Annex XXVI-The Netherlands

THE NETHERLANDS

1. Overview of penalties related to legislation on industrial installations

In The Netherlands, the Environmental Management Act (*Wet Milieubeheer*, WM) was, until recently, the only the primary legislation relating to industrial installations. However, in October 2010, the Act on general provisions environmental law (*Wet Algemene bepalingen omgevingsrecht*, ("WABO"), entered into force.[236] WABO sets out the provisions for regulation of the environmental permit (*omgevingsvergunning*), which is an integrated permit for the purposes of construction, housing, monuments, space, nature and the environment. This includes permit requirements for IPPC, VOC, WI and LCP installations, such as the obligation to apply for an environmental permit, pursuant to Article 2.1(e).[237] The obligations established in WABO are further detailed in an Order in Council; the Decree on the law on environment (*Besluit Omgevingsrecht, BOR*), of which Article 2.1 designates the different categories of installations for which an environmental permit is required.[238] WABO covers indirect emissions to air, soil and water. In addition, the Water Act covers direct emissions to water.

IPPC Directive: The IPPC Directive is transposed by the WM and the Water Act. On 1 October 2010, the Law of 6 November 2008, establishing a licensing system regarding activities that affect, and the enforcement of rules relating to, the physical environment (The Act on general provisions environmental law), entered into force. Currently, WABO and the Water Act[239] (with which the Water Pollution Act is merged) transpose the IPPC Directive. The Decree on general provisions (BOR) further elaborates on the obligations laid down in WABO, such as the content of the permit. The Ministerial regulation on the environment (MOR) provides further detailed rules on certain aspects of WABO and the Decree on Environmental Law (BOR).

VOC Solvents Directive: The VOC Directive is transposed by the Solvents Decree.[240] In addition to the Solvents Decree, the Regulation solvents-accounting and measurements VOC emissions[241] (published in the Official Journal of 9 August 2001) further elaborates on the Solvents Decree; mainly by measuring and verifying emissions as well as setting requirements for the use of an accounting system for the use of solvents. The Official Journal of 9 August 2001 also published the Regulation regarding NeR (Dutch Emission Guidelines).[242] The Emission Guidelines for Air, is a national guideline, aimed at harmonising the environmental permits in the Netherlands with respect to abatement of emissions to the air. For this purpose, the NeR gives emission standards that agree with the Best Available Techniques (BATs).[243]

Waste Incineration Directive: The Waste Incineration Directive is transposed by the Decree on burning of waste (*Besluit verbranden afvalstoffen*, BVA), published in the Official Journal on 18 March 2004 and entering into force on 15 April 2004. In addition, the Directive is transposed by the Regulation laying down rules for discharges of waste water from the cleaning of waste gases

---

(Regeling lozingen afvalwater van rookgasreiniging),[244] as well as the WM.

LCP Directive: The LCP Directive is transposed by the Decree Emission Requirements Medium Combustion Plants (Besluit Emissie Eisen Middelgrote Stookinstallaties, BEES).[245] This Decree entered into force on 1 April 2010.

In the Dutch legal system, both criminal and administrative penalties can be imposed for a breach of the legislation on industrial installations. These two enforcement systems have different aims (compliance and punitive aims respectively). Consequently, offences may be determined as either being administrative and/or criminal in nature.

Administrative sanctions are primarily enforced pursuant to WABO (Chapter 5 on enforcement) and the WM (Chapter 18 on enforcement). The General Administrative Law Act (AWB) provides a comprehensive toolkit of enforcement measures for enforcement by competent authorities. The AWB lists four types of administrative sanctions for offences that (according to Article 5:1(3) AWB) can be applied to both natural and legal persons:

- Administrative order (*dwangsom*)

The administrative order (dwangsom) is a restorative sanction which aims at reversing the effects of the offence or preventing further violations (Article 5:32 AWB). According to Article 5:32a AWB, the administrative order describes the remedial action to be taken. The amount must be proportionate to the seriousness of the violated interest and the intended effect of the penalty imposed (article 5:32 (4) AWB). This amount is established by the competent authority. To ensure legal certainty for the permit holder, Article 5:23b(2) AWB obliges the competent authority to indicate the maximum total amount of the penalty that can be imposed under administrative order. The competent authority shall not make use of the administrative order if it is in conflict with the rule that requires protection or restoration (Article 5:32(3) AWB).

- Administrative coercion (*bestuursdwang*)

Applying coercive enforcement is one of the instruments competent authorities have against violations of the law. Article 5:21 of the AWB defines administrative coercion as a recovery sanction, which includes (a) the obligation to fully or partially recover damages for the offence, and (b) the competence of the competent authority to implement the obligation if not performed by the operator within a certain period of time. The municipality and province board are authorised to use this sanction pursuant to Article 125 of the Municipalities Act and Article 122 Provinces Act respectively. The sanction is used to bring the illegal situation back in line with the standards required by law. The competent authority may use 'actual measures' in order to remedy the breach (for example by demolishing an illegal structure). Before doing so, the competent authority must send a written warning to the offender, informing them to remedy the breach within a specified time period. It the offender fails to do so, the competent authority may proceed to take the actual measures to remedy the illegal situation. The written notification is subject to appeal. The decision specifies which regulation and law is being violated (Article 5:24 AWB). The cost of performing the 'factual measure' (such as removal of the illegal structure) may be recovered from the offender (Article 5:25 AWB).

- Administrative penalty

The administrative fine is a punitive sanction. This is in contrast to the other administrative tools which are not designed to punish a violation but to restore a situation when it violates the regulations, or to prevent their repetition. The administrative penalty does not require the competent authority to

[244] Regeling van 17 december 2002 houdende regels voor lozingen van afvalwater afkomstig van de reiniging van rookgassen.
[245] Besluit van 7 december 2009, houdende nieuwe regels voor de emissie van middelgrote stookinstallaties (Besluit emissie-eisen middelgrote stookinstallaties milieubeheer).

send a notification (warning) to the offender. Once a violation is detected (for example by inspectors), they can enforce through the use of administrative fines.

- Revocation of the permit

If an offence is committed by the holder of a permit, the full or partial withdrawal of the permit is often a sanction. The law and regulations under which the permits are issued establishes the rules concerning the revocation of the permit.

As defined in the WM and WABO, the competent authority is the authority that is competent to take a decision in relation to a request for an environmental permit, as well as in relation to permits that are already provided (such as the withdrawal of the permit). In case of non-compliance with the requirements set out in the legislation, the competent authorities can make use of these sanctions.

The competent authority identifies the remedial action to be taken and, when determining the amount of the administrative sanction (administrative order or penalty) takes into account the seriousness of the offence or the financial benefit that the offender obtained by committing the offence.

The WM defines the competent authority as the authority that is competent to provide a permit or to take other decisions (such as changes in requirements or withdrawal) (Articles 1.1 WM). According to Article 1.1(1) WABO, the competent authority is the authority that has to take a decision on an application for an environmental permit or in relation to an environmental permit that was already granted. Depending on the type of installation and scale of activity as well as the specific decree that regulates the subject matter, the competent authority is the board of the municipality or the province.

In addition to administrative sanctions, non-appliance with certain legislative obligations may also be subject to criminal sanctions. Criminal penalties and the ways in which they may be enforced are listed in the Economic Offences Act (WED). The WED is a framework law, which lists a wide variety of (economic) offences. It provides a list of provisions of several Acts and Decrees, (including WABO and the WM), breaches of which are classified as economic offences (*economisch delict*). Acting contrary to the requirements of a permit constitutes an offence. When a contrary act is deemed to be intentional, it is considered a crime.

The sanctions provided in the WED are divided into two categories.

- Category 1 crimes are punishable with six years in prison, community service or a fine of the fifth category, which can be up to Euros 76,000. Offences are punishable with one year in prison, community service or a fine of the fourth category (up to Euros 19,000).
- Category 2 crimes are punishable with two years in prison or a fine of the fourth category. Offences are punishable with six months in prison or a fine of the fourth category (up to Euros 19,000). Investigative officers are appointed (pursuant to Article 17 WED) to investigate the offences listed in the Act. There is no distinction between natural and legal persons. Non-compliance with Article 2.1 of WABO (regulating the environmental permit) is listed as an economic offence (*delict*) by Articles 1a(1) and (2) of the WED.

Article 6 WED establishes the maximum fine/prison sentence Article 6(1)(1) states that *offences,* mentioned in Article 1(1) and/or 1a(1), are punishable with one year imprisonment, community service or a fine of the fourth category, which can be up to Euros 19,000.[246] For offences other than those in Article 1(1) and 1a(1), the punishment can be imprisonment up to a maximum of six months, community service or a fine of the fourth category, which can be up to Euros 19,000.[247]

Article 6(1)(1) states that *crimes*, mentioned in Article 1(1) and/or 1a(1), are punishable with six years

[246] As at 01-01-2010.
[247] As at 01-01-2010.

imprisonment, community service or a fine of the fifth category, which can be up to Euros 76,000.[248] Other crimes, are punishable with a maximum of two years imprisonment, community service or a fine of the fourth category, which can be up to Euros 19,000.[249]

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in the Netherlands

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in The Netherlands. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Annex XXVII- United Kingdom

UNITED KINGDOM

1. Overview of penalties related to legislation on industrial installations

In the UK, The Environmental Permitting (England and Wales) Regulations 2010 ("The Regulations") cover the legal obligations and penalties in relation to the four Directives on industrial installations.

The Regulations require the regulator to ensure compliance with the relevant provisions of each Directive. The methods available to the regulator to ensure compliance, along with the offences and penalties applicable for non-compliance, are the same for all four Directives. Pursuant to the Regulations, the "operator" is liable for any breach of the relevant provision. "Operator" may include any person (natural or legal).

Administrative sanctions as defined in the continental law system do not exist in the United Kingdom.

Persons who infringe their obligations in respect of industrial installations in the UK can be convicted on summary conviction (petty offences) or on conviction of indictment (serious offences) depending on the type and level of the infringement. A person found guilty is liable on summary conviction to a fine not exceeding £50,000 (Euros 59,772) and/or imprisonment not exceeding 12 months. A conviction on indictment carries an unlimited fine and/or imprisonment not exceeding 5 years.

The UK Regulations provide for the Regulator to ensure that every application for the grant of an environmental permit includes the information specified in the relevant Directive. It also states the specific provisions of the Directive with which the Regulator must ensure compliance when it is exercising its functions in relation to permits. Note that the Regulation makes no specific reference to existing installations, but rather the requirement for an environmental permit applies to all relevant installations defined under the Regulation.

The UK Regulations set out the relevant functions of the competent authorities in relation to regulated facilities covered by the four Directives. The competent authority is either the Environment Agency or the local authority. Relevant functions include determining applications for the granting of environmental permits, and exercising specific enforcement powers to ensure compliance with the Directive.

Under the UK legislation, the regulator must periodically review the operator's permit and make periodic inspections of regulated facilities. The regulator has three main powers in relation to enforcement. Firstly, if an operator contravenes, or is likely to contravene a permit condition, the regulator may serve them with an enforcement notice specifying the steps that must be taken to remedy/prevent the contravention or to ensure that it does not occur. Secondly, if a regulated facility under a permit involves a risk of serious pollution, the regulator may serve a suspension notice. Thirdly, the regulator may also serve a prohibition notice on a person carrying on or proposing to carry on an activity which might lead to a relevant discharge into groundwater. Failure to comply with the requirements of any of these notices constitutes an offence under the UK legislation.

In July 2010, DEFRA (the Department for the Environment, Food and Rural Affairs) carried out a 12 week consultation considering proposed changes to the current UK Regulations. The proposed changes include the introduction of new "civil sanction" enforcement powers for the Environment Agency in the form of Fixed Monetary Penalties (FMP), Variable Monetary Penalties (VMP), and Enforcement Undertakings (EU) as alternatives to criminal sanctions for less serious offences. The proposed changes are intended to take effect from April 2011.

2. Review of offences and sanctions

a) Enforceable provisions covered by penalties in the UK

The table below has been compiled on the basis of the requirements set up by the national legislation. This table indicates briefly which articles for each of the four Directives are covered by the national legislation.

Provisions which set up sanctions that are very general and not related to infringements of provisions in respect of each Directive are not included in the tables but are described in the Introduction. This would be the case, for example, where there is a provision in the criminal code which imposes sanctions for pollution of the environment.

Note that it is not possible under this project to carry out a full conformity check to verify that all relevant obligations have been correctly and fully transposed. Therefore we have not always systematically checked provision by provision. When there is a catch-all provision that covers any infringement to the transposing legislation, (that is a provision in the transposing legislation or in framework legislation (e.g. law on environment or administrative/criminal code), which sets up a specific penalty applicable to any infringement of the transposing legislation for the relevant Directive(s)), we have included a "C" in the row 'catch-all'. When a given obligation has not been transposed, the relevant row in the table will include a "–", hence there is no sanction applicable. An "X" means that a given obligation is covered by a specific provision.

b) Review of offences and sanctions per Directive

This section gathers information on the offences for each of the four Directives covered by this report and describes the corresponding applicable sanctions (administrative and/or criminal ones) in United Kingdom. We divided the offences into four groups relating to:

- Obligation to apply for a permit for new or existing installations;
- Obligation to supply information for application for permits;
- Obligation to notify the competent authority of any changes in the operation of an installation;
- Obligation to comply with the conditions set in the permit or mandatory ELVs.

In some cases, specific obligations are not covered by the VOC, LCP or WI Directives. In such cases, the corresponding row has been shaded and reference should be made to the provisions applicable to the corresponding infringement under legislation transposing the IPPC Directive. These instances are as follows:

- In relation to the VOC Directive, obligations 2 and 3 are not relevant as there are no such requirements set up under the VOC Directive. These obligations are covered under the IPPC Directive only for relevant plants falling within the scope of the IPPC Directive.
- In relation to the LCP Directive, obligations 1 and 2 are not relevant as there are no such requirements set up under the LCP Directive. These obligations are covered under the IPPC Directive as they fall within the scope of the IPPC Directive.
- In relation to the WI Directive, obligation 3 is not relevant as there is no such requirement set up by the WI Directive. The Directive only defines what is a 'substantial change' in relation to waste incineration plants, but does not require the competent authority to be notified. This obligation is covered under the IPPC Directive.

Document on Good Practices

Introduction

This document is primarily informative. It aims at presenting the enforcement procedures and sanctions in place in Member States for infringement of legislation on industrial emissions, with a focus on legislation transposing the Directive 2008/1/EC concerning integrated pollution prevention and control (the IPPC Directive),[1] and to identify "good practices" in this field. Good practices are to be understood as examples of successful approaches to enforcement. This relates in particular to the different elements of the sanctioning system, both in terms of enforcement procedure and sanctions. Throughout the document, the term "sanction" is used as covering financial and imprisonment penalties but also other measures such as confiscation, closure of an installation used for enforcement purposes. The objective is to support the Member States in implementing their legislation on industrial emissions and in elaborating their own sanctioning strategies. The document also clarifies how Member States interpret the notions of dissuasiveness, proportionality and effectiveness.

