to the risk of explosions, ESPs will have to shut down during elevated CO levels in the flue-gases. The following techniques prevent CO trips and, therefore, reduce ESP shutdown times:

— control of the combustion process

— control of the organic load of raw materials

— control of the quality of the fuels and fuel feeding system.

Disruptions predominantly happen during the start-up operation phase. For safe operation, the gas analysers for ESP protection have to be online during all operational phases and the ESP downtime can be reduced by using a backup monitoring system maintained in operation.

The continuous CO monitoring system needs to be optimised for reaction time and should be located close to the CO source, e.g. at a preheater tower outlet, or at a kiln inlet in the case of a wet kiln application.

Applicability

Generally applicable to rotary kilns fitted with electrostatic precipitators (ESPs).

1.3.7.5 Total organic carbon emissions (TOC)

50. In order to reduce the emissions of TOC from the flue-gases of kiln firing processes, BAT is to use one or a combination of the following techniques:

	Technique
a	Applying general primary techniques and monitoring (see also BAT 30 and 31 in Section 1.3.1, and BAT 32 in Section 1.3.2)
b	Avoid feeding raw materials with a high content of volatile organic compounds into the kiln system (except for hydraulic lime production)

Applicability

For applicability of general primary techniques and monitoring see BAT 30 and 31 in Section 1.3.1, and BAT 32 in Section 1.3.2.

Technique (b) is generally applicable to the lime industry, subject to local raw materials availability and/or the type of lime produced.

BAT-associated emission levels

See Table 12.

Table 12

BAT-associated emission levels for TOC from the flue-gas of kiln firing processes

Kiln type	Unit	BAT-AEL (1) (daily average value or average over the sampling period (spot measurements for at least half an hour))
LRK, PRK	mg/Nm^3	< 10
ASK, MFSK (2), PFRK (2)	mg/Nm^3	< 30

(1) Level can be higher depending on the content of organic matter of raw materials used and/or the type of lime produced, in particular for the production of natural hydraulic lime.
(2) In exceptional cases, the level can be higher.

1.3.7.6 Hydrogen chloride (HCl) and hydrogen fluoride (HF) emissions

51. In order to reduce the emissions of HCl and the emissions of HF from the flue-gas of kiln firing processes, when using waste, BAT is to use the following primary techniques:

	Technique
a	Using conventional fuels with a low chlorine and fluorine content
b	Limiting the amount of chlorine and fluorine content for any waste that is to be used as fuel in a lime kiln

Applicability

The techniques are generally applicable in the lime industry but subject to local availability of suitable fuel.

BAT-associated emission levels

See Table 13.

Table 13

BAT-associated emission levels for HCl and HF emissions from the flue-gas of kiln firing processes, when using wastes

Emission	Unit	BAT-AEL (daily average value or the average value over the sampling period (spot measurements, for at least half an hour))
HCl	mg/Nm^3	< 10
HF	mg/Nm^3	< 1

1.3.8 *PCDD/F emissions*

52. In order to prevent or reduce the emissions of PCDD/F from the flue-gas of kiln firing processes, BAT is to use one or a combination of the following primary techniques:

	Technique
a	Selecting fuels with a low chlorine content
b	Limiting the copper input through the fuel
c	Minimising the residence time of the flue-gases and the oxygen content in zones where the temperatures range between 300 and 450 °C

BAT-associated emission levels

The BAT-AELs are < 0,05 – 0,1 ng PCDD/F I-TEQ/Nm^3, as the average over the sampling period (6 – 8 hours).

1.3.9 *Metal emissions*

53. In order to minimise the emissions of metals from the flue-gases of kiln firing processes, BAT is to use one or a combination of the following techniques:

	Technique
a	Selecting fuels with a low content of metals
b	Using a quality assurance system to guarantee the characteristics of the waste fuels used
c	Limiting the content of relevant metals in materials, especially mercury
d	Using one or a combination of dust removal techniques as set out in BAT 43

BAT-associated emission levels

See Table 14.

Table 14

BAT associated emission levels for metals from the flue-gases of kiln firing processes, when using wastes

Metals	Unit	BAT-AEL (average over the sampling period (spot measurements for at least half an hour))
Hg	mg/Nm^3	< 0,05
Σ (Cd, Tl)	mg/Nm^3	< 0,05
Σ (As, Sb, Pb, Cr, Co, Cu, Mn, Ni, V)	mg/Nm^3	< 0,5

NB: Low levels were reported when applying techniques as mentioned in BAT 53 (a) – (d).

Furthermore in this context, see also BAT 37 (Section 1.3.5.1.1) and BAT 38 (Section 1.3.5.1.2).

1.3.10 *Process losses/waste*

54. In order to reduce the solid wastes from the lime manufacturing processes and to save raw materials, BAT is to use the following techniques:

	Technique	Applicability
a	Reuse the collected dust or other particulate matter (e.g. sand, gravel) in the process	Generally applicable whenever practicable
b	Utilise dust, off-specification quicklime and off-specification hydrated lime in selected commercial products	Generally utilised in different kinds of selected commercial products, whenever practicable

1.4 **BAT conclusions for the magnesium oxide industry**

Unless otherwise stated, the BAT conclusions presented in this section can be applied to all installations in the magnesium oxide industry (dry process route).

1.4.1 *Monitoring*

55. BAT is to carry out monitoring and measurements of process parameters and emissions on a regular basis and to monitor emissions in accordance with the relevant EN standards or, if EN standards are not available, ISO, national or other international standards that ensure the provision of data of an equivalent scientific quality, including the following:

	Technique	Applicability
a	Continuous measurements of process parameters demonstrating the process stability, such as temperature, O_2 content, pressure, flow rate	Generally applicable to kiln processes
b	Monitoring and stabilising critical process parameters, i.e. raw material and fuel feed, regular dosage and excess oxygen	
c	Continuous or periodic measurements of dust, NO_x, SO_x and CO emissions	Generally applicable to kiln processes
d	Continuous or periodic measurements of dust emissions	Applicable to non-kiln processes. For small source (< 10 000 Nm^3/h) the frequency of the measurements or performance check should be based on a maintenance management system

Description

The selection between continuous or periodic measurements mentioned in BAT 55 (c) is based on the emission source and the type of pollutant expected.

For periodic measurements for dust, NO_x, SO_x and CO emissions from kiln processes, a frequency of once a month and up to once a year and at the time of normal operating conditions is given as an indication.

1.4.2 *Energy consumption*

56. In order to reduce thermal energy consumption, BAT is to use a combination of the following techniques:

	Technique	Description	Applicability
a	Applying improved and optimised kiln systems and a smooth and stable kiln process by applying: I. process control optimisation II. heat recovery from flue-gases from kiln and coolers	Heat recovery from flue-gases by the preliminary heating of the magnesite can be used in order to reduce fuel energy use. Heat recovered from the kiln can be used for drying fuels, raw materials and some packaging materials	Process control optimisation is applicable to all kiln types used in the magnesia industry.
b	Using fuels with characteristics which have a positive influence on thermal energy consumption	The characteristics of fuels, e.g. high calorific value and low moisture content have a positive effect on the thermal energy consumption	Generally applicable subject to availability of the fuels, the type of kilns used, the desired product qualities and the technical possibilities of injecting the fuels into the kiln.
c	Limiting excess air	The excess oxygen level to obtain the required quality of the products and for optimal combustion is usually in practice about 1 – 3 %	Generally applicable

BAT-associated consumption levels

The BAT-associated thermal energy consumption is 6 – 12 GJ/t, depending on the process and the products [1].

57. In order to minimise electrical energy consumption, BAT is to use one or a combination of the following techniques:

	Technique
a	Using power management systems
b	Using grinding equipment and other electricity based equipment with high energy efficiency

1.4.3 *Dust emissions*

1.4.3.1 Diffuse dust emissions

58. In order to minimise/prevent diffuse dust emissions from dusty operations, BAT is to use one or a combination of the following techniques:

	Technique
a	Simple and linear site layout
b	Good housekeeping of buildings and roads, along with proper and complete maintenance of the installation
c	Watering of raw material piles
d	Enclosure/encapsulation of dusty operations, such as grinding and screening
e	Use of covered conveyors and elevators, which are constructed as closed systems, if dust emissions are likely to be released from dusty material

[1] This range only reflects information provided for the magnesium oxide chapter of the BREF. More specific information about best performing techniques along with the products produced was not provided.

	Technique
f	Use of storage silos with adequate capacities and equipping them with filters to deal with dust-bearing air displaced during filling operations
g	A circulation process is favoured for pneumatic conveying systems
h	Reduction of air leakage and spillage points
i	Use of automatic devices and control systems
k	Use of continuous trouble-free operations

1.4.3.2 Channelled dust emissions from dusty operations other than kiln firing processes

59. In order to reduce channelled dust emissions from dusty operations other than those from kiln firing processes, BAT is to use flue-gas cleaning with a filter by applying one or a combination of the following techniques, and to use a maintenance management system which specifically addresses the performance of techniques:

	Technique [1]	Applicability
a	Fabric filters	Generally applicable to all units in the magnesium oxide manufacturing process, especially for dusty operations, screening, grinding and milling
b	Centrifugal separators/ cyclones	Because of the system-dependent limited degree of separation, cyclones are mainly applicable as preliminary separators for coarse dust and flue-gases
c	Wet dust separators	Generally applicable

[1] A description of the techniques is provided in Section 1.7.1

BAT-associated emission levels

The BAT-AEL for channelled dust emissions from dusty operations other than those from kiln firing processes is < 10 mg/Nm^3, as daily average or average over the sampling period (spot measurements, for at least half an hour).

It should be noted that for small sources (< 10 000 Nm^3/h) a priority approach, based on a maintenance management system regarding the frequency for checking the performance of the filter has to be taken into account (see BAT 55).

1.4.3.3 Dust emissions from the kiln firing process

60. In order to reduce dust emissions from the flue-gases of kiln firing processes, BAT is to use flue-gas cleaning with a filter by applying one or a combination of the following techniques:

	Technique [1]	Applicability
a	Electrostatic precipitators (ESPs)	ESPs are mainly applicable in rotary kilns. They are applicable for flue-gas temperatures above the dew point and up to 370 – 400 °C
b	Fabric filters	Fabric filters for dust removal from flue-gases can, in principle, be applied for all units in the magnesium oxide manufacturing process. They can be used for flue-gas temperatures above the dew point and up to 280 °C. For the production of caustic calcined magnesia (CCM) and sintered/dead burned magnesia (DBM), due to the high temperatures, the corrosive nature and the high volume of the flue-gases occurring from the kiln firing process, special fabric filters with high temperature-resistant filter material have to be used. However, experience from the magnesia industry producing DBM shows that no suitable equipment is available for flue-gas temperatures of approximately 400 °C for magnesia production

	Technique [1]	Applicability
c	Centrifugal separators/ cyclones	Because of the system-dependent limited degree of separation, cyclones are mainly applicable as preliminary separators for coarse dust and flue-gases
d	Wet dust separators	Generally applicable

[1] A description of the techniques is provided in Section 1.7.1.

BAT-associated emission levels

The BAT-AEL for dust emissions from the flue-gases of kiln firing processes is < 20 – 35 mg/Nm^3 as the daily average value or average over the sampling period (spot measurements, for at least half an hour).

1.4.4 *Gaseous compounds*

1.4.4.1 General primary techniques for reducing emissions of gaseous compounds

61. In order to reduce the emissions of gaseous compounds (i.e. NO_x, HCl, SO_x, CO) from flue-gases of kiln firing processes, BAT is to use one or a combination of the following primary techniques:

	Technique	Applicability
a	Careful selection and control of the substances entering the kiln in order to reduce the pollutant precursors, i.e.: I. selecting fuels with low contents of sulphur, if available, chlorine and nitrogen II. selecting raw materials with low contents of organic matter III. selecting suitable waste fuels for the process and the burner	Generally applicable subject to availability of raw materials and fuels, the type of kiln used, the desired product qualities and the technical possibility of injecting the fuels into the selected kiln. Waste materials can be considered as fuels in the magnesia industry but had not yet been applied in the magnesia industry in 2007
b	Using process optimisation measures/techniques to ensure a smooth and stable kiln process, operating close to the stoichiometric required air	Process control optimisation is applicable to all kiln types used in the magnesia industry. However, a highly sophisticated process control system may be necessary

1.4.4.2 NO_x emissions

62. In order to reduce the emissions of NO_x from the flue-gases of kiln firing processes, BAT is to use a combination of the following techniques:

	Technique	Applicability
a	Appropriate fuel selection along with a limited nitrogen content in the fuel	Generally applicable subject to fuels availability
b	Process optimisation and improved firing technique	Generally applicable in the magnesia industry

BAT-associated emission levels

The BAT-AEL for the emissions of NO_X from the flue-gases of kiln firing processes is < 500 – 1 500 mg/Nm^3, as the daily average value or average over the sampling period (spot measurements for at least half an hour) stated as NO_2. The higher values are related to the high temperature DBM process.

1.4.4.3 CO emissions and CO trips

1.4.4.3.1 CO emissions

63. In order to reduce the emissions of CO from the flue-gases of kiln firing processes, BAT is to use a combination of the following techniques:

	Technique	Description
a	Selecting raw materials with a low content of organic matter	A part of CO emissions results from the organic matter of raw materials thus selection of raw materials with low organic content can reduce CO emissions
b	Process control optimisation	A complete and correct combustion is essential to reduce CO emissions. Air supply from cooler and primary air as well as the draught of the stack fan can be controlled in order to keep an oxygen level of between 1 (sinter) and 1,5 % (caustic) during the combustion. A change of air and fuel charge can reduce CO emissions. Furthermore, CO emissions can be decreased by changing the depth of the burner
c	Feeding fuels controlled, constantly and continuously	Controlled fuel addition includes, e.g.: — using weight feeders and precision rotary valves for petcoke feeding and/or — using flow meters and precision valves for heavy oil or gas feeding regulation to the kiln burner

Applicability

The techniques for the reduction of CO emissions are generally applicable to the magnesia industry. The selection of raw materials with a low content of organic matter is subject to raw materials availability.

BAT-associated emission levels

The BAT-AEL for the emissions of CO from the flue-gases of kiln firing processes is < 50 – 1 000 mg/Nm^3, as the daily average value or average over the sampling period (spot measurements for at least half an hour).

1.4.4.3.2 Reduction of CO trips

64. In order to minimise the number of CO trips when applying ESPs, BAT is to use the following techniques:

	Technique
a	Manage CO trips in order to reduce the ESP downtime
b	Continuous automatic CO measurements by means of monitoring equipment with a short response time and situated close to the CO source

Description

For safety reasons, due to the risk of explosions, ESPs will have to shut down during elevated CO levels in the flue-gases. The following techniques prevent CO trips and, therefore, reduce ESP shutdown times:

— control of the combustion process

— control of the organic load of raw materials

— control of the quality of the fuels and fuel feeding system.

Disruptions predominantly happen during the start-up operation phase. For safe operation, the gas analysers for ESP protection have to be online during all operational phases and the ESP downtime can be reduced by using a backup monitoring system maintained in operation.

The continuous CO monitoring system needs to be optimised for reaction time and should be located close to the CO source, e.g. at a preheater tower outlet, or at a kiln inlet in the case of a wet kiln application.

Applicability

Generally applicable to kilns fitted with electrostatic precipitators (ESPs).

1.4.4.4 SO_x emissions

65. In order to reduce the emissions of SO_x from the flue-gases of kiln firing processes, BAT is to use a combination of the following primary and secondary techniques:

	Technique	Applicability
a	Process optimisation techniques	Generally applicable
b	Selecting fuels with a low sulphur content	Generally applicable subject to availability of low sulphur fuels which may be impacted by the energy policy of the Member State. The selection of fuel also depends on the quality of the final product, technical possibilities and economic considerations
c	A dry absorbent addition technique (sorbent addition into the flue gas stream such as reactive MgO grades, hydrated lime, activated carbon, etc.), in combination with a filter ([1])	Generally applicable
d	Wet scrubber ([1])	The applicability may be limited in arid areas by the large volume of water necessary and the need for waste water treatment and the related cross-media effects

([1]) A description of the measure/technique is provided in Section 1.7.2

BAT-associated emission levels

See Table 15.

Table 15

BAT-associated emission levels for SO_x from flue-gases of kiln firing processes in the magnesia industry

Parameter	Unit	BAT-AEL ([1]) ([2]) (daily average value or average over the sampling period (spot measurements for at least half an hour))
SO_X expressed as SO_2	mg/Nm^3	< 50 – 400 ([3])

([1]) The BAT-AELs depend on the content of sulphur in the raw materials and fuels. The lower end of the range is associated with the use of raw materials with low sulphur content and the use of natural gas; the upper end of the range is associated with the use of raw materials with higher sulphur content and/or the use of sulphur-containing fuels.
([2]) Cross-media effects should be taken into account to assess the best combination of BAT to reduce SO_x emissions.
([3]) When a wet scrubber is not applicable, BAT-AELs depend on the sulphur content of raw materials and fuels. In this case, the BAT-AEL is < 1 500 mg/Nm^3 while ensuring a SO_X emissions removal efficiency of at least 60 %.

1.4.5 *Process losses/waste*

66. In order to reduce/minimise process losses/waste, BAT is to reuse various types of collected magnesium carbonate dusts in the process.

Applicability

Generally applicable, subject to dust chemical composition.

67. In order to reduce/minimise process losses/waste, BAT is to utilise the various types of collected magnesium carbonate dusts in other marketable products when these are not recyclable.

Applicability

The utilisation of magnesium carbonate dusts in other marketable products may not be within the control of the operator.

68. In order to reduce/minimise process losses/waste, BAT is to reuse sludge resulting from the wet process of the flue-gas desulphurisation in the process or in other sectors.

Applicability

The utilisation of sludge resulting from the wet process of the flue-gas desulphurisation in other sectors may not be within the control of the operator.

1.4.6 *Use of wastes as fuels and/or raw materials*

69. In order to guarantee the characteristics of waste to be used as fuels and/or raw materials in magnesium oxide kilns, BAT is to use the following techniques:

	Technique
a	To select suitable wastes for the process and the burner
b	To apply quality assurance systems to guarantee and control the characteristics of wastes and to analyse any waste that is to be used for: I. availability II. constant quality III. physical criteria, e.g. emissions formation, coarseness, reactivity, burnability, calorific value IV. chemical criteria, e.g. chlorine, sulphur, alkali and phosphate content and relevant metals (e.g. total chromium, lead, cadmium, mercury, thallium) content
c	To control the amount of relevant parameters for any waste that is to be used, such as total halogen content, metals (e.g. total chromium, lead, cadmium, mercury, thallium) and sulphur

Applicability

Wastes may be used as fuels and/or raw materials in the magnesia industry (although they had not yet been applied in the magnesia industry in 2007) subject to availability, the type of kiln used, the desired product qualities and the technical possibility of feeding the fuels into the kiln.

DESCRIPTION OF TECHNIQUES

1.5 **Description of techniques for the cement industry**

1.5.1 *Dust emissions*

	Technique	Description
a	Electrostatic precipitators	Electrostatic precipitators (ESPs) generate an electrostatic field across the path of particulate matter in the air stream. The particles become negatively charged and migrate towards positively charged collection plates. The collection plates are rapped or vibrated periodically, dislodging the material so that it falls into collection hoppers below. It is important that ESP rapping cycles be optimised to minimise particulate re-entrainment and thereby minimise the potential to affect plume visibility. ESPs are characterised by their ability to operate under conditions of high temperatures (up to approximately 400 °C) and high humidity. The major disadvantages of this technique are their decreased efficiency with an insulating layer and a build-up of material that may be generated with high chlorine and sulphur inputs. For the overall performance of ESPs, it is important to avoid CO trips Even though there are no technical restrictions on the applicability of ESPs in the various processes in the cement industry, they are not often chosen for cement mill dedusting because of the investment costs and the efficiency (relatively high emissions) during start-ups and shutdowns
b	Fabric filters	Fabric filters are efficient dust collectors. The basic principle of fabric filtration is to use a fabric membrane which is permeable to gas but which will retain the dust. Basically, the filter medium is arranged geometrically. Initially, dust is deposited both on the surface fibres and within the depth of the fabric, but as the surface layer builds up, the dust itself becomes the dominating filter medium. Off-gas can flow either from the inside of the bag outwards or vice versa. As the dust cake thickens, the resistance to gas flow increases. Periodic cleaning of the filter medium is therefore necessary to control the gas pressure drop across the filter. The fabric

	Technique	Description
		filter should have multiple compartments which can be individually isolated in case of bag failure and there should be sufficient of these to allow adequate performance to be maintained if a compartment is taken off line. There should be 'burst bag detectors' in each compartment to indicate the need for maintenance when this happens. Filter bags are available in a range of woven and non-woven fabrics. Modern synthetic fabrics can operate at quite high temperatures of up to 280 °C. The performance of fabric filters is mainly influenced by different parameters, such as compatibility of the filter medium with the characteristics of the flue-gas and the dust, suitable properties for thermal, physical and chemical resistance, such as hydrolysis, acid, alkali, and oxidation and process temperature. Moisture and temperature of the flue-gases have to be taken into consideration during the selection of the technique.
c	Hybrid filters	Hybrid filters are the combination of ESPs and fabric filters in the same device. They generally result from the conversion of existing ESPs. They allow the partial reuse of the old equipment

1.5.2 *NO_x emissions*

	Technique	Description
a	Primary measures/techniques	
	I Flame cooling	The addition of water to the fuel or directly to the flame by using different injection methods, such as injection of one fluid (liquid) or two fluids (liquid and compressed air or solids) or the use of liquid/solid wastes with a high water content reduces the temperature and increases the concentration of hydroxyl radicals. This can have a positive effect on NO_x reduction in the burning zone
	II Low NO_x burners	Designs of low NO_x burners (indirect firing) vary in detail but essentially the fuel and air are injected into the kiln through concentric tubes. The primary air proportion is reduced to some 6 – 10 % of that required for stoichiometric combustion (typically 10 – 15 % in traditional burners). Axial air is injected at high momentum in the outer channel. The coal may be blown through the centre pipe or the middle channel. A third channel is used for swirl air, its swirl being induced by vanes at, or behind, the outlet of the firing pipe. The net effect of this burner design is to produce very early ignition, especially of the volatile compounds in the fuel, in an oxygen-deficient atmosphere, and this will tend to reduce the formation of NO_x. The application of low NO_x burners is not always followed by a reduction of NO_x emissions. The set-up of the burner has to be optimised
	III Mid kiln firing	In long wet and long dry kilns, the creation of a reducing zone by firing lump fuel can reduce NO_x emissions. As long kilns usually have no access to a temperature zone of about 900 – 1 000 °C, mid-kiln firing systems can be installed in order to be able to use waste fuels that cannot pass the main burner (for example tyres). The rate of the burning of fuels can be critical. If it is too slow, reducing conditions can occur in the burning zone, which may severely affect product quality. If it is too high, the kiln chain section can be overheated – resulting in the chains being burned out. A temperature range of less than 1 100 °C excludes the use of hazardous waste with a chlorine content of greater than 1 %
	IV Addition of mineralisers to improve the burnability of the raw meal (mineralised clinker)	The addition of mineralisers, such as fluorine, to the raw material is a technique to adjust the clinker quality and allow the sintering zone temperature to be reduced. By reducing/lowering the burning temperature, NO_x formation is also reduced

	Technique	Description
	V Process optimisation	Optimisation of the process, such as smoothing and optimising the kiln operation and firing conditions, optimising the kiln operation control and/or homogenisation of the fuel feedings, can be applied for reducing NO_x emissions. General primary optimisation measures/techniques, such as process control measures/techniques, an improved indirect firing technique, optimised cooler connections and fuel selection, and optimised oxygen levels have been applied
b	Staged combustion (conventional or waste fuels), also in combination with a precalciner and the use of optimised fuel mix	Staged combustion is applied at cement kilns with an especially designed precalciner. The first combustion stage takes place in the rotary kiln under optimum conditions for the clinker burning process. The second combustion stage is a burner at the kiln inlet, which produces a reducing atmosphere that decomposes a portion of the nitrogen oxides generated in the sintering zone. The high temperature in this zone is particularly favourable for the reaction which reconverts the NO_x to elementary nitrogen. In the third combustion stage, the calcining fuel is fed into the calciner with an amount of tertiary air, producing a reducing atmosphere there, too. This system reduces the generation of NO_x from the fuel, and also decreases the NO_x coming out of the kiln. In the fourth and final combustion stage, the remaining tertiary air is fed into the system as 'top air' for residual combustion
c	SNCR	Selective non-catalytic reduction (SNCR) involves injecting ammonia water (up to 25 % NH_3), ammonia precursor compounds or urea solution into the combustion gas to reduce NO to N_2. The reaction has an optimum effect in a temperature window of about 830 to 1 050 °C, and sufficient retention time must be provided for the injected agents to react with NO
d	SCR	SCR reduces NO and NO_2 to N_2 with the help of NH_3 and a catalyst at a temperature range of about 300 – 400 °C. This technique is widely used for NO_x abatement in other industries (coal fired power stations, waste incinerators). In the cement industry, basically two systems are considered: low dust configuration between a dedusting unit and stack, and a high dust configuration between a preheater and a dedusting unit. Low dust flue-gas systems require the reheating of the flue-gases after dedusting, which may cause additional energy costs and pressure losses. High dust systems are considered preferable for technical and economical reasons. These systems do not require reheating, because the waste gas temperature at the outlet of the preheater system is usually in the right temperature range for SCR operation

1.5.3 *SO_x emissions*

	Technique	Description
a	Absorbent addition	Absorbent is either added to the raw materials (e.g. hydrated lime addition) or injected into the gas stream (e.g. hydrated or slaked lime ($Ca(OH)_2$), quicklime (CaO), activated fly ash with a high CaO content or sodium bicarbonate ($NaHCO_3$)). Hydrated lime can be charged into the raw mill together with the raw material constituents or directly added to the kiln feed. The addition of hydrated lime offers the advantage that the calcium-bearing additive forms reaction products that can be directly incorporated into the clinker-burning process. Absorbent injection into the gas stream can be applied in a dry or wet form (semi-dry scrubbing). The absorbent is injected into the flue-gas path at temperatures close to the water dew point, which results in more favourable conditions for SO_2 capture. In cement kiln systems, this temperature range is usually reached in the area between the raw mill and the dust collector

	Technique	Description
b	Wet scrubber	The wet scrubber is the most commonly used technique for flue-gas desulphurisation in coal-fired power plants. For cement manufacturing processes, the wet process for reducing SO_2 emissions is an established technique. Wet scrubbing is based on the following chemical reaction: $SO_2 + ½ O_2 + 2 H_2O + CaCO_3 \leftrightarrow CaSO_4 \cdot 2 H_2O + CO_2$ SO_x are absorbed by a liquid/slurry which is sprayed in a spray tower. The absorbent is generally calcium carbonate. Wet scrubbing systems provide the highest removal efficiencies for soluble acid gases of all flue-gas desulphurisation (FGD) methods with the lowest excess stoichiometric factors and the lowest solid waste production rate. The technique requires certain amounts of water with a consequent need for waste water treatment

1.6 **Description of techniques for lime industry**

1.6.1 *Dust emissions*

	Technique	Description
a	ESP	A general description of ESPs is provided in Section 1.5.1. ESPs are suitable for use at temperatures above the dew point and up to 400 °C. Furthermore, it is also possible to use ESPs close to, or below, the dew point. Because of high volume flows and relatively high dust loads, mainly rotary kilns without preheaters but also rotary kilns with preheaters are equipped with ESPs. In the case of combination with a quenching tower, excellent performance can be achieved
b	Fabric filter	A general description of fabric filters is provided in Section 1.5.1. Fabric filters are well suited for kilns, milling and grinding plants for quicklime as well as for limestone; lime hydrating plants; material transport; and storage and loading facilities. Often a combination with cyclone prefilters is useful. The operation of fabric filters is limited by the flue-gas conditions such as temperature, moisture, dust load and chemical composition. There are various fabric materials available to resist mechanical, thermal and chemical wear to meet those conditions
c	Wet dust separator	With wet dust separators, dust is eliminated from off-gas streams by bringing the gas flow into close contact with a scrubbing liquid (usually water), so that the dust particles are retained in the liquid and can be rinsed away. There are a number of different types of wet scrubbers available for dust removal. The main types that have been used in lime kilns are multi-cascade/multistage wet scrubbers, dynamic wet scrubbers and venturi wet scrubbers. The majority of wet scrubbers used on lime kilns are multi-cascade/multistage wet scrubbers. Wet scrubbers are chosen when the flue-gas temperatures are close to, or below the dew point. They may also be chosen when space is limited. Wet scrubbers are sometimes used with higher temperature gases, in which case, the water cools the gases and reduces their volume
d	Centrifugal Separator/ cyclone	In a centrifugal separator/cyclone, the dust particles to be eliminated from an off-gas stream are forced out against the outer wall of the unit by centrifugal action and then eliminated through an aperture at the bottom of the unit. Centrifugal forces can be developed by directing the gas flow in a downward spiral motion through a cylindrical vessel (cyclonic separators) or by a rotating impeller fitted in the unit (mechanical centrifugal separators). However, they are only suitable as pre-separators because of their limited particle removal efficiency and they relieve ESPs and fabric filters from high dust loading, and reduce abrasion problems

1.6.2 *NO_x emissions*

	Technique	Description
a	Burner design (low NO_x burner)	The low NO_x burners are useful for reducing the flame temperature and thus reducing thermal and (to some extent) fuel derived NO_x. The NO_x reduction is achieved by supplying rinsing air for lowering the flame temperature or pulsed operation of the burners. Low NO_x burners are designed to reduce the primary air portion which leads to lower NO_x formation whereas common multi-channel burners are operated with a primary air portion of 10 to 18 % of the total combustion air. The higher portion of the primary air leads to a short and intensive flame by the early mixing of hot secondary air and fuel. This results in high flame temperatures along with a creation of a high amount of NO_x formation which can be avoided by using low NO_x burners
b	Air staging	A reducing zone is created by reducing the oxygen supply in the primary reaction zones. High temperatures in this zone are particularly favourable for the reaction which reconverts the NO_x to elementary nitrogen. At later combustion zones, the air and oxygen supply is increased to oxidise the gases formed. Effective air/gas mixing in the firing zone is required to ensure that CO and NO_x are both maintained at low levels. In 2007, air staging had never been applied in the lime sector
c	SNCR	Nitrogen oxides (NO and NO_2) from the flue-gases are removed by selective non-catalytic reduction and converted into nitrogen and water by injecting a reducing agent into the kiln which reacts with the nitrogen oxides. Ammonia or urea is typically used as the reducing agent. The reactions occur at temperatures of between 850 and 1 020 °C, with the optimal range typically between 900 to 920 °C

1.6.3 *SO_x emissions*

	Technique	Description
a	Absorbent addition techniques	The technique involves the addition of an absorbent in dry form directly into the kiln (fed or injected) or in dry or wet form (e.g. hydrated lime or sodium bicarbonate) into the flue-gases in order to remove SO_x emissions. When absorbent is injected into the flue-gases, a sufficient residence time between the injection point and the dust collector (fabric filter or ESP) must be provided in order to obtain an efficient absorption. For rotary kilns, absorption techniques may include: — Use of fine limestone: At a straight rotary kiln fed with dolomite, significant reductions in SO_2 emissions can occur with feedstones which either contain high levels of finely divided limestone or are prone to break up on heating. The finely divided limestone calcines are entrained in the kiln gases and remove SO_2 en route to, and in, the dust collector. — Lime injection into the combustion air: A patented technique (EP 0 734 755 A1) which removes SO_2 emissions from rotary kilns by injecting finely divided quick or hydrated lime into the air fed into the firing hood of the kiln

1.7 **Description of techniques for the magnesia industry (dry process route)**

1.7.1 *Dust emissions*

	Measure/Technique	Description
a	Electrostatic precipitators (ESPs)	A general description of ESPs is provided in Section 1.5.1

	Measure/Technique	Description
b	Fabric filters	A general description of fabric filters is provided in Section 1.5.1 Fabric filters receive high particle retention, typically over 98 % and up to 99 % depending on the particle size. This technique offers the best efficiency on particle collection in comparison to other dust abatement measures/techniques used in the magnesia industry. However, because of the high temperatures of the kiln flue-gases, special filter materials which can tolerate high temperatures have to be used. In DBM manufacturing, filter materials operating with temperatures of up to 250 °C are used, such as PTFE (Teflon) filter material. This filter material shows good resistance to acids or alkalis and a lot of corrosion problems have been solved
c	Cyclones (centrifugal separator)	A general description of cyclones is provided in Section 1.6.1. They are robust equipment and they have a wide operational temperature range with a low energy requirement. Because of the system-dependent limited degree of separation, cyclones are mainly used as preliminary separators for coarse dust and flue-gases
d	Wet dust separators	General description of wet dust separators (also called wet scrubbers) is provided in Section 1.6.1 Wet dust separators can be divided into various types according to their design and working principles, such as the venturi type. This type of wet dust separator has a number of applications in the magnesia industry, including when gas is directed through the narrowest section of the venturi tube, the 'venturi neck', and gas velocities of between 60 and 120 m/s can be achieved. The washing fluids which are fed into the venturi tube neck are diffused into a mist of very fine droplets and are intensively mixed with the gas. The particles separated onto the water droplets become heavier and can be readily drawn off using a drop separator installed in this venturi wet dust separator

1.7.2 *SO_x emissions*

	Technique	Description
a	Absorbent addition technique	The technique involves the injection of an absorbent in dry or wet form (semi-dry scrubbing) into the flue-gases in order to remove SO_x emissions. A sufficient gas residence time between the injection point and the dust collector is very important to obtain highly efficient absorption. Reactive MgO grades can be used as efficient absorbents for SO_2 in the magnesia industry. Despite the lower efficiency compared to other absorbents, the use or reactive MgO grades has a double advantage as it lowers the investment costs and also the filter dust is not contaminated by other substances and can be reused in place of raw materials for the production of magnesia or employed as a fertiliser (magnesium sulphate) minimising waste generation
b	Wet scrubber	In the wet scrubbing technique, SO_x are absorbed by a liquid/slurry which is sprayed countercurrently to the flue-gases in a spray tower. The technique requires an amount of water between 5 and 12 m^3/tonne product, with a consequent need for a waste water treatment

2013 SUBSCRIPTION PRICES (excluding VAT, including normal transport charges)

EU Official Journal, L + C series, paper edition only	22 official EU languages	EUR 1 300 per year
EU Official Journal, L + C series, paper + annual DVD	22 official EU languages	EUR 1 420 per year
EU Official Journal, L series, paper edition only	22 official EU languages	EUR 910 per year
EU Official Journal, L + C series, monthly DVD (cumulative)	22 official EU languages	EUR 100 per year
Supplement to the Official Journal (S series), tendering procedures for public contracts, DVD, one edition per week	multilingual: 23 official EU languages	EUR 200 per year
EU Official Journal, C series — recruitment competitions	Language(s) according to competition(s)	EUR 50 per year

Subscriptions to the *Official Journal of the European Union*, which is published in the official languages of the European Union, are available for 22 language versions. The Official Journal comprises two series, L (Legislation) and C (Information and Notices).

A separate subscription must be taken out for each language version.

In accordance with Council Regulation (EC) No 920/2005, published in Official Journal L 156 of 18 June 2005, the institutions of the European Union are temporarily not bound by the obligation to draft all acts in Irish and publish them in that language. Irish editions of the Official Journal are therefore sold separately.

Subscriptions to the Supplement to the Official Journal (S Series — tendering procedures for public contracts) cover all 23 official language versions on a single multilingual DVD.

On request, subscribers to the *Official Journal of the European Union* can receive the various Annexes to the Official Journal. Subscribers are informed of the publication of Annexes by notices inserted in the *Official Journal of the European Union*.

Sales and subscriptions

Subscriptions to various priced periodicals, such as the subscription to the *Official Journal of the European Union*, are available from our sales agents. The list of sales agents is available at:

http://publications.europa.eu/others/agents/index_en.htm

EUR-Lex (http://eur-lex.europa.eu) offers direct access to European Union legislation free of charge. The *Official Journal of the European Union* can be consulted on this website, as can the Treaties, legislation, case-law and preparatory acts.

Provisions on penalties related to legislation on industrial installations

Executive summary

This executive summary brings together the key findings of the project 'Provisions on penalties related to legislation on industrial installations' carried out for DG Environment under Service Contract DG ENV № 070307/2010/569468/SER/C3. The project aims at:

- providing the European Commission and the Member States with an overview of penalties applicable in all 27 Member States for the enforcement of EU air emission legislation
- assess the effectiveness, proportionality and dissuasive nature of these measures
- support Member States in future implementation of legislation on industrial emissions by identifying good practices.

1. Methodology/Background

In order to obtain a comprehensive and detailed analysis of how EU requirements for industrial installations are enforced at Member State level, the study followed a staged approach, starting with a general overview of sanctions in each of the 27 Member States, a detailed review of enforcement in seven selected Member States, including case studies and a workshop, which all fed into the development of a Document on Good Practices which was subject to further consultation with national experts before finalisation.

The general overview of the national legislation and procedures in relation to infringements of the legislation on industrial emissions for the 27 Member States is the first output. It covers the four main directives on air emission, namely

- Directive 2008/1/EC concerning integrated pollution prevention and control;[1]
- Directive 2001/80/EC on the limitation of emissions of certain pollutants into the air from large combustion plants;[2]
- Directive 1999/13/EC on the limitation of emissions of volatile organic compounds due to the use of organic solvent in certain activities and installations;[3]
- Directive 2000/76/EC on the incineration of waste.[4]

National legal experts reviewed for each of the Member States the sanctions in place, administrative, quasi-criminal and criminal, for the main enforceable obligations of the four directives, along with general information on the legal background and enforcement of the directives in each Member State. These national reports served as a basis for analysing the types of sanctions used, the maximum levels of penalties (fines and imprisonment), and any additional sanctions which may also be imposed either in addition, or as an alternative, to such penalties. A comparative analysis of the country overviews

[1] Directive 2008/1/EC of the European Parliament and of the Council of 15 January 2008 concerning integrated pollution prevention and control (Codified version). *Official Journal L 024, 29/01/2008 P. 0008 – 0029.*

[2] Directive 2001/80/EC of the European Parliament and of the Council of 23 October 2001 on the limitation of emissions of certain pollutants into the air from large combustion plants. *Official Journal L 309, 27/11/2001 P. 0001 – 0021.*

[3] Directive 1999/13/EC of 11 March 1999 on the limitation of emissions of volatile organic compounds due to the use of organic solvents in certain activities and installations. *Official Journal L 085, 29/03/1999 P. 0001 – 0022.*

[4] Directive 2000/76/EC of the European Parliament and of the Council of 4 December 2000 on the incineration of waste. *Official Journal L 332 , 28/12/2000 P. 0091 – 0111.*

served as a basis to frame the detailed review of enforcement in seven Member States and select those Member States - Denmark, France, Germany, Hungary, Spain, The Netherlands and UK.

The report '*Overview of provisions on penalties related to legislation on industrial installations in the Member States'* is presented as a stand-alone document, together with the 27 individual country overviews.

The second output of the study was a guidance document aimed at identifying good practices in the enforcement procedures and sanctions in place in Member States for infringement of legislation on industrial emissions, with a particular focus on the enforcement of Directive 2008/1/EC (the IPPC Directive). This document was primarily based on a detailed analysis of the national enforcement systems and applicable sanctions relating to the IPPC Directive in seven Member States (UK, Germany, France, Hungary, the Netherlands, Denmark and Spain). Case studies were used to illustrate how each country's system operates in practice as well as to determine the extent to which the sanctions imposed for non-compliance were deemed to be effective, proportionate and dissuasive.

Following the detailed country studies, a stakeholder workshop was held at DG Environment on 27 June 2011. The workshop focused on the effectiveness, proportionality and dissuasiveness of sanctions, and included presentations on the project methodology and case studies illustrating the enforcement procedures and mechanisms in selected Member States. This was followed by a round-table discussion by the participants. Following the workshop, a draft guidance document was prepared to highlight good practices based on examples drawn from the detailed national studies where successful approaches to enforcement were identified. The Document on Good Practices also serves to clarify how the notions of dissuasiveness, proportionality and effectiveness are interpreted by Member States. The country studies and the draft guidance document were then submitted to the participants of the workshop for comments. These comments were incorporated into the final Document on Good Practices.

The Document on Good Practices is presented as a stand-alone document, together with the seven detailed country studies.

2. Main conclusions and findings

The project showed that there is a range of different factors and elements which concur to the effectiveness, dissuasiveness and proportionality of penalties.