In order to ensure operators of the installations covered by this Directive comply with the EU requirements, it is crucial that the national transposing legislation provides adequate enforcement mechanisms, including penalties that are effective, proportionate and dissuasive. The requirement for Member States to determine penalties is explicitly stated in most of the directives related to industrial emission.[2] Although the IPPC Directive does not contain such an explicit provision, Article 14 requires *"Member States to take the necessary measures to ensure that the conditions of the permit are complied with by the operator when operating the installations"*. Article 79 of the new Directive 2010/75/EC on industrial emissions place on Member States an obligation *"to determine penalties applicable to infringements of the national provisions adopted pursuant to this Directive"*. It also prescribes that *"the penalties thus provided for shall be effective, proportionate and dissuasive"*.

The Court of Justice of the European Union has held that although the Treaty leaves Member States to choose the ways and means of ensuring that a directive is implemented, that freedom does not affect the obligation imposed on all Member States to which the directive is addressed, to adopt, in their national legal systems, all the measures necessary to ensure that the directive is fully effective, in accordance with the objective which it pursues.

Furthermore, according to the established case-law of the Court of Justice of the European Union relating to Article 10 EC Treaty, now Article 4(3) of the Treaty on the European Union,[3] whilst the choice of penalties remains within their discretion, Member States must ensure in particular that infringements of EU law are penalised under conditions, both procedural and substantive, which are

- Directive 2001/80/EC of the European Parliament and of the Council of 23 October 2001 on the limitation of emissions of certain pollutants into the air from large combustion plants. *Official Journal L 309, 27/11/2001 P. 0001 – 0021.*
- Directive 2000/76/EC of the European Parliament and of the Council of 4 December 2000 on the incineration of waste. *Official Journal L 332 , 28/12/2000 P. 0091 – 0111.*

[3] Article 4(3), second indent, of the Treaty on the European Union reads 'The Member States shall take any appropriate measure, general or particular, to ensure fulfillment of the obligations arising out of the Treaties or resulting from the acts of the institutions of the Union'.

analogous to those applicable to infringements of national law of a similar nature and importance and which, in any event, make the penalty effective, proportionate and dissuasive.

Penalties are essential tools in the effective enforcement and implementation of EU environmental legislation. The adoption of penalties as an enforcement mechanism for ensuring that this legislation is complied with falls under the competence of the Member States. While all Member States provide for sanctions, generally both administrative and criminal, or, in some cases administrative or criminal, the way in which these are applied varies significantly between Member States, both in terms of the type and range of enforcement mechanism used. In addition, as there is no mandatory level of "minimum" or "maximum" fine to be imposed for non-compliance with a particular legislative provision, there will inevitably be variations between Member States in the different penalties provided for breaches of the legislation transposing the IPPC Directive.

Finally, the enforcement system should be seen as a whole, especially when assessing the effectiveness of sanctions. Factors such as the length of the procedure, interaction between the different competent organisations (inspections, competent authorities, prosecution, judges), should also be considered.

In order to respond to the practical implementation and enforcement challenges posed by the IPPC Directive, a Member State must have in place an effective administrative system and sufficient qualified staff able to:

- Provide information to industrial installations concerning their pollution control obligations and responsibilities
- Carry out permitting of industrial installations (process applications, determine whether suggested industrial pollution control measures are BAT for the particular industrial installation, set permit conditions, ensure public participation)
- Regularly monitor and inspect the industrial installations to see if they are operating in accordance with their permit conditions
- Notify operators of non-compliant industrial facilities of the measures that need to be taken to come into compliance
- Bring enforcement actions when operators do not have permits or fail to comply with the conditions in the permit

Carrying out the above tasks can be quite demanding for an environmental administration, and considerable variations among the Member States in terms of the sophistication and effectiveness of their implementation and enforcement regimes have been identified. The present document focuses on the three last tasks as these are directly relevant in terms of efficiency of the enforcement system in general.

Methodology

The document is the result of a study, which included two main stages. During the first stage, the study focused on overviews of the relevant legislation and procedures for infringement of key enforceable obligations set by of the four Directives regulating emissions from industrial installations, that is in addition to the IPPC Directive, directives relating to large combustion plants, emissions of volatile organic compounds due the use of organic solvent in certain activities and installations and incineration of waste. It covered all the Member States. Some of the conclusions of this comparative overview have been reflected in the present document.

For the second stage of the study, seven Member States were then selected for the purposes of carrying out more detailed reviews of the sanctions and enforcement measures applicable for non-compliance with the IPPC Directive. These particular Member States were chosen to provide a good cross-section view of how penalties are being implemented in practice across all Member States, to ensure a comprehensive geographical coverage of the EU, to obtain a representative sample of the different major legal systems (common law, continental law, administrative (quasi)criminal system), a mixture of founding members and new Member States. The seven Member States are Denmark, France, Germany, Hungary, the Netherlands, Spain and the United Kingdom (with a focus on England and Wales).

Each country study was also supplemented by case studies and interviews with relevant authorities. These case studies were used to illustrate how each country's system operates in practice as well as to determine the extent to which the sanctions imposed for non-compliance were deemed to be effective, proportionate and dissuasive. The detailed country studies are available as separate documents.

A workshop on "provisions on penalties related to legislation on industrial emissions" was held in June 2011 at the Commission premises, with a view to present the preliminary results of the study and discuss the legislation and practice in the Member States. A draft Document on Good Practices, taking into account the results of the discussion held during the workshop, as well as the detailed analysis for Denmark, France, Germany, Hungary, Spain, the Netherlands and UK have been submitted to the members of the Industrial Emission Directive Committee for consultation. The present document also integrates these comments.

The study has shown that, in general, there is a lack of quantitative data. In most Member States, while general statistical information is available on enforcement e.g. data on number of inspectors, number of formal notices, these are not as a rule broken down per type of installations. As a result, in many instances, it is not possible to obtain detailed figures specific to IPPC installations, although such data may be available at the regional level.

The IPPC Directive – main enforceable provisions

The IPPC Directive (2008/1/EC) provides the framework for the other legislation on industrial emissions control. Its objective is to achieve integrated prevention and control of pollution from a wide range of industrial activities covered in Annex I to the Directive. The IPPC Directive applies to around 52,000 industrial installations in the European Union. It covers a wide range of industrial installations such as energy industries, production and processing of metals, mineral industries, chemical industries, and waste management installations.

Under the IPPC Directive, no new industrial and agricultural activities with a high pollution potential listed in Annex I of this directive shall be operated without an environmental permit from the authorities in the respective Member State. The permits are to include measures ensuring that certain

environmental conditions are met (e.g. preventive measures are taken against pollution, no significant pollution is caused, and waste production is avoided).

Only the provisions of the IPPC Directive, which place an obligation on the operator are relevant, as they are enforceable and, as such, their infringement should be identified as an offence and corresponding penalties should be set by the transposing national legislation.

Table 1 below presents the key enforceable provisions of the IPPC Directive which provided the focus for the detailed studies.

Table 1: Key enforceable provisions of the IPPC Directive

Article	Key enforceable provisions
Article 4	No new installation shall be operated without a permit in accordance with the Directive
Article 5	Existing installations shall have permits in accordance with the Directive by 30 October 2007
Article 6	Applications for permits shall contain specific information listed in Article 6 (description of the installation and its activities, the raw and auxiliary materials, other substances and the energy used in or generated by the installation…)
Article 9	Permits shall include emission limit values for polluting substances based on BAT & other appropriate requirements ensuring protection of soil and groundwater, waste management, etc.
Article 12(1)	Operators shall inform the competent authorities of any planned change in the operation.
Article 12(2)	Operators shall request a permit when they are planning substantial changes in their installation
Article 14(a)	Operators shall comply with the conditions of a permit when operating the installation
Article 14(b)	Operators shall regularly inform the competent authority of the results of monitoring of releases
Article 14(c)	Operators shall afford the competent authority all necessary assistance with inspections

The number of relevant obligations is quite large. In order to streamline the analysis and provide a clear and simple comparative framework, all relevant provisions have been grouped under four key obligations to focus the comparison across countries. The following table describes the four key obligations and how each of these link to the relevant provisions of the IPPC.

Table 2: Key obligations and relevant provisions of the IPPC Directive

Key obligation	Relevant provisions in IPPC Directive
Obligation 1: to apply for a permit for existing and new installations	Article 4, Article 5, Article 12(2)
Obligation 2: to supply information for application for permits	Article 6
Obligation 3: to notify the competent authority of any changes in the operation of an installation	Article 12(1), Article 14(b)* * For the part setting a requirement to notify the CA in case of incident or accident significantly affecting the environment
Obligation 4: to comply with the conditions set in the permit or mandatory ELVs	Article 14(a)-(c)

The document structure

The first section of this document briefly presents the overall legal and institutional framework of the selected Member States. In section two, the document introduces and comments upon the notions of effectiveness, proportionality and dissuasiveness of penalties. Section three of the document focuses on sanctions, as they are set in legislation and applied in practice, while section four provides the key elements of the different procedures, which may influence the level of penalties. This section also considers the aspects linked to inspections and to judicial procedures. The last section of the document provides a list of guidelines and guidance documents that the selected Member States have developed to support the different actors of the sanctioning procedures.

The document also contains examples drawn from the country detailed studies and case studies, which present key elements and good practices that ensure effective, proportionate and dissuasive penalties and efficient enforcement systems. These key elements and good practices are structured around the following themes:

1. How the different factors governing the setting of sanctions can concur to the setting of effective, proportionate and dissuasive penalties, presenting in turn:
    - The nature of the sanctions, administrative, administrative (quasi)criminal and criminal, the comparative advantages of these different types of sanctions, along with criteria used to start a criminal procedure and the potential synergies between administrative and criminal sanctions
    - The range of sanctions available to the enforcement bodies, in terms first of penalties *stricto sensus* i.e. fines and imprisonment, but also the arsenal of other remedial measures and/or sanctions, which can be a powerful tool for enforcement.
    - The aggravating or mitigating criteria used when selecting an enforcement measure/sanction or setting a penalty.
    - The importance of publicity
2. What are the most important features which strengthen the enforcement and sanctioning procedure at the inspection stage and during criminal proceedings, paying particular attention to the need for specialisation of and cooperation between the

different actors of the enforcement system, as well as the main conditions to ensure proper public access to justice.

1. The different legal and institutional frameworks

Member States overall legal and institutional frameworks are characterised by a great variety. Similarly, the institutional structure, and in the present case, the authorities competent for the implementation and control over industrial installations, differ significantly from one Member State to another. This section gives an overview of the different legal and institutional frameworks of the seven Member States studied in detail.

1.1. Overall legal framework

One of the selection criteria of the seven Member States considered in this document was to have a good overview of the different types of national legal frameworks and institutional structure, combined with geographical and historical criteria. Table 3 below presents the main differences in terms of:

- overall legal and institutional framework: continental versus common law system with two examples of administrative (quasi)criminal law system, federal versus unitary state, with some countries having extensive devolution of powers to their regions,
- geographical criteria: mix of founding, old and new Member States as well as geographical spread across Europe

Table 3: Overview of key characteristics of the selected Member States

	Legal framework	Geographical, etc.
France	– Continental legal system – Republic – Unitary State	– Founding Member State – Western Europe
Hungary	– Continental legal system, with quasi-criminal sanctions – Republic – Unitary State	– Joined EU in 2004 – 'New' MS – Central and Eastern Europe
Germany	– Continental legal system with administrative (quasi) criminal law system – Federal Republic	– Founding Member State – Western Europe
Netherlands	– Continental legal system – Constitutional Monarchy – Unitary State	– Founding Member State – Western Europe
Spain	– Continental legal system – Constitutional Monarchy – Unitary State, highly decentralised	– Joined EU in 1986 – 'Old' MS – Southern Europe
Denmark	– Continental legal system – Constitutional Monarchy – Unitary State	– Joined EU in 1973 – 'Old' MS – Northern Europe
UK	– Common law system – Monarchic Republic – Unitary State, highly decentralised	– Joined EU in 1973 – 'Old' MS – Western Europe

1.2. Competent Authorities

In most of the EU Member States, regulatory and enforcement competences are divided between a number of different "competent authorities". In several Member States, including Austria, Germany, Belgium and Bulgaria, this involves the division of regulatory functions between authorities at the national/federal level and at regional/state levels. In other countries, such as Denmark and Hungary, the regional authorities exercise the major control functions over industrial installations. In the Czech Republic, the Netherlands, UK and Ireland, regulatory functions are also carried out at the municipal/local authority level.

Table 4: Competent Authorities in the seven selected Member States

Country	Competent Authorities
France	– Departmental préfets (government representatives in districts)
Hungary	– National and regional level: Ministry of Rural Development and Inspectorate for Environment, Nature and Water (10 regions)
Germany	– Länder level
Netherlands	– Multiplicity of CAs, at central and provincial levels but mainly provinces
Spain	– Autonomous communities
Denmark	– Municipalities, decentralised units of the Environmental Protection Agencies for larger and/or most polluting installations and state regional authorities for polluted soils
UK	– the Environment Agency in England and the Environment Agency Wales in Wales

2. Effectiveness, proportionality and dissuasiveness

The criteria of effectiveness, proportionality and dissuasiveness are still vague notions. They are not defined by EU legislation and the case law of the Court of Justice of the European Union is rather limited on this topic. The "founding" case is the Greek Maize Case[4] where the Court ruled that while the choice of penalties remains within their discretion, Member States must ensure that infringements are penalised under conditions, both procedural and substantive, which, in any case, make the penalty effective, proportionate and dissuasive.

With regard to the principle of proportionality, the Court has consistently held that, in order to establish whether a provision of EU law complies with the principle of proportionality, it must be ascertained whether the means which it employs are suitable for the purpose of achieving the desired objective and whether they do not go beyond what is necessary to achieve it.[5]

In another case, the Court specified the notion of dissuasiveness looking specifically at the procedural aspects rather than the penalty itself.[6] The Court recalled that a limited number of sanctioning procedures have been initiated, some of them more than a year after the date of control. It also highlighted that some of the infringement procedures were subject to an administrative decision more than two years after this date. The Court considered the time elapsed between the date of control and the initiating of the sanctioning procedure as well as between the date of control and the date at which an administrative decision has been taken. Considering the dissuasive nature of the sanctions, the Court specifically looked at the number of fines which were actually paid. The absence of payment in several cases was due to the fact that no constraint measure was taken. In other instances, the procedure has been suspended by appeal procedure. On these grounds, the Court ruled that Spain failed to impose penalties which have a deterrent effect on those responsible for infringing EU law provisions.

Based on literature and case law, the three criteria can be defined as follows.

Effectiveness: penalties are capable of ensuring compliance with EU law and achieving the desired objective

Proportionality: penalties adequately reflect the gravity of the violation and do not go beyond what is necessary to achieve the desired objective

Dissuasiveness: penalties have a deterrent effect on the offender which should be prevented from repeating the offence and on the other potential offenders to commit the said offence.

However, these definitions raise some challenges. Firstly, these criteria are closely inter-linked in the sense that, for example, a sanction can be seen as effective if it is proportionate and dissuasive. The criteria set by the Court of Justice of the European Union as regard the dissuasiveness of the penalties could also be equally seen as ensuring effectiveness. Besides, the interpretation of the Court focuses on proportionality in the context of immediate sanctions. According to the Court case-law, the necessity element of the sanction needs to be assessed while also deciding on the proportionality of

[4] Case C-68/88 Greek Maize Case
[5] Case C-94/05 Emsland-Stärke; Case C-426/93 Germany v Council; and Case C-26/00 Netherlands v Commission.
[6] Case C-189/07 Commission v Kingdom of Spain

immediate sanctions. When it comes to punitive sanctions, the link between necessity and proportionality is not clear. In other words, the punitive element of the sanction, which demonstrates the social disapproval, may lead to a more stringent sanction than what the sanction would be only based on the proportionality criteria. Effectiveness can be differentiated from dissuasiveness in the sense that the effectiveness of sanctions relates primarily to the short-term i.e. to meet the objectives of the legislation and ensure compliance with regard to the current behaviour of the operator (restoration of harm), whereas dissuasiveness criteria relates to the future (prevention of future harm).

Secondly, the application of the criteria should be guided by the specific circumstances of individual cases and be seen as part of a broader context. Typically, many cases of infringement are solved without imposition of penalties as such, but up-front in the procedure, through discussion and negotiation between the operator and the inspector and/or administrative authority. Each case is unique and a key principle is to take into account the particularities of individual cases e.g. the ability of the offender to pay. Looking at the broader context is important as, for example, lengthy and costly litigations could be more dissuasive for companies than the specific sanctions imposed. The risk to be detected and the likelihood that prosecution will take place are very much a question of capacity and are important to ensure dissuasiveness. In other words, the question of the effectiveness, proportionality and dissuasiveness of penalties should be considered together with the assessment of the national enforcement systems.

Thirdly, there is a lack of empirical and evidential analysis of the penalties as applied in practice. For example, dissuasiveness is hard to measure. The fines imposed in cases related to air emissions are often far below those usually set in the field of competition law, making often difficult to judge the effective, proportionate and dissuasive character of the sanctions imposed.

These challenges are further complicated by the significant differences between the national legal and institutional frameworks and practices, as well as in the economic situation of each of the 27 Member State. These differences across Member States explain that it is not feasible to define common ideal solutions, which could apply to all. This is why this document presents examples of good practices, both substantive and procedural features of the national sanctioning systems as they are implemented in practice, in order to support the Member States in their responsibilities to ensure enforcement of the EU requirements on industrial emissions. However, the specificities of each Member State should be always taken into account, and the document does not pretend to set best practices that could be implemented directly in any Member State.

Keeping this consideration in mind, as per the following box, some elements can be linked to each of the three criteria applicable to penalties, although it should be noted that some of them could relate to more than one criterion.

Proportionate

- Proportionality of the sanction to the seriousness of the offence
- Proportionality of the sanction to the damage caused and/or the illegal revenues obtained
- Consideration of the circumstances of particular situation e.g. the size of the installation

Effective

- Ensuring that the objective set by the law is achieved
- Ensuring that the procedure is not overly long and costly

- Existence of coercive measures, possibility to proceed with remediation measures immediately at the operator's expenses
- Range and type of measures available, possibility to combine different measures (administrative measures and sanctions)
- Ensuring cooperation between different actors of the sanctioning procedure and their specialisation

Dissuasive

- Penalties sufficiently severe to punish the offenders and ensure a deterrent effect
- Higher penalties in case of recidivism, aggravating circumstances
- Importance of publicity to enhance the deterrent effect of the penalty

3. The sanctioning system

This part focuses on sanctions, as they are set in legislation and applied in practice.

3.1. The nature of the sanctions

The description of the nature of sanctions applicable to infringement of legislation on industrial emissions involves looking at the branch of law under which the sanctions are set, administrative or criminal, and how the two systems interact.

3.1.1. Administrative versus criminal sanctions

With regard to the imposition of administrative or criminal penalties, previous studies[7] indicated that while in some countries, administrative sanctions are considered to have the same repressive and preventive character as criminal ones, in certain regimes there is a substantial distinction between administrative and criminal sanctions. For the latter, there is no social blame in the administrative sanction; rather, the only intention is to re-establish the public order. The body imposing the sanction and the proceedings to impose the sanction in many countries will be a clear tool to differentiate between both types of measures. In most cases, an administrative body will be responsible for imposing administrative measures whereas a criminal court will be in charge of imposing criminal measures. The proceedings to impose the sanctions are also different. Except in common law countries where there is usually not a specific and differentiate procedure to impose administrative sanctions, an administrative sanction will be imposed through an administrative procedure whereas the criminal sanction will be imposed through a criminal procedure.

Not all EU Member States have specific provisions for both administrative and criminal sanctions relating to industrial installations. Unlike the continental legal systems which exist in most EU countries, several common law countries, or countries with a common law influence, including Ireland, Cyprus and Malta have no administrative sanctions in place for offences.

However, the introduction of administrative sanctions in the UK suggests that these are an efficient instrument for enforcement. Until recently, the UK had no specific provision for administrative sanctions. However, new legislation was introduced in 2010 allowing administrative sanctions to be applied to a limited number of environmental offences.[8] These sanctions are known as "civil sanctions" and can be used against a business committing certain environmental offences, as an alternative to prosecution and criminal penalties of fines and imprisonment. However, civil sanctions do not currently extend to those breaches of legislation in respect of industrial installations. It is expected that these sanctioning powers should be extended to industrial installations in the near future.

As explained below, the reviews carried out prior to the adoption of the new legislation concluded that administrative penalties are an effective way of ensuring regulatory compliance whilst reserving criminal prosecutions for the most serious of cases of regulatory non-compliance.

[7] See for instance Study on measures other than criminal ones in cases where environmental Community law has not been respected in the EU Member States, Milieu, 2003 http://ec.europa.eu/environment/legal/crime/pdf/ms_summary_report.pdf

[8] The Environmental Civil Sanctions (England) Order 2010 and the Environmental Sanctions (Miscellaneous Amendments) (England) Regulations 2010

The role of administrative sanctions alongside criminal ones

In 2005, a report by Sir Philip Hampton set out principles for better regulation.[9] The report concluded that sanctions were not a deterrent to serious non-compliance and proposed a review of penalty regimes, which was subsequently carried out by Professor Richard Macrory in 2006. The resulting report, "Regulatory Justice: Making Sanctions Effective" concluded that the existing system was too heavily reliant on criminal prosecutions which were not always a proportionate response to the seriousness of the offence, stating:

> *Criminal prosecutions remain the primary formal sanction available to most regulators. While this sanction is appropriate in many cases, the time, expense, moral condemnation and criminal record involved may not be appropriate for all breaches of regulatory obligations and is burdensome to both the regulator and business. While the most serious offences merit criminal prosecution, it may not be an appropriate route in achieving a change in behavior and improving outcomes for a large number of businesses where the non-compliance is not truly criminal in its intention.*

The report recommended a broad "toolkit" of civil sanctions for regulators to promote and enforce regulatory compliance. Among its recommendations included the extension of flexible administrative monetary sanctions and the strengthening of statutory notices to work alongside the criminal law in combating non-compliance. It was believed that such regulatory sanctions would provide a more flexible and proportionate approach to non-compliance and help to resolve many cases more quickly and effectively.

In some countries, there is no specific criminal sanction for the particular offences covered by the study (see introduction). However, in most of these cases, general criminal sanctions are provided for by a criminal code or framework environmental law and as a rule, would apply. In such instances, the sanction is often conditional upon the existence of damage to the environment (Czech Republic, Latvia, Lithuania, Slovenia and Spain). Where specific criminal sanctions are set for particular offences, general criminal sanctions as described above also apply.

In Germany and Hungary, administrative (quasi)criminal sanctions operate along administrative and criminal ones. In both countries, these give the possibility to impose financial penalties on offenders through a more simple procedure than the criminal one. They bear a punitive function.

Hungary sets quasi-criminal sanctions in addition to administrative and criminal sanctions. Such sanctions are generally applicable to less serious offences (i.e. petty offences). The main objective is to ensure a quicker punishment of offences which are considered as less harmful than those covered by the criminal code. Administrative (quasi) criminal sanctions carry similar penalties to criminal sanctions i.e. fines or imprisonment. However, they are less stringent in nature and involve a simplified procedure. At first instance they are handled by the administrative authorities rather than by the judicial system. In Hungary, only natural persons may be subject to such proceedings.

In Germany, administrative (quasi) criminal sanctions are used instead of administrative sanctions. Such administrative (quasi) criminal sanctions are known as "administrative criminal" and are established as an alternative method of enforcement, sitting alongside criminal sanctions and

[9] Philip Hampton, "Reducing administrative burdens: effective inspection and enforcement". This document sets out the Hampton principles of effective inspection and enforcement

administrative enforcement measures. The use of such sanctions is conditional upon the offender's negligence or intent. The aim of such sanctions is not to restore legality or to prevent danger but to have a punitive, deterrent and preventive effect by imposing convictions on the offender for a wrongdoing.

The benefits and disadvantages of imposing administrative, administrative (quasi) criminal and/or criminal sanctions can be summarised as follows.

	Administrative sanctions	**Administrative (quasi) criminal sanctions**	**Criminal sanctions**
Advantages	• Communication with the perpetrator (e.g. a warning letter could be enough to force the operator to comply with its legal obligations) • Fines can be even higher than through criminal proceedings	• Simplified and quicker procedures compared to criminal procedures • Tool with which to punish (dissuasive sanction)	• Strong tool with which to punish (dissuasive sanction), • Allows the victim to be compensated, • Public procedures (shaming effect), • Significant powers of prosecutor and the investigating bodies • Guarantee of impartiality
Disadvantages	• Lack of publicity • Sometimes too much room for bargaining	• Lack of publicity • In some countries, legal persons are not subject to quasi-criminal liability	• Lengthy procedures • Resource consuming

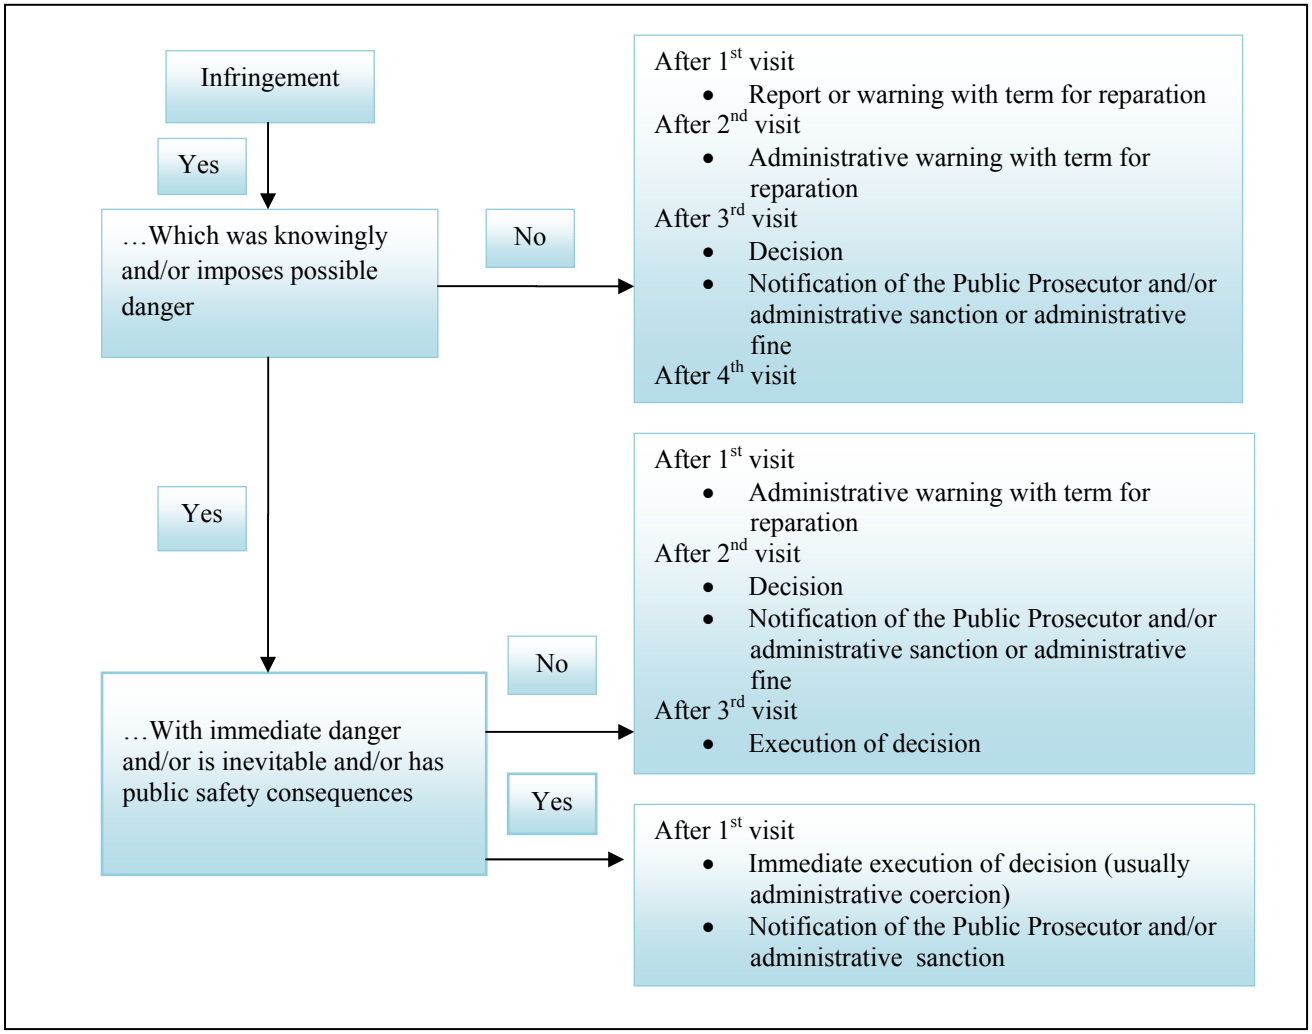
The choice between an administrative or a criminal sanction also depends on the objective of the sanction. For example, under the England and Wales Environment Agency outcomes-focused enforcement policy, criminal sanctions are more geared towards dissuasive effect. The outcomes of the Agency's enforcement policy are:

(1) stopping the illegal activity,
(2) bringing the offender under regulatory control,
(3) restoring and remediating the environmental damage, and,
(4) punishing and/or deterring future offending.

While outcomes (1)–(3) are enforced by administrative mechanisms, type (4) outcomes are enforced via administrative (quasi) criminal and/or criminal sanctions.

Finally, the inspection and enforcement strategy of the Province of Overijssel in the Netherlands gives a good example of the criteria and considerations upon which to impose administrative measures and sanctions or criminal ones, and this throughout the different stages of the enforcement procedure.