These three criteria are currently undefined by EU legislation. However, by analysing the relevant literature and limited case law available, the following definitions were devised:

- *Effectiveness:* penalties are capable of ensuring compliance with EU law and achieving the desired objective
- *Proportionality:* penalties adequately reflect the gravity of the violation and do not go beyond what is necessary to achieve the desired objective
- *Dissuasiveness:* penalties have a deterrent effect on the offender which should be prevented from repeating the offence and on the other potential offenders to commit the said offence

A number of challenges arise from these definitions, primarily due to the fact that the three criteria are closely interlinked and there is a lack of empirical and evidential analysis of the penalties as applied in practice. In addition, the application of these criteria should be guided by the specific circumstances of individual cases and viewed within the wider context of the national enforcement systems within

Member States. These challenges are further complicated by the significant differences between national legal and institutional frameworks and practices and economic situations of each Member State, and furthermore, in the types of sanctions applied (e.g. administrative, criminal, quasi-criminal) and in the ranges and levels of penalties imposed for infringement. This is also linked to the fact that there is no EU mandatory level of 'minimum' or 'maximum' fine for non-compliance with a particular legislative provision.

Most Member States provide for both administrative and criminal sanctions. However, several common law countries, or countries with a common law influence, including Ireland, Cyprus and Malta, have no administrative fines in place. Of interest, the introduction of administrative fines in the UK suggests that these are an efficient instrument for enforcement. While in some countries administrative sanctions are viewed as having the same repressive and preventive character as criminal ones, in some Member States there is a substantial distinction between the two types of sanction. In such cases this distinction reflects the aim of the administrative sanction to re-establish the public order rather than to allocate social blame. In most countries, the key difference between the two types of sanction is the body responsible and the procedure used to impose the sanction. As noted in the Member State overviews, a number of common law countries, or those with a common law influence, do not have specific provisions for both administrative and criminal sanctions relating to industrial installations. In such countries there is not usually a specific and differentiated procedure to impose administrative sanctions. In other Member States, the administrative sanction will be imposed through an administrative procedure while the criminal sanction will be imposed through the criminal procedure.

The majority of Member States have provisions for criminal sanctions for breaches of legislation relating to industrial installations. Most criminal sanctions in those Member States are established through a combination of sectoral legislation transposing the main enforceable requirements, and a single criminal code or act which establishes sanctions for breaches of that sectoral legislation. A number of Member States do not have specific criminal sanctions for some or all of the particular offences covered by the study. However, in most of these cases, general criminal sanctions for environmental damage are provided for by a criminal code or framework environmental law. Where specific criminal sanctions are set for particular offences, general criminal sanctions also apply.

Five Member States use quasi-criminal penalties as a means of enforcement, either in addition to administrative and criminal sanctions or instead of administrative sanctions. In two Member States, quasi-criminal sanctions carry similar penalties to criminal sanctions but involve a simplified procedure, and at first instance are handled by the administrative authorities rather than by the judicial system. In other Member States, quasi-criminal sanctions are used instead of administrative sanctions as an alternative method of enforcement, sitting alongside criminal sanctions and administrative enforcement measures. The use of such sanctions may be conditional upon the offender's negligence or intent and their primary aim is to have deterrent and preventive effect.

One of the main advantages of administrative sanctions is that they allow for communication with the perpetrator, giving the regulator greater flexibility over the types of measures it can use. Fines can also be higher than for criminal proceedings. Criminal sanctions, on the other hand, tend have a stronger dissuasive effect and may be more appropriate for serious, deliberate or repeat offences where there may be significant damage to the environment or human health or need for compensation.

The analysis has identified a number of features that support a differentiation and possible graduation of sanctions, which in turn ensure that sanctions can be effective, proportionate and dissuasive. These include:

1. *The distinction between minor and serious offences:* in several Member States, the legislation itself often distinguishes between minor and serious offences, providing a tool which allows taking into account elements that influence the gravity of the offence. The most commonly met are the existence of a damage to the environment or to human health and the intent as opposed to offences committed by negligence.

2. *The existence of minima or maxima level of fines:* the approach varies greatly across Member States from setting both minima and maxima, to only maxima or none. Besides, maximum fines or imprisonment length also differ greatly, with the highest administrative fines ranging from up to Euros 2,134 to Euros 2,500,000. Of those Member States which impose criminal penalties, the level of fines range from Euros 547 up to an unlimited amount, while the length of imprisonment ranges from thirty days up to 15 years. Some countries have also developed guidance on the level of fines. Due to limited information, it is not possible to draw meaningful conclusions about the levels of fines imposed as compared with these maximum levels. Furthermore, it is not clear whether prescribing minimum or maximum levels of fines supports the setting of proportionate, effective and dissuasive penalties. It is recommended that comprehensive and detailed studies are carried out at national level in this regard.

3. *The differentiation in the level of fines for natural and legal persons:* in some countries, the same penalties apply to natural and legal persons, while in other Member States the penalties are differentiated with higher ones potentially applicable to legal persons. In this perspective, due account should be taken of the possibility to impose additional financial penalties to legal persons such as the seizure of the profit made, a possibility seen as extremely powerful as it allows to increase significantly the fine (ensuring a deterrent effect) and at the same time to ensure that the criteria of proportionality is followed.

4. *Criteria used to determine the severity of the sanctions:* these are sometimes set by legislation as explained in (1) or developed through practice and case laws. Aggravating criteria can be the potential and/or actual harm to the environment or human health; the 'mental element' i.e. whether the offence has been committed with intent or gross negligence; the foreseeability of the offence i.e. whether the circumstances leading to the offence could reasonably haven foreseen; the lack of ccoperation of the offender e.g. with the inspection; the fact that the offence is repetitive or has last for a long duration of time; the potential benefits from the illegal behaviour whether in the form of profits made or avoided costs. Mitigating criteria often mirror the aggravating ones e.g. absence of imminent danger to the environment or human health; prompt cessation of the offence; cooperative behaviour of the offender; length of time elapsed since the offence. Concurrent obligations on the operator (i.e. the offence was committed in order to ensure that another obligation is fulfilled) are also considered as a mitigating factor.

   Two key elements in establishing the seriousness of the offence can be difficult to prove, namely the environmental impacts of the illegal conduct, and whether or not the illegal conduct was committed intentionally. Practitioners noted that proving and judging the intent can be a challenge. Proving the intent can be difficult for infringements of industrial emission legislation, as regulatory authorities often do not have sufficient evidence to judge the impacts or the level of intention. On the other hand, judging the intention is not always necessary, since there may already be a basis for bringing a case to court, e.g. in negligence.

5. *The publicity of the sanction:* The risk of adverse publicity is also viewed as an efficient dissuasive element or factor contributing to the effectiveness of the penalty. This relates not only to the decision on the actual fine or imprisonment but also on other administrative measures such as formal records of infringement or reports from inspection. It is acknowledged that such

publicity, in combination with administrative sanctions could be more effective than criminal proceedings. Data sharing between Member States in this area should be encouraged.

6. *Efficiency of measures and/or sanctions other than fines and imprisonment:* alongside fines and imprisonment penalties, all Member States provide for other types of measures and sanctions. In most cases, such measures/sanctions are the only ones available as part of the administrative proceedings. This is the case when there are no administrative financial penalties for breaches of legislation on industrial emissions, although administrative fines may exist for other environmental offences. Their role is often a remedial one as they aim to stop the unlawful behaviour or to remediate the damage caused to the environment. These are seen as very effective tools to ensure compliance. They are, as a rule, applied in a gradual way. They also can represent a heavy financial burden and have a strong deterrent effect e.g. the rehabilitation of the premises or the closure of the facility.

Finally, the detailed review of the enforcement system in the seven selected countries has shown the importance of the enforcement and sanctioning procedure, which can ultimately greatly influence the level of penalties, while the need for greening the judicial network and improving cooperation is widely recognised.

The different actors of the sanctioning procedure, the inspectors, the supervisory authorities, the prosecutors and the judges have to face a very technical matter. As some do not have special training, this may be an obstacle to an efficient enforcement of the legislation on industrial emissions. Lack of cooperation and information exchange is seen as a serious obstacle to enforcement. Different competent authorities may take the lead but there is a lack of information exchange between the different authorities. It is up to the authorities/the public prosecutor to develop the case and to go back to the inspectors if necessary. Where both the inspection and the enforcement body are combined in one organisation, it can provide a very effective partnership between inspectors (who often act as witnesses) and prosecutors who bring the case. Some stakeholders advocate the establishment of specialised legal structure, i.e. environmental courts and specialist prosecutors, along with environmental police and inspection. There is currently a tendency within Member States towards gradual specialisation.

Civil society, aside from initiating enforcement procedures through complaints, plays a significant role in enforcement through litigation. While some Member States are granting broader access to justice, others have a more limited approach. Several procedural aspects are central to effective access to justice allowing the public, including non-governmental organisations, to play their role as a watchdog to support enforcement. It is recommended that Member States ensure that legal standing for non-governmental organisations is not restricted, that it is possible to obtain interim relief and interim measures, and that the cost of the procedure should not be an obstacle to public access to justice. Good practices include effective mechanisms to ensure legal aid. Furthermore, recent decisions of the Court of Justice of the European Union should be taken into account when considering possible improvements in public access to justice. These relate to the requirement to ensure *locus standi* for non-governmental organisations and to avoid excessive costs of proceedings.

Overview of provisions on penalties related to legislation on industrial installations in the Member States

1. Introduction

This report is one of the deliverables of the project 'Provisions on penalties related to legislation on industrial installations'. This project aims at providing the European Commission and the Member States with an overview of how the EU environmental requirements for industrial installations are being implemented and enforced in practice. In order to ensure operators of the installations covered by these directives comply with the EU requirements, it is crucial that the national transposing legislation provides adequate enforcement mechanisms, including penalties that are effective, proportionate and dissuasive.

Penalties are essential tools in the effective enforcement and implementation of EU environmental legislation. The adoption of penalties as an enforcement mechanism for ensuring that this legislation is complied with falls under the competence of the Member States. While all Member States provide for sanctions, generally both administrative and criminal, or, in some cases administrative or criminal, the way in which these are applied varies significantly between Member States, both in terms of the type and range of enforcement mechanism used. In addition, as there is no mandatory level of "minimum" or "maximum" fine to be imposed for non-compliance with a particular legislative provision, there will inevitably be variations between Member States in the different penalties provided for in the transposing legislation in respect of the four Directives in this study.

The effect of this discretionary application of penalties by Member States can be illustrated by comparing the different enforcement mechanisms which currently exist within the Member States.

The present report provides a broad comparative overview of administrative and criminal penalties set by national legislation in relation to infringements of the legislation transposing the four main directives on industrial installations, for all 27 Member States. It includes an analysis of the common sanctions used (e.g. administrative/criminal penalties), the maximum levels of such penalties, and any additional sanctions which may also be imposed either in addition to, or as an alternative to such penalties. This analysis constitutes the background information for a detailed review of the enforcement system and applicable sanctions in seven Member States. This detailed study will be focusing on the key factors/areas influencing the effectiveness of enforcement mechanisms. It will also be completed by case studies aiming at reviewing practical implementation and identifying good practices.

The summary draws on individual country reviews undertaken for each of the Member States. These are presented separately. Each country overview comprises two sections. The first section provides a general presentation of the sanctions in place. It includes a summary of the general framework for administrative and criminal penalties, including the relevant legislation, the types of sanctions (e.g., administrative/criminal) and general information on enforcement. It also indicates whether liability applies to natural and legal persons. The second section considers in detail the offences, types and levels of penalties applicable for an infringement of the main obligations set by each of the Directives covered by the study.

2. The Project Background and Methodology

The project covers the four main Directives regulating emissions from industrial installations:

- Directive 2008/1/EC concerning integrated pollution prevention and control (IPPC Directive);[1]
- Directive 2001/80/EC on the limitation of emissions of certain pollutants into the air from large combustion plants (LCP Directive);[2]
- Directive 1999/13/EC on the limitation of emissions of volatile organic compounds due to the use of organic solvent in certain activities and installations (VOC Directive).[3]
- Directive 2000/76/EC on the incineration of waste (WI Directive);[4]

Not all the provisions of each Directive are relevant to this study. Only provisions which place an obligation on the operator are relevant, as they are enforceable and, as such, their infringement should be identified as an offence and corresponding penalties should be set by the transposing national legislation. However, the number of such obligations is quite large and it was considered necessary to streamline the analysis. Therefore, all relevant provisions have been grouped under four key obligations to focus the comparison across countries. The detailed obligations set by the EU legislation on industrial emissions and the four key obligations identified for the sake of the study are detailed in the present section.

2.1. Relevant provisions of the legislation on industrial emissions

The IPPC Directive (2008/1/EC) provides the framework for the other legislation on industrial emissions control. Its objective is to achieve integrated prevention and control of pollution from a wide range of industrial activities covered in Annex I to the Directive. The IPPC Directive applies to around 52,000 industrial installations in the European Union. It covers a wide range of industrial installations such as energy industries, production and processing of metals, mineral industries, chemical industries, and waste management installations.

Under the IPPC Directive no new industrial and agricultural activities with a high pollution potential listed in Annex I of this directive shall be operated without an environmental permit from the authorities in the respective Member State. The permits are to include measures ensuring that certain environmental conditions are met (e.g. preventive measures are taken against pollution, no significant pollution is caused, waste production is avoided). The table below summarises the main enforceable articles of the IPPC directive.

[1] Directive 2008/1/EC of the European Parliament and of the Council of 15 January 2008 concerning integrated pollution prevention and control (Codified version). *Official Journal L 024, 29/01/2008 P. 0008 – 0029.*

[2] Directive 2001/80/EC of the European Parliament and of the Council of 23 October 2001 on the limitation of emissions of certain pollutants into the air from large combustion plants. *Official Journal L 309, 27/11/2001 P. 0001 – 0021.*

[3] Directive 1999/13/EC of 11 March 1999 on the limitation of emissions of volatile organic compounds due to the use of organic solvents in certain activities and installations. *Official Journal L 085, 29/03/1999 P. 0001 – 0022.*

[4] Directive 2000/76/EC of the European Parliament and of the Council of 4 December 2000 on the incineration of waste. *Official Journal L 332 , 28/12/2000 P. 0091 – 0111.*

Table 1: IPPC Directive 2008/1/EC

Article	Key enforceable provisions
Article 4	No new installation shall be operated without a permit in accordance with the Directive
Article 5	Existing installations shall have permits in accordance with the Directive by 30 October 2007
Article 6	Applications for permits shall contain specific information listed in Article 6 (description of the installation and its activities, the raw and auxiliary materials, other substances and the energy used in or generated by the installation…)
Article 12 (1)	Operators shall inform the competent authorities of any planned change in the operation.
Article 12(2)	Operators shall request a permit when they are planning substantial changes in their installation
Article 14(a)	Operators shall comply with the conditions of a permit when operating the installation
Article 14(b)	Operators shall regularly inform the competent authority of the results of monitoring of releases
Article 14(c)	Operators shall afford the competent authority all necessary assistance with inspections

The Directives on VOC, LCP and WI emissions regulate the emissions of pollutants from certain industrial activities through the setting of limit values of pollutants and monitoring requirements. Pursuant to Article 19(2) of the IPPC Directive, the emission limit values set by these sectoral directives shall be applied as minimum emission limit values.

The 1999 VOC Directive covers emissions of organic solvents from stationary commercial and industrial sources. Industrial operators of plants using volatile organic solvents listed in Annex I must comply with specific emissions limits by installing equipment to reduce emissions or by introducing a reduction scheme to arrive at an equivalent emission level by replacing conventional products which are high in solvent with low-solvent or solvent free products. The main enforceable articles are:

Table 2: VOC Directive 1999/13/EC

Article	Key enforceable provisions
Article 3(2)	All new installations not covered by Directive 96/61/EC are registered or undergo authorisation before being put into operation
Article 4	Where an installation undergoes a substantial change, or comes within the scope of the Directive for the first time following a substantial change, that part of the installation shall be treated either as a new installation or as an existing installation, provided that the total emissions of the whole installation do not exceed those that would have resulted had the substantially changed part been treated as a new installation.
Article 5(2)(a) and (b)	Installations shall comply with the emission limit values[…] and other requirements laid down in Annex IIA; or the requirements of the reduction scheme specified in Annex IIB.
Article 5(4)	For installations not using the reduction scheme, any abatement equipment installed after 1999 shall meet all the requirements of Annex IIA.
Article 5(5)	Options for installations where two or more activities are carried out, each of which exceeds Annex IIA thresholds, e.g., each activity must meet specified requirements individually[…]
Article 5(6)	Substances or mixtures classified as CMR because of VOCs content shall be replaced, as far as possible[…]by less harmful substances or mixtures within the shortest possible time.
Article 5(8)	Certain discharges of halogenated VOCs assigned risk phrase R40 where the mass

Article	Key enforceable provisions
Article 3(2)	All new installations not covered by Directive 96/61/EC are registered or undergo authorisation before being put into operation
Article 4	Where an installation undergoes a substantial change, or comes within the scope of the Directive for the first time following a substantial change, that part of the installation shall be treated either as a new installation or as an existing installation, provided that the total emissions of the whole installation do not exceed those that would have resulted had the substantially changed part been treated as a new installation.
	flow is ≥ 100 g/h shall comply with emission limit value of 20 mg/Nm3.
Article 5(9)	Discharges of VOCs classified as CMR or assigned risk phrases R40, R45, R46, R49, R60, R61 or R68 after Directive enters into force have to comply with the para. 7 & 8 ELVs within shortest possible time.
Article 5(10)	All appropriate precautions to be taken to minimise emissions during start-up & shut down.
Article 8(1)	Operators shall supply the competent authority once a year or on request with data to enable competent authority to verify compliance with this Directive;
Article 9(1)	Operators have to demonstrate compliance to the satisfaction of the CA with: — ELVs in waste gases, fugitive emission values & total ELVs, — the requirements of the reduction scheme under Annex IIB. Solvent management plans according to Annex III can demonstrate compliance. Gas volumes added to waste gas for cooling or dilution purposes shall not be considered when determining mass concentration of the pollutant in the waste gas.
Article 10 (a)	The operator shall inform the competent authority and take measures to ensure that compliance is restored within the shortest possible time

The LCP Directive applies to combustion plants with a rated thermal input equal to or greater than 50 MW, irrespective of the type of fuel used (solid, liquid or gaseous). Its aim is to limit the amount of sulphur dioxide, nitrogen oxides and dust emitted from large combustion plants. The table below summarizes the main enforceable articles of the LCP Directive.

Table 3: LCP Directive 2001/80/EC

Article	Key enforceable provisions
Article 4(1)	Operators of plants…put into operation before November 2003 shall comply with the ELVs laid down in Part A of Annexes III to VII in respect of SO_2, NOx & dust, as set in their license.
Article 4(2)	Operators of new plants [put into operation after November 2003] shall comply with ELVs laid down in part B of Annexes III to VII in respect of SO_2, NOx & dust, as set in their license.
Article 4(4)	In case they benefit from an exemption from compliance with the emission limit values and from their inclusion in the national emission reduction plan pursuant to this provision, operators are required to submit each year to the competent authority a record of the used and unused time allowed for the plants' remaining operational life.
Article 5	Plants of rated thermal input ≥ 400 MW which do not operate more than 2 000 hours per year until December 2015 & 1 500 hours from January 2016 shall be subject to limit value for SO_2 emissions of 800 mg/Nm3.
Article 7(1)	In case of breakdown the operator must reduce or close down operations if a return to normal operation is not achieved within 24 hours, or operate the plant using low polluting fuels. In any case the CA shall be notified within 48 hours. Cumulative duration of unabated operation in any 12-month period shall not exceed 120 hours.
Article 9	Waste gases shall be discharged in controlled fashion by means of a stack & in

Article	Key enforceable provisions
	accordance with the licence. The stack height must be calculated as to safeguard health and the environment.
Article 10	Where a combustion plant is extended by at least 50 MW, ELVs set in part B of the Annexes shall apply to the new part & fixed in relation to the thermal capacity of the entire plant[…]
Article 13	The operator shall inform the CA […] about results of continuous measurements, the checking of measuring equipment, & all individual & other measurements carried out to assess compliance.

The WI Directive applies to facilities intended for waste incineration and also to co-incineration plants (plants that use waste to produce energy). These facilities shall not operate without an authorisation. This Directive sets some limit values for the emissions of pollutants such a heavy metals, dioxins and furans, carbon monoxide, dust, total organic carbon, hydrogen fluoride, sulphur dioxide, nitrogen monoxide and nitrogen dioxide. The main enforceable articles of the WI directive are summarised below.

Table 4: Waste Incineration Directive 2000/76/EC

Article	Key enforceable provisions
Article 4(1)	No incineration or co-incineration plant shall operate without a permit.
Article 4(2)	Applications for permits shall contain a description of specific measures.
Article 4(8)	Where the operator of an incineration/co-incineration plant for non-hazardous waste envisages a change of operation which would involve incineration/co-incineration of hazardous waste, this shall be regarded as a substantial change pursuant to Article 2(10)(b) of Directive 96/61/EC and Article 12(2) of that Directive shall apply (namely that no substantial change shall be made without a permit)
Article 5(1)	The operator of the incineration or co-incineration plant shall take all necessary precautions concerning the delivery and reception of waste in order to prevent or to limit as far as practicable negative effects on the environment[…]as well as direct risks to human health.
Article 5(2), (3) & (4)	Conditions to be followed by the operator prior to accepting the waste at the incineration plant, including -- determining the mass of each category of waste, if possible according to the EWC; -- if hazardous waste, checking waste shipment documentation, taking samples, etc.
Article 6	Sets several requirements for operation of incineration and co-incineration plants.
Article 7	Requires incineration plants to be designed, equipped, built and operated in such a way that they comply with the air emission limit values set in this article.
Article 8 (1)	No waste water from the cleaning of exhaust gases discharged from an incineration or co-incineration plant can be discharged without a permit.
Article 8(4)	Where waste water from exhaust gases cleaning is treated collectively with other on-site sources of waste water, the operator must take measurements[…] to determine emission levels in the final waste water discharge attributed to that arising from exhaust gasses cleaning.
Article 8(5)	Specific requirements to apply when cleaning of exhaust gases containing Annex IV polluting substances are treated outside the incineration or co-incineration plant.
Article 8(7)	Incineration plant sites, including waste storage areas, shall be designed to prevent unauthorised & accidental release of pollutants into soil, surface & ground water, including storage capacity for contaminated run-off from rainwater, spillage or fire-fighting operations.
Article 9	Operators shall comply with the requirements in this article on residues resulting from the operation of the incineration or co-incineration plant.

Article	Key enforceable provisions
Article 10(1)	Measurement equipment shall be installed and techniques used to monitor the parameters, conditions and mass concentrations relevant to the incineration or co-incineration process.
Article 10(2)	Measurement requirements shall be laid down in the permit or in the conditions attached to the permit issued by the competent authority.
Article 11	Operators shall comply with the measurement requirements set in this article.
Article 12(2)	For incineration/co-incineration plants with a nominal capacity of two tonnes or more/hour and notwithstanding Article 15(2) of Directive 96/61/EC, an annual report to be provided to the competent authority on the functioning and monitoring of the plant shall be made available to the public.
Article 13 (2)	In case of breakdown, the operator shall reduce or close down operations as soon as practicable until normal operations can be restored.
Article 13(3)	Incineration plants shall under no circumstances continue to incinerate waste for > 4 hours uninterrupted where ELV are exceeded; cumulative duration of such conditions over one year shall be less than 60 hours.
Article 13(4)	Total dust content of emissions into air shall under no circumstances exceed 150 mg/m3 as a half-hourly average; moreover, all Article 6 conditions shall be complied with.

2.2. Identification of key enforceable obligations

In order to provide a clear and simple comparative framework, all relevant provisions of the four directives covered by the study have been grouped under four key obligations:

Four key obligations

- ***Obligation 1:*** to apply for a permit for existing and new installations
- ***Obligation 2:*** to supply information for application for permits
- ***Obligation 3***: to notify the competent authority of any changes in the operation of an installation
- ***Obligation 4:*** to comply with the conditions set in the permit or mandatory ELVs

Table 2.2.1 next page summarises how each of these key obligations link to the relevant provisions of the IPPC, VOC, LCP and WI Directives, as per the tables in Section 2.1.

Table 5: Overview of key enforceable obligations

	IPPC Directive (2008/1/EC)	VOC Directive (1999/13/EC)	LCP Directive (2001/80/EC)	WI Directive (2000/76/EC)
Obligation 1	Obligation to apply for a permit for new or existing installations Art 4, Art 5, Art 12(2)	Obligation to apply for an authorisation/registration for new or existing installations Art 3(2), Art 4	Not relevant for LCP Directive (covered under IPPC Directive)	Obligation to apply for a permit for new or existing installations including for waste water Art 4(1), Art 4(8)
Obligation 2	Obligation to supply information for application for permits Art 6	Not relevant for VOC Directive (covered under the IPPC Directive only for relevant plants falling under the IPPC Directive)	Not relevant for LCP Directive (covered under IPPC Directive)	Obligation to supply information for application for permits Art 4(2)
Obligation 3	Obligation to notify the competent authority of any changes in the operation of an installation Art 12(1), Art 14(b)* * For the part setting a requirement to notify the CA in case of incident or accident significantly affecting the environment	Not relevant for VOC Directive (covered under the IPPC Directive only for relevant plants falling under the IPPC Directive)	Obligation to notify the competent authority of any changes in the operation of an installation Art 7(1)	Obligation to notify the competent authority of any changes in the operation of an installation
Obligation 4	Obligation to comply with the conditions set in the permit or mandatory ELV's Art 14(a) - (c)	Obligation to comply with: Conditions set in the authorisation/registration or mandatory ELV's; Art 9(1) Appropriate measures via conditions of authorisation/general binding rules including *ELVs/**FEV's/the Reduction Scheme in Annex IIB; Art 5(2)–(4), Art 5(8)-(10) Monitoring requirements; Art 8(1) and A duty to notify the competent authority of non-compliance with the Directive Art 10(a)	Obligation to comply with the conditions set in the permit or mandatory ELV's Art 4(1), (2) and (4), Art 5, Art 7(1), Art 9, Art 10, Art 13	Obligation to comply with the conditions set in the permit or mandatory conditions including ELV's Art 5(1)-(4), Art 6, Art 7, Art 8(1), Art 8(4), Art 8(5), Art 8(7), Art 9, Art 10(1)-(2), Art 11, Art 12(2), Art 13(2)-(4)

There are a few cases when the key enforceable obligations are not specifically mentioned as such in all the four directives, as follows:

- Obligations 1 and 2 to apply for a permit for existing and new installations and to supply information for application for permits are not specifically reflected in the LCP Directive. However, all LCP installations are covered by the IPPC Directive and need to operate with an IPPC permit. Therefore, as a rule, infringements to these obligations are covered by the relevant infringements to the IPPC Directive and related sanctions.

- Obligations 2 and 3 to supply information for application for permits and to notify the competent authority of any changes in the operation of an installation are not relevant in the case of the VOC Directive. Only some of the plants covered by the VOC Directive fall under the scope of the IPPC Directive. For these plants, as a rule, infringements to these obligations are covered by the relevant infringements to the IPPC Directive and related sanctions.

- With regard to the WI Directive, Obligation 3 is shaded as the Directive defines what is to be considered an essential change in relation to waste incineration plants, but does not set up an obligation to notify the CA of changes in the operation of the installation.

3. Comparative Analysis

The review of individual Member States' sanctions for infringement to industrial emissions legislation shows many differences between national frameworks and enforcement mechanisms, including the use of administrative versus criminal sanctions, and the types and level of penalties imposed.

With regards to the imposition of administrative or criminal penalties, previous studies[5] indicated that while in some countries, administrative sanctions are considered to have the same repressive and preventive character as criminal ones, in certain regimes there is a substantial distinction between administrative and criminal sanctions: for the latter, there is no social blame in the administrative sanction; rather, the only intention is to re-establish the public order. The body imposing the sanction and the proceedings to impose the sanction in many countries will be a clear tool to differentiate between both measures. In most cases the administration or administrative body will be responsible for imposing administrative measures whereas a criminal court will be in charge of imposing criminal measures. The proceedings to impose the sanctions are also different. Except in common law countries where there is not a specific and differentiate procedure to impose administrative sanctions an administrative sanction will be imposed through an administrative procedure whereas the criminal sanction will be imposed through a criminal procedure.

The tables on the next pages provide an overview of the situation in each Member State, based on country studies, while these differences and variations across Member States are further described in this section.

[5] See for instance Study on measures other than criminal ones in cases where environmental Community law has not been respected in the EU Member States, Milieu , 2003 http://ec.europa.eu/environment/legal/crime/pdf/ms_summary_report.pdf

Table 6: Operation of an installation without the required environmental permit

Member State	Administrative Penalties (Maximum amount/sentence)	Additional/other administrative sanctions	Criminal Penalties (Maximum amount/sentence)	Additional/other Criminal sanctions
Austria	Euros 72,600, 6 weeks	Closure of installation, seizure of tools, machines and equipment	Euros 1,800,000, 5 years	N/A
Belgium				
Flanders:	Euros 50,000	Suspension/revocation of permit Ban/restriction of activity	Euros 250,000, 2 years	Dissolution, ban/ restriction of activity, closure (legal)
Wallonia:	Euros 100,000	Ban/restriction of activity	Euros 10,000,000 15 years	Dissolution, ban/ restriction of activity, closure (legal)
Brussels Capital:	Euros 62,500		Euros 50,000, 12 months	Dissolution, ban/ restriction of activity, closure (legal)
Bulgaria	Euros 3,068 (natural) Euros 10,226 (legal)	Termination of activity	Euros 2,557 (natural) Euros 1,534, 3 years (officials)	N/A
Cyprus	N/A	Cancellation of licence/restriction of terms	Euros 34,172, 2 years	Ban/restriction of activity
Czech Rep.	Euros 405,872	Ban/restriction of activity	None	N/A
Denmark	None	Ban/restriction of activity	Euros 6,000, 2 years	Seizure of the net profit (legal)
Estonia*	Euros 1,200 (natural) Euros 32,000 (legal)	N/A	Euros 16,000 (legal[6])	N/A
Finland	N/A	Rectification, corrective measures	Variable fine[7], 6 years (natural) Euros 850,000 (legal)	Rectification, corrective measures
France	N/A	Ban/restriction of activity/closure	Euros 75,000, 1 year (natural) Euros 375,000 (legal)	Ban/restriction of activity, closure (legal)
Germany*	Euros 50,000	N/A	Euros 10,800,000[8], 3 years (natural) Euros 1,000,000 (legal)	N/A
Greece	Euros 500,000	Ban/restriction of activity	Euros 15,000, 2 years	N/A
Hungary*	182 – 365/ day	Ban/restriction of activity	Euros 547, 8 years (natural)	Ban/restriction of activity, dissolution, variable fine (legal)
Ireland	N/A	Ban/restriction of activity	Euros 15,000,000, 10 years	Ban/restriction of activity

[6] For natural persons, fine is proportional to income
[7] Proportional to income
[8] Hypothetical amount (unlikely in practice). The judge determines the amount of one daily unit taking into account the economic background of the convict. The maximum amount of one daily unit is 30,000 Euros/Unit, and the maximum number of daily units is 360 daily units.

Member State	**Administrative Penalties** (Maximum amount/sentence)	Additional/other administrative sanctions	**Criminal Penalties** (Maximum amount/sentence)	Additional/other Criminal sanctions
Italy	Euros 35,000	Ban/restriction of activity, revocation of permit, closure	Euros 50,000 2 years (natural[9])	Ban/restriction of activity
Latvia	Euros 711 (natural) Euros 4,269 (legal)	N/A	None	N/A
Lithuania	Euros 2,320 (natural persons/ officials)	N/A	None	N/A
Luxembourg	N/A	Ban/restriction of activity/closure	Euros 125,000, 6 months (natural) Euros 750,000 (legal)	Ban/restriction of activity(legal), closure (natural)
Malta	N/A	N/A	Euros 4,660, 2 years	Confiscation, payment for enforcement/restitution
The Netherlands	Variable fine	Withdrawal of permit, restoration damages	Euros 76,000, 6 years	N/A
Poland	Variable fine	Ban/restriction of activity	Euros 1,250, 30 days	Restriction of movement and obligation to carry out public works
Portugal	Euros 37,500 (natural) Euros 2,500,000 (legal)	Ban/restriction of activity, closure, confiscation	Liability for pollution: 8 years fine, 3 years imprisonment	N/A
Romania	Euros 23,182	Ban/restriction of activity	Continuing activity after suspension of permit: Euros 23,182, 3 years	N/A
Slovakia*	Euros 331,939	N/A	Ban on operations and/or 10 years (natural) Euros 1,660,000 (legal)	N/A
Slovenia	Euros 4,100 (natural) Euros 125,000 (legal)	Ban/restriction of activity, corrective measures, monitoring	None	N/A
Spain	Euros 2,000,000	Ban/restriction of activity/ closure	N/A	N/A
Sweden	Euros 111,394	Ban/restriction of activity	A fine[10], 2 years	N/A
UK	N/A	Ban/restriction of activity	Euros 59,772, 5 years	N/A

* Applies Quasi-Criminal fines/penalties for less serious offences (either in addition to or as an alternative to criminal ones)

[9] Includes corporate individuals
[10] Proportional to income

Slovakia*	Euros 331,939	N/A	Ban on operations and/or 10 years (natural) Euros 1,660,000 (legal)	N/A
Slovenia	Euros 225,000 (natural) Euros 375,000 (legal)	Ban/restriction of activity, corrective measures	None	N/A
Spain	Euros 2,000,000	Ban/restriction of activity/ closure	None	N/A
Sweden	Euros 111,394	Ban/restriction of activity	A fine, 2 years	N/A
UK	N/A	Ban/restriction of activity	Euros 59,772, 5 years	N/A

* Applies Quasi-Criminal fines/penalties for less serious offences (either in addition to or as an alternative to criminal ones)

3.1. General remarks

Administrative versus criminal sanctions

Not all Member States have specific provisions for both administrative and criminal sanctions relating to industrial installations. Unlike the continental legal systems which exist in most EU countries, several common law countries, or countries with a common law influence, including Ireland, Cyprus and Malta have no administrative sanctions in place for offences. Until recently, the UK had no specific provision for administrative sanctions. However, new legislation was introduced in 2010 allowing administrative sanctions to be applied to a limited number of environmental offences[11]. These sanctions are known as "Civil sanctions" and can be used against a business committing certain environmental offences, as an alternative to prosecution and criminal penalties of fines and imprisonment. Currently however, civil sanctions do not extend to those breaches of legislation in respect of industrial installations. These sanctioning powers are expected to extend to industrial installations from April 2011.

In some countries, there is no specific criminal sanction for the particular offences covered by the study. However, in most of these cases, general criminal sanctions are provided for by a criminal code or framework environmental law and as a rule, would apply. In such instances, the sanction is often conditional upon the existence of damage to the environment (Czech Republic, Latvia, Lithuania, Slovenia and Spain). Where specific criminal sanctions are set for particular offences, general criminal sanctions as described above also apply.

Whether criminal and administrative sanction regimes can apply simultaneously varies between Member States. In Denmark, Greece, Hungary, The Netherlands, Poland, Portugal, Romania, the Czech Republic and Sweden, both administrative and criminal sanctions may be applied simultaneously. However, in a number of countries including Austria, Belgium, Germany, Slovakia, and Spain, administrative and criminal sanctions cannot be applied simultaneously. Spain and Germany are typical examples of countries where the imposition of a criminal penalty excludes the possibility of imposition of an administrative sanction, by operation of the rule "non bis in idem". In Belgium, if the public prosecutor considers that the infringement to the environmental legislation is a criminal offence and triggers a criminal procedure, the administrative is suspended.

Federal States

For three Member States (Austria, Germany and Spain) the legislative competence to regulate installations is split between the Federal level and the State/Regional level. In Germany, the main rules and sanctions are set up at the federal level, but may also in certain cases be further regulated at the State level. This is the case for infringements of obligations set by the federal Water Management Act concerning the unlawful discharge of waste water from the cleaning of exhaust gases. While sanctions are established by the federal Water Management Act, sanctions are also set by the relevant laws of the States although not all States lay down sanctions, some relying only on the sanctions set u at the Federal level.

In Spain, sanctions establish at the Federal level constitute a minimum level of penalties. Autonomous communities may set more stringent penalties for infringement of the corresponding obligations set by the regional legislation. Article 149(1)(23) of the Constitution of 1978 provides that the State has exclusive competence on matters related to the protection of the environment without prejudice to

[11] The Environmental Civil Sanctions (England) Order 2010 and the Environmental Sanctions (Miscellaneous Amendments) (England) Regulations 2010

powers of the Autonomous Communities (Comunidades Autonomas) to take additional protective measures. In other words, the Autonomous Communities can provide more stringent and detailed environmental measures than the environmental legislation issued by the State which is regarded as a minima legislation. With regard to environment, the Autonomous Communities pursuant to Article 148(1)(9) of the Constitution of 1978 are competent in the management of environmental matters. This provision implies that the Autonomous Communities are competent for the inspection and enforcement of environmental legislation and that they have sanctioning power. For instance the Law 16/2002 on classified installations states that the offences encompassed in its Article 31 shall be without prejudice to the ones that can be established by the Autonomous authorities.

Several Autonomous Communities (e.g. Cataluña, Andalucía, Cantabria, Pais Vasco) but not all of them (e.g. Asturias, Madrid Community) have established their own sanctioning regime for the infringement of environmental legislation. Related to classified installations, almost all of them refer to the same offences that the ones listed in Law 16/2002 on classified installations (e.g. the operation of an activity without the integrated environmental permit, or failure to comply with the conditions set in the integrated environmental permits). However the sanctions sometimes differ from the ones set in Law 16/2002. For instance the failure to comply with the conditions established in the integrated environmental authorisation provided that there has been a serious injury or damage to the environment or such situation seriously endangered the health or safety of people can lead to a fine of Euros 3 million in Cantabria, Euros 2.4 million in Andalucía, Euros 2.5 million in Aragon, while under Law 16/2002 the same offence can lead to a fine of Euros 2 million.

On the other hand, while Belgium is a federal system, sanctions in respect of industrial emissions regulations are set at the regional level but within the framework of the Federal legislation, in particular the Criminal Code.

Competent Authorities

In most Member States, regulatory and enforcement competences are divided between a number of different "competent authorities". In several Member States, including Austria, Germany, Belgium and Bulgaria, this involves the division of regulatory functions between authorities at the national/federal level and at regional/state levels. In other countries, such as Denmark and Hungary, the regional authorities exercise the major control functions over industrial installations. In The Czech Republic, The Netherlands, UK and Ireland, regulatory functions are also carried out at the municipal/local authority level.

3.2. Administrative sanctions

In most Member States, administrative sanctions are established through a combination of sectoral legislation (e.g. legislation relating to air, waste management, and water, which transposes the requirements for each of the four Directives) as well as a single administrative code or "framework" act.

For example, in Bulgaria, the sanctions relating to industrial installations are primarily transposed by the following: the Environmental Protection Act (EPA) (SG 91/2002) (providing the general framework on environmental offences and corresponding sanctions); Ordinance SG 69/2003, (stipulating the sanctions and procedures for imposing sanctions in cases of harm/pollution of the environment above the limit values); the Clean Ambient Air Act (CAAA) (SG 45/1996) (determining sanctions in cases of breach of the air quality legislation); and the Waste Management Act (WMA) (SG 86/2003) – which lays down the penalties for breaching the requirements of waste management legislation, including for operating the installations for incineration and co-incineration of waste.

A number of Member States including Bulgaria, Cyprus, Estonia, Greece, Hungary, Portugal, Slovakia and Slovenia do not provide specific administrative sanctions for all four obligations. Instead they apply more general administrative sanctions for environmental damage. This is the case in Greece, where Article 30 of Law 1650/1986 provides for administrative sanctions in the form of a fine for any natural or legal persons that cause pollution or other degradation of the environment or who violates the provisions of the relevant legislation, independently of civil or penal responsibility.

Administrative sanctions are in most cases pecuniary sanctions (i.e. fines). However, in some countries, other measures can be applied in case of infringement of the legislation relating to industrial installations (see below).

Level of fines

In most Member States the legislation provides a range of fines which may be imposed, depending, amongst other things, on the severity of the offence and its effect on the environment. Other Member States provide specific categories of offences and corresponding levels of fines. Spain is a typical example, where offences are divided into "petty offences" "serious offences" and "very serious offences", with different levels of penalties applicable to each category of offence.