Figure 1 Inspection and enforcement strategy of the province of Overijssel[10]



3.1.2. Criteria for starting a criminal procedure

One of the main measures the competent authority and/or the inspectorate can undertake is to report the infringement to the public prosecutors. This is an important aspect of the sanctioning procedure as it is the initial phase which can ultimately lead to a criminal sanction, rather than to an administrative one.

The action to report the infringement can be subject to conditions, sometimes linked to practice. For example, in France, the practice is that formal records of infringements to the legislation on classified installations are only submitted to the prosecutor when there is a potential threat to health and the environment. In other words, prosecution is thought for only with regard to what is considered as a serious offence. The Guidelines set by Denmark constitute an interesting example of the setting of such criteria. However, these are not always well followed.

[10]Ferwerda, C., *Handhaven of gedogen, dat is de vraag*, Handhaving 2010, no. 4.

Danish rules governing compulsory report to the prosecution

In Denmark, the supervisory authority shall report the infringement to the public prosecutors in case the administrative sanction has not resulted in the illegal activity being brought under regulatory control. According to the Guidelines on enforcement of the Environmental Protection Act, certain types of infringement would require that the supervisory authority should report the infringement to the police although the administrative sanction has resulted in the illegal activity being brought into compliance with the law. This would be the case where a new IPPC installation is operated without the required permit or and typically in cases where offender acted deliberately or by gross negligence and the infringement resulted in a damage to the environment or risk of a damage, or actual or intended economic advantages.

However, a review of the enforcement of the environmental legislation by the municipalities, the decentralised units of the Environmental Protection Agency and the public prosecution authorities (the police) launched by the Danish Environmental Protection Agency revealed that reporting of violations to the public prosecutions authorities is inadequate. The review showed that there is a tendency not to follow the guidance on when reporting of violations should take place as set out in the Enforcement guidelines issued by the Ministry and that cooperation between the environmental enforcement authorities and the public prosecutions authorities could be enhanced.

Similarly, the Netherlands provide guidance as to when criminal proceedings should be initiated.

The Netherlands: criteria to start criminal proceedings

The guidance document *Instruction on enforcement of environmental law* stresses that, in principle, criminal proceedings will only be initiated in case of a breach of "core provisions" of environmental legislation. Core provisions of industrial emissions legislation are those setting the obligation to have a permit and to comply with the conditions set in the permit. This rule applies except when the Public Prosecutor considers that the behaviour was a) unintended and incidental and did not have major environmental consequences; and ceased immediately after adequate action of the operator (cumulative conditions) or b) if criminal law has no function in the case at hand because *de facto* the administrative measure(s) already constitute a sufficient 'punishment', in light of *ad hoc* or structural agreements between the Public Prosecutors Office and the administration. In principle, where the infringement relates to non-core provisions, no prosecution is to take place, except in cases when the Public Prosecutor finds that special circumstances prevail (for instance relating to a direct substantial threat to the environment or public health) that makes it necessary to prosecute.

The UK has developed a comprehensive system submitting criminal prosecution to strict threshold through the so-called "two stage" test, based on the evidence available and public interest criteria.

Whether to prosecute or not: the two-stage test set by the Code for Crown Prosecutors

When considering prosecution, regulators must have regard to the Code for Crown Prosecutors ("The Code"). The Code provides guidance on the general principles to be applied when

considering prosecutions. Where the regulator decides that a criminal sanction is appropriate it must assess the case in accordance with the requirements of the Code before commencing a prosecution. The Full Code Test has two stages: (i) the evidential stage; followed by (ii) the public interest stage.

For the evidential stage, prosecutors must be satisfied that there is sufficient evidence to provide a realistic prospect of conviction against each suspect on each charge. This will include considering the reliability and admissibility of the evidence.[11] They must also consider what the defence case may be, and how it is likely to affect the prospects of conviction. A case which does not pass the evidential stage must not proceed, no matter how serious or sensitive it may be. Where there is sufficient evidence to justify a prosecution or to offer an out-of-court disposal, prosecutors must go on to consider the second stage, i.e. whether a prosecution is required in the public interest. A number of factors will make a prosecution more likely, for example where a conviction is likely to result in a significant sentence, and where the offence was committed in order to facilitate more serious offending.[12]

Based on these factors as well as its own public interest factors it uses when deciding on the type and severity of sanction, the Environment Agency will make a decision as to whether a prosecution is an appropriate response or whether an alternative to prosecution may be more appropriate. This assessment will include a consideration of factors set out by DEFRA, including those which will tend to suggest that prosecution is the proportionate action.

3.1.3. Synergies between administrative and criminal sanctions

The question of whether or not administrative and criminal sanctions can apply cumulatively should be considered in the light of the principle of *ne bis in idem* as interpreted by the European Court of Human Rights (ECHR) in its Decision Zolotukhin v. Russia.[13] The ECHR recalled that Article 4 of Protocol No. 7 imposed a prohibition on trying or punishing an individual twice in criminal proceedings for the same offence. The Court ruled that, although the proceedings instituted against the applicant were classified as administrative in national law, they amounted to criminal proceedings based on the so-called Engel criteria: the classification of the offence under national law, the nature of the offence and the degree of severity of the penalty by reference to the maximum potential penalty for which the relevant law provides. With regard to the "idem" element, the Court held that "*Article 4 of Protocol No. 7 must be understood as prohibiting the prosecution or trial of a second "offence" in so far as it arises from identical facts or facts which are substantially the same"*.

In Germany for example, the principle of *ne bis in idem* is strictly applied in relation to criminal and administrative criminal offences.

Germany: an example of non-cumulative sanctions

The prosecution of administrative criminal offences and the prosecution of criminal offences are

[11] Code for Crown Prosecutors, pages 7-9
[12] Code for Crown Prosecutors, pages 10-12
[13] *Serguey Zolotukhin v. Russia* [GC] (Application no. 14939/03), 10 February 2009

intertwined. The same behaviour of the perpetrator can only be punished once and accordingly either as a criminal offence or a criminal administrative offence.[14] If the behaviour of the perpetrator meets the conditions of a criminal offence and an administrative criminal offence simultaneously the public prosecution office must prosecute the criminal offence and the competent authority must stop the prosecution of the administrative criminal offence (§ 21(1) Administrative Criminal Offences Act). This is, for example, the case when the operator of an installation for the production of basic organic chemicals runs the installations without a permit.

This case-law would not prevent administrative measures other than pecuniary ones to be applied in conjunction with criminal sanctions to the same offence, at least as long as these administrative measures do not have a punitive character.

Example of cumulative application of administrative 'measures' and criminal sanctions

In Denmark, where there is no administrative financial penalty, the legislation provides for the use of both measures and regulatory guidance advises the use of either and/or both where it is considered proportionate under the circumstances. The way in which the administrative and criminal sanctions are applied and the factors which regulators must take into account when deciding whether or not to prosecute is determined by various guidance documents, including the Environmental Protection Agency's guidelines on enforcement of the Environmental Protection Act and the Instructions from the Director of public prosecutions concerning judicial procedures for environmental infringement. Administrative measures will thus be used with the option to resort to criminal prosecution where operators have breached their permit conditions or where administrative procedures are not complied with.

The application of the ECHR case law would be more problematic in countries where administrative sanctions can have a punitive nature. It could be considered as admissible with some safeguard, notably the total of both fines cannot exceed the potential maximum amount of the criminal fine. An example is France although it does not apply in the case of IPPC penalties given that there are no administrative fines in this instance.

France: cumulative administrative and criminal sanctions

Both administrative and criminal sanctions can apply for the infringement of the legislation on classified installation in France. These sanctions can be imposed separately on the offender and even be cumulative. For instance the non-respect of the requirement set in the letter of formal notice issued by the prefect to close an installation or suspend its activity can both lead to an administrative sanction and a criminal sanction. The Constitutional Council considers that the rule of *non bis in idem* does not prohibit the combination of criminal and administrative sanctions incurred for the same facts since these sanctions do not have the same purpose and the interests they aim to safeguard are not identical. The Constitutional Council, however, provides that administrative and criminal sanctions when applied cumulatively shall be subject to the principle of proportionality. In particular, the total amount of administrative fines and criminal fines issued for the same facts shall not exceed the highest amount possible between these two

[14] In favour of this: Jarass/Pieroth, Legal Commentary to the Basic Law of the Federal Republic of Germany, Article 103, recital 74.

penalties.[15]

3.2. The range of sanctions

All EU Member States set administrative sanctions in case of breaches of IPPC legislation. These include different kinds of measures and sanctions, and, sometimes only financial penalties. With regard to criminal sanctions, all the seven countries studied provide for criminal penalties (fines and imprisonment), with also in some cases the possibility to impose other types of sanctions, such as the dissolution of the company. The following section firstly considers fines and imprisonment penalties both administrative and criminal. Secondly, it focuses on the other types of measures and sanctions that can be taken alongside traditional penalties.

3.2.1. Fines and imprisonment

Tables 6 and 7 present respectively administrative and criminal penalties available in each of the seven Member States studied in more detail. They do not include sanctions other than fines and imprisonment, which are covered in the next section. Table 6 includes administrative fines and specifies when financial sanctions are not provided for by the national administrative legislation for infringement to legislation on industrial emissions. Administrative (quasi) criminal sanctions have been added within Table 7 on criminal penalties for the two countries which provide for such sanctions, Germany and Hungary.

[15] Constitutional Council Decision No ° 89-260 DC of 28 July 1989, § 16-22.

Table 5: Administrative penalties

Countries	Obligation to apply for a permit for new or existing installations	Obligation to supply information for application for permits	Obligation to notify the competent authority of any changes in the operation of an installation	Obligation to comply with the conditions set in the permit or mandatory ELV's
Denmark	No financial sanction	No financial sanction	No financial sanction	No financial sanction
France	No financial sanction	No financial sanction	No financial sanction	No financial sanction
Germany	No financial sanction	The infringement of these obligations does not lead to sanctions, but as a consequence of this infringement the authority will not grant the permit	No financial sanction	No financial sanction
Hungary	Having regard to the danger the illegal conduct may have on the environment, fine from Euros 182 to 365/day (HUF 50,000 to 100,000)	No financial sanction	No financial sanction	Fine of Euros 730-1,826 (HUF 200,000 to 500,000)
Spain	In case of serious damage to the environment or serious danger to human health or safety, fine from Euros 200,001 to 2,000,000 If not, fine from Euros 20,001 to 200,000	Serious offences (intentional element): fine from Euros 20,001 to 200,000 If not, fine from Euros up to 20,000	In case of serious damage to the environment or serious danger to human health or safety, fine from Euros 200,001 to 2,000,000 If not, fine from Euros 20,001 to 200,000	In case of serious damage to the environment or serious danger to human health or safety, fine from Euros 200,001 to 2,000,000 If not, fine from Euros 20,001 to 200,000
The Netherlands	No financial sanction	No financial sanction	No financial sanction	No financial sanction
UK	No financial sanction	No financial sanction	No financial sanction	No financial sanction

Table 6: Overview of administrative (quasi) criminal and criminal sanctions

Countries	Obligation to apply for a permit for new or existing installations	Obligation to supply information for application for permits	Obligation to notify the CA of any changes in the operation of an installation	Obligation to comply with the conditions set in the permit or mandatory ELVs
Denmark	Fines: no minima or maxima (Fines typically in the range of DKK 10,000 – 40,000 (app Euros 1,200 - 6,000)) In case of intent or gross negligence and if the violation is harmful for the environment or provides economic advantage to the operator, imprisonment up to two years Same for natural and legal persons but additional financial penalties can apply to legal persons	Fines: no minima or maxima In case of intent or gross negligence and if the violation is harmful for the environment or provides economic advantage to the operator, imprisonment up to two years Same for natural and legal persons but additional financial penalties can apply to legal persons	Fines: no minima or maxima In case of intent or gross negligence and if the violation is harmful for the environment or provides economic advantage to the operator, imprisonment up to two years Same for natural and legal persons but additional financial penalties can apply to legal persons	Fines: no minima or maxima In case of intent or gross negligence and if the violation is harmful for the environment or provides economic advantage to the operator, imprisonment up to two years Same for natural and legal persons but additional financial penalties can apply to legal persons
France	Individuals: - Fine of up to Euros 75,000 - Up to one year imprisonment Legal persons: Fine up to Euros 375,000 (75,000 x 5)	N/A	Individuals: fine up to Euros 1,500 Legal persons: fine up to Euros 7,500	Individuals: - Fine up to Euros 75,000 - Up to six months imprisonment Legal persons: Fine up to Euros 375,000 (75,000 x 5)
Germany	*Administrative (quasi) criminal sanctions:* - In case of intent, fine up to Euros 50,000 - By negligence, fine up to Euros 25,000 Identical fines for legal persons	N/A	*Administrative (quasi) criminal sanctions:* - If intentional, fine up to Euros 10,000 - By negligence, fine up to Euros 5,000 Identical fine for legal persons.	*Administrative (quasi) criminal sanctions:* - In case of intent, fine up to Euros 50,000 - By negligence, fine up to Euros 25,000 Identical fine for legal persons.

Countries	Obligation to apply for a permit for new or existing installations	Obligation to supply information for application for permits	Obligation to notify the CA of any changes in the operation of an installation	Obligation to comply with the conditions set in the permit or mandatory ELVs
	Criminal sanctions: Individuals: - if intentional, imprisonment up to 3 years or fine up to 360 daily units - if by negligence: imprisonment up to 2 years or fine up to 360 daily units *Note: one daily unit amounts from Euro 1 up to Euro 30,000* Legal persons: Fine up to Euros 1,000,000/ if intentional / Euros 500,000 if by negligence.		*Criminal sanctions:* N/A	*Criminal sanctions:* Individuals: - if intentional, imprisonment up to 3 years or fine up to 360 daily units - if by negligence: imprisonment up to 2 years or fine up to 360 daily units *Note: one daily unit amounts from Euro 1 up to Euro 30,000* Legal persons: Fine up to Euros 1,000,000 if intentional / Euros 500,000 if by negligence.
Hungary	*Administrative (*quasi) criminal sanctions: a fine up to 547 Euros (HUF 150,000) No criminal penalties specific to breaches of IPPC legislation General offences *e.g.* 'damaging the environment/the nature', 'illegal deposition of waste', 'danger to the public'. The great variety in the different sanctions in terms not only of level but also in their nature, administrative, administrative criminal or criminal, and other elements as described below show how difficult it would be to determine general "good practices" applicable across countries.

Rare occurrence of financial administrative sanctions

Out of seven countries, only two have set up financial administrative sanctions (fines) for breaches to IPPC legislation, Hungary and Spain. In Hungary, administrative fines are very low (Euros 182 to 365) but this amount is applicable per day, hence can increase with the time. By contrast, Spain has set very high administrative fines – up to Euros 2 millions when the offence had impacted negatively the environment or presented a danger to human health. Otherwise, the maximum is Euros 200,000. Interestingly, the maximum amount of criminal fines is far less high for general crimes against natural resources and the environment, with fines up to Euros 300,000. On the other hand, criminal penalties include imprisonment.

Distinction between minor and serious offences

This is an important feature when considering the requirement to set proportional penalties, as it provides a tool to take into account elements that influence the seriousness of the offence. These can differ from one country to another – depending on the existence of damage to the environment or to human health, based on the intent (and gross negligence in the case of Denmark), as opposed to an offence committed by negligence, or if the offence led to an economic benefit. In the Netherlands, offences are differentiated from more serious 'crimes' to which higher penalties are associated. Other countries set only one maximum for a given offence.

Existence of administrative (quasi) criminal penalties

As mentioned above, two of the Member States studied, Hungary and Germany, use a so-called ":administrative (quasi) criminal" or administrative criminal system. These relate to minor offences while the more serious ones are as a rule handled through criminal proceedings.

Minima and maxima for penalties

The seven Member States studied, follow different approaches to define the level of fines. In some cases, both minima and maxima are defined e.g. administrative sanctions in Hungary and Spain. With regard to criminal sanctions, in all the seven Member States, a maximum is set, with the exception of Denmark which does not set any minima or maxima.

If to take only the maximum fine applicable to breaches of the obligation to comply with the conditions set in the permit or mandatory ELVs in each country, the following variations can be identified.

Table 7: Overview of maximum sanctions

Countries	Specific v. General criminal sanctions[16]	Maximum sanctions
Denmark	Specific	• Fine: no maxima • In case of intent or gross negligence and if the violation is harmful for the environment or provides economic advantage to the operator, imprisonment up to two years • Same for natural and legal persons
France	Specific	• Legal persons: € 375,000 • Natural persons: € 75,000 - 6 months imprisonment
Germany	Specific	• Legal persons: €1 million /500,000 (intentional/negligent) • Natural persons: €10 million (that is 360 daily units at the maximum rate of €30,000 per daily units)* – 2/3 years imprisonment (intentional/negligent)
Hungary	General	• Individuals: Imprisonment: in average up to 10 years** • Legal persons: (1) the dissolution of the legal person, (2) constraining the activity of the legal person and (3) fines: three times the benefits gained, but minimum € 1.862
Spain	General	• € 300,000 • 4 years of imprisonment
The Netherlands	General	• Offences: €19,000 and 6 months to 1 year imprisonment • Crimes: €76,000 and 6 years imprisonment
UK	Specific	• On summary conviction: €59,770 and 12 months imprisonment • On conviction on indictment: no maxima for the fine, 5 years imprisonment

*The amount of €30,000 is theoretical as a number of factors are considered when setting the number and the rate of the daily unit.
** The maximum length of imprisonment depends on the offence, the level of guilt and other factors. In some cases the relevant provisions set minima and maxima, whereas in some cases there is only a maximum duration of imprisonment.

The maximum fine ranges from Euros 1,862 to an unlimited amount, while the maximum imprisonment penalty can be found in Hungary where it reaches 10 years. Taking into account these differences, it should be underlined that, in practice, criminal sanctions appear to be rarely used. In Hungary as a matter of fact, no case of application of criminal sanctions to IPPC installations could be identified. In countries where there have been instances where breaches to legislation transposing the IPPC Directive have been subject to criminal proceedings, when data is available as to the level of sanctions, the financial penalties are rather low compared to the maximum. However, it is not possible to draw meaningful conclusions on the basis of the information available. Comprehensive and detailed studies should be undertaken on a national level, as the setting of low penalties can be justified for a number of reasons linked to the specificities of the cases.

More generally, the question as to whether the prescription of minimum and maximum level of fines is supporting the setting of proportionate, effective and dissuasive penalties or not, can be subject to discussion. Besides, when such minima and maxima are set in legislation, they may not always be adapted to the particular circumstances of the country and each individual case. Some practitioners

[16] The term specific criminal sanction refers to cases where a specific provision is set in the Criminal Code or other criminal law legislation for the breach of IPPC related obligations, whereas the term general criminal sanction refers to cases where a general provision is included in the Criminal Code or other criminal law legislation and has a broader scope than offences to IPPC legislation.

mentioned that while minimum level of fines could be too high and the maximum one too low for certain cases.

Differentiation in the level of fines for natural and legal persons

Table 5 also indicates in which countries criminal sanctions are differentiated for legal and natural persons. In all seven Member States studied, penalties can apply to both natural and legal persons. In some countries, the same penalties apply while in others, the penalties are differentiated, with higher ones potentially applicable to legal persons. In this perspective, due account should be taken of the possibility to impose additional financial penalties to legal persons. For example, in Denmark, fines can be completed with other financial sanctions such as the seizure of the profit made. An example is a ruling by the Eastern High Court where a County was fined DKK 500,000 (approximately Euros 65,000) for failure to comply with the mandatory emission limit values for a waste incineration plant and seizure of the saved amount of DKK 4 million (approximately Euros 350,000), more than five times the amount of the fine itself.

Guidance on the level of fines

In Germany, the practice of developing indicative catalogues of fines can be an interesting example of such guidance. However, on one hand, it raises the question of the necessary flexibility to ensure proportionate, dissuasive and effective penalties. The catalogue actually sets narrower limits to the amount of fines. The recommended levels of fines are adapted in function of the value of the installation itself for construction without permit. On the other hand, there may be many other circumstances to take into account when setting the fines and the fines set by the catalogues are only indicative.

Germany: use of indicative catalogue of fines

The Länders specify the scale of fines by adopting indicative catalogues of fines. According to the catalogue of fines for infringements against environment related provisions of North-Rhine Westphalia (*Bußgeldkatalog Umwelt*) of 2006[17] the scale of fines for the construction of installations (including IPPC) without permit depends on the value of the constructed installation:

Value of the installation	**Fine foreseen**
Less than Euros 50,000	Between Euros 510 and 2,600
Between Euros 50,000 and 500,000	Between Euros 510 and 5,100
Between Euros 500,000 and 5,000,000	Between Euros 2,600 and 25,600
More than 5,000,000	Between Euros 5,100 and 50,000

The catalogue also contains indicative fines for many other infringements.

Similarly, in Denmark, recommendations on minimum level of fines have also been adopted. For example, a fine of at least DKK 50,000 (approximately EUR 2,700) is recommended in case of putting into operation or operating an installation without a permit from the relevant authorities.

[17] The fine catalogue environment of North-Rhine Westphalia of 2006 was established by the Ministry for the Environment, Nature Conservation, Agriculture and Consumer Protection of North-Rhine Westphalia and is available at: http://www.kreisjaegerschaft-coesfeld.de/red/ges-bussgeldkatalog-umwelt-nrw-2010-02-27.pdf

3.2.2. Other measures and/or sanctions

Alongside financial and imprisonment penalties, all Member States provide for other types of measures and/or sanctions. In most cases, such measures/sanctions are the only ones available as part of the administrative proceedings. This is the case when there are no administrative financial penalties for breaches of legislation on industrial emissions, although administrative fines do exist for other environmental offences. In some countries, no administrative fines are available. This was the case in the UK until recently as shown above.

A distinction should be made between administrative measures and administrative sanctions, based on their objective. Typically, national legislation would provide for a range of measures that can be taken by the inspector or the supervisory authority to stop the unlawful behaviour or to remediate the damage caused to the environment or to human health. These would be classified as coercive or remedial measures. In contrast, the administrative sanctions can equate to a punishment of the unlawful behaviour. Sometimes, the same type of measures can be seen as a coercive or a punitive measure. For example, the closure of an installation may aim at preventing further damage while it can also be considered as a punishment, as it is the case in France.

These administrative measures and sanctions are seen as very effective tools to ensure compliance.

The following Table 8 provides some examples of such additional measures and sanctions in the seven selected Member States.

Table 8: Overview of administrative measures and sanctions other than fines

Measure / Country	Restricting/ Limiting the activity, including removal or permanent closure of the installation	Rectification/ imposition of corrective measures on the operator	Seizure of equipment	Publicity	Other
Denmark	Injunctions or prohibitions to prohibit continued operation and to order closure of the facility Imposing more onerous permit conditions, and revocation of permit. May include closure of installation	Issuing an "Order", requiring operator to rectify non-compliance. Injunctions and prohibitions may also be issued to restore site to original position "Self-help actions" (prescription of corrective measures, carried out at offender's expense)			Obtaining financial guarantees from the operator
France	Formal notices which suspend operations until conditions are complied with suspension of operations Closure, removal or sealing of installation	The Court can order that the work to rehabilitate the premises be carried out automatically at the expense of the condemned party			Formal notices may also include conditions requiring money to be deposited, corresponding to the clean-up work required
Germany	Suspension of operations, withdrawal of permit Closure or removal of installation where an installation has been constructed or significantly changed without a permit	Enforcement notices (to restore or remediate harm/damage, remediation notices (to remedy pollution)	Seizure of equipment by environmental inspectors (authority)		
Hungary	Limiting, suspending or prohibiting activities, withdrawal of the permit, variation of permit conditions				Requiring the operator to prepare a programme of measures, or to carry out an environmental review Require the operator to comply with the conditions set in the permit
Spain	Prohibition of activities, revocation or temporal suspension of the authorisation to operate the installation Closure of all or part of the installation	Require offender to restore the damage caused		Publication of sanctions	

The Netherlands	Restorative orders (e.g. to prevent further violation), revocation of permit Removal/demolition of illegal structures	Restorative orders may also be issued to reverse the effects of the offence Administrative coercion (to recover damages caused and to implement obligations if not performed by operator)			Reparations
UK	Enforcement notices (to bring activity under regulatory control), suspension notices (to stop offending), variation notices (to vary a permit), revocation notices (to stop offending), injunctions (to stop a criminal act) and court orders (to stop an activity)	Enforcement notices (to restore or remediate harm/damage, remediation notices (to remedy pollution)	Seizure of equipment by environmental inspectors	Environment Agency press releases	Advice and written warnings

Remedial sanctions other than fines and imprisonment are often seen by practitioners as very effective. The case studies provide two examples of the effective and dissuasive character of such sanctions. They relate to suspension of the activity in France and to administrative orders subject to financial payment in the Netherlands. The latter sanction (in Dutch: "*dwangsom*", which could be translated literally as "coercive sum") is a remedial (reparation) sanction which aims at reversing the effects of the offence. The administrative order describes the remedial action to be taken. The administrative authority shall determine the payment either as a lump sum, or as a sum payable per unit of time in which the order has not been complied with or for each violation of the order. The amounts shall be reasonably proportionate to the gravity of the interest violated and to the intended effect of the penalty. This amount is established by the competent authority. In the Province of Zeeland, internal guidelines are used in order to establish the appropriate amount of the payments. Amongst other things, the profits from non-compliance with the legal obligations are taken into account, as are the frequency of violations, the type of violation and its nature. In 2010, the order prescription was complied with ten times out of the 13 times such order was imposed on companies in the Province of Zeeland.

France: effectiveness of suspension of activity

In one of the case studies identified in France, the supervisory authority (the prefect) imposed a suspension of the activity until the operator regularised the situation. The installation was one of the main treatment centres of household waste in the Aisne Region (a French Region North of Paris). The installation was operating a section of the landfill without authorisation. Beginning of 2006, the Prefect sent a letter of formal notice to the operator with an injunction to regularise its situation. In April 2006, since the operator did not comply with the letter of formal notice, the Prefect decided, as an administrative sanction, to suspend the operation of the section until an authorisation was granted. This administrative sanction was considered very effective as the operator promptly rectified the situation to comply with the law. In this case, the sanctioning administrative procedure was less time consuming and more flexible than the criminal procedure. The criminal sanction was issued after the infringement ended.

Netherlands: effectiveness of administrative order subject to financial payment

Similarly, the imposition of an order subject to financial payment proved to be effective in an instance of non-conformity with the permit conditions in the Netherlands. An inspection revealed that the operator, an industrial waste management firm, was breaching its permit conditions as it repeatedly mixed volatile liquid substances. The provincial authority issued a first warning notifying the company that an administrative order subject to a financial payment might be issued if compliance was not restored. Follow-up inspections showed that the company was still not in compliance almost two years later. The authorities subsequently issued a notification of their intent to issue an administrative order subject to financial payment. The company replied several times and contested the findings of the inspection, but without supplying convincing arguments in the authority's view. As a result, the supervisory authority issued the order, with a financial payment set at Euros 5,000 per infringement with a maximum of Euros 50,000. The first payment was to be made one week after the decision if, at this date, the infringement had not ceased. The company ceased the infringement before this deadline had elapsed. Considering the fact that the company did not agree with the findings of the inspection, the prospect of a fine clearly dissuaded the company from further infringing the permit conditions.

Administrative measures and sanctions, as a rule, are applied in a gradual way. Dialogue with the operator and the use of warnings can be instrumental in stopping the illegal behaviour and avoiding damage to the environment or health, and this without taking further steps.

The operator's willingness to cooperate is, for example, taken into account in France when deciding upon administrative sanctions, such as the suspension of the activity. When the operator does not give any sign of willingness to comply with the warning or letter of formal notice and non-compliance can present a risk to human health and the environment, the supervisory authority is more likely to impose stringent administrative sanctions.

The England and Wales Environmental Agency has formalised such a gradual approach in its enforcement policy.

An example of gradual application of administrative sanctions: UK

The Environment Agency, in the case of minor infringements, will normally apply sanctions in a gradual way, as part of its an "outcome focused" approach to enforcement:

- *Advice and Guidance:* As an initial enforcement measure, the EA will normally provide advice and guidance after the commission of an offence or where an offence is likely to be committed, unless this would have the effect of undermining any enforcement action.
- *Warnings:* A warning or site letter may also be deemed appropriate in response to a minor breach of a condition or where an offence is suspected to have taken place.
- *Other measures:* Where issuing advice and guidance or a warning do not achieve the objective, or in more serious cases, it may be considered more proportionate to consider other measures such as an enforcement notice (to bring an activity under regulatory control).

Similarly, additional criminal sanctions are usually provided for by national legislation. The following box gives an example of those available in France. Some of these additional sanctions can represent a heavy financial burden such as the rehabilitation of the premises.

Criminal sanctions in France other than fines or imprisonment

- The ban, either permanently or for a period of five years, to exercise directly or indirectly one or more social or professional activities;
- The final closure or a suspension of the installation for a period of five years
- The exclusion from public tenders either permanently or for a period of five years;
- Penalty of confiscation
- The posting of the ruling or distribution thereof by the press or by any electronic means to the public

Complementary measures:
- The ban of the use of the facility
- The rehabilitation of the premises

Some countries have developed extensive guidelines on the use of sanctions. A good example can be found in Denmark.

An example of guidelines on application of administrative sanctions: the Danish Guidelines on Enforcement of the Environmental Protection Act

The guidelines on enforcement of the Environmental Protection Act[18] provide practical guidance to the supervisory authorities on the application of administrative sanctions, including preventive and remedial measures available to the supervisory authority to prevent that negative impact on the environment occurs as a result of future operating conditions and enforcement measures to ensure compliance with inter alia legal rules, permits and decisions. It contains some specific examples of injunctions and prohibitions which can be used as templates.

Finally, another very important point made by practitioners is that it is worth considering whether there is the possibility for the courts to confiscate the proceeds of crime. Sanctions themselves are often not enough to remove the financial benefit. The seizure of the profit is seen as an efficient tool which can considerably strengthen the deterrent effect of the sanction.