The levels and ranges of fines for administrative offences vary widely between Member States. The highest fines for administrative offences are to be found in Portugal, where a breach of the first obligation (namely the operation of an installation without a required permit, table 3.1) is punishable with a fine of up to Euros 2,500,000 for legal persons. In Czech Republic, the maximum fine for a breach of the fourth obligation (namely non-compliance with the permit/licence conditions or mandatory ELVs, table 3.4) is Euros 2,025,234. In Spain, the highest fines are imposed for breaches of the first and the fourth obligations. A breach of either obligation can result in a fine of up to Euros 2,000,000, (or even higher in the case of several Autonomous Communities). In Greece, a breach of any of the four obligations can result in a fine of up to Euros 500,000. By comparison, in Latvia the maximum fine for a breach of the fourth obligation is Euros 711 for natural persons and Euros 2,134 for legal persons.

Additional/other administrative measures

In a few Member States, such as Slovakia, a fine is the primary sanction available to regulatory authorities, while in others a "toolkit" of different enforcement measures is available to the competent authority. Additional sanctions include:

- restriction, suspension or prohibition/ban of the activity
- cancellation of the licence or restriction of its terms;
- seizure of tools, machinery and equipment;
- imposition of rectification or corrective measures on the operator;
- closure.

It is worth noting that, in Portugal, the legislation provides a comprehensive list of 'Accessory sanctions' which may also be imposed for serious and very serious environmental offences (in addition to those sanctions mentioned above). These include:

- Suspension of the right to obtain subsidies or other benefits issued by national or European public authorities or services;
- Suspension of the right to participate in national and international conferences, exhibitions or markets with the aim of selling or marketing the products or activities, or to participate in public auctions or tenders which have as their object the contract or award of public works;

- Loss of tax benefits, credit benefits and credit financing acquired prior to the offence;
- Making public the sentence;

Some of these additional sanctions are very stringent and have a very powerful deterrent effect, and could be seen as more effective than a fine regardless of its level. It should be noted that while in most countries closure is seen as a coercive measure, primarily intended to stop the damage to the environment, it is applied as a sanction in a number of countries including Austria, France, Luxembourg, Portugal and Spain.

Natural/legal persons

Most Member States provide administrative sanctions for both natural and legal persons. An exception to this is Lithuania, where administrative sanctions may be imposed on natural persons (citizens) but not legal persons. Instead, administrative liability can be imposed on "officials" of legal entities, which may include managers and heads of municipal institutions.

A number of Member States set different levels of administrative fines for natural/legal persons. More specifically, in Bulgaria, Estonia, Latvia, Portugal and Slovenia, legal liability is generally higher for legal persons than for natural persons. In Slovenia, different levels of fines are set for breaches of each of the obligations in respect of the following three categories: i) legal entities, ii) independent individuals/entrepreneurs and iii) responsible persons of those legal entities or individuals/entrepreneurs.

Coverage and level of sanctions for the different obligations considered by the study

Of the four obligations considered in this study, breaches of Obligation 1 (operation of an installation without a required permit, table 3.1) and Obligation 4 (namely non-compliance with the permit/licence conditions or mandatory ELVs, table 3.4) are generally the most sanctionable under administrative law, and carry the highest administrative penalties among the 27 Member States. In Bulgaria, Czech Republic, Hungary, and Portugal the fines are highest in respect of Obligation 4. In all other Member States the maximum levels of fines between these two obligations are the same.

The enforcement policy is usually less stringent for breaches of Obligation 3 (failure to notify the competent authority of changes in the operation of an installation, table 3.3). Of those Member States which impose administrative sanctions for non compliance, several do not impose administrative sanctions in respect of Obligation 3, namely Hungary, Latvia, and Poland. In a number of other Member States, e.g. Czech Republic, Estonia, Germany, Portugal and Spain, sanctions are lower in respect of Obligation 3, as compared with Obligations 1 and 4. In Bulgaria on the contrary, the maximum fines for Obligations 3 and 4 are the same (approximately Euros 51,125).

Obligation 2 (to supply information for permit applications, table 3.2) is the least enforceable among Member States, with a number of countries not imposing any administrative sanctions for non-compliance, e.g. Austria, Belgium (Wallonia and Brussels regions), Estonia, Germany, Hungary, Latvia, Poland, Portugal, and Slovenia. In most cases a failure to supply the required information does not constitute an offence but merely results in the permit not being granted.

Quasi-criminal sanctions

Only two Member States, Hungary and Slovakia, set quasi-criminal sanctions in addition to administrative and criminal sanctions. Such sanctions are respectively known as 'Misdemeanours' (Hungary) or 'Petty offences' (Slovakia) and are generally used for less serious offences. Quasi-

criminal sanctions carry similar penalties to criminal sanctions (see below). However, they involve a simplified procedure, and at first instance are handled by the administrative authorities rather than by the judicial system. In Hungary, only natural persons may be subject to such proceedings, while in Slovakia both legal and natural persons may be liable.

In three countries (Austria, Germany and Estonia), quasi-criminal sanctions are used instead of administrative sanctions. In Austria and Germany, such quasi-criminal sanctions are known as "administrative criminal" and are established as an alternative method of enforcement, sitting alongside criminal sanctions and administrative enforcement measures. The use of such sanctions is conditional upon the offender's negligence or intent. In Austria and Germany the aim of such sanctions is not to restore legality or to prevent danger but to have deterrent and preventive effects by imposing convictions on the perpetrator for a wrongdoing. In Estonia, such quasi-criminal offences are known as "misdemeanours", and are stipulated in the Penal Code and other laws, including sectoral legislation.

3.3. Criminal sanctions

The majority of Member States have provisions for criminal sanctions for breaches of legislation relating to industrial installations. Of those Member States, the majority of criminal sanctions are set up through a combination of sectoral legislation transposing the requirements for each of the four Directives and a single criminal code or act which establishes sanctions for breaches of that sectoral legislation e.g. Austria, Bulgaria, Germany, Denmark, Finland, Hungary, Latvia, Lithuania, and Czech Republic. In other countries, such as Estonia and Poland, environmental crimes are also set out in the relevant sectoral legislation such as waste, water, air and nature protection.

A number of Member States including Bulgaria, Cyprus, Hungary, Portugal, Slovakia and Slovenia do not have specific criminal sanctions for all four obligations. Instead they apply more general criminal sanctions for environmental damage. In Bulgaria, Article 352 of the Criminal Code makes it a crime to pollute air, water or soil, which renders it dangerous for humans, animals, and plants or makes it unfit for use for cultural, health, agricultural and other economic purposes. Such a crime is punishable with imprisonment of up to 5 years and a fine of up to Euros 2,557, with liability resting with the individual who has committed the crime. In cases of negligence, the punishment is probation or a fine of between Euros 51 and Euros 153. In minor cases the sanction is a fine up to Euros 153, imposed by administrative order.

In Portugal, there are no specific criminal offences for any of the obligations covered by this study. Instead, the Portuguese Penal Code includes a number of different categories of environmental crimes including Articles 279 and 280 of the Code, which provide for criminal liability including liability for air pollution from industrial installations. In case of fault, Article 279 establishes a penalty of 3 years maximum imprisonment and a fine of 600 days which, in accordance with Article 280, can be increased to 8 years whenever such pollution represents a danger to life, physical integrity or assets of others as well as to high value historical or cultural monuments.

By way of contrast, in Greece, breaches of the four obligations are punishable by a combination of specific and more general criminal sanctions. Article 28 of Law on Environment Protection (Law 1650/1986) provides for criminal sanctions including fines and imprisonment, for pollution or carrying out an activity/enterprise without a necessary permit, including imprisonment of between three months and two years. A failure to comply with permit conditions pursuant to Article 4 may also result in imprisonment for a period of 3 months to 2 years, or a fine or both, because of environmental pollution. However, in addition to the aforementioned offences, Greece also provides general criminal sanctions for environmental damage. Article 28(1) of Law 1650/1986 sets up offences for a) causing

pollution or degrading the environment with an action or omission that infringes the provisions of that law or published decrees and ministerial or prefectoral decisions adopted pursuant to that law or b) carrying out an activity or enterprise without the required authorisation or approval or exceeding the limits of authorisation or approval and degrading the environment.

Level of fines

Of those Member States which impose criminal sanctions, the primary penalties include imprisonment and a fine. However, there are wide variations between the maximum levels of sanctions which may be imposed. A clear illustration of this disparity can be seen by comparing the maximum levels of fines between Poland and Austria. In Poland, a breach of obligation 1 (operation of an installation with the required permit, Table 3.1) and obligation 4 (to comply with the permit/licence conditions or mandatory ELV's, Table 3.4), is punishable with a maximum penalty of Euros 1,250 and 30 days imprisonment, while in Austria the maximum penalty for breaching the same obligations is Euros 1,800,000 and 5 years respectively. Furthermore, Austria applies the same penalty for a breach of obligation 3 (to notify the competent authority of any changes to the operation of an installation, Table 3.3), while Poland does not apply any penalty.

In most Member States the levels of liability and sentencing will vary depending on the severity of the offence, for example where there is a danger to human life, and in some cases where the assets of others are endangered (e.g. Portugal). Fines may also be proportional to the benefits accrued due to non- compliance with the law (e.g. Finland). Generally, national legislation provides for more severe penalties where the offence has been intentionally or negligently committed. In some Member States, the levels of criminal sanctions are categorised according to severity, e.g. Denmark, Ireland, UK and Poland have two levels of offence, one for basic and one for more serious offences. Other member States have heavier sanctions for repeat offences (e.g. Malta), or aggravated circumstances (e.g. Finland and Austria)

As an illustration, in Austria, there are five different categories of environmental offence, for which the penalties vary depending on the level of severity of the pollution and its effect, or potential effect on the environment, as well as on the context of the pollution (e.g. disposal of waste):

Offences	**Penalties**
In non-compliance with a regulatory provision or act, operation of an installation, in which dangerous operations are carried out that have the **general potential to cause long-term deteriorations in water, soil or air quality or substantial risks to animal and plants species** (or have other impacts enumerated in the law), §§ 181d, 181e of the Criminal Code	• ***Intentional commission:*** a maximum of **2 years** imprisonment or a maximum fine of **360 daily units**[12] • ***plus aggravated circumstances:*** a maximum imprisonment of **3 years** or a maximum fine of **360 daily units** • ***Gross negligent commission:*** a maximum of **6 months** imprisonment or a maximum fine of **360 daily units** • ***plus aggravated circumstances:*** an imprisonment of maximum of **1 year** or a maximum fine of **360 daily units**

[12] Taking into account the personal guilt of the perpetrator of a criminal offence, the court decides about the number of daily units which the perpetrator is punished with. The level of payment in relation to one daily unit depends on various circumstances, e.g. the income of the perpetrator. One daily unit is a minimum amount of 4 Euros and maximum amount of 5000 Euros (§ 19(2) of the Criminal Code).

In non-compliance with a regulatory provision or act, impairments of the environment that have the **general potential to cause long-term deteriorations in water, soil or air quality or substantial risks to animal and plants species** (or have other impacts enumerated in the law), §§ 180, 181 Criminal Code:	• ***Intentional commission:*** a maximum of **3 years** imprisonment • ***plus aggravated circumstances:*** a minimum of **6 months** imprisonment and a maximum of **5 years** imprisonment • ***negligent commission:*** a maximum of **1 year** imprisonment or a maximum fine of **360 daily units** • ***plus aggravated circumstances:*** a maximum of **2 years** imprisonment or a maximum fine of **360 daily units**
In non-compliance with a regulatory provision or **act, treatment, storage and disposal of waste that has the general potential to cause long-term deteriorations in water, soil or air quality or substantial risks to animal and plants species** (or have other impacts enumerated in the law), §§ 181b, 181c Criminal Code	• ***Intentional commission***: a maximum of **2 years** imprisonment or a maximum fine of **360 daily units** • ***plus aggravated circumstances:*** a maximum imprisonment of **3 years** • ***negligent commission:*** a maximum of **6 months** imprisonment or a maximum fine of **360 daily units** • ***plus aggravated circumstances:*** an imprisonment of maximum of **1 year** or a maximum fine of **360 daily units**
• In non-compliance with a regulatory provision or act, **endangering of flora and fauna,** §§ 182, 183 of the Criminal Code	• ***Intentional commission:*** a maximum of **2 years** imprisonment or a maximum fine of **360 daily units** • ***negligent commission:*** a maximum of **6 months** imprisonment or a maximum fine of **360 daily units**
• In non-compliance with a regulatory provision or act **serious impairment by noise**, § 181a of the Criminal Code	• ***Intentional commission:*** imprisonment of **maximum 6 months** or a maximum fine of **360 daily units**

Additional/other criminal measures

Other criminal penalties applicable to legal persons include:

- restriction, suspension or prohibition/ban of the activity (e.g. Belgium (Brussels Capital), Cyprus, France, Hungary, Ireland, Italy, Luxembourg, UK);
- seizure of the net profits (e.g. Denmark),
- imposition of rectification or corrective measures on the operator (e.g. Finland, Malta);
- Dissolution of the legal entity (e.g. Belgium (Brussels Capital), Hungary)
- closure of the installation (e.g. France, Luxembourg and Belgium (Brussels Capital), France, Italy, Luxembourg, Portugal)

Natural/legal persons

Most Member States provide criminal sanctions for both natural and legal persons. Exceptions to this include Italy and Bulgaria, where criminal sanctions may be imposed on natural persons but not on legal persons. In Italy, criminal liability may be imposed on "officials" of legal entities. This may include managers and individuals who have made the relevant decisions on behalf of the corporate entity. In Bulgaria, criminal liability for intentional pollution of the soil, air or waters, rests with the individual who commited the crime, (pursuant to Article 352 of the Criminal Code). Alternatively, where an official allows exploitation of a power plant without the necessary treatment facilities, or does not fulfill their obligation to ensure continuous and proper operation of the facility, he or she will be liable (pursuant to Article 353).

Most Member States set different levels of criminal fines according to whether the perpetrator is a natural or legal person. In such cases, legal liability is generally higher for legal persons than for natural persons, e.g. in Estonia and Finland, natural persons are subject to a variable fine according to their level of income, while legal persons are subject to a specific maximum fine. In Germany, limits for natural persons are set according to maximum fines per daily unit and a maximum number of daily units. The judge determines the amount of one daily unit, taking into account such factors as the guilt and the economic background of the perpetrator.

Coverage and level of sanctions for the different obligations considered by the study

Of the 27 Member States, only 10 apply criminal penalties in respect of all four obligations, namely Belgium (Flanders), Bulgaria, Cyprus, Finland, Greece, Ireland, Malta, Slovakia, Sweden and the UK. All of those countries except Malta impose one maximum level of sanctions across all four obligations. In Malta, the highest sanctions are imposed for breach of obligations 3 and 4, with a fine of Euros 11,600 and 2 years of imprisonment.

The highest criminal penalty of all the Member States is found in Ireland, where the maximum penalty for all four obligations is Euros 15,000,000 and 15 years imprisonment. In Belgium (Wallonia), the maximum fine is Euros 10,000,000 and 15 years imprisonment.

In Austria and Germany, the level of payment is calculated on a daily unit basis. In Austria, one daily unit is a minimum of Euros 4 and a maximum of Euros 5,000, up to a maximum number of 360 daily units. This means that a breach of obligation 1 (operation of an installation with the required permit), obligation 3 (to notify the competent authority of any changes to the operation of an installation) and obligation 4 (to comly with the permit/licence conditions or mandatory ELV's), are punishable by a potential maximum fine of Euros 1,800,000 and imprisonment of up to 5 years. In Germany, the maximum fine may be even higher, since a perpetrator may be fined up to Euros 30,000 /Unit, and up to a maximum number of 360 daily units. This equates to a potential amount of Euros 10,800,000, for the most serious environmental crimes. When imposing a fine in either Austria or Germany, the judge determines the allocated amount for one daily unit and the number of daily units by taking into account a number of factors, including the level of guilt and the economic background of the perpetrator.

For the following Member States, only Obligation 1 (operation of an installation with the required permit) and Obligation 4 (to comply with the permit/licence conditions or mandatory ELVs) are sanctionable: Denmark, Germany, Hungary and Poland. Each of these applies the same level of penalty across those obligations.

As is the case for administrative sanctions, Obligation 2 (to supply information for permit applications) is the least enforceable among Member States, with a number of countries imposing no sanctions for non-compliance. Of those countries that impose criminal sanctions for breaches of environmental legislation, the following do not impose sanctions for this obligation: Austria, Belgium (Wallonia and Brussels), France, Germany, Hungary, Luxembourg and Lithuania, The Netherlands, Poland, Portugal and Romania. Two notable exceptions are Estonia and Italy, both of which impose sanctions for Obligation 1, 2 and 4. Estonia imposes sanctions for providing false information when applying for a permit, including a maximum of Euros 16,000 for legal persons and up to 1 year imprisonment for natural persons. Italy imposes its highest penalties for breaches of Obligation 2: A fine of Euros 51,646 and a maximum sentence of 3 years imprisonment for natural persons.

Annex I - Austria

AUSTRIA

1. Overview of penalties related to legislation on industrial installations

The Austrian legislation transposing Directives 2008/1/EC, 2001/80/EC, 2000/76/EC and 1999/13/EC on industrial installations provides for administrative criminal sanctions, administrative enforcement measures and criminal sanctions. Administrative criminal sanctions and administrative enforcement measures are regulated in each act transposing the Directives and criminal sanctions are regulated in the Criminal Code of Austria.

It is worth noticing that, in Austria, the legislative competence to regulate installations is split between the Federation and the states. On the federal level, the Trade, Commerce and Industry Regulation Act (GewO), the Waste Management Act (AWG), the Emission Protection Act for Boiler Plants (EG-K) and the Mineral Resource Act (MinroG) have been adopted. The states are competent in relation to IPPC installations that do not fall under the federal legislation, e.g. installations, where agricultural activities are carried out, installations for intensive rearing of animals or certain electricity producing plants. In detail, it is sometimes difficult to identify the applicable law that covers a specific installation. The following presentation provides a rough overview.

The administrative criminal sanctions for infringements of obligations transposing Directive 2008/1/EC are mainly regulated in the Trade, Commerce and Industry Regulation Act (§§ 77a, 81a-c, 353ff, Annex 3 Gewerbeordnung), but also in the Waste Management Act 2002 (Abfallwirtschaftsgesetz), the Emission Protection Act for Boiler Plants (Emmissionsschutzgesetz für Kesselanlagen) and the Mineral Resource Act (Mineralrohstoffgesetz). Additionally, except for Tyrol, where installations for the intensive rearing of animals are forbidden,[13] all Bundesländer of Austria adopted IPPC-laws mainly to transpose the obligations with regard to agricultural activities and electricity producing large combustion plants.

The Volatile Organic Compounds-Plants-Ordinance (VOC-Anlagen-Verordnung) and the federal Ordinance on Solvents (Lösungsmittelverordnung 2005) transposing Directive 1999/13/EC respectively Directive 2004/42/EC are based on the Trade, Commerce and Industry Regulation Act and do only apply to installations requiring a permit or having already received a permit under the Trade, Commerce and Industry Regulation Act. They do not provide for an independent permit procedure.

The Emission Protection Act for Boiler Plants (Emissionsschutzgesetz für Kesselanlagen), which repealed the Clean Air Quality Law for Boiler Plants (Luftreinhaltegesetz für Kesselanlagen), transposes Directive 2001/80/EC. The Emission Protection Law for Boiler Plants provides for an independent permit procedure for boiler plants and determines sanctions in case of infringements of its requirements.

[13] As the IPPC Directive refers also to slaughterhouses, treatment and processing of milk, installations for the disposal or recycling of animal carcases and animal waste exceeding a certain capacity and such plants may be subject to the legislation of the Länder Tyrol seems not to be in compliance with the Directive. Additionally, if a large combustion plant is producing electricity with a capacity over 50 MW the Bundesländer are competent for the legislation of the details of the permit procedure.

Directive 2000/76/EC was transposed by the federal Ordinance on Waste Incineration (Abfallverbrennungsverordnung), which is based on the Waste Management Act, the Trade, Commerce and Industry Regulation Act, the Emission Protection Act for Boiler Plants and the Water Management Act (Wasserrechtsgesetz), as well as the federal Ordinance on the Limitation of Waste Water Emission of the Cleaning of Incineration Gas (AEV Verbrennungsgas) that is based on the Water Management Act. The Waste Management Act provides for an independent permit procedure and determines its own sanctions.

Administrative criminal sanctions are classified as such because they are conditional upon the offender's negligence or intent and they do not aim to restore legality and to prevent danger but to have deterrent and preventive effects and to convict the perpetrator for a wrongdoing. Infringements of most of the enforceable provisions transposing the four Directives are subject to administrative criminal sanctions. These infringements entail fines or in exceptional cases imprisonment. The transposing legislation sets forth the minimum and maximum limits of fines, in the range of which the competent administrative authority shall identify the proportionate fine, taking into account the severity of the infringement. In accordance with the Administrative Penalties Act (VStG) the admissible minimum duration of imprisonment is 12 hours, imprisonment of more than two weeks is only permitted in exceptional circumstances and imprisonment longer than six weeks is prohibited. In addition to these sanctions the competent authority can also confiscate machines and tools (e.g. § 369 GewO). In accordance with the Administrative Penalties Act the competent authorities responsible for prosecution of administrative criminal sanctions are at first instance the district administrative authorities of the Bundesländer (states) while appeals can be lodged to the independent administrative tribunals of the states. According to § 5(1) of this Act intentional and negligent violations of penal administrative offences are sanctioned, unless the specific legislation regulates this differently. Since none of the legislation transposing the four Directives regulates this differently, the sanctions for infringements of the transposing legislation apply to intentional and negligent violations. Finally, the district administrative authority can withdraw the operator` s licence to pursue commercial and industrial activities, and thereby prevent him from operating an installation. The authority shall withdraw this licence, if the operator violates provisions linked to commercial and industrial activities, e.g. provisions linked to the operation of industrial installations (§ 87(1) no.3 GewO in conjunction with § 361 GewO).

In accordance with the Administrative Penalties Code (§ 9) authorised representatives of legal persons and registered partnerships are responsible for the compliance of these bodies with regulatory provisions. Legal persons and registered partnerships are liable for fines imposed on authorised representatives for the perpetrations of administrative criminal offences and any other financial impacts incurred by this perpetration.

National legislation transposing these Directives additionally provides for a number of (preliminary) enforcement measures that facilitate the competent authorities to restore legality in case of an infringement of administrative provisions. For example the GewO and the AWG entitle the competent authority to close parts of or complete installation, if requests for acting legally within the stated time period are not complied with, if the operator runs the installation without a permit; or to ban dangers to life and health of human beings or property (§ 360 (1) and (3) GewO and § 62(2) AWG); additionally, tools, machines and transport equipment can be seized (§ 360(2) GewO).

Environmental criminal law is regulated in sections 177b and 177c and 180 – 183 of the Criminal Code.[14] It does not refer to the legislation transposing the Directives and does not sanction the infringement of a regulatory provision per se, but only in combination with additional conditions.

[14] In the course of amendments to the criminal law new environmental criminal offences were introduced in 2006.

However, § 181d of the Criminal Code contains a provision dealing with the unlawful operation of an installation in general and applies to all installations falling under the scope of the legislation transposing the four Directives. Additionally, the unlawful operation of an installation can meet the conditions of all other criminally sanctioned offences. Sanctions for violating environmental criminal provisions are imprisonment and fines.

Two general characteristics of the criminal offences are noteworthy. Firstly, environmental criminal law does not require that the environment is polluted or actually at risk of being polluted; a general potential risk for the environment suffices. Secondly, the Austrian environmental criminal law (with the exemption of §§ 182f Criminal Code) is subject to the principle of administrative accessoriness. In light of this principle, an environmental criminal offence can only be committed if the perpetrator infringes a regulatory provision; and the commission of an environmental criminal offence is justified if the perpetrator complies with the administrative act authorising a polluting action, e.g. permits for installations. The only case when this principle does not apply is, when the administrative act, which authorises the polluting action, has been obtained by fraud or on the basis of incorrect information. The prosecution of a criminal offence and the subsequent court procedures are regulated in the Code of Criminal Procedure.

Taking into account the fact that the provisions of criminal environmental law do not sanction the infringement of a specific regulatory provision per se, these provisions can not be exclusively assigned to one of the obligations scrutinised in the tables below. For the purpose of a comprehensive presentation they are described below instead of being repetitively included in each row of each table bearing in mind that in light of the principle of administrative accessoriness, the infringement of all regulatory provisions, including the obligations presented in the tables below, leads to criminal sanctions if the following conditions are met:

Criminal Offences	**Penalties**
In non-compliance with a regulatory provision or act, **operation of an installation,** in which dangerous operations are carried out that have the general potential to cause long-term deteriorations in water, soil or air quality or substantial risks to animal and plants species (or have other impacts enumerated in the law), §§ 181d, 181e of the Criminal Code	• Intentional commission: a maximum of 2 years imprisonment or a maximum fine of 360 daily units[15] • plus aggravated circumstances: a maximum imprisonment of 3 years or a maximum fine of 360 daily units • **Gross** negligent commission: a maximum of 6 months imprisonment or a maximum fine of 360 daily units • plus aggravated circumstances: an imprisonment of maximum of 1 year or a maximum fine of 360 daily units
In non-compliance with a regulatory provision or act, impairments of the environment that have the general potential to cause long-term deteriorations in water, soil or air quality or substantial risks to animal and plants species (or have other impacts enumerated in the law), §§ 180, 181 Criminal Code:	• Intentional commission: a maximum of 3 years imprisonment • plus aggravated circumstances: a minimum of 6 months imprisonment and a maximum of 5 years imprisonment • negligent commission: a maximum of 1 year imprisonment or a maximum fine of 360 daily units • plus aggravated circumstances: a maximum of 2 years imprisonment or a maximum fine of 360 daily units
In non-compliance with a regulatory provision or act, treatment, storage and disposal of waste that has the general potential to cause long-term deteriorations in water, soil or air quality or substantial risks to animal and plants species (or have other impacts enumerated in the law), §§ 181b, 181c Criminal Code	• Intentional commission: a maximum of 2 years imprisonment or a maximum fine of 360 daily units • plus aggravated circumstances: a maximum imprisonment of 3 years • negligent commission: a maximum of 6 months imprisonment or a maximum fine of 360 daily units • plus aggravated circumstances: an imprisonment of maximum of 1

[15] Taking into account the personal guilt of the perpetrator of a criminal offence, the court decides about the number of daily units which the perpetrator is punished with. The level of payment in relation to one daily unit depends on various circumstances, e.g. the income of the perpetrator. One daily unit is a minimum amount of 4 Euros and maximum amount of 5000 Euros (§ 19(2) of the Criminal Code).

	year or a maximum fine of 360 daily units
• In non-compliance with a regulatory provision or act, endangering of flora and fauna, §§ 182, 183 of the Criminal Code	• Intentional commission: a maximum of 2 years imprisonment or a maximum fine of 360 daily units • negligent commission: a maximum of 6 months imprisonment or a maximum fine of 360 daily units
• In non-compliance with a regulatory provision or act serious impairment by noise, § 181a of the Criminal Code	• Intentional commission: imprisonment of maximum 6 months or a maximum fine of 360 daily units

With the entry into force of the Association Liability Law (Verbandsverantwortlichkeitsgesetz – VbVG) as of 1 January 2006, criminal liability in the context of criminal law of autonomous corporations is possible in Austria for the first time. From this time onward associations can be made liable for all offences (including environmental offences, in as far as this is provided in special laws). Legal persons (including public corporations, with the exception when those are involved in the execution of the law), partnerships, registered acquisition enterprises and European Economic Interest Groupings are to be subsumed under the term "Association". They can be held criminally liable like private individuals, with the difference that only a fine can be imposed on them. The following section summarises important issues in relation to the liability of associations:

- The prerequisite is the perpetration of an offence by a natural person who presides over the association as a decision-maker (as an executive with representation rights, exercising supervisory powers in a managerial position or otherwise as the result of substantial influence on the management) or who has employment status with the association and carries out work for the association (employee).

- The offences committed by such persons must (i) be to the advantage of the association or (ii) constitute a breach of duty, for the adherence of which the association is liable.

- Thus, an association is liable every time a decision-maker violates criminal law. The association is liable for offences committed by an employee if (i) the employee committed the offence and (ii) the perpetration of the offence was made possible or facilitated by technical, organisational or employment measures of the association. In general, the personal liability of the decision-maker and the employee does not eliminate the liability of the association.

- The fine is charged in daily rates (from 40 to 180) in the amount of the 360th part of the annual revenue (at least Euros 50 no more than Euros 10,000.00 a day).

- The liability of an association is even conceivable, if the damaged occurred due to an employee's omission to take due care.

Criminal environmental law has been subject to criticism in relation to the principle of administrative accessoriness. It is considered as ineffective that pollution of the environment is only sanctioned under the condition that administrative obligations have been infringed. Criminal sanctions preventing the environment from being polluted irrespective of the infringement of administrative obligations were requested.[16]

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Austria

[16] Criticism summarised by the NGO, oekobüro, available at:
http://www.oekobuero.at/start.asp?showmenu=yes&fr=&b=1408&ID=15365

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.
Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Austria. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

In addition some remarks should be made regarding the relationship between the pieces of Austrian legislation applicable in relation to sanctions for infringements of obligations set up by each of the four Directives.

In relation to the different pieces of legislation transposing Directive 2008/1/EC it must be noted that most of the installations in the meaning of Directive 2008/1/EC fall under the scope of the Trade, Commerce and Industry Regulation Act (GewO); they are listed in Annex 3 to the GewO. Some IPPC installations fall under the scope of the Waste Management Act (AWG), the Emission Protection Act for Boiler Plants (EG-K) or the Mineral Resource Act (MinroG) that are *leges speciales* in relation to these installations. The IPPC laws of the Bundesländer (states) complement the federal laws in relation to installations that carry out agricultural activities. The following bullet points in more detail describe

the relation between the Trade, Commerce and Industry Regulation Act and the three *leges speciales*.

- Waste treatment plants falling under the scope of the IPPC Directive are regulated in the Waste Management Act (AWG) and the Trade, Commerce and Industry Regulation Act (GewO). Since the Waste Management Act (AWG) is lex specialis in relation to these installations the Waste Management Act is primarily applicable. If waste treatment plants are exempted from the scope of the Waste management act, e.g. waste treatment plants that are part of an industrial or commercial installation in the meaning of the Trade, Commerce and Industry Regulation Act and exclusively recover waste that is produced in these installations (§ 37(2)no.3 AWG), the Trade, Commerce and Industry Regulation Act is applicable.[17]

- The Emission Protection Act for Boiler Plants (EG-K) applies to boiler plants and gas turbine plants. Many of them are large combustion plants in the meaning of Directive 2008/1/EC. The Emission Protection Act for Boiler Plants is lex specialis for these IPPC installations.

- Mining processing plants in the meaning of the IPPC Directive fall under the Mineral Resource Act (MinroG), if they are run in an operational context with prospecting for or extraction of mineral resources. Otherwise, they fall under the Trade, Commerce and Industry Regulation Act (GewO).

The Volatile Organic Compounds-Plants-Ordinance (VAV) transposing Directive 1999/13/EC sets requirements and emission limit values for installations that require permits under the Trade, Commerce and Industry Regulation Act (GewO).

The Emission Protection Act for Boiler Plants (EK-G) transposes Directive 2001/80/EC in relation to boiler plants and gas turbine plants. Installations in the meaning of this Directive that do not fall under the Emission Protection Act for Boiler Plants (EK-G) are covered by the provisions of the Trade, Commerce and Industry Regulation Act (GewO) or the Waste Management Act (AWG) or the respective IPPC laws of the states. For the sake of a comprehensive presentation the provisions of the Trade, Commerce and Industry Regulation Act, the Waste Management Act and the IPPC laws of the states are not presented in the table on Directive 2001/80/EC. They are included in the tables on Directive 2008/1/EC and Directive 2000/76/EC.

Transposing Directive 2000/76/EC the substantial requirements for waste-incineration and co-incineration installations are regulated in the Ordinance on Waste Incineration (AVV), which is based on the Waste Management Act (AWG), the Trade, Commerce and Industry Regulation Act (GewO) and the Emission Protection Act for Boiler Plants (EG-K). These three basic acts regulate the permit procedures for different installations that incinerate or co-incinerate waste, e.g. the Waste Management Act regulates the permit procedure for waste treatment plants that incinerate or co-incinerate waste. For the purpose of a comprehensive presentation the first three rows of the table on Directive 2000/76/EC only present the relevant provisions of the AWG. The corresponding provisions in relation to the Trade, Commerce and Industry Regulation Act (GewO) are presented in the table on Directive 2008/1/EC and the corresponding provisions of the Emission Protection Act for Boiler Plants (EK-G) are presented in the table on Directive 2001/80/EC.

As explained in the introduction the Austrian sanctioning system distinguishes between criminal and administrative criminal sanctions on the one hand and administrative enforcement measures on the other hand. Only the criminal and administrative criminal sanctions are presented in the following tables.

[17] With regard to the complex issue of the application of the AWG or the GewO in specific cases see also Holoubek/Potacs, Handbuch des öffentlichen Wirtschaftsrechts, 2002, p. 522 s.

Table 2.10 *Directive 2008/1/EC (IPCC Directive): types of offences and related administrative and criminal penalties in Austria*

	Administrative criminal		Criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to apply for a permit for new or existing installations	Construction, operation of and substantial changes to IPPC-installations that fall under the scope of the GewO without permit, ***§§ 366(1) no.2, 74 of GewO***	Maximum fine of Euros 3.600	See introduction	See introduction

Annex II – Belgium

BRUSSELS CAPITAL REGION

1. Environmental protection: a regional competence

Belgium is a Federal State composed of three communities (the Flemish Community, the French Community and the German-speaking Community) and three regions (the Walloon Region, Flanders and the Brussels Capital region).

Division of competences between the communities, the regions and the federal authority outlined in the special law on institutional reforms of 8 August 1980[20] is complex and still on-going.

The federal authority remains competent in several areas, such as national defence, justice, labour law, consumer protection and some aspects of public health (the remaining aspects having been transferred to the communities). Environmental protection is of regional competence. However, the federal authority is still competent for:

- Establishing product standards;
- Protection against radiation, including radioactive waste;
- Transit of waste; and
- Import, export and transit of non-indigenous species.

The Brussels Capital Region is thus competent to transpose Directive 2008/1/EC, Directive 1999/13/EC, Directive 2001/80/EC and Directive 2000/76/EC and enforce their requirements through the setting of sanction regimes and inspection bodies.

Even though the Regions are competent to set their own sanction regime, this has to be done in the framework of the Federal legislation, in particular the Criminal Code. This is important in relation to the applicability of sanctions to legal persons. The provisions related to the criminal liability of legal persons in Belgium are included in Article 7(bis) of the Federal Criminal Code. The criminal sanctions for legal persons (a fine, the confiscation of goods, the dissolution of the legal person, the prohibition to exercise an activity, the closure of the activity, the publication or dissemination of the decision) are thus harmonised in the three regions.

Another specificity of the Belgian criminal system, which applies across the three regions, is that criminal fines shall be multiplied by 5.5 according to the legal coefficient fixed on the current monetary value (*système des décimes additionnels*).[21]

2. Overview of penalties related to legislation on industrial installations

Directive 2008/1/EC was transposed by Ordinance of 5 June 1997 on environmental permits that sets the criminal offences and their related sanctions. The administrative offences to the requirement of this Ordinance and their related sanctions are set under Ordinance of 25 March 1999 related to the research, investigation, detection, prosecution and punishment of offences related to the environment[22] (Ordinance on environmental offences).

Directive 1999/13/EC, Directive 2001/80/EC and Directive 2000/76/EC were transposed by governmental Orders in the (BCR).[23] These Orders do not set any sanctions. The activities that fall

[20] Loi spéciale de réformes institutionnelles du 8 août 1980 (M.B. du 15/08/1980, p. 9434)
[21] Loi du 5 mars 1952 relative aux décimes additionnels sur les amendes pénales.
[22] Ordonnance du 25 mars 1999 relative à la recherche, la constatation, la poursuite et la répression des infractions en matière d'environnement.
[23] Directive 1999/13/EC was transposed by several Order of the Government of the Brussels Capital Region. Directive 2001/80/EC was transposed by Order of the Government of the Brussels Capital Region related to the emission of certain pollutants in the atmosphere from large combustion plants *(Arrêté du gouvernement de la Région de Bruxelles-Capitale*

under these Orders shall be granted an environmental permit under the Ordinance on environmental permits and the requirements set by the sectoral Orders mentioned above are considered as conditions to be fulfilled in environmental permits. The non-compliance with the conditions set in the environmental permits are qualified criminal and administrative offences respectively under the Ordinance on environmental permits (see Article 96(1)(1)) and the Ordinance of 25 March 1999 related to the research, investigation, detection, prosecution and punishment of offences relating to the environment (See Article 33(5)).

Administrative or criminal sanctions apply in case of infringement of environmental legislation in the BCR. However if the public prosecutor considers that the infringement to the environmental legislation is a criminal offence and initiate a criminal procedure the administrative one shall be suspended.

The Ordinance on environmental offences gathers all the administrative sanctions related to the infringement of the environmental legislation of the Brussels Region (maximum fine of Euros 62,500).

Each specific sectoral environmental legislation such as for instance the Ordinance of 7 March 1991 related to the prevention and management of waste[24] or the Ordinance of 5 June 1997 on environmental permits[25] transposing the IPPC Directive sets criminal sanctions for infringement of their requirements (e.g. penalties of imprisonment up to one year and a fin up to Euros 25,000 to operate an installation without a permit). The Ordinance on environmental offences also sets specific criminal sanctions that judges can take when dealing with infringements of environmental legislation (e.g. the partial or total closure of an installation).

The authority in charge of enforcing environmental legislation in the Brussels Region is the Environmental Inspectorate of the Brussels Environmental Agency.[26] The Ordinance on environmental offences empowers the inspectors of this Agency to issue warning and injunctions where necessary.[27]

3. Review of offences and sanctions

a) Enforceable provisions covered by penalties in the Brussels Region

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions, which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive, are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code, which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any

infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Latvia. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Table 2.14 *Directive 2008/1/EC (IPPC Directive): types of offences and related administrative and criminal penalties in the Brussels Region*

	Administrative		Criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to apply for a permit for new or existing installations	Operating an installation without an environmental permit (Installations of category I A, I B and II) or a preliminary declaration (Installations of category I C or III) or without the approval required *(agrément)*. ***Article 33(5)(a) of the Ordinance of 25 March 1999***	A fine between Euros 625 to 62, 500. ***Article 33) of the Ordinance of 25 March 1999***	Operating an installation without an environmental permit (Installations of category I A, I B and II) or a preliminary declaration (Installations of category I C or III) or without the approval required *(agrément)*. ***Article 96(1)(2) of the Ordinance on environmental permits***	Imprisonment from 8 to 12 months and/or a fine from Euros 2,50 (x 5.5) to 12,500 (x5.5)[28] A fine from Euros 2,50 (x 5.5) to 12 500 (x 5.5) for category I B installations, and installations requiring an approval A fine from Euros 25 (x 5.5) to 25,000 (x 5.5) for category IA installations These fines are multiplied by two when the infringement is knowingly done and with a profit motivation. ***Article 96 of the Ordinance on environmental permits*** Complementary measures that can be issued by a judge Confiscation of movable goods that can potentially harm the environment Sum of money equivalent to the spending of the region, communities or Brussels Environment Agency to prevent, reduce end or remedy harm to the environment or public health

[28] It is crucial to note that in Belgium criminal fines shall be multiplied by 5.5 according to the legal coefficient fixed on the current monetary value *(système des décimes additionnels)*

				The rehabilitation of the environment to its previous state The closure or suspension in part or totally of the activity The prohibition to exercise a professional activity ***Article 24 of the Ordinance of 25 March 1999.*** Sanctions for legal persons : fine, confiscation, the dissolution of the legal persons, prohibition to exercise an activity, closure of the activity, publication or dissemination of the sentence (and/or). ***Article 7 (bis) of the federal Criminal Code***
Obligation to supply information for application for permits	Not considered an administrative offence		Not considered as a criminal offence	
Obligation to notify the competent authority of any changes in the operation of an installation	Not considered an administrative offence		Failure to comply with the obligations of holders of environmental permits. These obligations include the notifications to the competent authorities of any changes since the issue of the environmental permits. ***Article 96(1)(5) of the Ordinance on environmental permits***	Imprisonment from 8 to 12 months and/or a fine from Euros 2,50 (x 5.5) to 12,500 (x 5.5) A fine from Euros 2,50 (x 5.5) to 12 500 (x 5.5) for category I B installations, and installation requiring an approval[29] A fine from Euros 25 (x 5.5) to 25,000 (x 5.5) for category IA installations The fine is two-fold when the

FLANDERS

1. Environmental protection: a regional competence

Belgium is a Federal State composed of three communities (the Flemish Community, the French Community and the German-speaking Community) and three regions (the Walloon Region, Flanders and the Brussels Capital Region).

Division of competences between the communities, the regions and the federal authority outlined in the 8 August 1980 special law of institutional reforms,[30] as amended, is complex and still on-going.

The federal authority remains competent in several areas, such as national defence, justice, labour law, consumer protection and some aspects of public health. Environmental protection is under the competence of the regions. However, the federal authority is still competent for:
- Establishing product standards;
- Protection against radiation, including radioactive waste;
- Transit of waste; and
- Import, export and transit of non-indigenous species;

Flanders is thus competent to transpose Directive 2008/1/EC, Directive 1999/13/EC, Directive 2001/80/EC and Directive 2000/76/EC and enforce their requirements through the setting of sanction regimes and inspection bodies.

Even though the Regions are competent to set their own sanction regime, this has to be done in the framework of the Federal legislation, in particular the Criminal Code. This is important in relation to the applicability of sanctions to legal persons. The provisions related to the criminal liability of legal persons in Belgium are included in Article 7(bis) of the Federal Criminal Code. The criminal sanctions for legal persons (a fine, the confiscation of goods, the dissolution of the legal person, the prohibition to exercise an activity, the closure of the activity, the publication or dissemination of the decision) are thus harmonised in the three regions.

Another specificity of the Belgian criminal system, which applies across the three regions, is that criminal fines shall be multiplied by 5.5 according to the legal coefficient fixed on the current monetary value (*système des décimes additionnels*).[31]

2. Overview of penalties related to legislation on industrial installations

In Flanders the legal framework for industrial installations is encompassed in the Decree of 28 June 1985 on environmental permits (hereinafter 1985 Decree).[32] This Decree has been implemented by two executive Orders (VLAREM I and VLAREM II) of the Flemish Government that regulate in details the licensing procedure and environmental conditions for environmentally harmful establishments. The Decree of the Flemish Government on the establishment of the Flemish

[30] Loi spéciale de réformes institutionnelles du 8 août 1980 (M.B. du 15/08/1980, p. 9434).
[31] Loi du 5 mars 1952 relative aux décimes additionnels sur les amendes pénales.
[32] 28 JUNI 1985. - Decreet betreffende de milieuvergunning. Decree of 28 June 1985 on environmental permits, (publication on 17 September 1985, entry into force on 01 September 1991, last amendment by Decree of the Flemish Council of 11 June 2010).

Regulations concerning environmental permits (hereinafter VL:AREM I), dates from February 1991.[33] Vlarem II is the Decree of the Flemish Government of 1 June 1995 concerning general and sectoral provisions relating to environmental hygiene (hereinafter VLAREM II).[34] VLAREM II contains the environmental conditions that apply to installations.

The Decree of 5 April 1995 on general provisions on environmental policy (hereinafter 1995 Decree) lays down provision on monitoring and penalties (Title XVI).

In addition, the Decree of 12 December 2008 of the Decree on environmental policy (hereinafter 2008 Decree) lays down the procedure that must be followed in establishing and contesting an environmental violation or environmental crime. Its Annex contains a list of environmental offences, subject to an administrative fine.[35]

The requirements of Directive 2008/1/EC, Directive 1999/13/EC, Directive 2001/80/EC and Directive 2000/76/EC have been transposed via (amendment to) VLAREM II.

Pursuant to Article 39 of the 1985 Decree the enforcement procedure related to the infringement of the requirements of this Decree and two implementing executive Orders (VLAREM I and VLAREM II) shall be set in conformity with Title XVI of the 1995 Decree. Chapter VI of Title XVI of the 1995 Decree regulates criminal enforcement in relation to environmental infringements. This Decree provides for catch-all criminal offences and does not set criminal sanctions for the specific infringements of the requirements of the Directives related to industrial installations. For instance, Article 16.6.1 of the 1995 Decree provides that each breach of environmental legislation committed deliberately or by lack of precaution or care can be punished with a fine of Euros 100 (x 5.5) to 250,000 (x 5.5) and/or imprisonment of one month to one year.

If the public prosecutor considers that the infringement to the environmental legislation is a criminal offence and triggers a criminal procedure, the administrative one shall be suspended (see Article 16.4.30 and following of the 1995 Decree).

An administrative sanction (*bestuurlijke maatregel*) is a measure that is aimed specifically at terminating an environmental infringement or an environmental crime, to undo its consequences and to prevent recurrence, in other words, it aims at restoration of the environment. The supervisor (the Environmental Inspectorate), governor or mayor is empowered to take an administrative measure. These can be an order for regularisation, a prohibition order and/or a form of administrative order.[36] Administrative sanctions are regulated in the 1995 Decree. Title XVI, Chapter IV regulates administrative enforcement; Articles 16.4.5 and following further regulate the administrative sanctions.

According to Article 16.4.7 of the 1995 Decree, administrative enforcement measures may take the form of, for example, an order to the suspected offender to take steps to reduce the environmental infraction or environmental crime, to partially or fully terminate its effects or to avoid repetition; or an order to the suspected offender to end activities, operations or to end the use of certain items.

[34] 1 JUNI 1995. - BESLUIT van de Vlaamse regering houdende algemene en sectorale bepalingen inzake milieuhygiëne.
[35] 12 DECEMBER 2008. - Besluit van de Vlaamse Regering tot uitvoering van titel XVI van het decreet van 5 april 1995 houdende algemene bepalingen inzake milieubeleid (entry into force on 01 May 2009).
[36] See: http://www.lne.be/themas/handhaving/afdeling-milieuhandhaving-milieuschade-en-crisisbeheer.

An administrative fine (*bestuurlijke geldboete*) is a penalty where the offender is required to pay a sum of money. For administrative fines, a distinction is made between an exclusive or alternative fine (Article 16.4.27 of the 1995 Decree).

- An exclusive administrative fine is only imposed in case of environmental offences. These are infringements to the administrative requirements, exhaustively listed by the Flemish Government in the Annexes to the Implementation Decree on the Environment (2008 Decree). These infringements cannot be subject to criminal sanctions. The amount of an exclusive administrative fine can be up to a maximum of Euros 50,000. Article 16.4.40 and followings lay down the requirements for the exclusive administrative sanctions.

- An alternative administrative fine can only be imposed for environmental crimes. In principle, these offences are dealt with under criminal law, however when the public prosecutor decided not to prosecute a case and timely notifies the Department Enforcement of Environmental damage and crisis management (*Afdeling Milieuhandhaving, Milieuschade en Crisisbeheer*, AMMC), the environmental crime is punishable by an alternative administrative fine. This amounts to between 0 and maximum Euros 250,000. Article 16.4.31 to 16.4.39 lay down the requirements for the alternative administrative sanctions.

- In addition, the 1995 Decree provides for other coercive administrative measures. Pursuant to Title XVI, Chapter IV of the Decree on environmental policy, environmental inspectors, governors and mayors are empowered to issue administrative coercive measures aiming at terminating infringements to environmental legislation (e.g. injunctions to comply with environmental requirements, the suspension of the operation of the installations, the sealing of the installations).

The Environmental Inspection Division of the Department of Environment, Nature and Energy[37] of the Flemish Region is in charge of enforcing the Flanders environmental legislation and consequently the requirements of the Directives on industrial installations. The environmental Inspection is responsible for supervising installations. The inspectors can issue advices, warnings and final notices. If it operates without a permit, an installation can be subject to closure, partial or full.

3. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Belgium (Flanders)

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in

[37] Afdeling Milieu-inspectie van het Departement Leefmilieu, Natuur en Energie.

framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

On the basis of Article 16.6.1 of the 1995 Decree, any violation of regulations enforced by the 1995 Decree (covering the 1985 Decree and VLAREM I and II), committed intentional or through lack of foresight or prudence is punishable by imprisonment from one month to two years and a fine of Euros 100 to 250,000, or one of these penalties (environmental *crime*).[38] These penalties do not apply to behaviour defined as an environmental *offence* (on the basis of Article 16.1.2, 1, and Article 16.4.27 (a) of the 1995 Decree), and listed in the Annexes to the 2008 Decree as exclusive administrative sanctions.

Failure to comply with the legal obligations that are listed in the Annex is considered an environmental offence.

For example, Article 5.43.2.1.3 Vlarem II (Section 5.43.2 on large combustions plants) regulates that smoke and exhaust gases from combustion plants shall be discharged through a chimney in a controlled manner (Art. 9 LCP Directive). Article 5.43.2.1.3(7) states that the results of the measurement or calculations must be kept available for inspection by the supervisory officials, which is marks as an offence in Annex VII to the 2008 Decree, subject to an alternative administrative sanction.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Flanders. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste

incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

On their request, the operator provides the supervisory officials the relevant information on the recourse used and produces in the installation, products, waste streams or emissions. • The information derived from the obligations for measurement and registration is kept by the operator , and shall remain available for	Same as above

	inform the competent authority regarding of releases (Section 4.2.4). • Art. 4.1.3.3 and 4.1.3.4 require the operator to take measures immediately when damage to the environment threatens, and informs the mayor and relevant competent authorities. • Section 4.1.8 requires a yearly environment report.		supervision by the competent authority for a period of five years (Section 4.1.4.). • The operator has the obligation to inform the competent authority regarding of releases (Section 4.2.4). • Art. 4.1.3.3 and 4.1.3.4 require the operator to take measures immediately when damage to the environment threatens, and informs the mayor and relevant competent authorities. • Section 4.1.8 requires a yearly environment report.	

WALLOON REGION

1. Environmental protection: a regional competence

Belgium is a Federal State composed of three communities (the Flemish Community, the French Community and the German-speaking Community) and three regions (the Walloon Region, Flanders and the Brussels Capital Region)

Division of competences between the communities, the regions and the federal authority outlined in the special law on institutional reforms of 8 August 1980 special law of institutional reforms[42] is complex and still on-going.

The federal authority remains competent in several areas, such as national defence, justice, labour law, consumer protection and some aspects of public health. Environmental protection is under the competence of the regions. However, the federal authority is still competent for:
- Establishing product standards;
- Protection against radiation, including radioactive waste;
- Transit of waste; and
- Import, export and transit of non-indigenous species.

The Walloon Region is thus competent to transpose Directive 2008/1/EC, Directive 1999/13/EC, Directive 2001/80/EC and Directive 2000/76/EC and enforce their requirements through the setting of sanction regimes and inspection bodies.

Even though the Regions are competent to set their own sanction regime, this has to be done in the framework of the Federal legislation, in particular the Criminal Code. This is important in relation to the applicability of sanctions to legal persons. The provisions related to the criminal liability of legal persons in Belgium are included in Article 7(bis) of the Federal Criminal Code. The criminal sanctions for legal persons (a fine, the confiscation of goods, the dissolution of the legal person, the prohibition to exercise an activity, the closure of the activity, the publication or dissemination of the decision) are thus harmonised in the three regions.

Another specificity of the Belgian criminal system, which applies across the three regions, is that criminal fines shall be multiplied by 5.5 according to the legal coefficient fixed on the current monetary value (*système des décimes additionnels*).[43]

2. Overview of penalties related to legislation on industrial installations

Directive 2008/1/EC was transposed in the Walloon Region by the Decree on environmental permit[44] which, read in conjunction with the Decree on environmental offences,[45] sets the offences and the related administrative and criminal sanctions.

Directive 1999/13/EC, Directive 2001/80/EC and Directive 2000/76/EC were transposed by Orders of the Government of the Walloon Region.[46] These Orders do not set any sanctions. The activities that

[42] Loi spéciale de réformes institutionnelles du 8 août 1980 (M.B. du 15/08/1980, p. 9434)
[43] Loi du 5 mars 1952 relative aux décimes additionnels sur les amendes pénales.
[44] Décret du 11 mars 1999 relatif au permis d'environnement.
[45] Décret relatif à la recherche, la constatation, la poursuite et la répression des infractions et les mesures de réparation en matière d'environnement.
[46] Arrêté du Gouvernement de la Région de Bruxelles-Capitale du 21 Novembre 2002 relatif à l'incinération des déchets.

fall under these Orders shall, however, be granted an environmental permit under the Ordinance on environmental permit and the requirements set by the sectoral Orders mentioned above are considered as conditions to be fulfilled in environmental permits, their infringements leading to administrative or criminal sanctions pursuant to the Decree on environmental permit read in conjunction with the Decree on environmental offences.

Administrative or criminal sanctions apply in case of infringement of environmental legislation in the Walloon Region. However if the public prosecutor considers that the infringement to the environmental legislation is a criminal offence and triggers a criminal procedure, the administrative one shall be suspended.

The Decree on environmental offences gathers the different categories of administrative and criminal sanctions. It classifies environmental sanctions in four categories (category 1 being the more stringent). Criminal sanctions of category one can lead to imprisonment from 10 to 15 years and a fine up to Euros 10,000,000 (these are infringements leading to category 2 sanctions that were done in purpose and maliciously or that potentially endangered human health). The administrative sanctions listed in this Decree can lead to a fine up to Euros 100,000.

The Police and Inspection of the General Directorate of Agriculture, Natural Resources and Environment[47] is in charge of inspecting and enforcing the environmental legislation in the Walloon Region. In case of infringement a letter of formal notice is sent to the operators of industrial installations. If within a specific deadline the operator does not comply with the relevant injunctions, the inspectors can issues enforcing measures such as the fall or partial suspension of the activity, the sealing of the activity or any other appropriate measures to eliminate any risk to the environment and human health.[48]

a) Enforceable provisions covered by penalties in Walloon Region

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions, which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive, are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code, which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Wallon Region. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Annex III - Bulgaria

BULGARIA

1. Overview of penalties related to legislation on industrial installations

In Bulgaria, the legal system is based upon the continental system of codification. The Environmental Protection Act (SG91/2002) is the primary legislation relating to industrial installations. More specific legislative provisions relating to each of the four Directives is outlined below. Breach of environmental laws and/or permits in Bulgaria may involve administrative and/or criminal liabilities. Administrative and criminal liability and sanctions are regulated in two framework acts, the Administrative Violations and Sanctions Act and the Criminal Code.

Environmental offences and corresponding sanctions are set up in specific environmental laws and, in conformity with the general principle of '*lex specialis derogat legi generali*' the legal provision, which governs a specific matter, takes precedence over the general law. The rule is that the administrative offences and sanctions shall be laid down in laws. As an exception they may be laid down in an Ordinance. In the area of industrial installations, covered by this study these are provided in the following legislative acts:

- Environmental Protection Act (EPA) (SG 91/2002) – provides general framework on environmental offences, corresponding sanctions and competent authorities.
- Ordinance on the Procedures for Determining and Imposing Sanctions for Harming or Polluting the Environment over the limit values (SG 69/2003). The Ordinance is issued on the basis of Article 69 of the EPA and stipulates the sanctions and the procedures for imposing of sanctions in cases of harm to or pollution of the environment above the limit values or in cases of breach of the ELVs laid down in the environmental permits or integrated permits.
- Clean Ambient Air Act (CAAA) (SG 45/1996) – determines sanctions in cases of breach of the air quality legislation and, in particular, the provisions transposing the VOC Directive and LCP Directive.
- Waste Management Act (WMA) (SG 86/2003) – lays down the penalties for breaching the requirements of waste management legislation, including for operating the installations for incineration and co-incineration of waste.

The competent authorities may impose administrative sanctions such as fines. Either individuals or legal entities may be administratively liable in the case of a violation of established statutory/permit requirements. The competent authorities have the power to impose one-off or recurrent fines, to take administrative coercive measures against operators (including termination of the activity), to issue mandatory prescriptions (for stopping non-compliance with the permits and/or legal provisions) and/or revoke or amend the granted permit. The competent authorities (CA) for industrial installations in Bulgaria are the Minister of Environment and Water (or officials duly authorised thereunder) - at national level and the Directors of the Regional Inspectorates on Environment and Waters (RIEW) (or duly authorised officials) - at regional level.

Pursuant to the Environmental Protection Act, Article 158, the CA has the power to impose administrative coercive measures in case of:
1. Accidents caused by acts or lack of action of owners or users of facilities and areas;
2. Disaster situations;
3. Occurrence of an immediate danger of environmental pollution or damage or of damage to human health or property;
4. Prevention or termination of administrative violations related to environmental protection, as well as prevention and/or elimination of the harmful consequences of such violations.

Coercive administrative measures can be preventive, suspensive and/or restorative (EPA Article 159(1)). In performing their control functions, the CA may carry out on-site inspections, document checking, sample and monitoring testing. According to the Bulgarian legislation, the CA should apply the principle of proportionality when laying down sanctions, taking into account the specific circumstances of each particular case and the purposes of the administrative penalties specified in Article 12 of the Administrative Violations and Sanctions Act and requirements set out in Article 27 - severity of the infringement, motivation of the offender, his economical status and other other mitigating and aggravating circumstances, as well as the extent of the risk caused by the infringement.

The Ordinance on the Procedures for Determining and Imposing Sanctions for Harming or Polluting the Environment over the limit values sets up a method and rules for determining the sanctions in case of breach of the ELVs –the pecuniary sanction is calculated on the basis of a single amount of the penalty for each pollutant, the total quantity of the pollutant emission over the ELV and the duration of the violation.

The Criminal Code has only few provisions on environmental offences, listed in Chapter 11, Section III (Articles 352-353d). They cover offences related to pollution of the environment, oil pollution of sea waters, illegal transboundary shipping of hazardous waste, dangerous chemicals and/or substances and radioactive substances.

Two provisions are relevant to the legislation on industrial installations.

Under Article 352, intentional pollution of the soil, air or waters is punishable with imprisonment of up to 5 years and a fine of up to BGN 5,000 with liability resting with the individual who has committed the crime. In cases of negligence, the punishment is probation or a fine, between 100 and 300 BGN. In minor cases the sanction is a fine up to 300 BGN, imposed by administrative order.

Under Article 353, an official who allows exploitation of a power plant without the necessary treatment facilities is liable to imprisonment up to 3 years and a fine of up to BGN 3,000 (in cases of intentional offence) or probation and a fine of 100 to 300 BGN in case of negligence or minor cases. The same punishments are envisaged for the official, responsible for the construction and proper exploitation of treatment facilities, who does not fulfil his obligation to ensure the continuous proper operation of the facility leading to a full or partial cessation or discontinuation of the facility's operations.

Such criminal sanctions only apply to natural persons. Legal entities cannot be subject to criminal penalties.

It should be noted that the span of the fines under the environmental laws is broader than the one for those envisaged in the Criminal Code (the provisions on the environmental crimes have not been updated since 2004).

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Bulgaria

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it was not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed or there is no sanction attached to the obligation, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision. In the case of Bulgaria, the catch-all provisions will cover some obligations (in this case, the row is left empty), while in other cases, the relevant offence is sanctioned under a specific provision (in this case, there a 'X' in the row).

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Bulgaria. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Table 2.21 *Directive 2008/1/EC (IPPC Directive): types of offences and related administrative and criminal penalties in Bulgaria*

	Administrative		Criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to apply for a permit for new or existing installations	Construction of a new installation without a permit and/or operation of an existing installation without an integrated environmental permit. ***Environmental Protection Act, Article. 117***	There is no specific sanction for breach of Article 117. The catch-all provision of Article 162, which provides sanctions for administrative violations of EPA, applies. Pecuniary sanction to the amount of 100 to 6,000 BGN for individuals and 1,000 to 20,000 BGN for legal persons and sole traders. For repeated infringements, the sanction is two-fold. For minor infringements committed by individuals, the fine is 100 BGN. ***Environmental Protection Act, Article 162***	Catch-all provision of Article 352 of the Criminal Code applies.	Catch-all provision of Article 352 of the Criminal Code applies.
Obligation to supply information for application for permits	Infringement or non-compliance with the following requirement: Obligation to include specific information in the application for permits, such as description of the installation and its activities, the raw and auxiliary materials, other substances and the energy used in or generated by the installation, etc. ***Environmental Protection Act, Article 122***	Pecuniary sanction to the amount of 100 to 6,000 BGN for individuals and 1,000 to 20,000 BGN for legal persons and sole traders. For repeated infringements, the sanction is two-fold. For minor infringements committed by individuals, the fine is 100 BGN. ***Environmental Protection Act, Article 162*** If the information in the application is not complete as required by law and/or it cannot be verified by the competent authorities by checking at site and/or the applicant does not supply any additional information requested by the competent authority the application for		

		issuing an integrated permit is rejected as laid down in ***Environmental Protection Act, Article. 122a(4)*** Although it is not explicitly provided in the EPA if the integrated permit is issued on the basis of false information submitted to the competent authorities this should be regarded as an administrative offence. In this case the catch-up provision of Article 162 should apply.		
Obligation to notify the competent authority of any changes in the operation of an installation	Carrying out changes in the operation of the installation without notification. ***Environmental Protection Act, Article 125(1)***	A pecuniary sanction for the operator of the installation, both legal person or sole trader, of 10,000 to 100,000 BGN ***Environmental Protection Act, Article 164 (1)*** Articles 162 and 164(1) of the EPA do not apply to the same violations. While Article 162 has more general nature and applies to all administrative violations of EPA, for which there is no specific sanctions, Article 164 applies specifically to violations of Article 125 of EPA (which stipulates obligations of the operator of IPPC installations). However in some cases Article 164 is regarded as a kind of catch-all provision as it covers violation of all obligations, set out in Article 125, without any differentiation between them.		
Obligation to comply with the conditions set in the permit or mandatory ELVs	<u>Infringement or non-compliance with the following requirements:</u> Obligation to fulfil the permit conditions. ***Environmental Protection Act, Article 125(2)*** Obligation of the operator (sole trader or legal entity) to comply with the ELVs	A pecuniary sanction for the operator of the installation, both legal person or sole trader, of 10,000 to 100,000 BGN. ***Environmental Protection Act, Article 164 (1)*** Pecuniary sanction is imposed, calculated on the basis of a single		

	set in the permit or integrated permit. ***Ordinance on the Procedures for Determining and Imposing Sanctions for Harming or Polluting the Environment over the limit values, Article 1***	amount of the penalty for each pollutant (as laid down in tables), the total quantity of the pollutants exceeding ELV and the duration of the violation. There are formulas in the Ordinance on the basis of which the sanction for each case is calculated. The single amount of the pollutants is given in BGN per kg for water and air pollutants and in BGN per sq.m for soil pollutants. It should be noted that the pecuniary sanction under the Ordinance cannot be set out beyond the limits, established in the Environmental Protection Act ***Ordinance on the Procedures for Determining and Imposing Sanctions for Harming or Polluting the Environment over the limit values, Chapter III, Annexes***		

*ELVs: Emission Limit Values

In minor cases the punishment is fine up to 300 BGN, imposed by administrative order. ***Criminal Code, Article 352***

	Environment over the limit values, Article 1			

Annex IV – Cyprus

CYPRUS

1. Overview of penalties related to legislation on industrial installations

In Cyprus, the law relating to industrial installations is found in a number of different acts which transpose the four Directives relevant to this study. The Integrated Pollution Prevention and Control Law of 2003 (Law No. 56(I)/2003) as amended, is a harmonised version of Cyprus' laws on the environment. This one law covers all licensing obligations under the four Directives.

Section 3 of Law No. 56(I)/2003 provides that the provisions of this Law apply as *complimentary provisions* to the Atmospheric Pollution Control Law (L. No.187 (I)/2002) and to the Water Pollution Control Law of 2002 (L. No. 106(I)/2002). As a result, it may be inferred that the provisions of these 3 Laws *should be read together as a whole* when dealing with licensing and other obligations under the four directives.

Law No. 56(I)/2003 lays down the requirements for the licensing of industrial installations. Section 3 of Law No. 56(I)/2003 also provides that the "*Scope of application of this Law*" is to achieve integrated prevention and control of pollution arising from the activities listed in Annex I. It lays down measures designed to prevent or, where that is not practicable, to reduce emissions in the air, water and land from the abovementioned activities, including measures concerning waste, in order to achieve a high level of protection of the environment taken as a whole.

However, this Law does not provide for any offences or penalties per se. According to section 7 of Law No. 56(I)/2003 the Council of Ministers may issue Regulations for the optimal implementation of the Law including Regulations prescribing offences and penalties for breaches of the Law or the general or specific terms imposed by relevant permits. However, no such regulations have been adopted.

The Cyprus legal system is based upon the common law system. Administrative sanctions are those imposed by the competent authority. Such administrative sanctions are not criminal in nature but they are actions of the administration subject to judicial review by the Supreme Court in its administrative jurisdiction.

According to section 16 of the Atmospheric Pollution Control Law of 2002 (L.No.187 (I)/2002), the Minister (the competent authority), where he deems justified, for reasons relating to the protection of public health, public safety or protection of the environment, has the power to:

(a) Recall a licence;
(b) Cancel or amend any licence terms;
(c) Add a new term in the licence, and
(d) Shorten the term of validity of the licence.

According to section 21 of the Atmospheric Pollution Control Law of 2002 (L.No.187 (I)/2002), the Council of Ministers may issue Regulations prescribing the terms of operation of any category of unauthorised installations (including technical specifications, level of pollution, serving notices by Inspectors to persons operating installations, etc). The Regulations may provide for the maximum level of sentences, imprisonment not exceeding 1 year or fines not exceeding CYP 3000 (Euros 5,126)[51] or both, imposing obligations for the provision of information by operators, etc. In the event that the Council of Ministers does not issue such Regulations, the Minister may serve a notice to any non-authorised installation the operation of which causes or is liable to cause serious atmospheric pollution, prescribing the measures to be taken within a prescribed time period. However, as stated

[51] 1 EUR = 0.585274 CYP (as at 14.12.2010).

above, no such Regulations have been adopted therefore currently no administrative fines may be imposed.

According to section 21(5) of the Atmospheric Pollution Control Law, in the event that the person responsible for a non-authorised installation fails to take the measures referred to in the notice, then an Inspector shall send a notice of prohibition instructing the operator to cease operating the installation.

According to section 22 of the Atmospheric Pollution Control Law of 2002 (L.No.187 (I)/2002), where an Inspector ascertains that there was a violation of the licence terms, it may serve a notice on the operator, informing them of the violation and instructing them to stop the breach within a prescribed time period. If the person responsible does not comply with the notice within the prescribed time limit, the Inspector may send a second (final) notice setting out the measures to be taken for lifting the violation. Section 26 provides that it shall be a criminal offence if a person fails to comply with any of the requirements under that section.

As opposed to administrative sanctions described in the previous question, criminal sanctions are those imposed by the Courts acting within the framework of their criminal jurisdiction. Such criminal sanctions are subject to appeal before the Court of Appeal. In addition to the criminal sanctions described below, there are only a few criminal provisions on environmental offences under the Criminal Code, Cap. 154, namely the criminal offence of common nuisance (Section 186 – 1 year imprisonment), water pollution (Section 191 – imprisonment up to 2 years and/or fine up to 1500 CYP) and the pollution of the atmosphere (Section 192 - imprisonment up to 2 years and/or fine up to 1500 CYP).

Where atmospheric pollution is concerned, the enforcement provisions are found in Sections 15 and 26 of the Atmospheric Pollution Control Law of 2002 (L.No.187 (I)/2002) as amended. These sections consist of a catch-all provision determining the offences related to all atmospheric pollution by industrial installations,[52] and as explained above, they must be read in conjunction with Law No. 56(I)/2003.

Section 15 of the Atmospheric Pollution Control Law of 2002 (L.No.187 (I)/2002) provides that every person operating or knowingly allows the operation of an authorised installation:

(a) Which has not obtained a licence by the Minister, or
(b) At a location other than that prescribed in its licence, or
(c) In a manner which is not in accordance with the terms of operation attached to the licence,

shall be guilty of a criminal offence and shall be liable to the sanctions referred to in section 26(2). Namely, in the event of breaches referred to above, the penalty will be imprisonment up to one year or a fine of up to 20,000 Cypriot Pounds (Euros 34,172). No distinction is made in section 15 of L.No.187 (I)/2002, between natural or legal persons. Section 15 simply states that any person is guilty of a criminal offence if he or she breaches the provisions of this section.

Section 26 of the Atmospheric Pollution Control Law of 2002 (L.No.187 (I)/2002) sets out the following with regards to criminal offences and penalties (our translation):

"Any person shall be deemed to have committed a criminal offence if:
(a) It obstructs an Inspector from carrying out its duties or exercise of its powers;
(b) It obstructs any police officer or qualified person or other person who entered inside an installation together with an Inspector for the purpose of assisting the Inspector;

[52] The Technical Committee for the Protection of the Environment, which is chaired by the representative of the Department of Labour examines applications and prescribes specific operating conditions and emission limit values. Upon the Technical Committee for the Protection of the Environment's proposals, the relevant Air Emission Permits are issued.

(c) Fails to comply with any instruction given lawfully thereto by an Inspector;
(d) Fails to present any book or document which he has a duty to supply when requested within reasonable time;
(e) Fails to give within reasonable time information lawfully requested by an Inspector or gives untrue or wrong or incomplete information;
(f) Fails to provide safe access to any installations; and
(g) Fails to give an Inspector any assistance for carrying out tests, measurements, inspections or examinations.

Section 26 of L.No.187 (I)/2002, provides criminal sanctions for breaches of any of the requirements set out in L.No.187 (I)/2002. No distinction is made in L.No.187 (I)/2002, between natural or legal persons. The penalty for a breach is imprisonment up to one year or a fine of up to 20,000 Cypriot Pounds (Euros 34,172). L. No.187 (I)/2002) further provides for a detailed list of criminal offences and sanctions in relation to, inter alia, obstructing investigating officers and failure to provide information to inspectors. This Law provides for the same level of penalties as mentioned above.

According to section 28 of the Atmospheric Pollution Control Law of 2002 (L.No.187 (I)/2002), in the event that a person is sentenced for a criminal offence for violations of sections 11 15, 20(4) or 22(5) (failure to comply with an administrative notice) or any regulations issued on the basis of sections 9 (sets out a list of issues entitling the issuing of Regulations) or 21 of the Law, the Court may in addition to the imposition of any sentencing, order the immediate termination or suspension of the operation of a business to which the installation belongs for as long and under such terms as the Court may deem appropriate.

It should be noted that Section 11 imposes certain obligations on an operator, namely an obligation to (a) keep the licence terms, (b) inform the Minister of results of monitoring emission levels if required by licence terms, (c) inform Minister immediately of each event or accident affecting the environment and (d) providing Inspectors facilities for carrying out inspections of installations, sample taking and collection of data for carrying out their duties.), Failure of an operator to comply with these obligations will result in the imposition of sanctions. Section 11 should be read together with Section 15 which imposes an obligation to keep the licence terms and Section 26 which imposes sanctions for failure to comply with obligations regarding the carrying out of Inspections.

Section 20(4) provides that it is an offence for an operator of an authorised installation to operate same whilst making additions, modifications or other important changes which may have additional important negative effects on the atmosphere before being granted a new authorisation for these or before being given a written confirmation by the Minister.

According to section 27 of the Atmospheric Pollution Control Law of 2002, for violations of sections 11, 15, 20(4) or 22(5) or of any regulations issued on the basis of section 21 of the Law, the Court may issue an interim order prohibiting the continuation or repetition of a criminal action until the issuing of a final judgement of the case. If a person against whom a Court order was issued fails to comply with the Court order, such person shall be guilty of a criminal offence and shall be liable to imprisonment for a period of up to 2 years or to a fine not exceeding 20,000 CYP (Euros 34,172) or both.

Finally, according to section 21(6) of the Law, a person shall be liable for an offence in the event that he refuses or fails to comply with a notice of prohibition as well as for failure to comply within reasonable time or within the prescribed time limit with the notice of the Minister or the Inspector for fixing the non-compliant act.

It should be noted that numerous regulations and orders have been issued on the basis of the aforementioned Laws which enable the implementation of the provisions of the law on industrial installations into practice. This secondary legislation provides that in the event of violation of the

provisions of the said secondary legislation, then the provisions of the Law regarding offences and penalties will apply. [53] These regulations include:

- Reg. 170/2004 - Atmospheric Pollution Control (Non-authorised Installations) Regulations of 2004. These Regulations are issued on the basis of L.No.187 (I)/2002, in order to facilitate the better implementation of certain provisions of that Law.
- Reg. 195/2004 - Quality of Atmospheric Air (Ozone and Atmospheric Air) Regulations of 2004. This Regulation was specifically adopted for implementing the provisions of Directive 2001/80/EC.
- Reg. 73/2003 - Atmospheric Pollution Control Regulations of 2003 - specifically adopted for implementing the provisions of Directive 1999/13/EC.

Where water pollution is concerned, the Water Pollution Control Law of 2002 (L. No. 106(I)/2002) as amended does not specifically mention the four Directives related to this study, but instead refers to older versions, including Council Directive 96/61/EEC of 24 September 1996 concerning integrated pollution prevention and control. For this purpose, the tables below do not mention offences concerning water pollution. The enforcement provisions are catch-all provisions and are found in section 6 of L. No. 106(I)/2002. No distinction is made between natural or legal persons. The penalty for violation of the provisions of the Law concerning deliberate pollution is that of imprisonment of up to 3 years or a fine of up to 50,000 Cypriot Pounds (Euros 85,430). For offences regarding the violation of permit obligations, the relevant sanctions include imprisonment for a period of up to 6 months or fines of up to 1,000 Cypriot Pounds (Euros 1,710).

According to Section 2 of Law No. 56(I)/2003, the Competent Authority for the issuing of a licence or the operation of installations is the Minister of Agriculture, Natural Resources and the Environment who is competent for the issuing of a licence and the control of an installation.

According to the Atmospheric Pollution Control Law of 2002 the Minister of Labour and Social Insurance is the authority competent for ensuring compliance with the terms of operation of authorised installations with regards to the emissions, as well as with regards to the operation of non-authorised installations.

Under the Water Pollution Control Law of 2002 (L. No. 106(I)/2002), the competent Minister for implementing the provisions of this Law and for taking the necessary measures is the Minister of Agriculture, Natural Resources and the Environment.

According to the Atmospheric Pollution Control Law of 2002 and the Water Pollution Control Law of 2002 (L. No. 106(I)/2002), the term "operator" includes *any natural person or legal entity* who operates or controls the installation or, where this is provided for in national legislation, to whom decisive economic power over the technical functioning of the installation has been delegated (same text as Article 2.13 of Directive 2008/1/EC and Article 2.6 of Directive 1999/13/EC). In addition, under the relevant sections referring to sanctions and criminal offences, the aforementioned laws provide for "any person", a term which may be inferred to mean both natural persons and legal entities as it relates to operators.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Cyprus

The table below has been compiled on the basis of the requirements set up by the national legislation.

[53] Reg. 170/2004 provides for additional criminal sanctions. In any event Regulations are secondary acts and the Law will always apply in any event.

This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Cyprus. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Annex V – Czech Republic

CZECH REPUBLIC

1. Overview of penalties related to legislation on industrial installations[55]

In the Czech Republic, the four Directives on industrial installations are transposed by a variety of legal acts and ministerial decrees. Obligations and sanctions for legal and natural persons are set out in laws (acts). By-laws (including government regulations and decrees of the Ministry of the Environment) can only lay down details of these obligations (for example the monitoring of emissions, requirements of applications or reporting requirements). The reason for this is that all acts must be adopted by the Parliament whereas by-laws are only issued by the executive bodies. The main acts and by-laws for each of the Directives are as follows:

IPPC Directive: Act No. 76/2002 Coll. on integrated pollution prevention and control, integrated pollution register and on amendment of some laws (Act on Integrated Prevention), as amended.[56]

VOC Directive: Act No. 86/2002 Coll. on air protection and amendment of some laws, as amended;[57] Decree of the Ministry of the Environment No. 337/2010 Coll. (Decree No. 355/2002) laying down emission limits and other conditions of operation of other stationary sources of air pollution emitting or using volatile organic compounds and conditions of handling products with VOCs.

LCP Directive: Act No. 86/2002 Coll. on air protection and amendment of some laws, as amended; Government Regulation No. 146/2007 Coll. (repealing Government Regulation No.352/2002 Coll.) on emission limits and other conditions for the operation of stationary combustion sources of air pollution, as amended by Government Regulation No. 476/2009 Coll.

Waste Incineration Directive:[58] Act No. 86/2002 Coll. on air protection and amendment of some laws, as amended; Act No. 185/2001 Coll. on waste management, as amended;[59]Government Regulation No. 354/2002 Coll. laying down emission limits and other conditions for waste incineration as amended by Government Regulation No. 206/2006 Coll.; Decree No. 205/2009 Coll. on obtaining information on the emission from stationary sources and to specify other provisions of Act No. 86/2002 Coll.

The main sources of environmental law in the Czech Republic are found in Act No.17/1992 Coll. on Environmental Protection and specific horizontal and sectoral acts.[60] A typical horizontal act is the Act on the IPPC (Act No. 76/2002 Coll.). Sectoral acts are those acts relating to particular environmental

---

[55] The following studies were used as resources : Measures other than criminal ones in cases where environmental Community Law has not been respected in a few Candidate countries, Criminal Penalties in Candidate Countries Environmental Law
http://ec.europa.eu/environment/legal/crime/studies_en.htm

[56] This Act was amended by the following acts: Act No. 521/2002, Act No. 437/2004., Act No. 695/2004, Act No. 444/2005, Act No. 222/2006, Act No. 25/2008 , Act No. 227/2009, Act No. 281/2009

[57] This Act was amended by the following acts: Act No. 521/2002, Act No.92/2004, Act No. 186/2004 , Act No. 695/2004, Act No.180/2005, Act No. 385/2005, Act No. 444/2005, Act No. 212/2006, Act No. 222/2006, Act No., 230/2006 Sb., Act No. 186/2006, Act No. 180/2007. Act No. 296/2007., Act No. 25/2008, Act No. 37/2008, Act No.124/2008, Act No. 483/2008, Act No. 292/2009, Act No. 223/2009, Act No. 164/2010, Act No. 172/2010, Act No.227/2009, Act No. 281/2009

[58] Waste water is also regulated under Water Act. There is a Government Regulation No. 61/2003 on limit values of pollutants in waste water as a by-law to this Act. In Annex 1 to this regulation, which in Part A sets limits for urban waste water, there is a note on how these limits should be obtained from waste incinerators.

[59] This Act was amended by the following acts : Act No. 477/2001, Act No.76/2002, Act No. 275/2002, Act No. 320/2002, Act No. 188/2004, Act No. 356/2003, Act No.167/2004, Act No. 317/2004, Act No.7/2005, Act No.444/2005, Act No. 222/2006, Act No. 314/2006, Act No.186/2006, Act No. 296/2007, Act No. 25/2008, Act No. 34/2008, Act No. 383/2008 Sb. Act No 9/2009, Act No. 157/2009, Act No. 297/2009, Act No. 291/2009, Act No. 326/2009, Act No. 223/2009 Sb, Act No. 227/2009, Act No. 154/2010, Act No. 281/2009 Sb.

[60] Measures other than criminal ones in cases where environmental Community Law has not been respected in a few Candidate countries
http://ec.europa.eu/environment/legal/crime/studies_en.htm

sectors such as water, soil, air, nature and landscape, and waste management. The different types of environmental liability are laid down in these individual acts. The Czech legal system operates with three main types of environmental liability: administrative, civil[61] and criminal liability.

Administrative liability arises in case of contravention with specific environmental obligations or decisions of the competent authorities. The authorities may impose penalties such as fines or other measures, including withdrawal of a permit, confiscation of goods, restriction or ceasing of the harmful activity, prohibition of the activity, refusal to grant a specific document, obliging the person to restore the environment to an appropriate state, or to provide a remedy for the illegal situation.[62] Sanctions can be imposed on both legal and natural persons. Administrative liability is a strict form of liability, which means that sanctions can be imposed regardless the fault of the perpetrator.

The competent authorities (first instance bodies), include local and/or regional municipalities, the Czech Environmental Inspectorate or other special authority (eg administration of specially protected areas, river basin administration). They have the power to impose certain administrative sanctions. In practice, however, most sanctions for industrial installations fall within the competence and regulatory powers of the Czech Environmental Inspectorate. This body is primarily responsible for ensuring compliance with environmental laws and imposing sanctions (if necessary). Occasionally, sanctions will fall within the competence of a superior permitting body or a body at a higher administrative level. The competences are always laid down in the relevant acts. Administrative decisions of the competent authorities can be appealed before the supervisory authorities. Upon the decision of the perpetrator, these cases can be brought before the administrative courts.

On the basis of a breach of the relevant environmental law provisions, the competent authorities may also impose quasi-criminal sanctions for certain administrative offences committed by natural persons (not legal persons). Quasi-criminal offences constitute a special branch of administrative law, regulated in the Act on Misdemeanours and in specific environmental acts. According to Czech law, specific environmental acts prevail over the application of the Act on Misdemeanours (*lex specialis derogat legi generali*). Admonitions, fine, prohibition of the activity and confiscation of goods can be imposed as quasi-criminal penalties. Administrative and quasi-criminal sanctions can be imposed separately or in conjunction.[63]

In case of serious contravention of specific legal obligations, criminal sanctions can be imposed. According to the Czech law,[64] only natural persons can be criminally liable. However, in case of legal persons, the statutory body (which consists of natural persons) can be subject to prosecution and sanctions. Criminal liability is fault-based.