3.3. Criteria used to determine the severity of the sanctions

As shown above, the legislation itself often distinguishes between minor and serious offences. The main criteria used are whether or not the offence was intentional (or caused by gross negligence), if the offence led to an economic benefit or to damage to the environment or to human health. In Germany for example, aggravated circumstances in terms of damage to the environment are met if the offence resulted in serious and permanent pollution of a river, soil or protected areas, if it endangers the water supply or if endangered species of fauna and flora are permanently damaged. In Hungary, the amount of administrative fines should be adjusted to the severity of the environmental damage caused and the length and periodicity of the illegal conduct.

The main aggravating criteria used in both legislation and in practice can be summarised as follows.

Aggravating criteria

- Potential and/or actual harm to the environment or human health
- The 'mental element': intent or gross negligence
- Foreseeability: When circumstances leading to the offence could reasonably have been foreseen
- Lack of cooperation by the operator with the competent authorities
- Repetitive offences, length of illegal conduct
- Benefits from illegal behaviour (profits made or avoided costs)

The boxes below present examples of the consideration of such aggravating factors by the courts in Hungary and the Netherlands.

[18] It is available on the web site of the Danish EPA. http://www2.mst.dk/udgiv/publikationer/2005/87-7614-833-5/pdf/87-7614-834-3.pdf The title in Danish is " Miljøstyrelsens vejledning nr 6/2005 om vejledning om håndhævelse af miljøbeskyttelsesloven".

Hungary

In Hungary, an IPPC installation carrying out waste treatment activities not in compliance with the conditions of its integrated environmental permits was imposed a fine of approximately Euros 20,800. The fine was confirmed despites several appeals of the operator. In last instance, the Supreme Court ruled that the fine was grounded by the seriousness of the infringement, the fact that the activity caused a risk to the environment and the circumstances of the case, namely the size of the installation.

Netherlands

In the case Corus Stall B.V., the criminal chamber of the District Court of Harlem considered a fine of Euros 12,500 appropriate due to the repetitive character of multiple infringements to the permit conditions and the damage it caused to the environment and danger it presented to human health.

As shown below, the consideration of the economic benefit made out of the infraction can result in a sizeable increase of the penalty and constitute a powerful deterrent for the offender.

Taking into account the economic benefit made out of the infraction in Germany and Spain

Under German legislation, irrespective of some criteria such as the assessment of the severity of the offence, the level of guilt of the offender and his financial situation, administrative criminal fines must be higher than the economic benefit that the offender has occurred, even if it means exceeding the maximum level of fine set in legislation.

In Germany, in a case involving non-compliance of the operator of storage tanks for petroleum products to have the tanks inspected by an audit company, the district government of Cologne imposed a fine of Euros 155,000 taking into account the profit that the company had made by not carrying out the periodic inspections. This is when the North-Rhine Westphalia legislation provides for a maximum of Euros 50,000 for such offence with the possibility to increase the fine on the basis of the economic benefit drawn from the illegal conduct.

The Spanish legislation also provides such a possibility as it prescribes that when the amount of the administrative is lower than the benefit obtained from the infringement, it shall be increased at least up to twice the amount the offender has benefited.

A contrario, several factors can be considered to mitigate the penalty. These have been mainly developed through practice and case law. Some of them such as the cooperative behaviour of the operator mirror the aggravating criteria listed above.

Mitigating criteria

- Concurrent obligations on the operator, resulting from legal or administrative provisions
- Absence of imminent danger to the environment or human health

- Prompt cessation of the offence
- Cooperative behaviour of the operator
- Length of time elapsed since the offence

For instance, in Corus Stall B.V. referred to above, the criminal chamber of the District Court of Harlem reduced the final amount of the fine to Euros 10,000 considering the time elapsed between the occurrence of the offences and the prosecution. Other examples drawn from the case studies show the use of such mitigating criteria by the supervisory authorities and the courts.

Germany: elements taken into account to mitigate the fine

In contrast to the example described in the box above, in another case involving the absence of notification of a non-essential change to an installation, the project manager who failed to notify the competent authority, was sanctioned with a fine of Euros 200. This low fine was considered as proportionate, effective and dissuasive taking into account that the non-essential change was serving safety purposes, that the project manager had admitted the infringement and that the operator of the installation had taken measures to prevent further infringements.

Denmark: absence of imminent danger

A fine of Euros 1,350 was imposed for the accidental discharge of nitric acid and formic acid into a municipal drain and a near-by brook. The Danish Environment Protection Agency did not impose "self-help actions" i.e. corrective measures, which are taken at the offender's expense as there was no imminent serious danger to health and no immediate action was required to prevent the spreading of contamination or pollution.

The two French cases described below show how the use of one criterion "the cessation of the infringement" can lead to over-lenient Court's decision.

France: cessation of infringement, concurrent obligation

In a case dealing with the operation of a household waste treatment facility, an IPPC installation, without permit, the level of the fine was reduced due to the fact that the operator brought its activity in compliance with the law before the end of the criminal procedure. Another element that could have influenced the decision of the Criminal Court to impose a limited fine (Euros 10,000 when the maximum is set at Euros 75,000 by legislation) is the fact that there was an obligation to treat the incoming household waste.

However, in another case, no sanction was imposed by the Criminal Court for operating a facility without an authorisation and not complying with the supervisory authority's (the prefect) letter of formal notice on the ground that the facility was already complying with the legislation on classified installations before the end of the criminal procedure. This can be seen as an overly lenient decision in view of one of the objectives of the criminal sanction, namely to punish illegal behaviour.

Taking into account the length of time elapsed since the offence is not considered as an effective criterion. As a matter of fact, a long delay between the offence and the imposing of a sanction, especially when it involves judiciary proceedings, is often due to deficiencies in the sanctioning procedure and is not the result of a cooperative behaviour of the operator (it can even be the contrary).

Finally, two key elements in establishing seriousness can prove to be difficult to assess, which can hinder the imposition of effective, proportionate and dissuasive sanctions:

- the environmental impacts of the illegal conduct; and
- whether the illegal conduct was committed intentionally, or not.

On one hand, several practitioners emphasized that proving the intent can be more difficult for infringements to industrial emission legislation as administrative authorities often do not have a sufficient level of evidence to judge the above two factors. They have no power of arrest and it is often difficult to convince people involved to be interviewed and to admit their intent. In the UK, the question of intention is crucial in order to judge the severity of the sanctions imposed. For example, the judges would tend not to order the confiscation of benefits if there is no offence.

On the other hand, judging the intention is not always necessary. In Belgium, negligence would provide a sufficient basis for bringing cases before the court. Moreover, in the case of infringement to industrial emission legislation, illegal conduct is usually committed by the operator in the form of negligence or lack of knowledge of the legislation.

How to take into account the revenues of the offender?

Several practitioners have underlined that the size and activity of the installation and its yearly turnover, in other words, its financial capacity should be taken into account. This is primarily linked to the deterrent effect of the sanction. The same level of fine can be negligible for one operator, while substantial for another one. A very high fine may lead to the installation's bankruptcy with a risk that the damage to the environment will not be restored. Similarly, the suspension or prohibition of the installation's operation may lead to its permanent closure. One of the case studies identified in Hungary provides an example of such a risk.

Hungary

A company 'B' Plc. decided to stop its activities of manufacturing and placing on the market of chemical substances and to sublet its site to the company 'F' Ltd., which was to carry out the same activities. The company 'F' Ltd. did not have a valid permit when starting its operation, and this, despites the fact that the installation was warned several times that no IPPC activity could be carried out without an integrated environmental permit. While considering the operator's request to change the name of the installation in the integrated environmental permit that was granted to company 'B' Plc., the regional inspectorate took the decision to prohibit the operation of company 'F' Ltd.

Following the decision of the regional inspectorate the company terminated the sublet and stopped all its activities on the site. According to the regional inspectorate, the decision did not have a deterrent effect. In other words, a sanction cannot be seen as dissuasive, if as its consequence, the operator stops its economic activities on the site.

In contrast, a similar sanction imposed on a foundry producing equipment from recycled metal for rail companies proved to be effective and dissuasive. The suspension of the installation's operation was motivated by non-compliance with the permit conditions, namely exceedance of SO_2 emission limit values and treatment of hazardous waste. Following the decision of the

Inspectorate, the operator installed filtering equipment and cleaned the site from the disposed hazardous waste.

3.4. The importance of publicity

The risk of bad publicity is often mentioned as a key dissuasive element or an aspect contributing to the effectiveness of the penalty.

Denmark: risk of bad publicity seen as a deterrent factor

A fine of only Euros 1,350 was imposed for the accidental discharge of nitric acid and formic acid into a municipal drain and a near-by brook. In that case, the Danish Environment Protection Agency noted that although the fine may not have been dissuasive in itself (it corresponded to approximately 30% of the average monthly salary in Denmark), the risk of bad publicity should a criminal case be opened against the facility had a more deterrent effect than the size of the fine.

France: deterrent effect linked to publicity of a case

In one of the case study, the initiation of a criminal procedure against an installation operating without a permit had a deterrent effect on the other operators of classified installations in the neighbouring area. This is explained by the fact that the case got a lot of publicity due to the notoriety of the operator of the facility.

UK: media coverage and 'name and shame' policy

Similarly, in both case studies identified in the UK, the decision of the Court received media coverage. This was seen as a powerful means of dissuasiveness. The Environment Agency has also a "name and shame" policy. It publicises regularly on its site under the News section, in the so-called "prosecution" theme,[19] penalties imposed in instances of infringement of environmental legislation, including industrial emissions.

The need for more publicity also implies that administrative measures, such as formal records of infringements to the legislation on classified installations, should be publicised. For example, in France, the official records submitted by the inspectors to the public prosecutor are only available on request but are not published on internet or posted in a public place.

The importance of publicity has been recognised by the European Commission, which is trying to raise awareness of industrial cases and push the Member States to make inspection reports publicly available. For instance, it is a legal obligation under Article 23(6) of the Industrial Emissions Directive (2010/75/EU)[20] to make publicly available within 4 months of the site visit taking place, the report drawn by the competent authority describing the findings related to compliance of the installation with permit conditions and conclusions on whether any further action is necessary.

[19] See for example, http://www.environment-agency.gov.uk/news/default.aspx?month=2&year=2010&persona=Prosecution
[20] Directive 2010/75/EU of the European Parliament and of the Council of 24 November 2010 on industrial emissions.

In some cases, such publicity, even when combined with relatively low administrative fines, could be more effective than lengthy criminal proceedings. This is to be considered in combination with the lack of information on cases launched and closed and, similarly, on administrative sanctions in general. In this context, data-sharing among Member States should be encouraged.

4. Enforcement and sanctioning procedure

This section focuses on the different key elements of the procedure, which ultimately influence the level of penalties. It considers aspects linked to inspections and to the judicial procedure.

4.1. The inspection

The role and function of inspectors and the methods and procedures which they may employ varies between Member States. In some countries the inspection is one of the functions of the competent authorities e.g. municipalities and provinces in the Netherlands, while *VROM-inspectie*, an inter-administration supervising agency oversees the manner in which the competent authorities implement their permitting and enforcement competences. In France, administrative measures and sanctions are taken by the Prefect (the representative of the central government in the regions and departments). In case of infringement, the inspector issues a formal record, which is sent to the Prefect. The Prefect will then issue a formal notice to the operator to comply with the relevant conditions by a set deadline. If, on expiry of the deadline set for performance, the operator has not complied with the said order, the Prefect may then issue administrative sanctions.

Effective inspection is central to proper enforcement as it is a first step to identify or confirm the existence of an offence. The inspection is also responsible to talk and negotiate with the operator in the first instance.

In most Member States studied, the enforcement powers of inspectors are primarily determined by national legislation, with additional regulatory guidelines providing guidance on the way in which these powers may be implemented.

4.1.1. Frequency of inspections

The frequency of inspections is determined by legislation and/or regulatory procedure and policy. In the UK for example, legislation provides for "periodic" inspections, while the regulatory guidance establishes detailed inspection and audit procedures. Inspection and enforcement procedures may also be determined at regional/federal level, e.g. in the Netherlands where provincial authorities are responsible for deciding on their own "inspection strategies" which determine the frequency of site visits and methods of inspection, including the number of visits per year. In Spain, the frequency of inspections is determined at regional level, and in accordance with annual inspection programmes. In Germany, the federal legislation requires competent authorities of the Länder to monitor compliance of IPPC installations, with a number of Länder setting specific requirements for inspection plans to be established. A number of countries specify a minimum number of inspections in their national legislation, e.g. in Hungary, the legislation provides that administrative authorities carry out site visits on a yearly basis and for environmental audits to be carried out in order to check if the operator is complying with its legal requirements. In Denmark, an agreement between the Minister of Environment and the Local Government Association (the interest group and member authority of Danish municipalities) on minimum frequency for so-called comprehensive inspections with industrial installations sets minimum frequency of inspections, which each municipality is required to meet. In case of non-compliance, discussion and publicity are used as tools to ensure the minimum frequency is met.

Procedures in Denmark to ensure minimum frequency of inspections

If the minimum frequency for inspections is not met, the Ministry of Environment requests the municipality in question to submit in writing an explanation on how the backlog will be overcome and how the municipality will continue to ensure that minimum frequencies are observed. Municipalities which for several years in a row have not completed the minimum of inspections, is summoned to a meeting of the Environmental Protection Agency to discuss the municipality's inspection efforts. Lists of municipalities not having observed the minimum frequency for inspections are available on internet.[21]

In a number of Member States studied, the frequency of inspections is also formally determined by way of on-going assessment and operator performance, with some Member States having specific assessment systems and procedures in place. In Germany, for example, inspections carried out by the competent authorities of the Länder are complemented by self-inspection requirements of the operators and by inspections carried out by private audit companies. The UK also has a self-assessment and scoring system which is used to help determine the frequency of inspections. In the Netherlands, most inspection strategies ensure that on-going perpetrators who commit infringements more than once can expect more visits from the inspecting authorities.

4.1.2. Rights and obligations of the inspectors

In the majority of seven Member States studied, inspections may be carried without notice when it is deemed reasonable to do so, for example on receiving a complaint or where an infringement has occurred or is believed to have occurred. For example, in Denmark, prior notification including information such as the purpose of inspection and the visit time and place is only required if the inspection involves access to buildings or documents. However, it is considered best practice (and in the interests of maintaining good dialogue with businesses) to provide prior notification, unless such notification would be deemed detrimental for the purposes of the inspection. In the UK, regulatory officers responsible for inspecting facilities may carry out such examination and investigations "as may be necessary" under the general environmental law. Such powers must normally be exercised under and in accordance with a written authorisation, except in an emergency where such notice is not required. In Hungary, regional inspectorates may enter an installation without the agreement of the operator where immediate actions are required. However such action may require the approval of the public prosecutor, or the attendance of a police official and witness, unless such approval would cause significant delays.

A number of Member States studied specifically allow for unannounced inspections. In Germany, the laws and regulations in some Länder require a certain number of announced and unannounced inspections. In Spain specific legal requirements for inspectors differ between regions. For example, in Andalucía, inspectors are authorised to access facilities, if necessary without a licence. In Cataluña, inspections can take place at any time, without prior notice.

During inspections, most of the selected Member States, including Germany, UK, Hungary and France, grant inspectors the power to inspect installations and premises, to audit and take copies of operational documents, to request information, and to take samples, measurements, recordings and photographs for the purposes of evidence gathering and investigation. In a number of Member States studied, including the UK and Germany, inspectors may also seize and render harmless items which

[21] http://www.mst.dk/Virksomhed_og_myndighed/Industri/miljoetilsyn_brugerbetaling/kommunernes_tilsyn/Kommunernes_indsats/

cause imminent danger of serious pollution or serious harm to health; however it is the regulators who are responsible for serving specific administrative sanctions. In Denmark, however, inspectors also have the power to serve an order to rectify non-compliance, to send a notice of injunction or prohibition or to prescribe corrective measures.

By contrast, inspectors in France and Spain may only initiate administrative or criminal procedures. They are not empowered to take administrative sanctions.

The Table 9 includes inspectors' rights and obligations as they are typically set in national legislation.

Table 9: Rights and obligations of inspectors

Rights	Obligations
1. Entry and access to installations, with prior notice 2. Entry and access to installations without prior notice (in case of emergency) 3. Access to and inspection of operational documents 4. Monitor/examine the working processes 5. Request relevant information (e.g. to clarify facts) 6. Record images and sounds 7. Take samples e.g. emissions/pollutants 8. Install monitoring equipment or devices 9. Seizure of equipment 10. Take preventative measures e.g. suspension of operations	1. preparing a report of proceedings to prosecution authorities 2. returning documents and physical evidences to the operator/persons concerned or submitting them to the competent authorities 3. confidentiality 4. prior notification for planned inspections (in respect of access to buildings or documents) to encourage good dialogue with operators

Finally, the European Commission is striving to harmonise national practices with regard to inspections. The Industrial Emissions Directive includes a provision specifically dedicated to environmental inspections, which sets up minimum requirements, applicable to all Member States from January 2013. In particular, it sets the obligations of the operator to assist the inspection. It also requires the establishment and minimum content of environmental inspection plans, programmes for routine site visits, periodicity of inspection and criteria for the environmental risks of the installations. Finally, it sets post-visit reporting obligations.

Article 23
Environmental inspections

1. Member States shall set up a system of environmental inspections of installations addressing the examination of the full range of relevant environmental effects from the installations concerned.
Member States shall ensure that operators afford the competent authorities all necessary assistance to enable those authorities to carry out any site visits, to take samples and to gather any information necessary for the performance of their duties for the purposes of this Directive.
2. Member States shall ensure that all installations are covered by an environmental inspection plan at national, regional or local level and shall ensure that this plan is regularly reviewed and, where appropriate, updated.
3. Each environmental inspection plan shall include the following:
(a) a general assessment of relevant significant environmental issues;
(b) the geographical area covered by the inspection plan;

(c) a register of the installations covered by the plan;
(d) procedures for drawing up programmes for routine environmental inspections pursuant to paragraph 4;
(e) procedures for non-routine environmental inspections pursuant to paragraph 5;
(f) where necessary, provisions on the cooperation between different inspection authorities.
4. Based on the inspection plans, the competent authority shall regularly draw up programmes for routine environmental inspections, including the frequency of site visits for different types of installations.
The period between two site visits shall be based on a systematic appraisal of the environmental risks of the installations concerned and shall not exceed 1 year for installations posing the highest risks and 3 years for installations posing the lowest risks.
If an inspection has identified an important case of non-compliance with the permit conditions, an additional site visit shall be carried out within 6 months of that inspection.
The systematic appraisal of the environmental risks shall be based on at least the following criteria:
(a) the potential and actual impacts of the installations concerned on human health and the environment taking into account the levels and types of emissions, the sensitivity of the local environment and the risk of accidents;
(b) the record of compliance with permit conditions;
(c) the participation of the operator in the Union eco-management and audit scheme (EMAS), pursuant to Regulation (EC) No 1221/2009.
The Commission may adopt guidance on the criteria for the appraisal of environmental risks.
5. Non-routine environmental inspections shall be carried out to investigate serious environmental complaints, serious environmental accidents, incidents and occurrences of non-compliance as soon as possible and, where appropriate, before the granting, reconsideration or update of a permit.
6. Following each site visit, the competent authority shall prepare a report describing the relevant findings regarding compliance of the installation with the permit conditions and conclusions on whether any further action is necessary.
The report shall be notified to the operator concerned within 2 months of the site visit taking place. The report shall be made publicly available by the competent authority in accordance with Directive 2003/4/EC of the European Parliament and of the Council of 28 January 2003 on public access to environmental information within 4 months of the site visit taking place.
Without prejudice to Article 8(2), the competent authority shall ensure that the operator takes all the necessary actions identified in the report within a reasonable period.

4.2. The national judicial systems

4.2.1. The different actors of the procedure

The presence of numerous actors, some of which are not especially trained in environmental matters, may be an obstacle to efficient enforcement of legislation on industrial emissions. As one judge stated "enforcement is a chain as strong as its smallest element".

In many Member States, prosecutors and judges are not specialised. In Belgium, the environmental criminal cases reaching the prosecutor's office are an outspoken minority of all detected infringements, and the majority of those are brought by prosecutors without specialised knowledge of environmental law. It should be noted that in Belgium, the prosecutor is the primary actor in conducting cases. Similarly in Austria, most cases are brought to the prosecutor by a non-specialised expert. In addition, local officers in the field are not specialised. In Belgium, the lack of skills of the local police is an issue as it partly results in the high rate of dismissal of cases for technical reasons.

The need for greening the judicial network and improving cooperation is widely recognised e.g. the 9th conference of the International Network for Environmental Compliance and Enforcement focused on "Enforcement Cooperation: Strengthening Environmental Governance".[22]

The lack of cooperation and information exchange is a serious obstacle to enforcement and the importance of such cooperation should not be underestimated. For example, with regard to the participation of inspectors and prosecutors in criminal procedures, in Austria it depends on the particular offence and criminal procedure in each case. Different competent authorities take the lead but there is a lack of information exchange between the different authorities. It is up to the authorities/the public prosecutor to develop the case and to go back to the inspectors if necessary. In the Netherlands, the manner in which the authorities responsible for criminal and for administrative enforcement need to coordinate their respective actions within their competences has not been regulated. In practice, the coordination between the Public Prosecutor's Office and Administrative authorities is considered as needing improvement. In the Province of Zeeland, despite a longstanding discussion on the need for structural coordination, ad hoc coordination remains the manner in which in individual cases issues of administrative and/or penal measures with regard to a company are dealt with. In the Province of Groningen, regular coordination meetings do take place between the Public Prosecutors Office and the administration

Where both the inspection and the enforcement body are combined in one organisation as is the case for the England and Wales Environment Agency in the UK, it can provide a very effective partnership between inspectors (who often act as witnesses) and prosecutors who bring the case.

Some stakeholders advocate the establishment of specialised legal structure, i.e. environmental courts and specialist prosecutors, along with environmental police and inspection.

There is currently a tendency within Member States towards gradual specialisation. Below are introduced some examples of specialisation.

Specialised Units of Environmental Prosecutors and Police

In Spain, the establishment of a Special Office of Environmental Prosecutors has resulted in an increase in the number of convictions for environmental offences. Similarly, since 1989, a specialised police unit, the Nature Protection Service *(Servicio de Protección de la Naturaleza*), is tasked with investigating directly or coordinating other police forces on environmental investigations. The Netherlands have also set a special official office for public prosecutors specialised in environment, the *"Functioneel Parket"*. In both countries, the central office is located in the capital city and coordinates environmental prosecutors operating at the regional or local level.

In Hungary, it is planned to set up a department within the Prosecution Office of the Prosecutor General dealing exclusively with environment related offences.

At the European level, two networks already exist:

- The European Union Network for the Implementation and Enforcement of Environmental Law, which groups environmental authorities (IMPEL). One of IMPEL cluster of activities

[22] INECE 9th International Conference, *Enforcement Cooperation: Strengthening Environmental Governance*, June 2011, Canada (http://inece.org/conference/9/)

focuses on permitting, inspection and enforcement looking at practical and technical aspects as these relate to capacity building, improving methodologies and development of good practices

- The European Union Forum of Judges for the Environment (EUFJE) created in 2004 aims at promote the enforcement of national, European and international environmental law through exchange of knowledge and experience, as well as training in environmental law.

The idea to set up a similar European network of environmental prosecutors is being widely promoted. For example, a seminar on "Investigation, prosecution and judgment of environmental offences", organised by the Belgium's Judicial Training Institute in May 2011 generated a strong support in favour of the establishment of such a European initiative for cooperation between public prosecutors on the criminal prosecution of environmental offences.

4.2.2. The criminal proceedings

Criminal procedures vary between Member States, but most such procedures are characterised by complex and lengthy proceedings. In most cases this will involve an initial investigation procedure which allows for evidence to be gathered and a case to be put together. Some Member States (e.g. UK) apply strict evidential and public interest tests before a prosecution can be brought, often at considerable time and cost to the authorities.

Delays in the process may also be due to the complex and time consuming nature of investigations (e.g. in France the first judgement can take place four or five years after the infringement). The investigation phase itself is often subject to an appeal procedure, which varies in complexity and time between Member States. In some Member States, time limits on certain stages of the procedure aim to speed up the process e.g. in Hungary, the initial investigation must be concluded within two months, during which time the prosecutor or investigating authority may collect data and interview the operator.

Some Member States put in place simplified procedures, which allow shortening the procedure, while still ensuring that the operator is subject to a punitive sanction. For instance, in Flanders, the prosecutor has the discretionary power to propose and make settlements, which are considered as a very powerful instrument and the percentage of cases resulting in settlement has recently increased from around 13% to 17%. The following boxes present three examples:

- the fast-track procedure instituted by Spain;
- the transaction procedure in the Netherlands; and
- the newly introduced plead-guilty procedure in France.

Fast-track procedure in Spain

The Law on criminal procedure set a fast-track criminal investigation and prosecution for offences punishable by imprisonment not exceeding five years, or with any other sanction, not exceeding ten years, whatever its pecuniary amount, provided, that criminal proceedings are initiated under a police report and the judicial police has arrested a person and made him/her available to the Police Court *(Juzgado de Guardia)*.

The environmental criminal sanctions enshrined in the Criminal Code do not exceed five years of imprisonment. Therefore this fast-track procedure can apply to those who have committed environmental criminal offences under Chapter IV of the Criminal Code. This requires, however, a policy report and the arrest of the alleged person that committed the environmental offence. This fast track procedure was designed for "*in flagrante delicto*" criminal offences and

it is less likely to apply for environmental crimes relate to the infringement of the IPPC requirement because of the difficulty to prove them.

Transaction procedure in the Netherlands

In the Netherlands, the Public Prosecutor's Office can offer a transaction to offenders, by which the payment of a fine is meant, in "simple" minor cases. The transaction serves as a penalty and avoids the need to go to court. In practice, this offer is often accepted, meaning that only a minority of cases in which the Public Prosecutor is involved actually reach the courts. If a company does not agree with the penalty and refuses the transaction, the case may be brought to the criminal court in first instance.

Plead-guilty procedure in France

The French legislator established in 2004 a "plead guilty" procedure which is applicable to persons who have committed a crime punishable by a fine or imprisonment for a time period not exceeding five years. The sanctions for the infringement of classified installations fall within the scope of this procedure (e.g. to operate a facility without authorisation can lead for individuals to a fine of up to Euros 75,000 and/or one year imprisonment).

Under this procedure the Public Prosecutor can directly propose without trial one or several penalties to a person (including legal persons) that admits the facts and the infringements. The imprisonment penalty proposed by the Public Prosecutor cannot be superior to one year and cannot exceed half of the time period of the one prescribed by law. S/he can also propose a suspension of enforcement. If the offender agrees on the proposal of the Public Prosecutor, this proposal shall be homologated by the President of the Tribunal the same day the proposal was issued. This homologation has the same effect than a judgement. Overall this procedure is much faster than the normal criminal procedure.

4.2.3. Public Access to Justice

Civil society, apart from its role in initiating enforcement procedures through complaints, plays a significant role in enforcement through litigation. The IPPC Directive itself through amendments introduced by Directive 2003/35/EC provides for access to justice to challenge the substantive or procedural legality of decisions, acts or omissions subject to the public participation provisions of the Directive. However, while some Member States are granting a broad access to justice, others have a more limited approach.

Several procedural aspects are central to an effective access to justice allowing the public, including NGOs, to play their role as a watchdog to support enforcement. In particular, the Member States should ensure that:

- Legal standing for NGOs is not restricted e.g. through strict criteria or strictly interpreting the concept of interest
- It is possible to obtain interim relief and interim measures

- The cost of the procedure should not be an obstacle to public access to justice. These can be considerable if the fees are high and the 'loser pays it all' principle applies. Good practices include effective mechanisms to ensure legal aid.

Recent decisions of the Court of Justice of the European Union should be taken into account when considering possible improvements in public access to justice. These relate to the requirement to ensure *locus standi* for NGOs and to avoid excessive costs of proceedings.

Court of Justice of the European Union's Decisions promoting public access to justice

In Germany, neither individuals nor non-governmental organisations are entitled to join the administrative criminal or the criminal procedure. Neighbours are entitled to challenge a permit for an IPPC installation if this installation violates their property rights or health. The Court of Justice of the European Union decided with judgement of 12 May 2011[23] that the national legislation regulating the standing of non-governmental organisations in court procedures infringes Directive 2003/35/EC and that, as a minimum, non-governmental organisations must have standing to enforce all national provisions based on European environmental legislation.

In another case, the Court has also ruled that national legislation should ensure that the cost of proceedings must not be prohibitively expensive.[24] The Court upheld that this rule covers only the costs arising from participation in such procedures and does not prevent the courts from making an order for costs provided that the amount of those costs complies with that requirement. The Court added that "*although it is common ground that the Irish courts may decline to order an unsuccessful party to pay the costs and can, in addition, order expenditure incurred by the unsuccessful party to be borne by the other party, that is merely a discretionary practice on the part of the courts"*. The Court concluded that a mere practice was not sufficient, recalling that *"the provisions of a directive must be implemented with unquestionable binding force and with the specificity, precision and clarity required in order to satisfy the need for legal certainty, which requires that, in the case of a directive intended to confer rights on individuals, the persons concerned must be enabled to ascertain the full extent of their rights*".

In the same case, the Court also recalled that "*the mere availability, through publications or on the internet, of rules concerning access to administrative and judicial review procedures and the possibility of access to court decisions cannot be regarded as ensuring, in a sufficiently clear and precise manner, that the public concerned is in a position to be aware of its rights on access to justice in environmental matters.*" It concluded that information on the rights offered to the public should be set in specific statutory or regulatory provision.

An example of broad access to justice can be found in Spain with the so-called "*acción popular*" procedure in case of criminal proceedings.