Administrative sanctions and criminal sanctions can be imposed in conjunction. However, in case of criminal sanction, quasi-criminal sanctions cannot be imposed. Criminal sanctions may include the prohibition of activities, fines and imprisonment.

[61] Civil liability is not subject to the current study.
[62] These penalties are included in the specific acts, which stipulate the related offences.
[63] Measures other than criminal ones in cases where environmental Community Law has not been respected in a few Candidate countries
http://ec.europa.eu/environment/legal/crime/studies_en.htm
[64] A bill on the criminal liability of legal persons has been drafted, but not yet been submitted to the Czech Parliament.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in the Czech Republic

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Czech Republic. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Obligation to supply information for application for permits	N/A [73]	NA	N/A	N/A

[69] Note that incineration or co-incineration plants are either very large or large stationary sources according to the Act No. 86/2002

[70] The following laws were analysed for the purposes of filling in the table: Government Order of 12 April 2006 amending Government Order No. 354/2002 on setting emission limits and other terms and conditions for the incineration of waste, http://www.mzp.cz/ris/vis-legcz-en.nsf/ Government Order of 3 July 2002 setting forth emission limit values and other requirements for waste incineration http://www.mzp.cz/ris/vis-legcz-en.nsf/ Act of 15 May 2001 on waste and amendment of some other acts, in the wording of later regulations http://www.mzp.cz/ris/vis-legcz-en.nsf/

[71] The obligation that incineration and co-incineration plants are required to obtain a permit from the air protection authority is set out in Article 17 (2) (c) of Act No. 86/2002.

[72] eg. Municipal waste incineration plants with the capacity of more than 3 tonnes/hour or incineration plants for hazardous waste with the capacity of ...need to have an IPPC permit so in these cased the act 76/2002 will apply.

[73] Article 4(2) was transposed by Article 17(2) of Decree No. 205/2009. These are mandatory requirements for the application – if this information is not given, the sanction is that the permit will not be granted. However, it does not constitute an offence.

Obligation to notify the competent authority of any changes in the operation of an installation	Operating an installation without a new permit for some changes (eg change in the type of waste, technology, change in the mandatory conditions of operation) - in this case Article *38 (2) (a) and 40 (1) (b)* on the operation without a permit (above) applies. ***Act No. 86/2002 Coll. on air protection and amendment of some laws, Article 38 (2) (a) and 40 (1) (b)***	N/A	N/A	N/A
Obligation to comply with the conditions set in the permits or mandatory ELVs	<u>Infringement or non-compliance with the following requirements:</u> Obligations of the operator of very large and large stationary sources to comply with requirements set in ***Act No. 86/2002 Coll. on air protection and amendment of some laws, Article 40 (1) (2) and (7)***	Fine: the amount of fine depends on the breach of the operator's obligation and on the size of the stationary source. The amount could be from Euros 406 to Euros 405,872 (CZK 10,000 to CZK 10,000,000). ***Act No. 86/2002 Coll. on air protection and amendment of some laws, Article 40(1)(2) and (7)*** Ban or restriction of operation ***Act No. 86/2002 Coll. on air protection and amendment of some laws Article 38 (2)(c)***	**Misdemeanours** Management of waste in a place or a building which is not designated for waste management purposes. ***Act 185/2001 Coll. on waste management Article 69 (2) (c)***	**Misdemeanours** Fine up to Euros 40 499 (CZK 1,000,000) . ***Act 185/2001 Coll. on waste management Article 69 (2) (c)***
	Obligation to operate an installations in compliance with the conditions of the permit or mandatory conditions of operation . ***Act 185/2001 Coll. on waste management Article 66 (3) (d)***	Fine up to Euros 405,872 (CZK 10,000,000). ***Act 185/2001 Coll. on waste management Article 66 (3) (d)***		
	Obligation to manage hazardous waste in compliance with the permit. ***Act 185/2001 Coll. on waste management article 66 (4) (d)***	Fine up to Euros 2,025,234 (CZK 50,000,000). ***Act 185/2001 Coll. on waste management Article 66 (4) (d)***		
	Obligation to comply with other requirements relating to waste	Fine up to Euros 40,499 (CZK 1,000,000).		

	management (set by this act or by the decision of the responsible authority according to this act). ***Act 185/2001 Coll. on waste management Article 66 (5)***	***Act 185/2001 Coll. on waste management Article 66 (5)***		

Annex VI – Denmark

DENMARK

1. Overview of penalties related to legislation on industrial installations

In the Danish legal system Environmental Acts are adopted by the Parliament and are supplemented by implementing ministerial orders. The Environmental Protection Act (EPA) is the main transposing legislation for the four Directives relevant to this report. It contains the relevant offences and penalties. It is also the legal basis for the Ministerial Orders transposing the more technical requirements of the Directives.

Chapter 5 of the Environmental Protection Act contains a licensing system that transposes the requirements of the IPPC Directive. Large combustion plants and waste incineration plants falling respectively under Directive 2001/80/EC and Directive 2000/76/EC, are considered installations that require an approval under Chapter 5 of the Environmental Protection Act. The specific requirements of these Directives transposed through Ministerial Regulations shall be applied by relevant operators through the approval procedure of this Chapter.

The transposing legislation for the four directives covered by the study is as follows:

IPPC Directive: The Environmental Protection Act No. 879 of 26 June 2010 *(Lovbekendtgørelse nr. 879 af 26. Juni 2010 om miljøbeskyttelse)* and the Approval Order No. 1640 of 13 December 2006 as amended including by Ministerial Order No. 284 of 25 March 2010 *(Bekendtgørelse nr 1640 af 13. December 2006 med senere ændringer inklusiv bekendtgørelse nr. 284 af 25. marts 2010(Godkendelsesbekendtgørelsen))*.

VOC Directive: The Environmental Protection Act No. 879 of 26 June 2010 *(Lovbekendtgørelse nr. 879 af 26. Juni 2010 om miljøbeskyttelse)* and the Ministerial Order No. 350 of 29/05/2002 (VOC-Order) *(Bekendtgørelse nr 350 af 29/05/2002 (VOC-bekendtgørelsen)med senere ændringer, senest bekendtgørelse 2010-03-25 nr.283))*.

LCP Directive: Ministerial Order No. 808 of 25/09/2003 (LCP-Order)*(Bekendtgørelse nr 808 af 25/09/2003 (bekendtgørelse om store fyr))* and the Environmental Protection Act No. 879 of 26 June 2010 *(Lovbekendtgørelse nr. 879 af 26. Juni 2010 om miljøbeskyttelse)* and the Approval Order No. 1640 of 13 December 2006 as amended including by Ministerial Order No. 284 of 25 March 2010 *(Bekendtgørelse nr 1640 af 13. December 2006 med senere ændringer inklusiv bekendtgørelse nr. 284 af 25. marts 2010(Godkendelsesbekendtgørelsen))*.

WI Directive: Ministerial Order No. 162 on 11 March 2003 (Incineration Order) *(Bekendtgørelse nr 162 af 11/03/2003 (Forbrændingsbekendtgørelsen)),* the Environmental Protection Act No. 879 of 26 June 2010 *(Lovbekendtgørelse nr. 879 af 26. Juni 2010 om miljøbeskyttelse)* and the Approval Order No. 1640 of 13 December 2006 as amended including by Ministerial Order No. 284 of 25 March 2010 *(Bekendtgørelse nr 1640 af 13. December 2006 med senere ændringer inklusiv bekendtgørelse nr. 284 af 25. marts 2010(Godkendelsesbekendtgørelsen))*.

The Environmental Protection Act provides for two types of administrative measures and sanctions:

1) Preventive and remedial measures, e.g. the administrative sanctions that the supervisory authority has at its disposal to prevent that negative impact on the environmental occurs as a result of future operating conditions. It concerns the possibility of refusing an environmental approval and grant special conditions (EPA Section 34, para 3) where the responsible persons have lost their so-called environmental responsibility pursuant to Section 40a – e.g. physical or legal persons convicted pursuant to the Criminal Act Section 196, the Environmental protection Act Section 110(2) or similar provisions issued pursuant to this Act .

2) Enforcement measures to ensure compliance with inter alia legal rules, permits and decisions. The Environmental Protection Act gives to the competent authority the power to issue injunctions and prohibitions, to ensure compliance with legal rules, permits and decisions. It may also prescribe corrective measures, which are taken at the offender's expense. The competent authority reports infringements to the police or the public prosecution authorities. The Environmental Protection Act provides for the principle of proportionality with regard to administrative enforcement measures, which should not be more intrusive than necessary in individual cases and take into account the circumstances of each particular situation e.g. the risk and type of negative impact on the environment.

Control functions are primarily exercised by the municipalities. However control functions relating to IPPC related injunctions and prohibitions for existing installations are exercised by the state regional authorities, the so-called Environmental Centres of which there are seven.

Chapter 13 of the Environmental Protection Act sets criminal penalties that include imprisonment and additional corporate fines in some circumstances. Some Ministerial Orders also contain provisions on criminal sanctions. These provisions specifically define which infringements of the requirements of the Act or Regulation shall lead to a criminal penalty. Those obligations that are enforced by Chapter 13 are listed in detail. Section 110(1) of the Environmental Protection Act[74] lists nineteen specific offences referring to specific provisions of this Act.

Offences are often divided between 'offences' and serious 'offences'. For instance serious offences are characterised when an offender acted deliberately or by gross negligence if the infringement resulted in damage to the environment or risk of damage or achieved or intended economic advantages.

The Criminal Code also sets up offences and corresponding penalties and sanctions. The provisions of the Criminal Code have precedence if the sanctions it lays down are equal or more sever than those established by the Environmental Code.

Administrative and criminal sanctions can apply simultaneously.

Finally, the related Danish legal provisions apply to both natural and legal persons alike. The difference is, however, that additional financial penalties may additionally apply to businesses.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Denmark

The table below has been compiled on the basis of the information provided in the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. This was the case for Denmark the assessment is based on the assumption that the listed articles have been fully transposed. When there is a catch-all

[74] Main Danish legal framework related to the environment.

provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Denmark. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Table 2.31 *Directive 2008/1/EC (IPPC Directive): types of offences and related administrative and criminal penalties in Denmark*

	Administrative		Criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to apply for a permit for new or existing installations	Operating a new installation (listed in the Regulation issued pursuant to Section 35 – Annex I of the IPPC Directive) without a permit issued in accordance with this Act. Extending or changing an installation structurally or operationally without approval. ***Environmental protection Act Section 33 and Approval Order Section 2***	Injunctions and prohibitions. ***Environmental protection Act Section 41***	Establish, commence or operate an installation without approval from the relevant authority. ***Environmental protection Act Section 110(1)(6)*** <u>Serious offence</u> It is a serious criminal offence where done intentionally or through gross negligence and if the violation is harmful for the environment or provides economic advantage to the operator. ***Environmental Protection Act Chapter 13 Section 110(6) in conjunction with Chapter 13 Section 110 paragraph (2) of this Act***	The fines are determined by the Courts as part of the criminal case and the Acts do not set any maximum amount or range. Fines typically in the range of DKK 10,000 – 40,000 (app Euros 1,200 - 6,000). Seizure of the net profit. Examples: Ruling by the Eastern High Court (ØLD 1991-11-16) a company fined DKK 300,000 (Euros 4,500) for disposal of 21 tons of soil containing heavy metals without the mandatory permit. Seizure of 1,2 mio DKK (Euros 161,000). <u>Serious offence</u> Imprisonment up to two years. This underlines the legislators desire for severe penalties for environmental offences, including an significant increase of the fines. <u>Legal persons</u> The Danish penalties provisions apply to both natural and legal persons alike. Pursuant to the Environmental Protection Act Section 110 (4), legal persons may be imposed sanctions

				pursuant to for under the fifth Chapter of the Criminal Act.
Obligation to supply information for application for permits	Infringement or non-compliance with the following requirement: Obligation to supply information for application for permits, including pursuant to the ***Environmental Protection Act Section 35, paragraph 2, Section 39 and the Approval Order Section 7.***	Refusal of granting a permit. It will basically rest with the applicant on his own initiative to provide the approving authority with the necessary information. In case of failure to supply the necessary information to approving authority, it may specify what additional information must be provided and set a deadline. In case of repeated failure to submit the requested information, the procedural detrimental effect occurs, namely that the approving authority must consider the application as annulled. For existing installations which are required to obtain a permit pursuant to § 39, the information may be sought through an injunction issued pursuant to Section 72. According to Section 39, paragraph. 2, the approving authority can, if necessary, prohibit the continued use of unapproved parts company if the installation/activity if the installation fails to meet the statutory deadlines for submission of information. Examples of administrative practice have been published in publication MAD (Environmental Rulings and jurisprudence) e.g. MAD 2000 1073 in which a permit of an existing company was lifted by the Environmental Protection Agency and the matter remitted for reconsideration, since no measurements for assessment of its noise ratio had been submitted). Another example is MAD 2009 349 in which the Environmental Board of Appeal refused an application as the application did not contain the	Failure to apply for a permit in accordance with Rules issued pursuant to Section 7 of this Act or failure to apply pursuant to Section 39 of this Act. ***Environmental protection Act Section 110(1)(8)) and Approval Order Section 22(1)(2)***	Ibid for the types of penalties. It has not been possible to find any jurisprudence of the size of the fines for failure to supply information for application of permits.

		information required for in the Approval Order (Annex 5).		
Obligation to notify the competent authority of any changes in the operation of an installation	Carrying out any changes in the operation of an installation without notifying the competent authority. Extending or changing the installation structurally of operationally before the extension or change is approved. ***Environmental protection Act Section 33 and Approval Order Section 2***	Injunctions and prohibitions ***Environmental protection Act Section 41 and 41 c***	The installation is extended changed structurally or operationally in a way that increases pollution without approval of the relevant competent authority. This is a serious criminal offence where done intentionally or through gross negligence and if the violation is harmful for the environment or provides economic advantage to the operator. ***Environmental Protection Act Chapter 13 Section 110(6) read in conjunction with Chapter 13 Section 110 para (2) of this Act***	Ibid No recent examples of jurisprudence on the size of fines for this type of offences. The jurisprudence does not reflect the more severe fines for violations of the IPPC requirements since 2003.
Obligation to comply with the conditions set in the permit or mandatory ELV's	Infringement or non-compliance with the following requirements: Obligation to comply with the conditions set in the permit or mandatory ELV's ***Environmental protection Act Section 34 and Approval Order Section 14***	Injunctions and prohibitions ***Environmental protection Act Section 41 and 41 c***	Failure to comply with injunction or prohibition issued pursuant to this Act ***Environmental Protection Act Section 110(1)(3)*** Neglect to comply with the terms of a permit or conditions laid down pursuant to this Act or to rules issued in pursuance thereof. ***Environmental Protection Act Section 110(1)(4)***	Ibid Examples of jurisprudence on the size of fines: Supreme Court ruling U2001.2045H A company taking over a chemical installation under bankruptcy was fined DKK 800,000 (app. Euros 120,000) and 40 days imprisonment for its Director combined with a fine of DKK 300,000 (app. Euros 40,000) for failure to comply with the conditions set in the permit following several injunctions on disposal of chemical waste. Another example is a ruling by the Eastern High Court where a County was fined DKK 500.000 (App Euros 65,000) for failure to comply with the mandatory ELV's for a waste incineration plant and seizure of the saved amount of DKK 4 mill (app. Euros 350,000).

Table 32.2 *Directive 1999/13/EC (VOC Directive): types of offences and related administrative and criminal penalties in Denmark*

Transposing legislation: Ministerial Order No. 350 of 29 May 2002 (VOC-Order) *(Bekendtgørelse nr 350 af 29/05/2002 (VOC-bekendtgørelsen)med senere ændringer, senest bekendtgørelse 2010-03-25 nr. 283)) and* The Environmental Protection Act No. 879 of 26 June 2010 *(Lovbekendtgørelse nr. 879 af 26. Juni 2010 om miljøbeskyttelse).*

Denmark has opted for general binding rules to transpose Article 4, 5, 8 and 9 of the VOC Directive The VOC Order also requires that all new installations not covered by Directive 96/61/EC (repealed by Directive 2008/1/EC) are registered or undergo authorisation before being put into operation and that all existing installations must have been registered by 31 October 2007 at the latest.

	Administrative		**Criminal**	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to apply for an authorisation/ registration for new or existing installations	Infringement or non-compliance with the following requirements: Obligation to apply for an authorisation/ registration for new or existing installations ***The VOC Order Section 12***	Injunctions and prohibitions. ***VOC Order Section 12, paragraph 2 and 4 and Environmental Protection Act Section 41 and 41 c***	Installation emitting Volatile Organic Compounds covered by Chapter 5 of the Environmental Protection Act and the Approval Order Start or operate an installation without approval from the relevant authority This is a serious criminal offence where done intentionally or through gross negligence and if the violation is harmful for the environment or provides economic advantage to the operator. ***Environmental Protection Act Chapter 13 Section 110(6) read in conjunction with Chapter 13 Section 110 paragraph (2) of this Act*** Installation emitting Volatile Organic Compounds not covered by Chapter 5 of the Environmental Protection Act and the Approval Order Failure to apply for a registration pursuant to Section 8(4) or 9(4) of the VOC Order.	Fines Seizure of the net profit if any. The fines are determined by the Courts as part of the criminal case. Serious offence -Imprisonment up to two years. This underlines the legislators desire for severe penalties for environmental offences, including an significant increase of the fines. Legal persons The Danish penalties provisions apply to both natural and legal persons alike. Pursuant to Section 12(3) of the VOC Order, legal persons may be imposed sanctions pursuant to for under the fifth Chapter of the Criminal Act.

			Violation of injunctions notified pursuant to Section 12(1),(2) and (4) of the VOC Order. ***VOC Order Section Section 15***	
Obligation to supply information for application for permits				
Obligation to notify the competent authority of any changes in the operation of an installation

Annex VII – Estonia

ESTONIA

1. Overview of penalties related to legislation on industrial installations

Estonian law is based on the continental law system. Estonian penal law distinguishes between two types of offences: criminal offences and misdemeanours. The branch of penal law that deals with misdemeanours is sometimes referred to as administrative penal law. Criminal offences are exhaustively stipulated in the Penal Code. Misdemeanours are stipulated in the Penal Code and other laws, i.e. there is no single code listing all misdemeanours, instead these offences are usually stipulated in the relevant specific laws. For the purposes of the current study the relevant specific laws are as follows: the Integrated Pollution Prevention and Control Act (RT I 2001, 85, 512), the Ambient Air Protection Act (RT I 2004, 43, 298), the Waste Act (RT I 2004, 9, 52) and the Water Act (RT I 1994, 40, 655).

Prosecution of private legal persons for offences does not, in principle, differ from the prosecution of natural persons. According to the Penal Code a legal person can be prosecuted when: 1) the law stipulating the offence explicitly allows such prosecution; 2) the punishable act is committed by a body or senior official or competent representative of the legal person; 3) the punishable act is committed in the interest of the legal person. Prosecution of a legal person does not preclude prosecution of the natural person who committed the offence – to the contrary: the parallel prosecution is the norm. The Penal Code does not allow prosecuting state, local governments and legal persons in public law. The exemption is based on the assumptions that the state cannot punish itself and that the legality of state actions has to be ensured by other means. Nonetheless, the Penal Code allows prosecution of the private legal person established by the state and the private legal person, whose major shareholder is the state. Also, the Penal Code allows prosecution of a private legal person fulfilling public functions on the basis of an administrative contract.

The distinction between criminal offences and misdemeanours is based on the principal punishments available for a particular offence. Punishments for criminal offences are more severe reflecting the more serious nature of these offences. If a person commits an act, which comprises the necessary elements of both a misdemeanour and a criminal offence, the person is punished only for the criminal offence. Principal punishments for criminal offences are pecuniary punishment (both natural and legal persons), imprisonment (natural persons) and compulsory dissolution (legal persons). Principal punishments for misdemeanours are detention (natural persons) and fine (both natural and legal persons).

The pecuniary punishment for natural persons is expressed in daily rates. The daily rate is calculated on the basis of the average daily income of the convicted offender. The daily rate may be reduced due to special circumstances, or increased on the basis of the standard of living of the convicted offender. The pecuniary punishment varies from 30 - 500 daily rates. In case of a legal person, the pecuniary punishment varies from Euros 3,200 – 16,000,000.[75] The term for imprisonment varies from 30 days to 20 years. Under exceptional circumstances the court may impose a life imprisonment. The compulsory dissolution can be imposed on a legal person if the commission of criminal offences has become part of the activities of the legal person. Punishments for criminal offences can be imposed only by the court.

The fine for natural persons is expressed in fine units. Unlike the pecuniary punishment for criminal offences, the fine unit does not depend on the income of the offender. The fine unit is Euros 4. A fine varies from 3 to 300 fine units, i.e. Euros 12 to 1,200. In case of a legal person, fine varies from Euros

[75] The amount of fines and pecuniary penalties are expressed in Estonian Krone (EEK) in the Estonian law in force as of 10.12.2010. However, the EEK will by replaced by the Euro on 01.01.2011. Therefore, the amounts in EEK were replaced with the amounts in EUR in the study using the calculation method stipulated in the Act on Putting Euros into Use (Euro kasutusele võtmise seadus RT I 2010, 22,108).

32 to 32,000. A fine can be imposed either by the court or an extra-judicial body that is listed in the relevant law. The primary extra-judicial body that conducts the extra-judicial proceedings is the Environmental Inspectorate. The maximum term for detention is 30 days. Detention can be imposed only by the court.

The penal law relevant for the current study tends to rely on generic or catch-all type of offences, e.g. "Violation of the requirements for protection of the ambient air is punishable by a fine." (the Ambient Air Protection Act §139), "Acting without a natural resource utilisation permit or pollution permit where such permit is required, or violation of the requirements set forth in the permit, is punishable by a pecuniary punishment." (the Penal Code §363). Such approach has the merit of providing penalties for a great number of requirements. On the other hand, it is not always clear whether a particular act qualifies as the offence. For instance, it is not self-evident what constitutes "the requirement for protection of the ambient air" and "pollution permit" is not defined in law.

Estonian penal law is under constant review. Currently, there are draft laws discussed in the Parliament and in the government that amend the relevant provisions in the Penal Code and in the specific acts. The nature of these amendments is evolutionary rather than revolutionary.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Estonia

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. This was the case for Estonia the assessment is based on the assumption that the listed articles have been fully transposed. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

However, it should be noted that the identification of 'catch-all' provisions is difficult in the case of Estonia. Estonian penal law tends to rely on another type of catch-all provisions, such as article 139 of the Ambient Air Protection Act "Violation of requirements for protection of ambient air shall be punished [...]" or provisions of the Criminal Code that sets up sanctions for non-compliance with the obligation to get a permit or submission of false information to an administrative authority. In other words, the catch-all provision actually applies across various acts transposing the four directives rather than applying to all provisions of national legislation transposing one specific directive.

[76] Estonian penal law provides a penalty for submitting false information.
[77] Estonian penal law provides a penalty for submitting false information.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Estonia. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Table 2.34 *Directive 2008/1/EC (IPPC Directive): types of offences and related administrative and criminal penalties in Estonia*

	Administrative criminal		Criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to apply for a permit for new or existing installations	Operating without a permit in a category of activity for which a permit is required. Only legal persons can be prosecuted. ***Integrated Pollution Prevention and Control Act §37***	Fine up to Euros 3,200. ***Integrated Pollution Prevention and Control Act, §37***	Acting without a natural resource utilisation permit or pollution permit where such permit is required. Both natural and legal persons can be prosecuted. ***Penal Code §363***	Pecuniary punishment. The punishment for legal persons is from Euros 3,200-16,000,000. The punishment for natural persons depends on their average income. ***Penal Code §363, §44***
Obligation to supply information for application for permits	*No offence* Remark. If an application for a permit does not contain all necessary information required the issuer of permits has to return the application and indicate the deficiencies contained in the application and establish a term for the elimination thereof. The permit cannot be issued if false information has been submitted upon application of permit. The permit has to be revoked when the competent authority discovers that upon application of permit false information of material importance was intentionally submitted. ***Integrated Pollution Prevention and Control Act §11(3), §16(1)3), §26(3)***		Submission of false information to an administrative agency, if committed in order to obtain an official document or any other benefit or gain. Both natural and legal persons can be prosecuted ***Penal Code §280***	Pecuniary punishment. The punishment for legal persons is from Euros 3,200 to 16,000,000. The punishment for natural persons depends on their average income. Natural persons can also be imprisoned for up to 1 year. ***Penal Code §363, §44***
Obligation to notify the competent authority of any changes in the operation of an installation	*No offence* However, changing operation without modifying the permit may constitute a violation of the conditions of the permit.		*No offence*	
Obligation to comply with the conditions set in the permit or mandatory ELVs	Infringement or non-compliance with the following requirement: Obligation to fulfil the requirements established by permit. Only legal persons can be prosecuted.	Fine up to Euros 3,200. ***Integrated Pollution Prevention and Control Act, §37***	Violation of requirements set forth in a natural resource utilisation permit or pollution permit. Both natural and legal persons can be prosecuted. ***Penal Code §363***	All offences allow pecuniary punishment. Certain offences also allow imprisonment of natural persons (see below.) The pecuniary punishment for legal persons is from Euros 3,200 to

	Integrated Pollution Prevention and Control Act §37 Violation of procedure for utilisation of natural resources or procedure for maintenance of records on pollution. Both natural and legal persons can be prosecuted. ***Penal Code §366***	Natural persons can be fined up to 100 fine units (Euros 400) or detained (up to 30 days). Legal persons can be fined up to Euros 2,000. ***Penal Code §366, §47, §48***	Unlawful release of substances, energy or waste into the environment, or causing noise exceeding the established limits if significant damage is caused thereby to the quality of water, soil or ambient air, or to the individuals of animal or plant species or parts thereof. Both natural and legal persons can be prosecuted. ***Penal Code §364(1)(3)***	16,000,000. The punishment for natural persons depends on their average income. ***Penal Code §44, §§363-365, §§367-368***
	<u>Infringement or non-compliance with the following requirements:</u> Obligation to respect the requirements for protection of ambient air. Both natural and legal persons can be prosecuted. ***Ambient Air Protection Act §139(1)(2)***	Natural persons can be fined up to 100 fine units (Euros 400) or detained (up to 30 days). Legal persons can be fined up to Euros 2,000. ***Penal Code §366, §47, §48***	Unlawful release of substances, energy or waste into the environment, or causing noise exceeding the established limits if if it causes: 1) significant damage to the quality of water, soil or ambient air, or to the individuals of animal or plant species or parts thereof; 2) serious damage to the health of a person, or 3) the death of a person. Both natural and legal persons can be prosecuted. ***Penal Code §364(2)(3)***	Up to 5 years of imprisonment. ***Penal Code §364(2)***
	Obligation to respect the requirements for the prevention of waste generation or for waste management or deposit of waste outside of waste management facilities. Both natural and legal persons can be prosecuted. ***Waste Act §120***	Natural persons can be fined up to 300 fine units (Euros 1,200). Legal persons can be fined up to Euros 3,200. ***Waste Act §120,,Penal Code §47***		
	Obligation to respect the procedure for water protection and use. Both natural and legal persons can be prosecuted. ***Water Act §38[5]***	Natural persons can be fined up to 100 fine units (Euros 400). Legal persons can be fined up to Euros 2,000. ***Water Act §38[5],Penal Code §47***	Unlawful release of substances, energy or waste into the environment, or causing noise exceeding the established limits through negligence, if it causes: 1) significant damage to the quality of water, soil or ambient air, or to the individuals of animal or plant species or parts thereof; 2) serious damage to the health of a person, or 3) the death of a person . Both natural and legal persons can be prosecuted. ***Penal Code §365***	Up to 3 years of imprisonment. ***Penal Code §365***
	Obstruction of state supervision, refusal to submit or failure to submit on time documents or information necessary for state supervision, submission of false information, or submission of documents or information in a manner which does not permit exercise of state supervision. Only natural persons can be prosecuted. ***Penal Code §279***	Natural persons can be fined up to 300 fine units (Euros 1,200) or detained (up to 30 days). ***Penal Code §366, §47, §48***		Up to 3 years of imprisonment. ***Penal***

			Violation of requirements for handling chemicals or waste dangerous to human health or the environment, if such violation causes a danger to human life or health or to the environment Both natural and legal persons can be prosecuted. ***Penal Code §367(1)(3)*** Violation of requirements for handling chemicals or waste dangerous to human health or the environment, if such violation causes a danger to human life or health or to the environment through negligence. Both natural and legal persons can be prosecuted. ***Penal Code §367(2)(3)*** . Violation of the requirements for handling chemicals or waste dangerous to human health or the environment through negligence, if such violation causes a danger to human life or health or to the environment. Both natural and legal persons can be prosecuted. ***Penal Code §368***	***Code §367(1)*** Up to 1 year of imprisonment. ***Penal Code §367(2)*** Up to 1 year of imprisonment. ***Penal Code §368)***

Both natural and legal persons can be prosecuted. ***Penal Code §367(2)(3)*** Violation of the requirements for handling chemicals or waste dangerous to human health or the environment through negligence, if such violation causes a danger to human life or health or to the environment. Both natural and legal persons can be prosecuted. ***Penal Code §368***	 Up to 3 years of imprisonment. ***Penal Code §367(1)*** Up to 1 year of imprisonment. ***Penal Code §367(2)*** Up to 1 year of imprisonment. ***Penal Code §368)***

Annex VIII – Finland

FINLAND

1. Overview of penalties related to legislation on industrial installations

In Finland, the legal obligations relating to the four Directives on industrial installations are transposed by a combination of different legislation including the Environment Protection Act (YSL 86/2000), as well as more specific legislation relating to each Directive, including, as follows:

IPPC Directive: Environmental Protection Decree 169/2000;

VOC Directive: Government Decree on the reduction of emissions of volatile organic components caused by the use of organic solvents in certain operations and installations 435/2001;

LCP Directive: Government Decree on the reduction of emissions of SO2, NOx and dust from combustion plants greater than 50 MW 1017/2002 as amended by Decree 907/205;

WI Directive: Government Decree on waste incineration 362/2003; Environmental Protection Decree 169/2000.

All administrative measures relating to industrial installations are found in Section 84 of the Environment Protection Act (YSL 86/2000). In accordance with this provision, administrative sanctions are aimed at either enforcing the legal obligations of operations, or closing down or limiting illegal activities. Measures may include direct interventions by supervising authorities, especially in case of danger to health or safety. In other cases, the decision-making procedure consists of two elements: prohibition of activities or a prescribed action under the threat of a fine, and the threat of fulfilment of the obligation by authorities at the expense of the operator. If the prohibition or prescription is not complied with, a fine will be imposed. The procedure may be repeated, if necessary. There is no limit on the monetary fine. Liability is the same for legal and natural persons. According to Section 8 of the Act on Conditional Fines (1113/1990), the amount shall be proportional to the nature and size of the obligation as well as the financial situation of the liable person.

According to section 16 of the Environmental Protection Act "the Government may additionally, in order to transpose obligations of international and European law binding Finland, enact decrees on the validity of an environmental permit, its revision and the prescriptions of a permit as well as other comparable requirements foreseen in sections 11 to 15 to prevent environmental pollution." This provision is the legal basis for bringing EU Directives fully under the sanctioning regime of this Act. The Act itself and the related Decree 169/2000 were enacted in order to transpose the IPPC Directive.
The Finnish permit system follows the structure of administrative sectors and corresponding legislation. There are separate permit rules according to sectoral law, i.e. water law, soil extraction law, chemicals law etc. Each of these acts is substantially connected to the prohibitions and requirements based of the Environmental Protection Act (and the related Waste Act) in cases where polluting emissions might occur. The result is that none of these related permit decisions may allow pollution which is restricted under the Environmental Protection Act and provisions enacted on the basis of this Act; these provisions include the governmental decrees of this study. Section 84 of the Environmental Protection Act provides full coverage of situations under this Act, and related decrees. Section 84 applies both to statutes (decrees, decisions) which are enacted directly by this Act and to related statutes when so prescribed (e.g. waste, chemicals). The provisions also apply to the obligations under the waste legislation to the extent these rules are applicable to waste activities regulated under the Environmental Protection Act.

The procedure for using administrative powers is generally regulated separately, in the Act on Conditional Fines (1113/1990) and additionally in Section 88 of the Environmental Protection Act. According to the latter provision, environmental regional state (permit and supervising) authorities and corresponding municipal authorities are the competent authorities for environmental matters. As

mentioned above, all EU directives on the reduction and control of environmental emissions fall within the scope of the generally applicable Environmental Protection Act, and the mandate is given to enact the requirements by means of decree. Penalties and other sanctions must be enacted by legislative acts and cannot therefore arise from decrees. The sanction system of the Act, as mentioned, applies without exceptions to all obligations which the government is entitled to introduce on the basis of EU law.

Criminal offences and sanctions are provided for primarily by Section 116 of the Environmental Protection Act 2000, as amended by 137/2006, 346/2008 and 681/2008 and Chapter 48 of the Penal Code (39/1889 amended by 578/1995, 112/2000 and 748/2007). Chapter 48 includes six different types of environmental offences, four of which may be applicable to environmental offences in respect of pollution caused by industrial installations. These include Section 1 (impairment of the environment), Section 2 (aggravated impairment of the environment), Section 3 (environmental infraction) and Section 4 (negligent impairment of the environment). These provisions are quite general, as they cover a wide range of actions. Chapter 48 also includes Section 7 (clarifying criminal liability, but not the liability for damages which is regulated by the Act on Environmental Damages (19.8.1994/737), and Section 9 which provides a statute of limitations and contains a reference provision concerning corporate criminal liability. Chapter 9 of the Penal Code sets the specific provisions concerning the corporate criminal liability and applies to the offences referred to in Chapter 48. Chapter 10 of the Penal Code specifies general provisions on forfeiture.

Criminal penalties vary from a fine (which must be proportional to the benefits accrued due to non – compliance) to a maximum of 6 years imprisonment, depending on the seriousness of the offence. An environmental violation involving danger to public health may also fall under Chapter 34 of the Penal Code (in serious cases up to 10 years imprisonment, no fine sanction). Laws outside the Penal Code only cover minor offences punishable by a fine. In practice, these sectoral provisions are numerous and applicable to the most common infringements such as acting without a permit or breach of emission limit values. Section 116 of the Environmental Protection Act, mentioned above, is a good example. All penalties must be based on law; they cannot be set by decrees.

As crimes are committed by physical persons, penalties focus on natural persons. However, companies may profit from those violations and even encourage persons to act illegally which is not in line with the polluter pays principle. Therefore, in those situations legal persons may be sentenced to a penalty called a "Community-fine" (Chapter 10 Penal Code), even in addition to the penalty imposed on the natural person. These provisions are fully applicable to the activities under the Environmental Protection Act and the Waste Act (The Waste Act 1072/1993 is applicable in all procedures of the Environmental Protection Act when waste activities, regulated by EU law, are involved). Presently the amount of the Community-fine is between Euros 850 and 850,000. The Criminal Code does not differentiate categories of environmental law, which means that the rules are the same for all kinds of violations against the Environmental Protection Act, other legislation (waste and water laws) and related decrees.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Finland

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation. The decrees by which the Directives in question have been transposed do not provide penalty rules of their own. Instead, Section 84 of the Environmental Pollution Act has a full mandate for all obligations concerned, including specific technical and substantial requirements.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This

would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Finland. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Table 2.38 *Directive 2008/1/EC (IPPC Directive): types of offences and related administrative and criminal penalties in Finland*[78]

	Administrative		Criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to apply for a permit for new or existing installations	Failure to comply with the requirements of the Act, (including those requirements set by Decrees under the Act). This covers all legal and administrative measures of the pollution control regime ***Environmental Protection Act 86/2000, Section 84*** For example, Section 1 of Decree 169/2000 prescribes the requirement of an environmental permit (a broader list than required by the IPPC Directive).	<u>Rectification of a violation or negligence</u> (1) A permit or supervisory authority may *1)* prohibit a party that violates this Act or a decree or regulation based on it from continuing or repeating a procedure contrary to a provision or regulation; *2)* order a party that violates this Act or a decree or regulation based on it to fulfil its duty in some other way; *3)* order a party as referred to in paragraphs 1 and 2 to restore the environment to what it was before or to eliminate the harm to the environment caused by the violation; *4)* order an operator to conduct an investigation on a scale sufficient to establish the environmental impact of operations if there is justified cause to suspect that they are causing pollution contrary to this Act. ***Environmental Protection Act***	Failure to comply with the requirements of the Act, (including those requirements set by Decrees under the Act). This covers all legal and administrative measures of the pollution control regime. ***Environmental Protection Act 86/2000, Section 116***	A fine (proportional to the perpetrators daily income) according to the Ch 2(a) of the Finnish Criminal Code or a sentence to imprisonment for at most two years. If the circumstances are especially aggravated the perpetrator shall be sentenced to imprisonment for at least four months and at most six years. A corporate fine between Euros 850 and Euros 850, 000. ***Chapter 48, Sections 1-4, of the Penal Code 39/1889, as amended by 578/1995 and 112/2000***

[78] The requirements of the IPPC Directive were transposed in Finland through the Environmental Act 86/2000 and the Environmental Protection Decree 169/2000. Sanctions related to the infringement of IPPC Directive are only mentioned in the Environmental Act 86/2000.

Obligation to comply with the conditions set in the permits or mandatory ELVs	As above For example, pursuant to Section 20a the permit rules which are required for waste incineration plants, The requirement of BAT and the use of emissions standards are transposed in the Environmental Protection Act (section 43). Also, pursuant to Section 25 of the Decree 362/2003: "The operator of an incineration plant or a parallel incineration plant shall annually give the supervising authority a report on the operation of the installation. The report must give an account at least of the process and the emissions into air and water compared to the emission standards of this decree. The public shall have the right to access these reports. The reports will be published electronically."	As above	As above	As above

Annex IX – France

FRANCE

1. Overview of penalties related to legislation on industrial installations

Both administrative sanctions and criminal sanctions can apply for the infringement of environmental Law in France. These sanctions are not linked and can be imposed separately on the offender.

Administrative sanctions are decided by administrative authorities. These sanctions cannot constitute a deprivation of individual freedom and shall be complemented by measures to safeguard the rights and freedoms guaranteed under the French Constitution.[83] Administrative sanctions are directly enforceable and are imposed without referral to a judge. The administrative procedure is easier to put in place than the criminal one. There are different types of administrative sanctions depending on the characteristics of the environmental legislation. For instance the legal framework on classified installations contains different administrative sanctions that can be issued by the Prefect (the State's representative in a department or region) which are, the suspension of the operation, the closure or removal of the facility, the sealing of a facility, the deposit of a sum corresponding to the amount of the work to be carried out and the enforcement ex officio of the measures required. These administrative sanctions cannot be imposed without prior issue of a letter of formal notice by the Prefect.

The French Criminal Code does not encompass general sanctions related to harm made to the environment. These criminal sanctions are scattered in specific sectors of the legislation on the environment (e.g. legislation on classified installations,[84] waste,[85] water pollution,[86] air[87]). French Law provides three categories of criminal offences which are serious offences *(crimes),* offences *(délits)* and petty offences *(contravention)*. Most criminal offences related to harm made to the environment are either offences *(délits)* or petty offences *(contraventions)*. For instance infringements to certain provisions of Book V Title I of the Code of the Environment (CoE) on classified installations for the protection of the environment can lead to one year imprisonment and a fine of Euros 75,000. The amendment of the Criminal Code in 1994 established the criminal liability of legal persons in French Law. Pursuant to Article 121(2) of the Criminal Code legal persons, with the exception of the State, are criminally liable for the offences committed on their account by their organs or representatives. For instance legal persons can be criminally liable to a fine of Euros 375,000 for operating a classified installation without an authorisation.[88]

The VOC, LCP and WI Directives were transposed in French national Law by Ministerial Orders. These Orders, however, do not contain any specific sanctions related to the infringement of the transposing provisions of these Directives. All the installations that fall within the scope of these Directives shall comply with the provisions of Book V Title I of the Code of the environment (CoE) on classified installations for the protection of the environment that transposes the requirement of the IPPC Directive.[89] They shall be subject either to authorisation, registration or declaration, according to the gravity of the hazards or drawbacks their operation might present.

---

[83] Decision of the Constitutional Council 89-260 DC of 28 July 1989 available at: http://www.conseil-constitutionnel.fr/conseil-constitutionnel/francais/les-decisions/acces-par-date/decisions-depuis-1959/1989/89-260-dc/decision-n-89-260-dc-du-28-juillet-1989.8652.html

[84] Article L.514-9 and following of the CoE, Articles R.514-4 and R.514-5 of the CoE

[85] Article L. 541-46 and following of the CoE

[86] Article L. 216-6 and following of the CoE

[87] Article L. 226-9 and following of the CoE

[88] See Article L514-9 read in conjunction with Article L.514-18 of the CoE and Article 131 of the Criminal Code

[89] The installations covered by the legislation on classified installations are listed in the nomenclature of classified installations set by a Conseil d'Etat decree issued on the basis of a report from the Minister responsible for classified installations, after the opinion of the Higher Council for Classified Installations. This decree defines the installations as being subject to authorisation or to declaration, according to the gravity of the hazards or drawbacks their operation might present.

The requirements of the transposing provisions of the VOC, LCP and WI Directives shall be considered as being included in the operational requirements set by ministerial or prefectural orders that will have to be fulfilled by the relevant classified installations. An infringement of these operational requirements can lead to specific administrative and criminal penalties under the Title on classified installations for the protection of the environment of the CoE (Article L514-1 (I), Article R514-4 and Article L-514-11).

Regarding the infringement to the requirements of the WI Directive, Title IV of Book V of the CoE provides specific sanctions for the infringement of requirements related to the disposal of waste likely to produce harmful effects on soils, flora and fauna, to damage sites or landscapes, to pollute the air or water, to cause noise and odours and, in general, to harm human health or the environment. Pursuant to Article L-541-2 second paragraph of the CoE, the disposal of waste includes the operations of collection, transport, storage, sorting and treatment required for the recovery of reusable elements and materials or energy, as well as for the deposit or discharge into the natural environment of all other products under the conditions required to avoid the nuisances mentioned in the previous paragraph. This definition of disposal should thus include the incineration of waste. Therefore these sanctions should indirectly apply for the infringement of the requirements of the national transposition of the WI Directive.

Finally, pursuant to Article L-226-8 and 9 of the CoE (Book II Title II on air and atmosphere) industrial, commercial, agricultural or services firms that emit pollutant substances constituting atmospheric pollution[90] can be subject to sanctions. The infringement of the emission requirements under the VOC, LCP and WI Directives could thus be indirectly covered by these provisions.

The Ministry for Ecology, Sustainable Development Transport and Housing[91] is responsible for the inspection of classified installations. Under the authority of Departmental Prefects, inspection and enforcement are mainly carried out by the directorates for industry, research and the environment[92] for most industrial facilities, the departmental veterinary services[93] for farms, abattoirs, animal carcass disposal contractors and some food processing activities and the technical department of the police prefecture of Paris[94] for Paris and its surrounding area. There are around 1,500 inspectors (equivalent to 1,150 full time) −engineers, technicians and veterinary surgeons− all of whom are State officials.[95]

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in France

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

[90] Atmospheric pollution is defined by Article L.220-2 of the CoE as the introduction by man, directly or indirectly, into the atmosphere and closed spaces, of substances having detrimental consequences likely to put human health in danger, to damage biological resources and ecosystems, to influence climate change, to damage material goods, or to result in odour nuisance

[91] Ministère de l'Ecologie, du Développement durable, du Transport et du Logement

[92] Directions régionales de l'industrie, de la recherche et de l'environnement

[93] Directions départementales des services vétérinaires

[94] Service technique de la préfecture de police de Paris

[95] See the Ministry for Ecology, Sustainable Development Transport and Housing presentation brochure on 'the Inspectorate of Classified Installations Environmental policing of industrial and agricultural facilities' available at: http://installationsclassees.ecologie.gouv.fr/IMG/pdf/plaquetteIC anglais.pdf

Provisions, which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive, are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code, which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in France. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Table 2.1 *Directive 2008/1/EC (IPPC Directive): types of offences and related administrative and criminal penalties in France*

	Administrative		Criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to apply for a permit for new or existing installations	Operating a facility without an authorisation or registration or declaration required. ***Article L514-2 first paragraph of the CoE***	Suspension by the prefect of the operation of the facility until the decision on the application for authorisation is issued. ***Article L514-2 first paragraph of the CoE*** If an operator fails to comply with the notice to rectify its situation or if its application for approval is refused, the prefect may, if necessary, order the closure or removal of the facility. ***Article L514-2 second paragraph of the CoE*** The prefect may proceed to the sealing of a facility that is maintained or operated in contravention of a measure of removal, closure or suspension. ***Article L514-2 third paragraph of the CoE***	<u>Without declaration</u> To operate a facility without a declaration. ***Article R.514-4 (1) of the CoE*** <u>Without authorisation or registration</u> To operate a facility without authorisation or registration: ***Article L514-9 of the CoE***	<u>Without declaration</u> Individuals: A fine of Euros: up to 1,500 Legal persons: A fine of up to Euros 7,500 ***Article R.514-4 (1) of the CoE*** <u>Without authorisation or registration</u> Individuals: - A fine of up to Euros 75,000 - Up to one year imprisonment ***Article L514-9 of the CoE*** Legal persons: A fine of up to Euros 375,000 (75,000 x 5) - The ban, either permanently or for a period of five years, to exercise directly or indirectly one or more social or professional activities; - Judicial supervision for a period of five years - The final closure or a suspension of the installation for a period of five years - The exclusion from public tenders either permanently or for a period of five years; - Prohibition, either permanently or for a period of five years, to conduct a public offering of financial securities or the admission of its financial securities to trading on a regulated market; - Penalty of confiscation - The posting of the ruling or distribution thereof by the press or by any

				electronic means to the public ***Article L.514-19 of the CoE*** **Complementary measures:** -The ban of the use of the facility -The rehabilitation of the premises ***Article L.514-9 IV of the CoE***
Obligation to supply information for application for permits	This is not considered an administrative offence	No sanctions	This is not considered a criminal offence	No sanctions
Obligation to notify the competent authority of any changes in the operation of an installation			Failure to notify to the Prefect, any modifications to the facility, its operation or vicinity leading to significant changes in the elements for the application of the authorisation. ***Article R514 (5) of the CoE read in conjunction with Article R512-33 of the CoE***	Individuals: A fine up to Euros 1,500 Legal persons: A fine up to Euros 7,500 ***Article R.514-4 (1) of the CoE***
Obligation to comply with the conditions set in the permit or mandatory ELVs	<u>Infringement or non-compliance with the following requirement:</u> Obligation to comply with the conditions imposed on the operator of a classified facility. ***Article L514-1 (I) of the CoE***	The Prefect issues a formal notice to the operator to comply with the said conditions by a set deadline. If, on expiry of the deadline set for performance, the operator has not complied with the said order, the Préfet may: 1° Oblige the operator to deposit with the Treasury a sum corresponding to the amount of the work to be carried out, which sum will be returned to the operator gradually as the required measures are performed; 2° Have the required measures enforced ex officio and at the expense of the operator; 3° Issue a ruling, after an opinion has been given by the competent advisory commission of the local region *(département)* suspending the operation of the facility until the conditions imposed have been fulfilled and take the necessary provisional measures.	Offences listed in Article R.514-4 of the CoE : Failure to comply with the general rules and technical regulations applicable to the installations subject to authorisation. These rules and regulations determine the appropriate measures to prevent and reduce the risks of an accident or of pollution of any kind occurring, as well as the conditions of integration of the facility into the environment and of rehabilitation of the site after operations have ceased. ***Article R514 (3) of the CoE read in conjunction with Article L512-5 of the CoE*** Failure to comply with the requirements set in the permits related to: -The effectiveness of best available techniques	<u>Penalties related to the offences listed in Article R.514-4 of the CoE</u> Individuals: A fine up to Euros 1,500 Legal persons: A fine up to Euros 7,500 ***(Article R.514-4 (1) of the CoE)*** <u>Penalties related to the offences listed in Article L514-11 of the CoE</u> Individuals: - A fine up to Euros 75,000 - Up to six months imprisonment Legal persons: - A fine up to Euros 375,000 (75,000 x 5) - The ban, either permanently or for a period of five years, to exercise directly or indirectly one or more social or professional activities;

		Article L514-1 (I) (1) (2) (3) of the CoE	-The quality, purpose and use of surrounding environment and the balanced management of water resources. - Emission limits based on best available techniques, within the meaning of Directive 2008/1/EC of 15 January 2008 for installations authorised by the relevant Minister. -The reduction or prevention of long range pollution and transboundary pollution -The start up, malfunction or sudden stop of the installations -The analyses and measures to control the installation and the monitoring of its effects on the environment and the conditions under which the results of these tests and measures are carried to inform the Inspectors of classified installations and services in charge of water policy. - Reporting and quantification of emissions of greenhouse gas emissions for the relevant installations ***Article R514 (3) of the CoE read in conjunction with Article R512-28 of the CoE*** Failure to comply with additional conditions proposed by inspectors of classified installations set in complementary Orders. ***Article R514 (3) of the CoE read in conjunction with Article R512-31 of the CoE*** Failure to comply with the conditions set by Ministerial Order related to the presentation of the overview of plant operation ***Article R514 (3) of the CoE read in conjunction with Article R512-45 of the***	- Judicial supervision for a period of five years - The final closure or a suspension of the installation for a period of five years - The exclusion from public tenders either permanently or for a period of five years; prohibition, either permanently or for a period of five years, to conduct a public offering of financial securities or the admission of its financial securities to trading on a regulated market; - Penalty of confiscation - The posting of the ruling or distribution thereof by the press or by any electronic means to the public ***Article L.514-19 of the CoE*** **Complementary measures:** -The ban of the use of the facility -The rehabilitation of the premises ***Article L.514-9 IV of the CoE***

			CoE Failure to comply with the declaration requirements related to emission of pollutants and production of waste ***Article R514 (3) of the CoE read in conjunction with Article R512-46 of the CoE*** Offences listed in Article L-514-11 of the CoE The continued operation of a classified facility while failing to comply with the summons to meet, within a set time, the technical stipulations determined for the application of Articles L. 512-1 (e.g. requirements related to the distance from dwellings, from buildings habitually occupied by third parties, establishments receiving the public, waterways, communication routes, water catchment areas, or zones destined for dwellings by binding planning documents) ***Article L-514-11 of the CoE read in conjunction with Article L512-1 of the CoE*** The continued operation of a classified facility while failing to comply with the summons to meet, within a set time, the technical stipulations indispensable for the protection of the convenience of the neighbourhood, or for public health and safety, or for agriculture, or for the protection of nature and the environment, or for the conservation of sites and monuments or elements of the archaeological heritage, related to the means of analysis and measurement and the means of intervention in case of an incident	

			Article L-514-11 of the CoE read in conjunction with Article L512-3 The continued operation of a classified facility while failing to comply with the summons to meet, within a set time, the technical stipulations preventing and reducing the risks of an accident or of pollution of any kind occurring, as well as the conditions of integration of the facility into the environment and of rehabilitation of the site after operations have ceased. ***Article L514-11 of the CoE read in conjunction with Article L512-5 of the CoE*** The continued operation of a classified facility while failing to comply with the summons to meet, within a set time, the technical stipulations related to the evaluations to be conducted or the remedies to be implemented which are rendered necessary either by the consequences of an accident or an incident occurring in the facility, or by the consequences of a failure to comply with the conditions imposed by the present Title, or by any other hazard or drawback interfering or threatening to harm the aforementioned interests. The continued operation of a classified facility while failing to comply with the summons to meet, within a set time, the technical stipulations related to particular requirements due to local circumstances set by the prefect in the registration order. ***Article L514-11 of the CoE read in conjunction with Article L512-7-3 of the CoE***	

			The continued operation of a classified facility while failing to comply with the summons to meet, within a set time, the technical stipulations related to the necessary requirements set by a complementary Order of the prefect for installations that shall be registered. ***Article L514-11 of the CoE read in conjunction with Article L512-7-5 of the CoE*** The continued operation of a classified facility while failing to comply with the summons to meet, within a set time, the technical stipulations related to the general requirements in the declaration set by the prefect. ***Article L514-11 of the CoE read in conjunction with Article L512-8 of the CoE*** The continued operation of a classified facility while failing to comply with the summons to meet, within a set time, the technical stipulations related to the necessary specific requirements imposed by the prefect to installations subject to declaration. ***Article L514-11 of the CoE read in conjunction with Article L512-12 of the CoE*** The continued operation of a classified facility while failing to comply with the summons to meet, within a set time, the technical stipulations related to evaluations to be done and implementation of remedies required by the prefect that are necessary as a consequence of an accident or incident at the facility or due to the breach of conditions imposed under the legislation	

			on classified installations. ***Article L514-11 of the CoE read in conjunction with Articles L512-20 of the CoE***

Criminal offences related to the disposal of waste: Disposing of or retrieving waste or materials waste likely to produce harmful effects on soils, flora and fauna, to damage sites or landscapes, to pollute the air or water, to cause noise and odours and, in general, to harm human health or the environment without fulfilling the prescriptions concerning the characteristics, quantities, technical and financial conditions for handling the waste or materials, and the treatment processes used, set in the approval certificate from the administration. ***Article L.541-46 I (8)) of the CoE read in conjunction with Article L.541-22 of the CoE, Article L.541-7 of the CoE and Article L.541-2 of the CoE***	See same row on IPPC tables Criminal sanctions related to atmospheric pollution: Individuals: - A fine up to Euros 7,500 - Up to six months' imprisonment ***Article L.541-46*** Legal persons: - A fine up to Euros 37,500 - The ban, either permanently or for a period of five years, to exercise directly or indirectly one or more social or professional activities - Judicial supervision for a period of five years - The final closure or a suspension of the installation for a period of five years - The exclusion from public tenders either permanently or for a period of five years; - prohibition, either permanently or for a period of five years, to conduct a public offering of financial securities or the admission of its financial securities to trading on a regulated market; - Penalty of confiscation - The posting of the ruling or distribution thereof by the press or by any electronic means to the public

				Article L.226-10 of the CoE read in conjunction with Articles 131-38 and 39 of the Criminal Code <u>Criminal sanctions related to the infringement on the requirements related to the disposal of waste</u>: Individuals: - A fine up to Euros 75,000 - Up to two years of imprisonment ***Article L.541-46 of the CoE*** Legal persons: - A fine up to Euros 375,000 - The ban, either permanently or for a period of five years, to exercise directly or indirectly one or more social or professional activities; - Judicial supervision for a period of five years - The final closure or a suspension of the installation for a period of five years - The exclusion from public tenders either permanently or for a period of five years; - prohibition, either permanently or for a period of five years, to conduct a public offering of financial securities or the admission of its financial securities to trading on a regulated market; - Penalty of confiscation - The posting of the ruling or distribution thereof by the press or by any electronic means to the public ***Articles L.541-46 and 47 of the CoE read in conjunction with Articles 131-38 and 39 of the Criminal Code*** **Complementary measures:** - The temporary or total closure of the installation

				- The rehabilitation of the places harmed by waste not treated under the conditions required by the Law. - The posting of the ruling or distribution thereof by the press or by any electronic means to the public. ***Articles L.541-46 of the CoE***

Annex X– Germany

GERMANY

1. Overview of penalties related to legislation on industrial installations

In Germany, sanctions for the infringement of provisions relating to industrial installations consist of administrative criminal sanctions, criminal sanctions and administrative enforcement measures. While administrative criminal sanctions and administrative enforcement measures are regulated in the legislation transposing Directives 2008/1/EC, 1999/13/EC, 2001/80/EC and 2000/76/EC, the criminal sanctions are laid down in the German Criminal Code, in the section on environmental criminal law.

Administrative criminal sanctions are classified as such because they are conditional upon the offender's negligence or intent. Their aim is not to restore legality or to prevent danger but to have deterrent and preventive effects and to convict the perpetrator for a wrongdoing.

Administrative criminal sanctions for infringements of obligations relating to the permit procedure for industrial installations in the meaning of the four Directives are regulated by the Federal Immission Control Act (BImSchG). The Federal Immission Control Act[96] is Germany's primary legislation for emission control and primarily transposes Directive 2008/1/EC. All installations that are listed in the Ordinance on Installations Requiring a Permit (4.BImSchV) are subject to the permit procedure of the Federal Immission Control Act.[97] All installations that fall under the scope of Directives 2008/1/EC, 2001/80/EC and 2000/76/EC and some installations that fall under the scope of Directive 1999/13/EC are listed in this Ordinance. Operations of installations falling under the scope of Directive 1999/13/EC that are not listed in this Annex, must be notified to the competent authority §5(2), when they exceed the emission limit values set out by Ordinance on the Limitation of Emissions of Volatile Organic Compounds (31.BImSchV) transposing Directive 1999/13/EC. In addition, the German federal states (Länder) have adopted sanctions for the infringement of obligations that are not covered by the Federal Law. However, since the federal law covers the main obligations of the abovementioned Directives, these sanctions are not included in this overview.

On the basis of the Federal Immission Control Act, the Federal Government has adopted the following Ordinances that transpose the substantial requirements of Directive 1999/13/EC, 2001/80/EC, and 2000/76/EC, including their relevant sanctions:

1. Ordinance on the Limitation of Emissions of Volatile Organic Compounds (31.BImSchV) transposing Directive 1999/13/EC;
2. Ordinance on Large Combustion plants and Gas Turbine Installations (13.BImSchV) transposing Directive 2001/80/EC;
3. Ordinance on Waste Incineration and Co-Incineration (17.BImSchV) transposing Directive 2000/76/EC.

Sanctions for infringements of obligations in relation to the unlawful discharge of waste water from the cleaning of exhaust gases is regulated in the federal Water Management Act (WHG) and in the laws of the states (Bundesländer), each transposing the provisions related to waste water of Directive 2000/76/EC. Not all states lay down sanctions for infringements of these obligations.

Only IPPC- landfills do not fall under the scope of the Federal Immission Control Act (BImSchG). The sanctions for infringements of the substantial requirements for landfills are regulated in the Landfill Ordinance (DepV) and the sanctions for non-compliance with the permit procedure are regulated in the Act for Promoting Closed Substance Cycle Waste Management and Ensuring

[96] The German law uses the term "immission" to underline that the BImSchG focuses on the protection of goods, including humans, animals and the environment, exposed to immission. However, this protection is provided by the control of emissions from installations.
[97] IPPC-landfills are not listed in this Annex.

Environmentally Compatible Waste Disposal – the Waste Management Act (KrW-/AbfG). Other waste management facilities fall under the scope of the Waste Management Act, however, the relevant provision (§ 31(1) KrW-/AbfG) cross-refers to the Federal Immission Control Act that provides for the applicable sanctions. IPPC-installations that fall under the scope of the Federal Mining Act (BBergG) are additionally subject to the Federal Immission Control Act that again provides for the applicable sanctions.

The procedure for the prosecution and litigation of an administrative criminal offence (Ordnungswidrigkeit) is regulated in the national Administrative Offence Act (Gesetz über Ordnungswidrigkeiten – OWiG). According to this law the minimum fine is five Euros. Each administrative law respectively identifies the maximum fine for the commitment of a specific offence. The amount of the fine imposed on the perpetrator for committing a specific offence is determined by an assessment of the level of guilt of the perpetrator (§ 17 OWiG). If the convict does not pay the fine and provided they are not bankrupt, the competent court can arrest this person for a maximum of six weeks in case of one offence and a maximum of three months in case of the perpetration of various offences to enforce the payment of the fine. However, this measure only serves to enforce the punishment and is not a measure of punishment.

The authorities competent for prosecuting and sanctioning administrative criminal offences vary between states. In many cases, the competent authorities responsible for emission control are also the competent authorities for the prosecution of related offences. These are authorities of the states or municipalities. Appeals must be lodged at the local criminal courts (§ 68 OWiG).

The competent authority has a number of different options to restore legality if an operator of an installation infringes his obligations. The authority can issue an administrative order that requires the operator of an installation requiring a permit to comply with legal obligations (§ 17 BImSchG). Under specific conditions, the authority is entitled to close the installation, for example if it is operated without a permit (§ 20 BImSchG). As a further measure, the competent authority can withdraw the permit, e.g. if the operator does not comply with obligations set out in the permit or if the conditions for granting the permit are no longer met (§ 21(1) no.2 and no.3 BImSchG). If an installation is not subject to a permit, the authority is entitled to require the operator to comply with the legal obligations, and in case of further non-compliance can close the installation (§ 25(1) BImSchG).

The administrative laws transposing the four Directives do not provide for criminal sanctions. The section on environmental criminal law (§ 324-330d StGB) of the national Criminal Code provides for criminal sanctions. Article 327(2) no.1, (3) of this Code specifically sanctions the operation of installations within the meaning of the Federal Immission Control Act (BImSchG) transposing the four Directives without a permit or against an enforceable administrative order. Additionally, this section contains general sanctions for the infringement of regulatory administrative provisions that lead to negative impacts on the environment.

According to § 327(2) no.1, (3) of the Criminal Code, the operation of a facility in the meaning of the Federal Immission Control Act that requires a permit and which is operated without a permit or contrary to an enforceable prohibition[98] as well as the operation of such a facility that does not require a permit (the operation of which has been prohibited in order to prevent danger) shall be punished. In case of an intentional perpetration of this offence the sanction is imprisonment of a maximum of three years or a maximum fine of 360 daily units[99] and where legal persons are liable for their representatives up to an amount of Euros 1,000,000. In case of a negligent perpetration of this offence

[98] This prohibition must refer to the infringement of an essential obligation (See Fischer, Thomas, commentary to the Criminal Code, 57 edition 2010, § 327 recital 12.. Conditions included in the permit stipulating mandatory emission limit values must be construed as essential obligation.

[99] Taking into account the personal guilt of the perpetrator of a criminal offence, the court decides on the number of daily units with which to punish the perpetrator. The level of payment in relation to one daily unit depends on various circumstances, e.g. the income of the perpetrator.

the sanction is imprisonment of maximum two years or a maximum fine of 360 daily units and where legal persons are liable for their representatives up to an amount of Euros 500,000. The same sanction applies to operators that run a landfill in the meaning of the Waste Management Act without a permit or contrary to enforceable provisions (§ 327(2) no.3, (3) of the national Criminal Code).

The first variant of § 327(2) no.1 of the Criminal Code sanctions the operation of an installation falling under the scope of the Federal Immission Control Act requiring a permit, without a permit. This includes the operation of an installation without a permit after this installation has been subject to substantial changes.[100] Taking into account the fact that almost all national permit procedures for installations falling under the scopes of the four Directives are regulated in the Federal Immission Control Act, the first variant of § 327(2) no.1 of the Criminal Code is applicable to almost all installations falling under the scope of these Directives which require a permit. The second variant of 327(2) no.1 of the Criminal Code applies to those installations which do not require a permit within the meaning of the Federal Immission Control Act. The operation of these installations is sanctioned if the operation is contrary to an administrative prohibition that aims to prevent a danger. The operation of installations falling under the scope of the Ordinance on the Limitation of Emissions of Volatile Organic Compounds (31.BImSChV) transposing Directive 1999/13/EC and not requiring a permit can be subject to this criminal sanction.

Additionally, German environmental criminal law contains a number of provisions (§ 324-330d StGB) that aim to protect the environment, in particular human beings, fauna and flora, soil and air and which sanction the violation of administrative provisions if these violations lead to negative impacts on the environment. In relation to air emission prevention, reduction and control, § 325 of the Criminal Code is of particular relevance.[101]

In accordance with § 325(1) of the Criminal Code the operation of an installation in violation of duties under administrative law that cause alterations of the air which are capable of harming the health of human beings, animals, plants or other property of significant value outside the area belonging to the installation shall be liable to imprisonment of a maximum of five years or a maximum fine of 360 daily units in case of an intentional perpetration and of imprisonment of a maximum of three years or a maximum fine of 360 daily units in case of a negligent perpetration (liability of legal persons for intentional perpetration: maximum fines of Euros 1,000,000/ liability of legal persons for negligent perpetration: Euros 500,000). In accordance with § 325(2) of the Criminal Code the same sanction applies to any person who in gross violation of duties under administrative law, releases harmful substances in significant amounts into the air outside the grounds of the facility.

It is noteworthy that environmental criminal law is marked by the principle of administrative accessoriness and in accordance with this principle its offences (except for § 330a StGB) are only punishable under the condition that the perpetrator violates an administrative obligation, e.g. operates an installation without a permit. The legitimacy of the application of this principle is controversially discussed in Germany.[102] However, in accordance with the opinion of the national courts and the majority of legal scholars[103] the application of this principle does not breach the constitution and is necessary. Eventually, it should be mentioned that Germany is in an early stage of the legislative process to amend the environmental criminal law in order to transpose Directive 2008/99/EC. However, it is too early to assess how this amendment will change the actual provisions.

---

[100] See Fischer, Thomas, commentary to the Criminal Code, 57 edition 2010, § 327 recital.12.

[101] This provision is not indicated in the tables below. Note that the procedure in relation to the prosecution of criminal offences and the court procedure are regulated in the German Code of Criminal Procedure (StPO). The judge determines the amount of one daily unit taking into account the economic background of the convict. The amount of one daily unit is minimum 1,-- and maximum 30.000,-- Euros.

[102] However, in accordance with the opinion of the national courts and the majority of legal scholars[102] the application of this principle does not breach the constitution and is necessary.

[103] See Thomas Fischer, commentary to the Criminal Code, 57 edition 2010, prior to § 324 recital .6

The procedure in relation to the prosecution of criminal offences and the court procedure are regulated in the German Code of Criminal Procedure (StPO). The StPO contains rules for the determination of the correct sanction. Instead of imprisonment the judge is also entitled to impose fines on the convict. Fines are calculated in daily units. The judge can impose a minimum of 5 and a maximum of 360 daily units. The number of daily units imposed on the convict depends on the level of guilt that is reflected in the perpetration of the offence. The judge determines the amount of one daily unit taking into account the economic background of the convict. The amount of one daily unit is a minimum of Euro 1 and a maximum of Euros 30,000.

Legal persons, associations and partnerships are liable for the commission of administrative and criminal offences committed by their authorised representatives or managers. This is regulated in §30 of the national Administrative Offences Act (OWiG). A fine can be imposed on legal persons, associations and partnerships if their authorised representatives or managers commit a criminal or administrative offence that infringes obligations addressed to these bodies or by which they are enriched. In case of an intentional offence the fine amounts to a maximum of Euros 1,000,000 and in case of a negligent offence the fine amounts to a maximum of Euros 500,000. If the authorised representative or manager commits an administrative offence, fines incurred by this commitment match the fines that may follow the perpetration of an administrative offence committed by a natural person as laid down by each administrative law. If the competent administrative or prosecution authority does not initiate a procedure against the authorised representatives or managers, if the procedure against them is closed or if the administrative authority or the court abstains from imposing a penalty on them, a fine can be independently imposed on the legal persons, associations and partnerships. The independent imposition of a fine is prohibited, if the offence cannot be prosecuted for legal reasons.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Germany

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Germany. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;

[104] The legislative power to transpose this Article is vested in the states (Bundesländer). Not all Bundesländer sanction infringements of the transposing legislation.
[105] See above.

- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Annex XI– Greece

GREECE

1. Overview of penalties related to legislation on industrial installations

Greece has general provisions for breaches of legislation relating to industrial installations. Law 1650/1986 on Environment Protection (as amended by L. 3010/2002 *"Harmonisation of Law 1650/1986 with Directives 97/11/EC and 96/61/EC*") provides for general criminal, administrative and civil liabilities and penalties for breaches of environmental laws and permits. Sanctions for infringement to the national legislation transposing the directives on industrial installations are set up through or by reference to the Law on Environment Protection as follows:

IPPC Directive - is transposed by the Law on Environment Protection (L.1650/1986) and sanctions are set by Articles 28-30 of L.1650/1986, as amended by Law 3010/2002 (OJ A 91/2002).

VOC - Directive 1999/13/EC has been transposed in the Greek legal order by Joint Ministerial Decision 11641/1942/2002 (OJ B832/2.07.2002) "On measures and conditions for the limitation of VOCs arising from the use of organic solvents in certain activities and installations". The penalty provisions are provided in Article 11 of the aforementioned JMD, which makes cross reference to articles 28-30 of L. 1650/1986.

LCP Directive - The penalty provisions pursuant to Article 16 of the Directive are transposed by Article 14 of JMD 29457/1511/2005 (OJ B992/2005) which makes cross-reference to Articles 28-30 of L.1650/1986, as amended by article 4 of L. 3010/2002.

WI Directive - Article 19 of the Directive referring to the imposition of sanctions is transposed by Article 15 of JMD 22912/1117/2005 (OJ B 759/2005) which makes cross-reference to Articles 28-30 of L.1650/1986.

Administrative bodies may propose sanctions and penalties if a breach is identified. Article 30 of Law 1650/1986 provides for administrative sanctions in the form of a fine for any natural or legal persons that cause pollution or other degradation of the environment or who violates the provisions of the relevant legislation, independently of civil or penal responsibility. The fine is imposed according to the severity of the infringement, the frequency, the relapse, the amount by which the limits were exceeded and the violation of environmental terms, of Euros 50 to 500,000 per organisation depending on the competent authority involved. Depending on the level of the fine, the competent authority is the Prefect, the Secretary General of the Region, or the Ministry of Environment, Energy and Climate Change.

Article 28 Law 1650/1986, provides for criminal sanctions including fines and imprisonment, for pollution or carrying out an activity/enterprise without a necessary permit, including imprisonment of between three months and two years. A failure to comply with permit conditions pursuant to Article 4 may also result in imprisonment for a period of 3 months to 2 years, or a fine or both, because of environmental pollution. Article 28(1) sets up offences for causing pollution or degrading the environment with action or omission that infringe the provisions of this law or published decrees and ministerial or prefectoral decisions adopted pursuant to this law or b) practises activity or enterprise without the required authorisation or approval or exceeds the limits of authorisation or approval and degrades the environment. Article 28 (1)-(6) of Law 1650/1986 establishes the following sanctions:
1) Imprisonment for a period of 3 months to 2 years, and a monetary penalty, because of environmental pollution. The amount of the fine is set by Article 57 of the Criminal Code and ranges from Euros 150 to 15,000.
2) In case of negligence, imprisonment up to one year.
3) With regard to the crimes of paragraph 1, if by the type or the quantity of pollutants or by the extent and the importance of degradation of the environment, danger of death or heavy bodily damage was caused, imprisonment of at least one year and a monetary penalty can be imposed. In case of heavy

bodily damage or death, imprisonment up to ten years is imposed. If the heavy bodily damage or the death concerns a foetus, imprisonment of at least two years and a monetary penalty can be imposed.
4) In case the pollution or other degradation of the environment results of the activity of a legal person, liability under civil law for the entire payment of the pecuniary sentence.
5) Chairmen of boards/ CEOs of limited companies/ Managing directors/ Administrators/ Managers of legal person are punished as perpetrators independently from other individuals' criminal responsibility and the legal person's civil responsibility, provided that, deliberately or by negligence, they did not comply with the legal obligation to supervise the application of this law provisions.
6) If the offender, willingly and before being interrogated for his action limits significantly the pollution or other degradation of the environment or by timely notice to the authority contributes effectively to the essential reduction of the impact, the court can decide a reduced sentence or exempt him from any sentence.

As specified above, the liabilities are the same for natural as for legal persons.

For all industrial installations covered by this study, the Environmental Inspectorate set up by Law 2947/2001 and by Presidential Decree 165/2003 is responsible for inspecting and monitoring implementation of and compliance with environmental conditions and recommending the imposition of sanctions in cases of infringement. On the basis of the inspection, the environmental inspector prepares a report, which includes infringements of the legislation or the environmental conditions. In case of such infringements, the offender is served a notice and must explain and justify the infringement within a given deadline. Once the offender's response has been received or the deadline has expired, the environmental inspector issues a reasoned statement confirming or not the infringement.

A copy of this statement is dispatched to the permitting authority and to the competent public prosecutor to examine whether there is any criminal liability involved.

The Environmental Inspectorate operates on a horizontal level, thus having the competence to inspect any public or private project and industrial or other activity.

According to Article 6 of Law 3818/2010 (OJ A 17/2010), a new Special Secretary is funded within the Ministry of Environment, Energy and Climate Change, under the title "Special Secretary of Energy and Environmental Inspections". The new Special Secretary incorporates the Environmental Inspectorate, the Coordinating Bureau for the Prevention and Remediation of Environmental Damage and the Consulting Committee for the Prevention and Remediation of Environmental Damage. The Coordinating Bureau and the Consulting Committee are responsible for the implementation of the Presidential Decree 148/2009, which transposes in Greece the Environmental Liability Directive (Directive 2004/35/EC). This new administrative restructure does not alter at all the competencies of the Environmental Inspectorate.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Greece

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions, which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive, are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code, which imposes sanctions for pollution of the environment. In Greece, Article 28 Law 1650/1986 establishes such general sanctions.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Greece. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Annex XII-Hungary

HUNGARY

1. Overview of penalties related to legislation on industrial installations

In Hungary, legal obligations in respect of the four Directives on industrial installations are transposed by the following specific acts and decrees relating to each Directive:

IPPC Directive: Government Decree No. 314/2005 (XII.25.) on Environmental Impact Studies and Integrated Environment Use Permits.

VOC Directive: Ministerial Decree (KöM) No. 10/2001 (IV.19.) on the limitation of emissions of volatile organic compounds due to the use of organic solvents in certain activities and installations, Government Decree No. 21/2001 (II.14) on Air Protection.

LCP Directive: Ministerial Decree (KvVm) No. 10/ 2003 (VII.11) on the limitation of emissions of certain pollutants into the air from large combustion plants, with a rated input equal to or greater than 50 MW; Government Decree No. 21/2001(II.14.) on Air Protection

WI Directive: Ministerial Decree (KöM) No. 3/ 2002 (II. 23) on the technical and operational conditions of waste incineration and on emission limit values relating to waste incineration, Ministerial Decree (KöM) No. 4/2001 (II. 23.) on waste oil management.

The Hungarian legal system provides several different mechanisms for liability in the event of non-compliance with environmental requirements. According to Article 101(1) of the Environmental Protection Act, *'whoever endangers, pollutes or harms the environment with his activity or omission, or performs his activity breaching environmental requirements shall bear the criminal, civil,*[107] *administrative or quasi-criminal responsibility defined by this Act or by other laws'.*

Administrative liability[108] applies when the activity of an installation lacks the consent of the competent authority[109] or is performed in such a way, which breaches environmental legislation or the decision of the competent authority. If the operator fails to comply with the environmental requirements, the competent authorities can impose administrative sanctions, including a fine and/or requiring the operator to perform or abstain from certain activity. Levels of fines often vary according to the level, weight and recurrence of the environmental pollution and environmental damage caused.[110] Administrative sanctions can be imposed both on legal and natural persons.[111]

The main administrative authorities at country level are the Ministry of Rural Development[112] and the National Inspectorate for Environment, Nature and Water.[113] However, at first instance, environment-related matters are managed by the regional environment, nature and water inspectorates and the national park directorates.[114]

Quasi-criminal liability constitutes a special type of liability, which has characteristics of both

---

[107] Civil liability is not subject to the current study.
[108] Resource used: Measures other than criminal ones in cases where environmental Community Law has not been respected in a few Candidate countries http://ec.europa.eu/environment/legal/crime/studies_en.htm
[109] Legal Act LIII. of 1995 (the Environmental Protection Act) 106. § on environmental fines
[110] Article 106 (1) of the Environmental Act
[111] As an example Article 18 (1) of the Government Decree No. 21/2001 (II.14) on Air Protection states that air protection fine can be imposed both on natural persons, legal persons and other unincorporated organizations.
[112] Before Ministry of Environmental Protection and Water, http://www.vm.gov.hu/main.php?folderID=945
[113] The National Main Inspectorate of Environment and Water is mainly a second instance authority. http://www.orszagoszoldhatosag.gov.hu/index.php?akt_menu=78&bemut=3
[114] Resources used: http://www.iclg.co.uk/khadmin/Publications/pdf/3609.pdf

administrative and criminal liability. Petty offences[115] are considered less harmful to society than criminal offences, therefore quasi-criminal procedures are more simplified than criminal law procedures. The first instance procedures are handled by administrative authorities. However, decisions of first instance authorities can be appealed before superior administrative bodies and regular courts (criminal chambers). The typical first instance authorities are the notaries, the police, or other competent authorities such as authorities of consumer protection, or the administrative authority responsible for nature protection.[116] The sanctions imposed for quasi-criminal offences are similar to those for criminal offences, therefore sanctions could for example include imprisonment or fines.[117] Coercive measures, such as custody or detention may also be imposed.With regard to the industrial installations, the so-called 'environmental protection petty offence' is the most relevant.[118] According to Article 148 of the Petty Offence Act, a fine up to Euros 547 (HUF 150,000) can be imposed in cases of operating without an environmental permit or non-complying with its conditions. According to the Hungarian legal system, only natural persons can be liable for petty offences. In case a legal person breaches its legal obligations, the person whose act or omission caused the breach will be liable.

In case of the most serious breaches of environmental obligations, criminal liability may arise. Criminal liability is regulated in the Hungarian Criminal Code (Act IV. of 1978. - Article 280- 281/A). In principle, environmental crimes are felonies.[119] Environmental crimes can be committed by both active behaviours and omissions. The result of the crime (material crime) usually constitutes harm or danger to the environment. Typical sanctions pursuant to Hungarian criminal law can include principle and supplementary punishments, such as imprisonment or a fine.[120] The Hungarian Criminal Code does not cover offences which relate specifically to infringements of the four directives, but it does include certain general offences which are of relevance, such as damage to the environment and violation of waste management regulations.

According to Article 280 (1) of the Criminal Code,[121] a person responsible for any pollution of the earth, the air, the water, the biota (flora and fauna) and their constituents, resulting in (i) their endangerment (ii) damage to such an extent that its natural or previous state can only be restored by intervention, or (iii) damage to such an extent that its natural or previous state cannot be restored at all, is guilty of a felony and can be punishable for imprisonment up to 8 years. Article 281/A of the Criminal Code (violation of waste management regulations) states that a person who carries out waste management activities without an environmental permit, fails to comply with its provisions, or carries out other unlawful activities is guilty of a felony and can be punished by imprisonment for up to 5 years.

---

[115] 'Petty Offences Act LXIX of 1999, Article 1 (1), *'petty offences are those illegal actions realized in an activity or omission that are classified as petty offences by an Act of Parliament, by a government decree or by a municipality decree, and whose perpetrators are threatened with sanctions defined below'*.

[116] Resource used: Article 32-35 of the Petty Offences Act

[117]13. § (1) Penalties applicable for petty offences: a.) imprisonment, b.) fine. Measures applicable for petty offences: a.) prohibition from driving, b)confiscation of goods, c.) notification, d.) expulsion

[118] List of petty offences which could be relevant with regard to IPPC installations:

- Environmental protection petty offence (Act LXIX of 1999, Article 148);
- Nature protection petty offence (Act LXIX of 1999, Article 147);
- Water pollution petty offence (Government Decree 218/1999 (XII. 28.), Article 126);
- Petty offence of breaching water law requirements (Government Decree 218/1999 (XII. 28.), Article 125); and
- Petty offence of breaching flood protection and/or inland flood protection requirements (Government Decree 218/1999 (XII.28.), Article 127).

[119]Criminal Code (Act IV. Of 1978) Article 11 (2) A felony is an act of crime perpetrated intentionally, for which the law orders the infliction of a punishment graver than imprisonment of two years. Any other act of crime is misdemeanor.

[120]Criminal Code Article 38: (1) Principal punishments are: 1. imprisonment, 2. labour in the public interest, 3. Fine 4. Prohibition from profession 5. Prohibition from driving vehicles and 6. Expulsion.
Supplementary punishments are: 1. prohibition from public affairs and 2. Banishment.

[121] Article 280 of the Criminal Code (Act IV of 1978): Harming the environment

The criminal liability of legal persons was introduced to the Hungarian legal system in 2001, by Act CIV of 2001.[122] Criminal measures against legal persons can only be imposed if the crime was intentional and the intention of the perpetrator was to get unlawful gains for the benefit of the legal person or his activity resulted in such gains. As a second precondition, criminal sanctions can only be imposed if the perpetrator was in a certain relationship with the legal person,[123] or was in charge of certain tasks.[124] Act CIV of 2001 foresees the following criminal measures against legal persons: dissolving the legal person, restricting/limiting the activities of the legal person, and/or imposing a fine.[125]

In practice, most of the environmental penalties in respect of industrial installations are administrative in nature. Administrative penalties can be imposed alongside quasi-criminal and criminal sanctions.[126] However, quasi-criminal and criminal penalties cannot be applied in conjunction.[127]

As a general rule, a polluter may also be held liable pursuant to Article 101(2) of the Environment Act for the costs of prevention and remediation of the polluting activity, In addition, the operator is required to *inter alia* mitigate the damage, inform the authorities of the pollution, refrain from engaging in any activity posing an imminent threat or causing damage to the environment, cease such an activity where applicable, accept the responsibility for the environmental damaged caused and cover the costs of prevention and rehabilitation.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Hungary

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant

[122] Legal Act CIV of 2001 on Criminal Measures Applicable against Legal Persons

[123] In line with Article 2(1)(a) of Act CIV of 2004, this category of covers the executive officer, member or employee of the legal person entrusted with the right of acting on behalf of the legal person, its official, director or member of its supervisory board and their representatives, within the activity of the legal person. Pursuant to Article 2(2) of Act CIV of 2004, criminal measures can also be imposed on legal persons if the criminal act resulted in unlawful gains for the legal person and the legal person's executive officer, member or employee entrusted to act on behalf of the legal person, its official, directors, or member of its supervisory board was aware of the criminal act.

[124] In line with Article 2(1)(b) of Act CIV of 2004 this category covers the member or employee of the legal person, if the crime was committed within the activity of the legal person and could have been prevented if the executive officer, the director, or the supervisory board had properly fulfilled his control and supervisory obligations.

[125] Article 2 (1) and Article 3 of Act No. CIV. of 2001

[126] Environmental Protection Act, Article 107, *'the imposition of an environmental fine does not free anyone from criminal, quasi-criminal or civil liability, or from being obliged to limit, suspend or halt an activity, from realizing protective measures or from restoring the natural or previous state of environment'.*

[127] Petty Offences Act, Article 1 (2) *'[…] no petty offence can be established if the action constitutes a crime'.*

Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Hungary. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Annex XIII-Ireland

IRELAND

1. Overview of penalties related to legislation on industrial installations

In Ireland, the legal obligations and penalties relating to industrial installations are covered primarily by the Environmental Protection Agency Act 1992 as amended by the Protection of the Environment Act 2003, as well as by the following specific acts relating to each Directive:

IPPC Directive: The Environmental Protection Agency (Licensing) Regulations 1994 (S.I. No. 85/1994), as amended by the Environmental Protection Agency (Licensing) (Amendment) Regulations 2004 (S.I. No. 394/2004), and the Waste Management (Licensing) Regulations 1997 (S.I. No. 133/1997) as amended by the Waste Management (Licensing) Regulations 2004 (S.I. No. 395/2004);

VOC Solvents Directive: Emissions of Volatile Organic Compounds from Organic Solvents Regulations 2002 (S.I. No. 543 of 2002); Limitation of Emissions of Volatile Organic Compounds due to the use of Organic Solvents in Certain Paints; The Air Pollution Act 1987;

Waste Incineration Directive: The Environmental Protection Agency (Licensing) Regulations 1994 (S.I. No. 85/1994), as amended by the Environmental Protection Agency (Licensing) (Amendment) Regulations 2004, and the Waste Management (Licensing) Regulations 1997 (S.I. No. 133/1997), as amended by the Waste Management (Licensing) Regulations 2004 (S.I. No. 395/2004), the Waste Management Act 1996, the Waste Management (Amendment) Act 2001, the European Communities (Incineration of Waste) Regulations 2003 (S.I. No. 275 of 2003);

LCP Directive: The Air Pollution Act 1987, the Large Combustion Plants Regulations 2003 (S.I. No. 644 of 2003), as amended by the Large Combustion Plants Regulations 2010 (S.I.No. 371/2010).

Administrative sanctions as defined in the continental law system do not exist in Ireland.

Persons who infringe their legal obligations can be convicted on summary conviction (petty offences) or on conviction on indictment (serious offences) depending on the type and level of infringement. A person found guilty is liable on summary conviction to a fine not exceeding Euros 3000 and/or to imprisonment for any term not exceeding 12 months. A person found guilty is liable on indictment to a fine not exceeding Euros 15,000 and/or to imprisonment for a term not exceeding ten years. Continued contravention on conviction carries extended penalties every day thereafter of up to Euros 1000 on summary conviction and up to Euros 130,000 on conviction on indictment.[136] "Person" includes natural or legal persons.

In Ireland, the Environment Protection Agency (EPA) is the primary body responsible for issuing permits and enforcing legislation relating to industrial installations. In many cases, prosecution will be the ultimate sanction used by the EPA. However, alternatives and precursors to prosecution include warning letters (often used as a first step before proceedings), statutory notices requiring specific actions to be taken (for example to suspend/revoke a licence) and court orders (which may be used to cease the cause of pollution). The EPA also has the statutory power to periodically review permits. The approach taken will usually depend on the nature and severity of the event causing the pollution.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Ireland

[136] The Environmental Protection Agency Act [No. 7] 1992 as amended by the Protection of the Environment Act [No. 27] 2003.

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Ireland. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Annex XIV-Italy

ITALY

1. Overview of penalties related to legislation on industrial installations

The Italian system of penalties appears to be rather complicated. In particular, relationships between various sanctions established by different acts and applicable to one offence are not clearly set, as briefly described below.

VOC and LCP Directives: The "Code of Environmental Law", i.e. the Legislative Decree 2006, no.152 (D.Lgs 152/2006)[138] Part V (Articles 267-298) transposes Directive 1999/13/EC and 2001/80/EC and sets the permit procedure and requirements for respectively VOC and LCP installations and lays down sanctions for the infringement of these obligations.

IPPC and WI Directives: IPPC and waste incineration facilities are regulated by two sectoral decrees, as follows:

- Legislative Decree of 18 February 2005, no. 59 (D.Lgs 59/2005) applies to IPPC installations.
- Legislative Decree 2005 no. 133 (D.Lgs 133/2005) transposes Directive 2000/76/EC.

Both decrees regulate the permit procedure for the relevant plants and sets corresponding sanctions.

All installations that fall under the scope of the IPPC Directive, irrespective whether they additionally fall under the scopes of Directive 1999/13/EC, 2001/80/EC or 2000/76/EC, are subject to the national IPPC authorisation procedure, in which the compliance with the requirements of all other legislation transposing these Directives are scrutinised. This so called "single permit" procedure allows the applicant to apply for one single permit and thus avoiding applying for different permits under different administrative procedures.

With regard to the scope of application of these different acts, in general, all the provisions/sanctions included in D.Lgs. 152/2006, D.Lgs. 59/2005 and D.Lgs. 133/2005 may be applicable, although each of the Decrees has partly a different scope. The legislation to be applied will depend on the alleged offence/fact. Pursuant to D.Lgs. 152/2006 (Art. 254), the *penalties included in specific existing legislation will remain applicable.* Therefore, D.Lgs. 152/2006 applies only if the Decree makes a specific reference to the application of 152/2006, otherwise the specific exiting legislation will apply.

However, the practical application of this rule is subject to uncertainties in relation to D.Lgs. 133/2005 (Art. 19), the specific legislation that establishes the sanctions for the infringements of the provisions on incineration and co-incineration of waste. In case of infringement to the requirements applicable to incineration installations, the sanctions provided for by Art. 19 will apply.

Certain incineration or co-incineration of waste plants fall within the scope of D.Lgs. 59/2005 on IPPC and will thus be required to obtain an IPPC permit. In this case, the prevailing view is that the IPPC legislation will take precedence. For instance, Art. 16.1 of D.Lgs. 59/2005 applies certain sanctions to the plants that were required to obtain an IPPC permit and failed to do so. If an incineration of waste plant operates without having obtained such a specific permit, then Art. 16.1 of D.Lgs. 59/2005 applies. The reasoning behind is that D.Lgs. 59/2005 is considered as a special legislation in relation to the D.Lgs. 152/2006, and even more specific compared to D.Lgs. 133/2005. Therefore, the sanctions set by D.Lgs. 59/2005 will apply in the case of an incineration plant that operates without having obtained an IPPC permit. As the sanctions provided for by D.Legs 59/2005 are less stringent than those set up by D.Lgs 133/2005, this leads to a paradox whereby sanctions for operating without a permit will be more severe for an incineration plant not covered by IPPC, than for one falling under the scope of IPPC.

[138] As amended by Legislative Decree 2008, no. 4

However, it seems that this approach is not always followed. The fact that an installation is required to obtain an IPPC permit does not in itself exclude the possibility of applying the sanctions of D.Lgs. 152/2006 or D.Lgs. 133/2005. Everything will depend on how the fact/omission is interpreted. So in practice, the prosecution could consider appropriate to apply a stricter sanction, although the defence could always argue that the fact is to be interpreted as included in the IPPC legislation and that therefore the sanctions of D.Lgs. 59/2005 should apply.

Offences pursuant to D.Lgs 152/2006, D.Lgs 59/2005 and D.Lgs 133/2005 are primarily criminal in nature, and are punishable with imprisonment, which may range from 2 months up to two years and fines up to Euros 50,000.

Recently, the Italian legislator has started to favour administrative sanctions for a range of environmental offences, when before criminal ones were preferred. One of the reasons is that administrative sanctions are seen as easier to enforce.[139] This is the case in Article 16 of D.Lgs 59/2005, which subjects to administrative sanctions the following offences:

- Failure to notify the competent authority and the city mayor the starting date for implementation of the permit conditions;
- Failure to notify the competent authority emission monitoring data;
- Failure to review the permit application as requested before the deadline specified by the competent authority.

Only the failure to notify emission monitoring data to the competent authority is relevant in relation to the Directives covered.

Another case of administrative sanctions is relevant to this overview and relates to VOC installations. D.Legs 133/2005 establishes an administrative sanction, which applies to all offences not covered by the particular sanctions relating to specific offences set by the Decree (See Table on VOC Directive in Section 2).

However, as a rule, sanctions for infringements to legislation transposing the four directives covered by this overview are generally of criminal nature and do not reflect this recent trend to favour administrative sanctions.

In addition to the sanctions described in the next section, Article 257 D.Lgs 152/2006 contains a criminal offence, which covers any behaviour or failure to act that is not in compliance with environmental legislation. If somebody causes the pollution of soil, subsoil, surface water or groundwater and thereby exceeds the risk concentration thresholds, the offender is subject to punishment of arrests from 6 months to 1 year or fines from Euros 2,600 to 26,000, if the offender does not remediate the site in accordance with this Decree. If hazardous substances are involved in the pollution, the courts are authorised to impose arrests from 1 year to 2 years and fines from Euros 5,200 to 52,000.

Under Italian law, there is a distinction between sanctions for natural and legal persons. Corporate entities cannot generally be held liable for criminal offences. Instead criminal sanctions are applied to those individuals who have made the relevant decisions on behalf of the corporate entity. Any reference to legal person has to be understood as a reference to the "person" representing it/acting on its behalf. With regard to criminal sanctions, only natural persons may be held liable of criminal offences. The criminal liability is so called "personal".

In addition to the criminal and administrative penalties, the Italian legislation entitles the competent authorities to enforce the national legislation by virtue of a variety of different administrative enforcement measures. Depending on the degree of seriousness of the offence, the competent authority

[139] *Environmental Penalties in Italy, Paola Brambilla*, Elni Review No1/2009, p.2

has the discretionary power to warn (give a notice) the perpetrator and give a period of time within which the irregularities shall be corrected, to warn and then to suspend the permitted activity for a limited time period if there is a danger for the environment and finally to warn and then revoke the integrated environmental permit and to close the plant in case of failure to comply with the requirements imposed by the notice and in case of repeated violations that lead to danger and harm to the environment.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Italy

"The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision".

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Italy. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste

[140] Only Article 5(1) is applicable in Italy
[141] This catch-all provision applies when no specific sanction is established for non-respect of a particular obligation set up by the Decree.
[142] Art. 19.12 of Dlg 133/05 expressly covers the breach of Art. 4.2 of the national legislation, while the catch-all provision of Art. 19.15 includes the remaining part of the national provision trasnposing Art. 4(2) of the Directive.

incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

			effects on the environment, meeting corresponding minimum requirements. ***Article 19(12) D.Lgs 133/2005***	

Annex XV-Latvia

LATVIA

1. Overview of penalties related to legislation on industrial installations

In Latvia, industrial installations are regulated by a variety of general and specific legal acts. The principle law concerning industrial installations is the Law on Pollution (adopted on 15 March 2001), which sets the basic principles of pollution prevention and control, as well as the basis for the permitting system for industrial pollution. Other important legal acts are: Regulations of the Cabinet No. 294 ("Procedures by which Polluting Activities of Category A, B and C shall be declared and Permits for the Performance of Category A and B Polluting Activities shall be Issued"), No. 379 ("Procedures by which emission of air polluting substances from stationary air pollution sources shall be prevented, restricted and controlled"), as well as the Waste Management Law and Regulations of the Cabinet No. 323 ("Requirements for the incineration of waste, and for the operation of waste incineration facilities") concerning the incineration of waste.

The Latvian Administrative Violation Code applies to infringements of the obligations specified in this report. It is the only act regulating penalties in case of infringements of the legislation transposing the four Directives.

Article 88^6 of the Administrative Violation Code applies penalties to both natural and legal persons specifically in relation to the first obligation for each Directive (namely to apply for a permit/authorisation/registration for new or existing installations), as well as the fourth obligation (to comply with the conditions set in the permit or mandatory Emission Limit Values (ELVs). Latvian law does not provide specific penalties for infringements of the remaining two obligations. Nevertheless, there is a catch-all provision in the Administrative Violation Code, which provides that it is an offence to conduct polluting activities which do not comply with the specific requirements of the regulatory enactments (Article 88^6).

There is no detailed description in Article 88^6 of those activities which do not comply with the specific requirements of the regulatory enactments. It could therefore be implied that any failure to comply with the requirements provided by the Law on Pollution, as well as Regulations of the Cabinet No. 294, No. 379 and No. 323, (i.e. all of the legislation regarding polluting activities), will also be subject to this provision. This means that Article 88^6 could include the remaining two obligations, namely to supply information for application of permits and to notify the competent authority of any changes in the operation of an installation. For example, Article 30(1) of the Law on Pollution provides that prior to a change in the operation of an installation an operator shall notify the Regional Environmental Board (the competent authority) thereof. If the operator has not fulfilled this obligation, it is considered a breach of the requirement of the Law on Pollution, which could result in application of penalties provided for in Article 88^6 of the Administrative Violation Code. Another example is Article 28 of Law on Pollution, which requires operators to supply certain information in the application for permits for the performance of category A and B polluting activities. Failure to comply with this requirement could be considered as non-compliance with the specific requirements of the regulatory enactments.

According to Article 88^6 of the Administrative Violations Code, in case of undertaking a polluting activity without the required permit, a fine should be imposed from Euros 213 up to 711 for natural persons and Euros 711 up to Euros 4,269 for legal persons. It is also provided that in case of failure to comply with the requirements of the permit for conducting polluting activities a fine should be imposed from Euros 142 up to Euros 640 for natural persons and Euros 285 up to Euros 2,134 for legal persons. If conducting polluting activities which do not comply with the specific requirements of the regulatory enactments a fine should be imposed from Euros 28 up to Euros 711 for natural persons and Euros 71 up to Euros 1,424 for legal persons.

The competent authorities in Latvia are the Regional Environmental Boards. They are responsible for

issuing, suspending and revoking permits for polluting activities. The Environment State Bureau examines complaints regarding the decisions of Regional Environmental Boards relating to the issuance of permits and permit conditions, the investigation of polluted or potentially polluted sites, and the covering or allocation of remediation and investigation or remediation expenditures. The Environment State Bureau also creates and maintains a register of permits issued, which is available, free of charge, to any natural or legal person.

There are no criminal sanctions provided for any breach of the obligations under these Directives, or to any general obligation relating to the environment concerning these Directives.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Latvia

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Latvia. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Annex XVI-Lithuania

LITHUANIA

1. Overview of penalties related to legislation on industrial installations

In Lithuania, the legislation relating to industrial installations is comprised of a range of laws and regulations (primary or secondary legal acts). The Criminal Code of the Republic of Lithuania (CC) as amended,[144] and the Code of Administrative Offences of the Republic of Lithuania (CoAO) as amended[145] apply to the enforcement of the Law on Environmental Protection of the Republic of Lithuania (LoEP) (as amended). [146]

The main laws governing the operation of industrial installations are:
The Law on Environmental Protection of the Republic of Lithuania (LoEP) - Article 19 requires, inter alia, legal and natural persons to obtain authorisation prior to commencing the operation of objects of economic activities and to comply with the conditions of authorisation for such activities. It also requires such persons not to violate regulations and standards of environmental protection;

Transposing legislation of the IPPC Directive: A secondary legal act (regulations) titled "The Rules on Issuance, Renewal and Revocation of Integrated Pollution Prevention and Control Permits" ((("the IPPC Rules") - establishes detailed permitting procedures including who should apply for a permit, when they should apply, and how they should apply).

Transposing legislation of the VOC Directive: A secondary legal act (regulations) titled "Procedure for limitation of emissions of volatile organic compounds generated due to the usage of solvents in certain activities"[147] establishes requirements related to the registration and mandatory Emission Limit Values (ELVs) for VOC activities;

Transposing legislation of the LCP Directive: A secondary legal act (regulations) titled "Emission Values of Pollutants Emitted from the Large Combustion Installations"[148] establishes mandatory ELVs for LCPs;

Transposing legislation of the WI Directive: A secondary legal act (regulations) titled "The environmental requirements for waste incineration"[149] establishes mandatory ELVs.

Article 34 of the LoEP links the requirements in the above legislation with the Criminal Code and with the Code of Administrative Offences. It provides that *a person who breaches the requirements*

governing environmental protection shall be held liable under laws of the Republic of Lithuania. This blanket provision means that the Code of Administrative Offences or the Criminal Code can be applied in cases of violations of environmental requirements. Liability is the same for both legal and natural persons.

The Code of Administrative Offences (CoAO) is the primary legislation for determining administrative sanctions for breaches of environmental legislation. Article 9(1) of the CoAO provides that "Administrative offence means illegal behaviour (action or omission) committed intentionally or by negligence which interferes with public order, ownership, citizens rights or freedom, disciple of administrative procedures and for which the law provides administrative liability". Administrative sanctions can also be taken if an offender potentially endangers the environment.

Administrative sanctions under the CoAO are measures (tools, means, instruments, etc.) of liability, which are imposed on natural persons (citizens). Legal persons are not considered liable but administrative liability can be imposed on "officials". Managers of legal entities and heads of municipal institutions are considered as "officials". Officials mean persons who have the right to exercise public administration functions, and persons who implement organizational and management executive power within public institution, an enterprise or an organisation (Article 14 (1) of the CoAO). Sanctions are also stricter for "officials".

The purpose of administrative sanctions is to punish persons who commit offences and to prevent them from violating the law in the future. The CoAO lays down sanctions for violation of environmental legislation which include warnings fines and removal of the right to hold a certain position. Fines are the main sanctions enforced for most administrative offences. Generally fines for environmental offences range from Litas 25 (Euros 7.2) to Litas 60,000 (Euros 17,377).

The CoAO applies in cases where the violation of environmental legislation causes or could cause minor damage to the environment. Article 51-2 of the CoAO provides that operation of economic or other activities without authorization, or usage of installations without permits, if such permits are required under the laws or official orders, or in violation of environmental protection requirements or standards, will incur a penalty of between Litas 800 to 1500 (Euros 232 to 434) for citizens and between Litas 1,000 to 3,000 (Euros 290 to 869) for officials. For repeated administrative offences the penalty is Litas 4,000 to 8,000 (Euros 1,158 to 2,317) for citizens and for officials.[150]

In accordance with Article 31 of the Law on Environmental Protection (LoEP) "In the Republic of Lithuania, the state control of environmental protection and utilisation of natural resources shall be exercised by officials of the system of the Ministry of Environment – state inspectors of environmental protection.

Their powers include, inter alia, the right to restrict the activities of legal and natural persons where laws on environmental protection are being violated or where these activities do not comply with the conditions established in respect of environmental protection. They also hear cases of administrative offences and impose administrative penalties.

Article 270 of the Criminal Code (CC) provides general criminal liability (for natural and legal persons) where the violation of environmental legislation causes or could cause damage to the fauna, flora or other serious or negligible effects on the environment. "Negligible" means insignificant consequences to the environment, such as short term exceedance of emissions established in IPPC permits causing inconvenience to residents (smell, noise from an installation), Criminal liability for "negligible" effects can arise only if the administrative sanctions cannot solve the problem. Criminal penalties are generally seen as a way of prevention of serious offences.

[150] 1 Euros = 3.45 Lita (12 December 2010)

In addition to a fine, if environmental damage ensues as a result of non-compliance with the laws, the person must also pay damages for harm caused to the natural environment. In this context Article 32 of the Law on Environmental Protection provides for damages to be collected in a government controlled environmental fund called the Environmental Support Program.[151]

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Lithuania

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Lithuania. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.

- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Table 2.62 *Directive 2008/1/EC (IPPC Directive): types of offences and related administrative and criminal penalties in Lithuania*

CC: Criminal Code
CoAO: Code of Administrative Offences
LoEP: Law on Environmental Protection
IPPC Rules: Rules on Issuance, Renewal and Revocation of IPPC Permits[152]

	Administrative		Criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to apply for a permit for new or existing installations	Operating an object of economic activities without obtaining an authorisation. ***Article 19-1 of the LoEP*** requires that legal and natural persons must, prior to commencing the operation of objects of economic activities and pursuit of economic activities, obtain an authorisation. The IPPC Rules establish a detailed permitting procedure, including obligation to apply for a permit in due time for new and existing installations. If operators do not implement the requirement, Article 51-9 of the CAO may be applied.	Fines: Natural persons: Fine of Litas 800 to 8,000 (Euros 232 to 2,320). Officials[153]: Fine of Litas 1,000 to 8,000 (Euros 290 to 2,320). ***Article 34 of the LoEP and Article 51-2, part 2 of the CoAO*** Fines for breach of IPPC Rules: Natural persons: from Litas 100 (Euros 29) to Litas 200 (Euros 58). Annex XVII-Luxembourg

LUXEMBOURG

1. Overview of penalties related to legislation on industrial installations

Directive 2008/1/EC was transposed by the Law on classified installations,[157] which sets the offences and the related administrative and criminal sanctions.

Directive 1999/13/EC was transposed in the Grand-Duchy legal order by the Grand Ducal Regulation of 11 March 2001 transposing Directive 1999/13/EC of 11 March 1999 on the limitation of emissions of volatile organic compounds due to the use of organic solvents in certain activities and installations.[158] This Regulation does not contain any provisions on penalties. Plants emitting volatile organic compounds due to the use of organic solvents are considered as installations that fall under the Law on classified installations.[159] Therefore the sanctions listed in the Law on classified installations shall also apply to plants emitting volatile organic compound due to the use of organic solvents. The specific requirements of Directive 1999/13/EC as transposed in the Grand Duchy legislation shall be considered as specific conditions set in the authorisation for classified installations to be fulfilled by the operators of these plants (See Article 13(1) of the Law on classified installations).[160]

Directive 2001/80/EC was transposed by the Grand Ducal Regulation of 9 May 2003 implementing Directive 2001/80/EC on the limitation of emissions of certain pollutants into the air from large combustion plants.[161] Similarly to the Regulation of 11 Marche 2001, this Regulation does not contain any provisions on penalties. Waste incineration plants are considered as installations that fall under the Law on classified installations.[162] Therefore the sanctions listed in the Law on classified installations shall also apply for the large combustion plants as defined under Directive 2001/80/EC. The specific requirements of Directive 2001/80/EC as transposed in the Grand Duchy legislation shall be considered as specific conditions set in the authorisation for classified installations to be fulfilled by the operators of the large combustion plants.

Directive 2000/76/EC was transposed in the Grand-Duchy legal Order by the Grand-Ducal Regulation of 19 of December 2002 relating to the incineration of waste[163] and does not contain any provisions on penalties. Waste incineration plants are also considered as installations that fall under the Law on classified installations (see point 122 (4) of the list of installations under the Grand Ducal Regulation on classification of installations).[164] Therefore the sanctions listed in the Law on classified installations shall also apply for the waste incineration plants. The specific requirements of Directive 2000/76/EC shall be considered as specific conditions set in the authorisation for classified installations to be fulfilled by the operators of the waste incineration plants.

---

[157] Loi modifée du 10 juin 1999 relative aux établissements classés

[158] Règlement grand-ducal du 4 juin 2001 portant application de la directive 1999/13/CE du Conseil du 11 mars 1999 relative à la réduction des émissions de composés organiques volatils dues à l'utilisation de solvants organiques dans certaines activités et installations.

[159] Règlement grand-ducal modifié du 16 juillet 1999 portant nomenclature et classification des établissements classés, point 321 (A) of the list of installations.

[160] Translation of Article 13(1) third paragraph reads as follow: If an environmental quality standard requires more severe conditions than those attainable for the use of the best available technologies, additional conditions are especially required by the authorization, without prejudice to other measures which can be taken to respect the environmental quality standards.

[161] Règlement grand-ducal du 9 mai 2003 portant application de la directive 2001/80/CE du Parlement Européen et du Conseil du 23 octobre 2001 relative à la limitation des émissions de certains polluants dans l'atmosphère en provenance des grandes installations de combustion

[162] See point 144(1)(b) of the list of installations under the Grand Ducal Regulation on classification of installations

[163] Règlement grand-ducal du 19 décembre 2002 concernant l'incinération des déchets

[164] See point 122 (4) of the list of installations under the Grand Ducal Regulation on classification of installations

Both administrative sanctions and criminal sanctions can apply for the infringement of environmental Law in Luxembourg.

Administrative sanctions related to industrial installations were already established in the Royal Grand Ducal Regulation of June 1872 on dangerous and unhealthy establishments[165] empowering authorities to close an installation infringing the conditions set forth in the authorisation. Administrative sanctions are the most common sanctions for the application of environmental law in Luxembourg. They are considered easier to apply, the administrative procedure being quicker and more flexible than the criminal procedure. The administrative sanctions in the Law on classified installations, which is the main legislation for industrial installation, do not include fines but the suspension or closure of the activity in part or totally.

Unlike administrative sanctions the determination of criminal sanctions shall take into account subjective elements (e.g. the intent). Furthermore, imprisonment sanctions can only be imposed under the criminal procedure. The criminal sanctions in the Law on classified installations can lead to imprisonment of eight days to six months and/or a fine up to Euros 125,000 for natural persons. Until recently there were no criminal sanctions for legal persons in Luxembourg. Since the promulgation of the Law of 3 March 2010 establishing criminal liability for legal entities, legal entities can be held criminally liable for the offences committed in their names, on their behalf, and in their interest. The scope of the Law is general and covers any kind of offences leading to criminal penalties for natural persons. The criminal sanctions for legal persons can lead to a fine up to Euros 750,000, the confiscation, the exclusion from participation in public procurement and in specific cases the dissolution of the legal person.[166]

Several administrative bodies within their domain of competence (e.g. the Environment Agency, the Water Management Agency, the Health and Safety Inspectorate, the Customs) are all responsible for investigating and recording offences punished by the Law on classified installations. They are empowered to visit, during the day and even at night and without prior notification, the installations, premises, land, facilities and means of transport subject to this Act and its implementing regulations.

2. Review of offences and sanctions

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions, which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive, are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code, which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Luxembourg. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Annex XVIII-Malta

MALTA

1. Overview of penalties related to legislation on industrial installations

The Environment Protection Act 2001 (Chapter 435 of the Revised Laws of Malta) is the primary legislation for the protection of the environment. In accordance with Article 9 of the Act, the Minister responsible for the environment has the power to issue subsidiary or secondary legislation. This includes the transposing legislation for the EU Directives relating to industrial installations:

IPPC Directive: Legal Notice 234 of 2002 (LN 234/2002), Integrated Pollution Prevention and Control Regulations, 2002 as amended by Legal Notice 230 of 2004 (LN 230/2004) and Legal Notice 56 of 2008 (LN 56/2008);

VOC Directive: Legal Notice 349 of 2010 (LN 349/2010), Limitation of Emissions of Volatile Organic Compounds Regulations, 2010;

LCP Directive: Legal Notice 172 of 2010 (LN 172/2010), Large Combustion Plants Regulations 2010;

WI Directive: Legal Notice 336 of 2001 (LN 336/2001), Waste Management (Incineration) Regulations, 2001 and Legal Notice 337 of 2001 (LN 337/2001), Waste Management (Permit and Control) Regulations, 2001;

With respect to the IPPC Directive, it must be noted that Malta has not yet transposed Directive 2008/1/EC and therefore the national law currently in force is that which transposes Directive 96/61/EC as amended by Directives 2003/87/EC and 2003/85/EC.

Administrative sanctions do not apply to Malta with regard to industrial installations

Liabilities for breach of relevant provisions in Malta are primarily criminal in nature. Criminal penalties range from fines (*multa*) of 1,000 to 2,330 Euros for a first conviction, and up to Euros 11,600 and/or imprisonment for a term not exceeding two years for second or subsequent convictions. Breaches of IPPC-enforceable provisions also incur liabilities for expenses incurred by the competent authority as a result of the offence and confiscation of the *corpus delicti* (material evidence). "The operator" can include natural or legal persons who operate or control the installation.

The Malta Environment and Planning Authority (MEPA) is the competent authority responsible for issuing environmental permits, ensuring compliance through monitoring and enforcing the regulations if they are breached. In accordance with the provisions of Part X of the Environment Protection Act (EPA) on enforcement, the Minister responsible for the environment may bestow upon the MEPA environment inspector, executive powers against offenders. MEPA inspectors also have the power to prosecute offences under the EPA and any of the regulations issued thereunder. If the Minister does not give the environment inspectors these executive powers, the Executive Police always have the power under the Criminal Code (Chapter 9 of the Revised Laws of Malta) to enforce the law and prosecute offenders. There is also the possibility of reaching out of court settlements for offences committed under the EPA and the regulations, through the payment of a fine, which is deposited in the Environment Fund.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Malta

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Malta. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Annex XIX-Poland

POLAND

1. Overview of penalties related to legislation on industrial installations

In Poland, the legal obligations relating to industrial installations are transposed by a variety of legal acts and decrees. The main obligations under each of the four Directives are transposed by the following legislation:

- Environmental Protection Law Act of 27 April 2001 (consolidated text: 2008/25/150 as amended)
- Minister of Environment Regulation of 20 December 2005 on installation emission standards (2005/260/2181 as amended)
- Minister of Environment Regulation of 4 November 2008 on the requirements for measurement of emission and of amount of water taken up (2008/206/1291)

Additional obligations under the Waste Incineration Directive are transposed by the following legislation:

- Waste Act of 27 April 2001 (cons. text: 2010/185/1243),
- Water Law Act of 18 July 2001 (cons. text 2005/239/2019 as amended);
- Building Law Act of 7 July 1994 (cons. text 2006/156/1118),
- Planning and Land Use Act of 27 March 2003 (2003/80/717 as amended);
- Minister of Economy Regulation of 21 March 2002 on requirements for the incineration of waste (2002/37/339 as amended);
- Minister of Environment Regulation of 27 July 2004 on permissible quantities of substances discharged with industrial sewage (2004/180/1867);
- Minister of Environment Regulation of 6 July 2004 on requirements for discharges into water and to soil and on dangerous substances the aquatic environment (2006/137/984 as amended).

The Polish legal system has three different liability systems for non-compliance with environmental requirements: civil,[167] administrative and criminal liability.

Administrative liability applies to breaches of the Environmental Protection Law (EPLA) as well as various sector-specific legislation, such as the Waste Act and the Water Law Act. Administrative liability does not depend on the fault of the perpetrator (ie it is based on strict liability). The following types of sanctions can be imposed as a result of administrative offences: fines, cessation of activities, revocation of the permit for the activity in question and an order to undertake specific action, e.g. to provide for clean-up of the polluted site, to take away waste deposited in a place not intended for this purpose.

There are two main types of administrative fines relevant for this study: so-called "increased fees" applied for using the environment (eg causing emissions) without a required permit and fines imposed for using the environment (eg causing emissions) in breach of the permit conditions. The amount of increased fees depends on the type and amount of substance emitted by the installation without a permit. The system of 'increased fees' for operation of an installation without a permit is based on the system of 'ordinary' environmental fees (fees for legal use of the environment). The 'increased fees' are 500% of ordinary fees. Ordinary fees are calculated according to Council of Ministers Regulation of 14 October 2008 on fees for using the environment (2008/ 196/1217 as amended) which lists specific substances and the fees for emitting a specified amount of those substances (eg 1 kg). For example: the ordinary fee for legal emission of 1 kg of Sulphur Dioxide (SO2) is PLN 0,44 (Euros 0,12); for legal emission of CFC-11, CFC-12 etc is PLN 157,91 (Euros 39,50) etc. (the Regulation lists 67 substances emitted to the air plus substances discharged into water, types of waste disposed on landfills etc.). The amount of fines for emissions into the air in breach of the permit conditions is 1000% of ordinary fees. The amount of fines for discharges into water in breach of the permit

[167] Civil liability is not subject to the current study.

conditions are set in Council of Ministers Regulation of 20 December 2005 on amount of fees for breach of conditions of discharges of waste water into water or into ground (2005/260/2177).

The main administrative and enforcement authorities in Poland are: the Ministry of Environmental Protection, the Environmental Protection Inspectorate, the regulatory authorities which issue environmental permits, (i.e. mainly the Marshall of Voividship or a Starost) and in certain cases connected with nature protection, the regional directorates of environmental protection.

Decisions made by first instance administrative bodies can be appealed to supervisory administrative bodies. Decisions can also be challenged before the regional administrative courts. However, their competence is restricted mainly to legal questions (although the court assesses them against the factual information regarding the case[168]).

Criminal liability for environmental crimes in Poland is specified in the Criminal Code and several other legal acts including the EPLA, the Water Law Act, the Waste Act and the Nature Protection Act. These Acts only provide for liability of natural persons. The Act on the Liability of Collective Entities, adopted in October 2002,[169] addresses the liability of legal persons. However, this Act only provides for sanctions for certain serious environmental offences against the environment.

Criminal liability can be divided into two types: serious offences and petty offences ("misdemeanours"). Serious offences are provided for in the Criminal Code as 'Offences against the environment' (Articles 181-188 of the Criminal Code). Petty offences (misdemeanours) are regulated under sector-specific legal acts and the EPLA.[170] These are complemented by the Petty Offences (Misdemeanour) Code. A petty offence may be deemed to have been committed intentionally or unintentionally, unless a particular provision specifies that only intention is required. Petty offences are punishable with imprisonment, restriction of freedom (connected with an obligation to carry out public works[171]) or a fine of up to 1,250 Euros.[172] Penalties imposed for petty offences are recorded as criminal penalties.[173]

In Poland, the different forms of legal liability may be imposed simultaneously.

For general environmental offences, Article 182 of the Criminal Code applies where there is any processing of air pollution that could cause serious environmental pollution. This could apply to IPPC Directive and all other directives concerning emissions. However, it is important to note that this provision only applies to situations where there is a threat of damage to the environment. For example, where emission limits in the permit have been exceeded, such a breach would not necessarily be sufficient to apply to this sanction.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Poland

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Poland. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

[175] Article 48 of the Waste Act is quite broad and concerns 'incorrect fulfilling of obligations by an operator of a waste incineration' which encompasses many but not all situations when operator violates environmental law

[176] There is no sanction but in case the permit application fails to contain all the required information, the authority will refuse the permit

Annex XX-Portugal

PORTUGAL

1. Overview of penalties related to legislation on industrial installations

The Portuguese Law on the Environment (Law 11/87 of 7 April 1987 as amended by Law 13/2002 of 19 February 2002) provides the legal framework on environmental matters. Other more specific laws have, however, been enacted to transpose specific EU Directives, and it is these that provide the enforceable provisions related to the four obligations concerning industrial installations. The relevant laws are as follows:

- IPPC Directive: DL 173/2008[184]
- VOC Directive: DL 242/2001[185] as amended
- LCP Directive: DL 178/2003[186]
- WI Directive: DL 85/2005[187] as amended

Administrative sanctions are more commonplace than criminal sanctions and apply in all circumstances for the purposes of this report. Compliance authorities such as the Portuguese Environmental Agency *(Agência Portuguesa do Ambiente and* the General Inspectorate for Environment and Planning *(Inspecção Geral do Ambiente e Ordenamento do Território)* – file administrative offence procedures that can result in pecuniary fines and accessory sanctions. The type and number of accessory sanctions has increased substantially pursuant to Law 89/2009 which amends the legal framework of environmental offences adopted under Law 50/2006.

The General Administrative Offences Regime (approved by Law Decree 433/82 and last amended by Law 109/2001) sets out a simplified procedure, based on "an illegal fact that results in the application of a fine" which is within the competence of administrative bodies with the aim of preserving public objectives and interests. It gives rise to the application of fines or accessory sanctions, which are administrative enforcement measures applied by administrative authorities. A special regime of Administrative Offences, approved by Law 50/2006 and amended by Law 89/2009, has been established for violations of environmental laws and regulations. According to this regime, penalties are set in accordance with the type of the offence, the agent (natural or legal person) and the degree of fault (Article 22 (2).

With the exception of DL 178/2003 (LCP Directive), which contains a special administrative offences regime, all the other transposing legislation refers expressly to the general environmental administrative offences regime:

- Article 32 of DL 173/2008 (IPPC Directive) classifies the type of offence "in accordance with Law 50/2006", and defines the accessory sanctions in accordance with the same regime (Article 33);

---

[184] Law Decree 173/2008, of 26 August, which establishes the legal regime governing integrated pollution prevention and control, transposing into national law Directive no. 2008/1/EC of the European Parliament and of the Council, of 15 January http://dre.pt/pdf1sdip/2008/08/16400/0596705980.pdf

[185] Law Decree 242/2001 which transposes into national law Directive 1999/13/EC on the limitation of emissions of volatile organic compounds due to the use of organic solvents incertain activities and installations http://dre.pt/pdf1sdip/2001/08/202A00/55945611.pdf as amended by DL 181/2006 (which revokes its Article 21 (5) http://dre.pt/pdf1sdip/2006/09/17200/65786583.pdf and by DL 98/2010 (which amends its Articles 2, 7, 17, 18 and 19) on the limitation of emissions of volatile organic compounds due to the use of organic solvents in certain activities and installations http://dre.pt/pdf1sdip/2010/08/15500/0335303398.pdf

[186] Law Decree 178/2003 which transposes into national law Directive 2001/80/EC on the limitation of emissions of certain pollutants into the air from large combustion plants http://dre.pt/pdf1sdip/2003/08/179A00/46264638.pdf

[187] Law Decree 85/2005 which transposes into national law Directive 2000/76/EC on incineration of waste http://dre.pt/pdf1sdip/2005/04/082A00/32143235.pdf as amended by DL 178/2006 (which amends Articles 5, 6, 7, 9 and 17) http://dre.pt/pdf1sdip/2006/09/17100/65266545.pdf and by DL 92/2010 (which amends Articles 6, 7, 8, 9, 10,13,14,15,18, 41, 42 and 44) http://dre.pt/pdf1sdip/2010/07/14300/0282502842.pdf

- Article 15 of DL 242/2001 (VOC Directive), as last amended by DL 98/10, classifies the type of offence "in accordance with Law 50/2006", and defines the accessory sanctions in accordance with the same regime (Article 16);
- Article 24 of DL 85/2005 (WI Directive), as last amended by DL 92/10, classifies the type of offence "in accordance with Law 50/2006", and defines the accessory sanctions in accordance with the same regime (Article 25);

However, these penalties do not exclude the possibility of administrative, criminal and/or civil liability being applied in conjunction. In fact, Law 50/2006 as amended by Law 89/2009 expressly foresees under its Article 28 (1) that "when the same fact constitutes simultaneously an administrative offence and a crime the offender is liable for both". It further clarifies under Article 28 (2) that "the administrative decision to apply a penalty shall prescribe if the offender is condemned in criminal procedure for the same fact".

Accessory sanctions may also apply, as specified under Article 28 (3). The amount of the penalties and the type of accessory sanctions are determined in accordance with the seriousness of the offence, the agent's degree of fault and his/her economic situation as well as the benefits the agent has obtained from violating the law (Article 20 of Law 50/2006 as amended by Law 89/2009).

Each piece of Portuguese legislation concerning industrial installations contains administrative enforcement provisions that differentiate between legal and natural persons and the amount of the penalties vary in accordance with the degree of fault. Higher fines apply for legal persons. With regard to administrative penalties, the IPPC, VOC and WI Laws refer to Law 50/2006 of 29 August 2006 establishing a framework of environmental offences[188]. Across the specific Portuguese legislation assessed below, the fines are as follows: For natural persons: between Euros 500-3,750 and Euros 200-375,000 pursuant to Law 50/2006 (as amended by Law 86/2009); and for legal persons: Euros 2,500-45,000 and Euros 3,000-2,500,000 under Law 50/2006 (as amended by Law 86/2009).

The Portuguese Penal Code includes different categories of environmental crimes. Relevant for this report, Articles 279 and 280 of the Code provide for criminal liability which includes air pollution from industrial installations. In case of fault, Article 279 establishes a penalty of 3 years maximum imprisonment and a fine of 600 days which, in accordance with Article 280, can be increased to 8 years whenever such pollution represents a danger to life, physical integrity or assets of others as well as to high value historical or cultural monuments.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Portugal

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always

[188] Law 50/2006 of August 29 establishing a framework of environmental offences and amended by Law 89/2009 – consolidated version: http://dre.pt/pdf1sdip/2009/08/16800/0570905722.pdf

systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Portugal. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

		c) Suspension of the right to obtain subsidies or other benefits issued by national or European public authorities or services; d) Suspension of the right to participate in national and international conferences, exhibitions or markets with the aim of selling or marketing the products or activities; e) Suspension of the right to participate in public auctions or tenders which have as their object the contract or award of public works, procurement of goods and services, the provision of public services and the issuing of licenses or permits; f) Closure of the installation which is subject to authorisation or license from the administrative authority; g) Termination or suspension of licenses, permits or authorisations related to the exercise of the respective activity; h) Loss of tax benefits, credit benefits and credit financing lines acquired prior to the offence; i) Sealing of working equipment (ie closing off the equipment so that no work can be performed); j) Application of measures that might be appropriate to the prevention of		

		environmental damage, restoration of the situation prior to the offence and minimisation of the effects derived from it; l) Making public the sentence. ***Article 30 of Law 50/2006 as amended by Law 89/2009***		

Annex XXI-Romania

ROMANIA

1. Overview of penalties related to legislation on industrial installations

The Romanian legal system is based upon the continental system of codification. The primary environmental legislation relating to industrial installations is the Government Emergency Ordinance No. 195/2005 on environmental protection, as amended[191](GEO No. 195/2005). GEO No. 195/2005 sets out the general principles and main obligations regarding the impact of social and economic activities on the environment, including environmental authorizations, approvals and permits. The more specific legislative provisions relating to each of the four Directives are as follows:

The IPPC Directive is transposed into Romanian legislation by Government Emergency Ordinance No. 152/2005 on integrated pollution prevention and control, as amended and completed by approval Law No. 84/2006 and by Government Emergency Ordinance No. 40/2010, as approved by Law No. 205/2010 (GEO No. 152/2005).

The VOC Directive is transposed through the Government Decision No. 699/2003 determining certain steps deemed to reduce the emissions of Volatile Organic Compounds due to the use of organic solvents in certain activities and installations, as amended by Government Decision No. 1902/2004, Government Decision No. 735/2006, Government Decision No. 1339/2006 and Government Decision No. 371/2010 (GD No. 699/2003).

The Government Decision No. 440/2010 establishing certain measures to limit the release into the atmosphere of certain pollutants originating in large combustion plants (GD No. 440/2010) transposes the LCP Directive.

The WI Directive is transposed by the Government Decision No. 128/2002 on the incineration of wastes, as amended by Government Decision No. 268/2005 and Government Decision No. 427/2010 (GD No. 128/2002).

Generally, a breach of the above legislation may involve administrative and/or criminal sanctions.

Contraventions (similar to misdemeanours in some common law countries) represent administrative offences expressly regulated and sanctioned by legislation. The framework regulation on contraventions is Government Ordinance no. 2/2001 on the legal regime of contraventions, as amended and completed.

Administrative sanctions may be imposed by the authority in case of contraventions provided by the above legislation on industrial installations on the operator (legal person), as well as on the legal representatives/employees of the operator and include administrative fines of up to approximately Euros 23,000. GEO No. 195/2005 also provides the possibility of taking the measure of suspension of the environmental permit or authorisation (for a maximum of six months) or cancellation of the environmental permit and termination of the project/activity.

In Romania, a number of different competent authorities are responsible for coordinating and monitoring the implementation of the legislation relating to industrial installations. The National Environmental Protection Agency and its territorial departments (the Regional Environmental Protection Agencies and the Counties Environmental Protection Agencies), have responsibilities for implementing the legislation in the area of integrated pollution prevention and control. In addition, the

[191] Amended by: Law no. 265/2006, Government Emergency Ordinance no. 57/2007, Government Emergency Ordinance no. 114/2007, Government Emergency Ordinance no. 164/2008.

National Environmental Guard and its territorial departments, the Regional and Counties Environmental Guards, have responsibilities for acknowledging breaches of legislation and imposing sanctions.

Administrative offences (contraventions) are different from criminal offences in terms of regulation sources (e.g. criminal offences may not be introduced in legislation by Government decisions), effective penalties, enforcement authorities (e.g. the National Environmental Guard may apply only administrative fines, in case evidences of criminal offences are discovered it can only inform thereon the police and/or the competent public prosecutor), procedural rights, court proceedings etc.

Criminal liability is a stricter form of legal liability that the administrative one. Under the Criminal Code (the framework regulation on criminal liability), both individual persons and legal persons (for criminal offences undertaken in the name or in the interest of legal persons) may be subject to criminal liability and to criminal sanctions.

Failure to comply with some requirements of the above special legislation on industrial installations may also constitute a criminal offence punishable with a criminal fine of up to approximately Euros 23,000 or imprisonment of up to three years.

There are cases where administrative and criminal sanctions are complementary. Thus, failure of the operator to comply with the requirements mentioned in the integrated environmental permit can be sanctioned, besides the administrative fines, with the suspension of the environmental permit (administrative sanction). Pursuing the activity after the suspension of the permit, provided that such continuation may endanger human, animal or plant life or health, represents a criminal offence and can be sanctioned with prison from 6 months to 3 years or criminal fine from 50,000 to 100,000 RON (Euros 11,590 to 23,182) under Art. 98 (2) 6 of GEO No. 195/2005.

Finally, administrative and penal sanctions apply to both natural and legal persons. As a rule, the sanctions are more stringent for legal than natural persons.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Romania

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision, which imposes criminal sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Romania. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Obligation to apply for a permit for new or existing installations	Infringement or non-compliance with the following requirement: Obligation to operate in accordance with the provisions of the environment permit. ***Art. 96 (3) 1 of GEO No. 195/2005***	A fine of 7,500 to 15,000 RON for natural persons (Euros 1,739 to 3,477) and of 50,000 to 100,000 RON (Euros 11,590 to 23,182) for legal persons. ***Art. 96 (3) of GEO No. 195/2005***	N/A	N/A
Obligation to supply information for application for permits	N/A	N/A	N/A	N/A
Obligation to notify the competent authority of any changes in the operation of an installation	Carrying out ay change of operation entailing incineration or co-incineration of hazardous waste (as specified at Art 8 (6) GD 128/2002, article which has a cross-reference to the provisions on substantial changes of GEO No 152/ 2005 on integrated pollution prevention and control) without notifying the competent authorities. The notification obligation falls on the operator of a incineration/co-incineration plant of non-hazardous waste. ***Art. 36(1)(d) of GEO No. 152/ 2005***	- A fine of 50,000 to 100,000 RON (Euros 11,590 to 23,182) ***Art. 36(1) of GEO No. 152/2005*** - Suspension of the permit in the conditions of Government Emergency Ordinance No. 195/2005 on environment protection ***Art. 36(2) of GEO No. 152/2005***	N/A	N/A
Obligation to comply with the conditions set in the permits or mandatory ELVs	Infringement or non-compliance with the following requirements: Obligation of the operators of the incineration and co-incineration plants to comply with the provisions of art. 16 on submitting the annual report to the competent authority for environmental protection and to grant access of the public to the information of public interest included in the report. ***Art. 18(2) (a) of GD 128/2002*** Obligation of the operators of the	A fine from 500 RON (Euros 116) to 1,500 RON (Euros 348) for natural persons and from 2,500 RON (Euros 580) to 7,500 RON (Euros 1,738) for legal persons. ***Art. 18(2) of GD 128/2002*** A fine from 500 RON (Euros 116) to	N/A	N/A

	incineration and co-incineration plants to comply with the provisions of art. 14 on setting the control and monitoring system and bearing of its costs. ***Art. 18(2) (b) of GD 128/2002***	1500 RON (Euros 348) for natural persons and from 2,500 RON (Euros 580) to 7,500 RON (Euros 1,738) for legal persons. ***Art. 18(2) of GD 128/2002***		
	Obligation of the operators of the incineration and co-incineration plants to comply with the provisions of chapter 6 item 6.3 of annex 2, on putting into operation and appropriate functioning of the monitoring equipment. ***Art. 18(2) (c) of GD 128/2002***	A fine from 500 RON (Euros 116) to 1,500 RON (Euros 348) for natural persons and from 2,500 RON (Euros 580) to 7,500 RON (Euros 1,738) for legal persons. ***Art. 18(2) of GD 128/2002***		
	Obligation of the operators of the incineration and co-incineration plants to comply with the provisions of art. 14 on the obligation to keep the registry evidencing the incinerated and co-incinerated waste. ***Art.18(2) (d) of GD 128/2002***	A fine from 500 RON (Euros 116) to 1,500 RON (Euros 348) for natural persons and from 2,500 RON (Euros 580) to 7,500 RON (Euros 1,738) for legal persons. ***Art. 18(2) of GD 128/2002***		
	Obligation of the operators of the incineration and co-incineration plants to comply with the provisions of chapter 7 item 7.9 of annex 2, on recording and processing of all measurements. ***Art. 18(2) (e) of GD 128/2002***	A fine from 500 RON (Euros 116) to 1,500 RON (Euros 348) for natural persons and from 2,500 RON (Euros 580) to 7,500 RON (Euros 1,738) for legal persons. ***Art. 18(2) of GD 128/2002***		
	Obligation of the operators of the incineration and co-incineration plants to comply with the provisions of chapter 2 items 2.1-2.8 of annex 2, on operating conditions. ***Art. 18(2) (f) of GD 128/2002***	A fine from 500 RON (Euros 116) to 1,500 RON (Euros 348) for natural persons and from 2,500 RON (Euros 580) to 7,500 RON (Euros 1,738) for legal persons. ***Art. 18(2) of GD 128/2002***		
	Obligation of the operators of the incineration and co-incineration plants to comply with the provisions of chapter 1 items 1.3 and 1.4 of annex 2,	A fine from 5,000 RON (Euros 1,159) to 10,000 RON (Euros 2,318). ***Art. 18(3) of GD 128/2002***		

	on the reception of waste. ***Art. 18(3) of GD 128/2002***			
	Obligation of the operators of the incineration and co-incineration plants to comply with the provisions of chapter 7 items 7.2, 7.3, 7.9, 7.10, 7.14 and 7.16 of annex 2, on the measurements of polluters in water and air. ***Art. 18(4) of GD 128/2002***	A fine from 5,000 RON (Euros 1,159) to 10,000 RON (Euros 2,318). ***Art. 18(4) of GD 128/2002***		
	Obligation of the operator to comply with the emission limit values provided by chapter 3 of annex 2 of GD 128/2002, the offence can also be sanctioned under Government Emergency Ordinance No. 195/2005 on environment protection. ***Art. 96 (3) 13 of GEO No. 195/2005***	A fine of 7,500 to 15,000 RON for natural persons (Euros 1,739 to 3,477) and of 50,000 to 100,000 RON (Euros 11,590 to 23,182) for legal persons. ***Art. 96 (3) of GEO No. 195/2005***		

Annex XXII-Slovakia

SLOVAKIA

1. Overview of penalties related to legislation on industrial installations

In Slovakia, the legal obligations and penalties relating to industrial installations are mostly covered by the Act No. 245/2003 on integrated environmental pollution prevention and control and by the Air Act No. 137/2010. However, not all of the relevant directives were already transposed into the Slovak legal system.

IPPC Directive: This Directive has not yet been transposed into the national legal system. The Law No. 245/2003 on integrated environmental pollution prevention and control transposed the repealed Directive 96/61/EC of 24 September 1996 on integrated pollution prevention and control. The Law 245/2003 was later amended in 2004 (four times), in 2005 and in 2008, but the amendment of 2008 changed only the currency of penalties from Slovak Korunas (SKK) into Euros.[194] There were two more indirect amendments adopted in 2010. However, there was no amendment (or other act) transposing /referring to the IPPC Directive of 2008.

The Waste Incineration, the LCP and the VOC Directives: These directives were originally transposed by the Law No. 478/2002 on Air Pollution and by various ministerial decrees. The Law on Air Pollution and the relevant decrees were, however, repealed in 2010 by Air Law No. 137/2010. The Ministry of Environment has adopted decrees implementing the Directives. The VOC Directive is implemented by the ministerial decree No. 358/2010, the LCP Directive and the VOC Directive are implemented by the ministerial decrees No. 356/2010 and 363/2010, all of them of 12 August 2010. Relevant provisions on penalties are regulated also by the Act No. 245/2003 on integrated environmental pollution prevention and control.

The Slovak legal system operates with administrative, quasi-criminal[195] and criminal sanctions. The liability system applicable and the type of sanction imposed will depend on the consequences of the breach. The penalties applicable will vary according to the severity of the damage caused. Administrative sanctions include a defined range of fines which can be imposed by the administrative authority whose discretion is to decide the final sum of the fine. In case of criminal sanctions the Criminal Code provides a range of sanctions proportional to the severity of the damage caused. The Criminal Code No. 300/2005 (of 20 May 2005) recognises four types of damage: small damage (over Euro 266), larger damage (ten times more), significant damage (one hundred times more) and damage of great extent (five hundred times more).[196]

In case of damage to the environment, Slovak law also provides for damages to restore the environment to its prior state, ie before the damage was caused (*restitutio in integrum*). The Nature and Landscape Protection Act No. 543/2002 stipulates that so-called "social value of protected species, trees and biotopes" shall be expressed according to their biological, ecological and cultural value (or in the case of protected minerals and fossils, their scientific and national value). This value is also determined with regard to other factors such as the infrequence of their occurrence within the Slovak Republic and their endangerment. The precise values of particular species are stipulated by the Ministerial Decree No. 24/2003 of 09 January 2003 which executes a number of provisions in the Nature and Landscape Protection Act.

Competent administrative authorities can impose administrative penalties for breaches of environmental legal duties both on legal or natural persons. Fines are the most common sanctions imposed. Slovak law excludes the possibility of accumulating administrative and quasi-criminal

[194] 2008 (law No. 515/2008)
[195] The equivalent term used in Slovakia for *quasi criminal* is 'contravention'.
[196] Articles 125 – 126, Criminal Code No. 300/2005.

liability. Therefore, if the same act constitutes both an administrative and a quasi-criminal offence, only administrative sanctions may be imposed. In Slovakia, the main administrative enforcement bodies are the Ministry of Environment and the Slovak Environmental Inspectorate, both of which have country-wide competences. In contrast, territorial environmental law enforcement is the competence of regional and district environmental offices, local inspectorates and municipalities.[197]

Quasi-criminal liability[198] is similar to criminal liability, in that similar sanctions can be imposed. However, the quasi-criminal procedure is a simplified procedure and only natural persons may be subject to proceedings. At first instance, petty offences are considered by administrative authorities (or by police in certain cases, such as traffic contraventions) and not by judicial courts. Decisions of the administrative authorities can be appealed before the superior administrative authorities and then before regular courts. Quasi-criminal offences are regulated by the Law No. 372/1990 on petty offences and by other administrative laws. Before September 2010, only natural persons could be liable for criminal and quasi criminal offences[199]. The National Council of the Slovak Republic (Slovak Parliament) has adopted an amendment to the Criminal Code No. 300/2005 of 20 May 2005. According to the latest amendment (Law No. 224/2010 of 27 April 2010) *'[t]he court may order a legal person's property to be confiscated if a criminal offence has been committed, and if the legal person has acquired the property with relation to this criminal activity or earnings coming from this criminal activity. Alternatively, the court may order a legal person's funds confiscated if a criminal offence has been committed in relation to legal person's activity, from Euros 800 to Euros 1,660,000 confiscated.*[200]'

The Slovak Criminal Code includes the following crimes against the environment:

• Threatening and damage to the environment (Articles 300 and 301 of the Criminal Code): This covers intentional or negligent violations of generally binding legal regulations in the field of environmental protection which cause danger of damage to the environment; it also covers illegal construction within protected areas.

• Unauthorised waste treatment (Article 302): waste treatment in breach of generally binding legal regulations.

• Violating water and air protection (Articles 303 – 304): any act in breach of generally binding legal regulations which causes deterioration of air quality, or of ground waters or surface waters quality. This crime also covers negligent violations of generally binding legal regulations which cause breakdown of air or water quality.

• Violating plants and animals protection (Article 305): any act in contradiction with generally binding legal regulations that causes damage, destroying, removal, gathering of protected plant or of its biotope; killing, wounding, catching, removing of protected animal or damage or destroying of its biotope and dwelling; damage or destroying of a tree or a bush, or cutting them down; threat to a protected animal species or plant species.

• Violating trees and bushes protection (Article 306): any act in contradiction with generally binding legal regulations that causes damage or destruction of a tree or a bush.

• Spreading of infectious animals and plants disease (Articles 307 – 308)

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Slovakia

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Slovakia. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Annex XXIII-Slovenia

SLOVENIA

1. Overview of penalties related to legislation on industrial installations

In Slovenia, only administrative sanctions are provided for infringement to legislation on industrial installations.

The administrative penalties in Slovenia are regulated in the Minor Offences Act. This Act establishes the general rules applicable to offences and penalties in other Slovenian legislation, and also provides the uniform procedure to determine offences and penalties.

Minor offences are not prescribed by the Minor Offences Act but by other laws and regulations. The penalties may be prescribed as a range or as a fixed amount. If the fines are prescribed as a range, they should be within the following boundaries, pursuant to Article 17 of the Minor Offences Act:

- for natural persons: Euros 40 – 5,000,
- for individual entrepreneurs and other individuals engaging in commercial activities: Euros 200 – 150,000;
- for legal entities: Euros 200 – 250,000;
- for medium and large legal entities (with more than 200 employees): Euros 400 – 500,000;
- for responsible persons of legal entities, of individual entrepreneurs or of public authorities: Euros 40 – 10,000.

The fines, which are prescribed as a fixed amount, are lower; their maximums are:

- Euros 2,000 for natural persons,
- Euros 75,000 for individual entrepreneurs and
- Euros 125,000 for small legal entities and Euros 250,000 for medium and large legal entities).

In the English translation of the Environmental Protection Act, which is available on the web site of the Ministry of Environment and Spatial Planning, the "individual entrepreneurs" (samostojni podjetniki posamezniki) are wrongly translated as "sole traders and farmers". Individual entrepreneurs are in fact all natural persons that engage in any kind of commercial activity and are registered as such. "The responsible persons » are the managers or CEOs of legal entities or individual entrepreneurs, and heads of public administrative bodies.

The Minor Offences Act also prescribes an exception which allows the law or governmental decree to prescribe fines that are higher than those mentioned above. Namely, for the worst offences related to natural resources, environment, protection of nature, health and safety at work, or cultural heritage, the law or governmental decree can prescribe penalties which are three times higher than those provided for by the Minor Offences Act (for example: Euros 15,000 instead of Euros 5,000 for natural persons).

The framework Environmental Protection Act covers the range of sanctions that apply across the four EU Directives on industrial installations. The Act sets out a comprehensive regime for enforcing the various requirements of the Act. However, the Act does not apply an offence or penalty concerning the second category: obligation to supply information for application for permits. The obligation to supply the information exists (Article 57); there is simply no enforcement provision. This omission is not serious since the operator of an installation or a plant cannot get the permit if it does not supply the prescribed information in the application for permit. The second obligation is thus sanctioned in the first one.

Beside the offences and penalties from the Environmental Protection Act, which apply for all four Directives, the offences and penalties are also prescribed by the Governmental decrees which transpose the VOC Directive, LCP Directive, and WI Directive. IPCC Directive is the only directive whose sanctions are prescribed only by the framework Environmental Protection Act (Zakon o varstvu

okolja), adopted on 31 March 2004, published in Uradni list RS, nr. 41/2004, amended by Uradni list nrs. 17/2006, 20/2006, 49/2006, 66/2006, 112/2006, 33/2007, 57/2008, 70/2008, and 108/2009 (Hereinafter: Environmental Protection Act).

With regard to Directive 1999/13/EC (VOC Directive), in addition to the Environmental Protection Act, are also relevant:

- The Decree on limit values of atmospheric emissions of volatile organic compounds using organic solvents, (Uredba o mejnih vrednostih emisije hlapnih organskih spojin v zrak iz naprav, v katerih se uporabljajo organska topila), published in Uradni list RS nr. 112/2005, amended Uradni list RS, nr. 37/2007 and 88/2009 (hereinafter : VOC Decree-1).
- The Decree on the emission limit values of halogenated volatile organic compounds into the atmosphere from installations using organic solvents, (Uredba o mejnih vrednostih emisije halogeniranih hlapnih organskih spojin v zrak iz naprav, v katerih se uporabljajo organska topila), published in Uradni list RS nr. 112/2007, amended Uradni list RS nr. 37/2007 (hereinafter VOC Decree-2).

Similarly, in relation to Directive 2001/80/EC (LCP Directive), apart from the Environmental Protection Act, the Decree on emission limit values discharged into the atmosphere from large combustion plants, (Uredba o mejnih vrednostih emisije snovi v zrak iz velikih kurilnih naprav), published in Uradni List RS, nr. 73/2005, amended Uradni list RS, nr. 92/2007, hereinafter : LCP Decree) also sets sanctions**.**

Finally, the legislation transposing Directive (WI Directive) is also relevant, namely:

- The Decree on the Incineration of Waste, Uredba o sežiganju odpadkov, adopted on 26.6.2008, published in Uradni list RS, nr. 68/2008, amended 41/2009 (hereinafter: WI Decree-1);
- The Decree on the emission of substances into the atmosphere from waste incineration and co-incineration plants (Uredba o emisiji snovi v zrak iz sežigalnic odpadkov in pri sosežigu odpadkov), adopted on 7.6.2001, published in Uradni list RS, nr. 50/2001, amended by Uradni list RS nrs. 56/2002, 84/2002, 41/2004, 76/2010 (hereinafter WI Decree-2).

The Inspectorate is responsible for control over compliance with the Environmental Protection Act and implementing regulations. If the installation operates without a permit or if the conditions of the permit are not complied with, an inspector can impose various administrative measures and/or sanctions, including:

- cessation of the infraction;
- corrective measures;
- limitation or adaptation of operation;
- monitoring;
- prohibition of operation or use of a facility or product and its placing on the market;
- propose withdrawal of the environmental permit; and
- impose fines.

There are no criminal penalties that apply to the four categories above.

Slovenia became the Euro-zone member in 2007. The fines prescribed before that date are nominated in Slovenian Tolar (SIT) and must be converted into Euro in accordance with exchange rate 1 euro = 239.64 SIT.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Slovenia

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Slovenia. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Annex XXIV-Spain

SPAIN

1. Overview of penalties related to legislation on industrial installations

The Spanish Constitution (Article 45) recognises everyone's right to an adequate environment and duty to preserve it. Art 45(3) specifies that for those that violate this duty, there should be criminal or, where required, administrative sanctions, as well as the obligation to restore the damage caused. It is the only case for which the Constitution foresees the establishment of specific sanctions in case of breaches of a Constitutional duty.

The IPPC Directive is transposed by the Law 16/2002 of 1st July 2002 on classified installations,[204] which sets the offences and related administrative sanctions.

The Royal Decrees transposing the VOC Directive, LCP Directive and the WI Directive in Spain do not set any specific sanctions related to the infringement of the requirements of these Directives. They however refer to the sanction regime of other environmental laws such as the Law 16/2002 on classified installations, the Law on waste, the Law on air quality and protection of the atmosphere,[205] the Law on water, the Law on coastal areas.[206] Therefore there are no specific sanctions for the infringements of the requirements of these Directives. This does not mean that the requirements of these Directives are not enforceable since they will be covered under broader offences such as for instance the infringement of general air emission limits under the Law on air quality and protection of the atmosphere.

Directive 1999/13/EC was transposed in the Spanish legal system by Royal Decree 117/2003 of 31 January on the limitation of emissions of volatile organic compounds due to the use of solvents in certain activities.[207] Installations falling within the scope of this Decree that also fall within the scope of Law 16/2002 shall be subject to the integrated environmental authorisation of this Law. The authorisation in that specific case will have to include emission limit values or emission reduction systems, as well as the other requirements of this Decree. The installations covered by this Royal Decree but not falling within the scope of Law 16/2002 shall provide a notification prior to their functioning to the administrative body responsible for registration and control.[208] This Royal Decree does not set any specific sanctions, it however provides that the infringements of its provisions will have to be qualified either as a petty offence, serious offence or very serious offence and are punishable under the provisions of Title IV of the Law 16/2002.

Directive 2001/80/EC was transposed by the Royal Decree 430/2004 of 12 March 2004 laying down new rules on the limitation of air emissions of certain pollutants from large combustion plants, and laying down certain conditions for the control of air emissions from oil refineries.[209] This Royal Decree does not set any specific sanctions. Article 19 of this Decree, however, provides that any violations of this Royal decree will be subject to the sanction regimes established by the relevant applicable laws and in any case, will be subject to the provisions on sanctions of Law 37/2007,[210] and

---

[204] Ley 16/2002, de 1 de julio, de prevención y control integrados de la contaminación.
[205] Ley 34/2007, de 15 de noviembre, de calidad del aire y protección de la atmósfera.
[206] Ley 22/1988, de 28 de julio, de Costas.
[207] Real Decreto 117/2003, de 31 de enero, sobre limitación de emisiones de compuestos orgánicos volátiles debidas al uso de disolventes en determinadas actividades.
[208] See Article 3 of the Royal Decree 117/2003 of 31 January on the limitation of emissions of volatile organic compounds due to the use of solvents in certain activities.
[209] Real Decreto 430/2004, de 12 de marzo, por el que se establecen nuevas normas sobre limitación de emisiones a la atmósfera de determinados agentes contaminantes procedentes de grandes instalaciones de combustión, y se fijan ciertas condiciones para el control de las emisiones a la atmósfera de las refinerías de petróleo.
[210] Royal Decree 430/2004 of 12 March 2004 refers to Law 38/1978 on the protection of the atmospheric environment, however this Law was repealed by the new Law 37/2007 on air quality and the protection of the atmosphere (Ley 34/2007, de 15 de noviembre, de calidad del aire y protección de la atmósfera)

the Law 16/2002. Large combustion plants covered by Directive 2001/80/EC fall within the scope of Law 37/2007 and within the scope of Law 16/2002.

Related to the application of different sanctions for a similar offence, Article 33 of the Law 37/2007 and Article 34 of Law 16/2002 provide that in case an offender, for the same facts is punished under these laws (either Law 37/2007 or Law 16/2002) and under other laws, the most severe sanctions shall apply.

Directive 2000/76/EC was transposed in Spain by Royal Decree 653/2003 of 30 May on waste incineration.[211] This Decree does not contain any provisions on sanctions related to the infringement of the transposing provisions of Directive 2000/76/EC. The recitals of this Decree, however, provide that the sanction regime of various laws can apply depending on the provisions of the Royal Decree that are infringed. These are the Law 10/1998 on waste (more specifically Article 18 and 19(4)[212]), the Law on water and Law on coastlines related to the discharge of water with pollutants from the cleaning of exhaust gases from incineration and to the requirements regarding measurements and controls of discharge at sea and inland water, the Law 34/2007 on air quality and the protection of the atmosphere for the requirements on emission limit values and the Law 16/2002 that shall apply to hazardous waste incineration or co-incineration plants with a capacity exceeding 10 tonnes per day and to municipal waste incineration plants with a capacity of more than three tons per hour.

Pursuant to Article 4 of Royal Decree 653/2003, waste incineration or co-incineration plants falling under Law 16/2002 shall request the integrated environmental authorisation under this Law. Waste incineration and co-incineration plants out of the scope of Law 16/2002 shall request an authorisation required under Law 10/1998 on waste and Law 37/2007 on air quality and the protection of the atmosphere.

Administrative sanctions are the most common tools for the enforcement of environmental legislation in Spain. The sanctioning power of the administration is regulated by Law 30/1992 related to the legal regime of public administrations and to the common administrative procedure.[213] The classification of administrative offences and their related sanctions are however set in each specific sectors of the legislation. This is the case for the different sectoral legislation on the environment (e.g. Law 16/2002 on classified installations,[214] Law on water,[215] Law 10/1998 on waste[216]) that list the different offences classified as petty offences (*faltas leves*), serious offences (*faltas graves*) and very serious offences (*faltas muy graves)* and their corresponding administrative sanctions. These sanctions are not only fines but can also require the closure of an activity, the withdrawal of a permit, the prohibition to exercise an activity.

Environmental sectoral laws do not list any specific criminal offences. Criminal environmental offences and their related sanctions are only mentioned in Chapter III Title 16 of the Spanish Criminal Code. These offences are broad and cover general crimes against natural resources and the environment and also crimes related to the protection of the flora, fauna and domestic animals. The sanctions set in this Chapter can lead to imprisonment from 6 months to four years and/or fines from 8 to 24 months[217] and/or the prohibition to exercice a profesional activity. In the Spanish jurisdiction a legal person cannot be prosecuted in a similar way as an individual offender. The criminal liability goes for instance to the managers of the legal person but not directly to the legal person. Since 2004

[211] Real Decreto 653/2003 de 30 de mayo, sobre incinieracion de residuos
[212] Article 18 and 19(4) empower the government to establish the plant, processes, products requirements related to the recovery of waste and disposal of waste
[213]Ley 30/1992, de 26 de noviembre, de Régimen Jurídico de las Administraciones Públicas y del Procedimiento Administrativo Común.
[214] Ley 16/2002, de 1 de julio, de prevención y control integrados de la contaminación.
[215] Real Decreto Legislativo 1/2001, de 20 de julio, por el que se aprueba el texto refundido de la Ley de Aguas.
[216] Ley 10/1998, de 21 de abril, de Residuo.
[217] Pursuant to Article 50(4) of the Criminal Code the The daily rate of a fine can be set between 2 euros to 400 euros

and the entry into force of the Law of 15/2003 amending the Criminal Code[218] legal persons may be held jointly and severally liable for payment of the fines imposed on their managers as a consequence of a criminal offence.

Accumulation of administrative and criminal sanctions is not allowed. If an administrative procedure has been initiated with the objective of imposing a sanction, and the competent authority considers that the situation could constitute a crime, it should stop the procedure and transfer the case to the criminal jurisdiction. Only if the criminal jurisdiction considers that the situation cannot be qualified as a crime, the administrative body is allowed to continue the administrative procedure. The imposition of a criminal penalty excludes the possibility of imposition of an administrative sanction, in accordance with the principle of *non bis in idem*. For example, Article 33 of Law 34/2007, mentions that when the offence is considered a criminal offence, the administration shall inform the competent court, suspend the administrative proceedings and penalties until the judicial authority has issued a final decision.

Article 149(1)(23) of the Constitution of 1978 provides that the State has exclusive competence on matters related to the protection of the environment without prejudice to powers of the Autonomous Communities *(Comunidades Autonomas)* to take additional protective measures. In other words, the Autonomous Communities can provide more stringent and detailed environmental measures than the environmental legislation issued by the State which is regarded as a minimum legislation. With regard to environment, the Autonomous Communities pursuant to Article 148(1)(9) of the Constitution of 1978 are competent in the management of environmental matters. This provision implies that the Autonomous Communities are competent for the inspection and enforcement of environmental legislation and that they have sanctioning power.[219] For instance the Law 16/2002 on classified installations explicitly provides that the Autonomous authorities are competent to take measures on control and inspection for the enforcement of this Law. It also states that the offences encompassed in its Article 31 shall be without prejudice to the ones that can be established by the Autonomous authorities.

Several Autonomous Communities (e.g. Cataluña, Andalucía, Cantabria, Pais Vasco) but not all of them (e.g. Asturias, Madrid Community) have established their own sanctioning regime for the infringement of environmental legislation. Related to classified installations almost all of them refer to the same offences that the ones listed in Law 16/2002 on classified installations (e.g. the operation of an activity without the integrated environmental permit, or failure to comply with the conditions set in the integrated environmental permits). However the sanctions sometimes differ from the ones set in Law 16/2002. For instance the failure to comply with the conditions established in the integrated environmental authorisation provided that there has been a serious injury or damage to the environment or such situation seriously endangered the health or safety of people can lead to a fine of 3 million euros in Cantabria,[220]2.4 million euros in Andalucía,[221] 2.5 million euros in Aragon,[222] while under Law 16/2002 the same offence can lead to a fine of 2 million euros.

As mentioned above the control and inspection for the enforcement of environmental legislation is under the competence of the Autonomous Communities. A network of environmental inspectors (*Red de inspeccion Ambiental)* has however been set up in order to harmonize and unify the inspection and control criteria in the different Autonomous Communities.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Spain

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions, which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive, are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code, which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Spain. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Obligation to notify the competent authority of any changes in the operation of an installation				
Obligation to comply with the conditions set in the permits or mandatory ELV's	Offences to the Law on water Discharges that may impair water quality and drainage conditions of the receiving streams, made without authorisation. Those offences are qualified as minor, less serious, serious or very serious, according to their impact on the use of public water, their significance as regards the safety of persons and property and the circumstances of responsibility , the degree of malice, participation and benefit gained, and the impairment of the quality of the resource. ***Article 116(3)(f) of the Law on water***	Sanctions related to the offences to the Law on water: - Minor offences, a fine of up to Euros 6,010.12 - Less serious offences, a fine of Euros 6,010.13 to 30,050.61 - Serious offences, a fine of 30,050,.62 to 300,506.06 - Very serious offences, a fine of Euros 300,506.06 to 601,012.10 ***Article 117 of the Law on water***		

	Offences to the Coastal Law Discharge of wastewater without authorisation ***Article 97(2)(f) of the Coastal Law*** Offences to Law 10/1998 on waste Petty offence: Any offences to the requirements encompassed in that Law or in the authorisations that are not considered as a very serious offence or a serious offence (in that case Article 18 and Article 19(4)) ***Article 34(4)(d) of Law 10/1998*** Offences to Law 34/2007 Very serious offence: Failure to comply with emission limit values, provided that it has generated or did not prevent air pollution that seriously endangers the health or safety of persons or seriously damages or deteriorates the environment. ***Article 30(3) (c) of Law 34/2007***	Sanctions related to offences of the Coastal Law - Fine: Euros 300,506.05 ***Article 97(1)(a) of the Coastal Law*** - Restoration of the environment to its previous state ***Article 95(1)(a) of the Coastal Law*** Sanctions related to offences to the Law 10/1998 on waste: Fine: Euros 601.01 This fine goes to Euros 6,010.12 in case of dangerous waste ***Article 35(1)(c) of Law 10/1998*** Sanctions related to offences to the Law 34/2007 Sanctions related to very serious offences: - Fine from Euros 200,001 to 2,000,000 - Definitive closure of all or part of the installation - Temporary closure of all or part of the installation for a period not less than 2 years and not more than 5 years. - The sealing of equipment, machines and products for a period not less than two years. - Prohibition to exercise this activity for not less than one year to a maximum of five year. - Revocation or suspension of the approval for not less than two years		

	Serious offence Failure to comply with emission limit values when they are not considered as a very serious offence ***Article 30(3)(b) of the Law 34/2007***	- Publication, through the means considered appropriate, of the sanctions, once they have become definitive ***Article 31(1)(a) of the Law 34/2007*** Sanctions related to serious offences: - Fine from Euros 20,001 to 200,000 - Prohibition to exercise this activity for a maximum period of one year - Temporary closure of all or part of the installation for a maximum period of two years - The sealing of equipment, machines and products for a maximum period of two years - Suspension de las autorizaciones en las que se hayan establecido condiciones relativas a la contaminación atmosférica por un periodo máximo de dos años. - Revocation or suspension of the approval for a maximum period of two years ***Article 31(1)(b) of the Law 34/2007***		

Annex XXV-Sweden

SWEDEN

1. Overview of penalties related to legislation on industrial installations

The Environmental Code (*Miljöbalken*, SFS 1998:808), which entered into force in 1999, integrated a number of existing environmental acts into one single code. For the purposes of this study, amendments until SFS 2010:1542, including specific amendments and new penalties provisions, e.g. by (SFS 2010:923), (SFS 2010:742), (SFS 2010:210) are considered. The Environmental Code also set up environmental courts to replace water courts and the Licensing Authority. The Environmental Code is the main transposing legislation for the four Directives relevant to this report. It contains provisions for the relevant offences and penalties relating to industrial installations. More specific technical requirements are often transposed by ministerial ordinances in which reference to the sanction provisions in the Environmental Code is given.

The following legislation applies to all four Directives for the purposes of this study:

Environmental Code (SFS 1998:808) as amended by until SFS 2010:1542, including specific amendments and new penalties provisions, e.g. by (SFS 2010:923), (SFS 2010:742), (SFS 2010:210)

In addition, the following specific legislation applies:

IPPC Directive: Two ministerial ordinances: The Waste Disposal Ordinance (SFS 2001:512) (Förordning om deponering av avfall) and Ordinance on supervision of certain installations (SFS 2004:989) (Förordning om översyn av vissa miljöfarliga verksamheter).

VOC Directive: A number of ministerial ordinances and regulations of the Swedish Nature Protection Agency: Ordinance (SFS 1998:901) on operators controls, Ordinance (SFS 1998:905) on environmental impact assessment, Regulations of the Swedish Nature Protection Agency (NFS 2001:12), Ordinance (SFS1998:900) on environmental inspections, Ordinance (SFS 1998:899) on environmentally hazardous activities as amended.

LCP Directive: Regulations of the Swedish Nature Protection Agency (NSF 2002.26) (Naturvardsverkets föreskrifter om utsläpp till luft av svaveldioxid, kväveoxider och stoft fran förbränningsanläggningar med en installerad tillförd effekt pa 50 MW eller mer NFS n° 26 du 29/10/2002).

WI Directive: Ministerial Ordinance on Waste Incineration (SFS 2002:1060), Ministerial Ordinance on Waste (SFS 2001:1063) and Regulations of the Swedish Nature Protection Agency (NSF 2002:28) as amended.

Chapter 26 of the Environmental Code provides the competent authority (the inspector) the power to issue injunctions and prohibitions with or without fines, to ensure compliance with legal rules, permits and decisions. It may also prescribe corrective measures, which are taken at the offender's expense. The competent authority reports infringements to the police or the public prosecution authorities. The Environmental Code provides for the principle of proportionality with regard to administrative enforcement measures, which should not be more intrusive than necessary in individual cases and take into account the circumstances of each particular situation such as the risk and type of negative impact on the environment.

Chapter 30 of the Environmental Code regulates the Environmental Sanction Fee (ESF). The ESF is an administrative sanction imposed by the competent authority and is based on the principle of strict liability. The situations in which the competent authority may impose an ESF are set out in the Governmental Decree on ESF (SFS 1998:950). The ESF has been considered as a quasi-criminal tool, as *the fees are decided by the supervision authority (which is not a court), but they are written in such a manner (strict liability) that, in some situations, they should be considered as if they were criminal penalties.*[223]

Chapter 29 of the Environmental Code sets criminal penalties that include imprisonment and additional corporate fines in some circumstances, depending on the seriousness of the violation. For the purposes of this study, Chapter 29 is essentially a catch-all provision which applies to all relevant offences under the Code. Those obligations that are enforced by Chapter 29 are listed in detail.

The Criminal Code also provides offences and corresponding penalties and sanctions. The provisions of the Criminal Code have priority if the sanctions it lays down are equal or more severe than those established by the Environmental Code.

Administrative and criminal sanctions can apply simultaneously.

Control functions are primarily exercised by the state regional authorities, the county administrative boards. The municipalities are responsible for the supervision of other environmentally hazardous activities and can also take over the county administrative board's responsibility for supervising an activity, fully or partly.

Finally, the Swedish legal provisions relevant to this study apply to both natural and legal persons. The difference is, however, that additional financial penalties may (a) additionally apply to businesses, and (b) exist to enforce a wider range of the provisions (i.e., Chapter 30 Sections 1 & 2 of the Environmental Code). For example, although Sweden applies criminal sanctions to the first three categories relevant to this study, the fourth does not carry a criminal sanction. That said, the "special charge" set out in Chapter 30 Environmental Code does apply in such circumstances, but only to businesses.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in Sweden

The table below has been compiled on the basis of the information provided in the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. This was the case for Sweden the assessment is based on the assumption that the listed articles have been fully transposed. When there is a catch-all

[223] Study on measures other than criminal ones in cases where environmental Community law has not been respected in the EU Member States, Milieu Ltd/Huglo Lepage, 2004

provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in Sweden. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.