The "popular action" in Spain

In Spain, any person, whether or not offended by a criminal offence can lodge a complaint to the Judge of the Magistrate Court, the so called 'popular action' *(acción popular)*[25]. The Jurisprudence of the Supreme Tribunal *(Tribunal Supremo)* has interpreted these provisions in a

[23] C-115/09, Trianel Kohlekraftwerk Lünen, judgment of 12 May 2011
[24] C-427/07, Commission v. Ireland, judgement of 16 July 2009
[25] Law of criminal procedure *(Ley de Enjuiciamento Penal)*

way that not only natural persons can lodge this popular action but also legal persons, public institutions and organisms[26].

In other words environmental NGOs are entitled to lodge a complaint to the judge of the Magistrate Court when they consider that an environmental criminal offence was committed.

In contrast, under the administrative procedure, the *locus standi* of NGOs is rather limited. Sanctions can be appealed before the administration itself and then to the Administrative Courts. The overall procedure is quite long and thus may lack of effectiveness (e.g. administrative court proceedings can last two or three years after the action was lodged). Environmental NGOs can challenge administrative sanctions (or their omissions) but they have to fulfil very strict criteria which limit their role in the procedure.

5. National guidance documents

We have already identified throughout the report different guidelines and guidance documents that have been developed by the seven selected Member States to support the different actors of the sanctioning procedure. It can be particularly useful to identify and disseminate principles and criteria, which could support the main actors involved in enforcement and sanctioning. For example, with regard to determining the level of sanctions, these can include the definition of aggravating and mitigating factors to assess the seriousness of the offence, such as defendant's cooperation with the authorities, responsiveness to prior warnings or persistence of the offence, previous convictions for likely offences, the existence of a financial gain for the offender, etc. The following box recalls the key examples which have been identified in the seven countries studied.

Annex I - Detailed review of sanctions and procedures applicable to breaches of the legislation on industrial emissions in seven selected countries

Table of content

Annex I- Denmark

Sanctions and procedures applicable to breaches of the legislation on industrial emissions in Denmark

Executive Summary

In the Danish legal system environmental acts are adopted by the Parliament and are supplemented by implementing ministerial orders. The Environmental Protection Act (EPA) is together with the Approval Order the main transposing legislation for Directive 2008/1/EC (IPPC Directive). The Environmental Protection contains the relevant offences and penalties. It is also the legal basis for the Ministerial Order transposing the more technical requirements of the Directive.

The Danish procedures applicable in case of breach of the IPPC Directive are set out in the Environmental Protection Act Chapters 5, 9 and 10 (the administrative procedures, e.g. injunctions and prohibitions – including closure to ensure compliance with legal rules, permits and decisions) and Chapter 13 (the criminal procedures). The criminal penalties include imprisonment and additional corporate fines in some circumstances. Some Ministerial Orders also contain provisions on criminal sanctions. These provisions specifically define which infringements of the requirements of the Act or Regulation shall lead to a criminal penalty. Those obligations that are enforced by Chapter 13 are listed in detail. Section 110(1) of the Environmental Protection Act[27] lists nineteen specific offences referring to specific provisions of this Act.

The table below indicates briefly which of the enforceable provisions of the IPPC Directive are covered by penalties in Denmark. The category of administrative (quasi) criminal sanctions does not exist in Denmark, thus this column is left blank in the table below.

Table 1: Enforceable provisions covered by penalties in Denmark

Article	Administrative measures and sanctions	Criminal sanctions	Administrative (quasi) criminal sanctions
IPPC Directive			
Catch-all	EPA Section 68-70[28] EPA Section 70a-72[29] EPA Section 34(3)[30] EPA Section 41c[31] EPA Section 41- 41d[32]	EPA Section 110(1) –(11) Criminal Code Section 196	
4	-	EPA Section 110(1)(6)	
5	-	EPA Section 110(1)(4) and (8)	
6	-	EPA Section 110(1)(8) and Approval Order Section 22(1)(2) and 22(2)-(3)	
12 (1)	-	EPA Section 110(1)(8) and Approval Order Section 22(1)(2) and 22(2)-(3)	
12 (2)	-	EPA Section 110(1)(6)	
14 (a)	-	EPA Section 110(1)(4)	

[27] The main Danish legal framework related to the environment.
[28] On injunctions and prohibitions (including closure to ensure compliance with legal rules, permits and decisions) as well as on the power to prescribe corrective measures, which are taken at the offender's expense.
[29] On the power to prescribe provision of information and sampling and own control including at the operator's expense.
[30] On refusing an environmental approval and grant special conditions.
[31] On recalling a permit or amend conditions
[32] On amending the permit/conditions through injunctions and prohibitions – including closure of installation in case of significant pollution, risk thereof including failure to ensure BAT.

14 (b)	-	EPA Section 110(1)(4) and 110(1)(7)	
14 (c)	-	EPA Section 110(1)(4) and 110(1)(7)	

Permitting and control functions, including inspections are primarily exercised by the municipalities. However the decentralised units of the Environmental Protection Agency (EPA) of which there are three (EPA Aarhus, Odense and Roskilde),[33] are permitting and supervisory authority for many of the larger and/or most polluting installations, approximately 260 installations. Several guidelines on enforcement and inspections and checklist for inspectors have been prepared.

It is noted that the related Danish legal provisions apply to both natural and legal persons alike. The difference is, however, that further financial penalties may additionally apply to businesses.

The way in which the administrative and criminal sanctions are applied and the factors which regulators must take into account when deciding whether or not to prosecute is determined by various guidance documents, including Environment Agency's guidelines on enforcement of the Environmental Protection Act and the Instructions from the Director of public prosecutions concerning judicial procedures for environmental infringement.

Examples of jurisprudence on the size of fines for e.g. failure to comply with the conditions set in the permit or mandatory emission limit values: The Supreme Court[34] fined a company taking over a chemical installation under bankruptcy DKK 800,000 (about Euros 120,000) and 40 days imprisonment for its Director combined with a fine of DKK 300,000 (about Euros 40,000) for failure to comply with the conditions set in the permit following several injunctions on disposal of chemical waste. Another example is a ruling by the Eastern High Court[35] where a County was fined DKK 500,000 (about Euros 65,000) for failure to comply with the mandatory emission limit values for a waste incineration plant and seizure of the saved amount of DKK 4 millions (about Euros 350,000).

The Danish legislation provides for the use of both administrative enforcement measures and criminal sanctions in conjunction. Regulatory guidance advises the use of either and/or both where it is considered proportionate under the circumstances. Interviews with experts at the Danish Environmental Protection Agency, case law and the case studies reviewed suggest that whilst the range of administrative and criminal sanctions available as a rule are sufficient to ensure that effective and dissuasive penalties can be imposed in case of infringement of IPPC requirements, their application may be enhanced in some cases.

[33] The decentralised units of the EPA were until 31 December 2010 called Environment Centres. The organisational change, which took effect the 1 January 2011, did not entail any changes with regard to competences for permitting and enforcement.
[34] Supreme Court ruling as reported in U2001.2045H.
[35] As reported in MAD 2000 334Ø.

1. Applicable sanctions

The Danish procedures applicable in case of breach of the IPPC Directive are set out in the Environmental Protection Act Chapters 5 and 9 (the administrative procedures) and Chapter 13 (the criminal procedures).

The Environmental Protection Act provides for two types of ***administrative procedures***:

1) Preventive and remedial measures, e.g. the administrative sanctions that the supervisory authority has at its disposal to prevent that negative impact on the environment occurs as a result of future operating conditions. Such measures relates to the possibility of refusing an environmental approval and granting special conditions where the responsible persons have lost their so-called 'environmental responsibility' pursuant to Section 40a – e.g. physical or legal persons convicted pursuant to the Criminal Act Section 196, the Environmental protection Act Section 110(2) or similar provisions issued pursuant to this Act as well as Environmental Protection Act Section 41 – 41d the power to issue injunctions and prohibitions – including closure of the installation in case of significant pollution and risk thereof, including failure to ensure BAT. All these measures apply only when the operators have lost their environmental responsibility.

2) Enforcement measures to ensure compliance with inter alia legal rules, permits and decisions. The Environmental Protection Act gives to the competent authority the power to serve orders, injunctions and prohibitions, to ensure compliance with legal rules, permits and decisions (EPA Section 65 – 73, in particular Section 68 – 69). It may also prescribe corrective measures, which are taken at the offender's expense. The competent authority shall report certain infringements to the public prosecution authorities.

   The main enforcement measure to ensure compliance is an 'order'[36] by which an installation is required to rectify an instance of non-compliance, e.g. comply with permit requirements and permit conditions, inculcate environmental compliance of a previously notified condition and/or decision. The competent authority shall also at the same time notify that the instance(s) of non-compliance will be reported to the police/ public prosecutor if it is not rectified. The order may be supplemented by: 'injunctions or prohibitions', e.g. to restore the original situation or prohibit continued operation and, where required, order the closure of the facility and/or so-called 'self-help actions': prescription of corrective measures, which are taken at the offender's expense. The competent authority shall also in certain instances report the infringements to the public prosecution authorities. The administrative procedure is initiated once an infringement is identified as described below in Section 2.

Chapter 13 of the Environmental Protection Act sets ***criminal penalties*** that include imprisonment and additional corporate fines in some circumstances. Some Ministerial Orders also contain provisions on criminal sanctions. These provisions specifically define which infringements of the requirements of the Act or Regulation shall lead to a criminal penalty. Those obligations that are enforced by Chapter 13 are listed in detail. Section 110(1) of the Environmental Protection Act[37] lists nineteen specific offences referring to particular provisions of this Act.

The Environmental Protection Act provides for the principle of proportionality with regard to administrative enforcement measures, which should not be more intrusive than necessary in individual cases and take into account the circumstances of each particular situation e.g. the risk and type of negative impact on the environment.

[36] In Danish the term is 'indskærpelse'.
[37] Main Danish legal framework related to the environment.

Offences are often divided between 'offences' and 'serious offences'. For instance serious offences are characterised when an offender acted deliberately or by gross negligence if the infringement resulted in damage to the environment or risk of damage or achieved or intended economic advantages.

The Criminal Code also sets up offences and corresponding penalties and sanctions. The provisions of the Criminal Code have precedence if the sanctions it lays down are equal or more severe than those established by the Environmental Code.

It is noted that the related Danish legal provisions apply to both natural and legal persons alike. The difference is, however, that further financial penalties may additionally apply to businesses.

Table 2 below indicates the types of offences and related administrative and criminal penalties in Denmark for each of the key enforceable obligations under the IPPC Directive.

Table 2: Directive 2008/1/EC (IPPC Directive): types of offences and related administrative and criminal penalties in Denmark

	Administrative		Criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to apply for a permit for new or existing installations	No new installation (listed in the Regulation issued pursuant to Section 35 – Annex I of the IPPC Directive) may be operated without a permit issued in accordance with this Act. Installations must not be extended or changed structurally or operationally before extension or change is approved. ***Environmental protection Act Section 33 and Approval Order Section 2***	Orders, injunctions and prohibitions. ***Environmental protection Act Section 69***	Establish, commence or operate an installation without a permit from the relevant authority. ***Environmental protection Act Section 110(1)(6)*** <u>Serious offence</u> It is a serious criminal offence where done intentionally or through gross negligence and if the violation is harmful for the environment or provides economic advantage to the operator. ***Chapter 13 Section 110(6) of the Environmental Protection Act read in conjunction with Chapter 13 Section 110 paragraph (2) of this Act***	The fines are determined by the Courts as part of the criminal case and the Acts do not set any maximum amount or range. Recommended minimum fines 50,000 (approximately Euros 2,700). Seizure of the net profit. Examples: Ruling by the Eastern High Court (ØLD 1991-11-16) a company fined DKK 300,000 (Euros 4,500) for disposal of 21 tons of soil containing heavy metals without the mandatory permit. Seizure of DKK 1,2 million (Euros 161,000). <u>Serious offence</u> Imprisonment up to two years. (This underlines the legislator's desire for severe penalties for environmental offences, including a significant increase of the fines.) <u>Legal persons</u> The Danish penalties provisions apply to both natural and legal persons alike. Pursuant to the Environmental Protection Act Section 110 (4), legal persons may be imposed sanctions pursuant to the fifth Chapter of the Criminal Act. Furthermore the Criminal Code provides for imprisonment of up to 6 years for the violations of the environment legislation under aggravating circumstances.

	Administrative		Criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to supply information for application for permits	Failure to supply information for application for permits. ***Environmental Protection Act Section 35, paragraph 2, Section 39 and the Approval Order Section 7***	Refusal of granting a permit. It basically rests with the applicant on his own initiative to provide the approving authority with the necessary information. In case of failure to do so, the authority may specify what additional information must be provided and set a deadline. In case of repeated failure to submit the requested information, the procedural detrimental effect occurs, namely that the approving authority must consider the application as annulled. For existing installations which are required to obtain a permit pursuant to § 39, the information may be sought through an injunction issued pursuant to Section 72. According to Section 39, paragraph. 2, the approving authority can, if necessary, prohibit the continued use of unapproved parts of the company if the installation fails to meet the statutory deadlines for submission of information. Examples of administrative practice have been published in MAD (Environmental Rulings and jurisprudence) e.g. MAD 2000/1073 in which a permit of an existing company was lifted by the Environmental Protection Agency and the matter remitted for reconsideration, since no measurements for assessment of its noise ratio had been submitted. Another example is MAD 2009/349 in which the Environmental Board of Appeal refused an application as it did not contain the information required for in the Approval Order (Annex 5).	Failure to apply for a permit in accordance with Rules issued pursuant to Section 7 of this Act or failure to apply including supply information for application for permits pursuant to Section 39 of this Act. ***Environmental protection Act Section 110(1)(8)) and Approval Order Section 22(1)(2)***	Ibid for the types of penalties. It has not been possible to find any jurisprudence on the size of the fines for failure to supply information for application of permits.

	Administrative		Criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to notify the competent authority of any changes in the operation of an installation	Failure to notify the competent authority of any changes in the operation of an installation. Installations must not be extended or changed structurally or operationally before extension or change is approved. ***Environmental protection Act Section 33 and Approval Order Section 2***	Order, injunctions and prohibitions. ***Environmental protection Act Section 69***	The installation is extended/ changed structurally or operationally in a way that increases pollution without approval of the relevant competent authority. This is a serious criminal offence where done intentionally or through gross negligence and if the violation is harmful for the environment or provides economic advantage to the operator. ***Chapter 13 Section 110(6) of the Environmental Protection Act read in conjunction with Chapter 13 Section 110 paragraph (2) of this Act***	Ibid. Recommended level of fines for failure to notify the competent authority of any changes in the operation of an installation, a fine of at least DKK 10,000 (approximately Euros 1,350) is recommended. For the second time there is a violation of Section 110 paragraph 1, there should generally be a doubling of the indicative level of fines. No recent examples of jurisprudence on the size of fines for this type of offences. The jurisprudence does not reflect the more severe fines for violations of the IPPC requirements since 2008.

	Administrative		Criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to comply with the conditions set in the permit or mandatory ELV's	Failure to comply with the conditions set in the permit or mandatory ELV's. ***Environmental protection Act Section 34 and Approval Order Section 14***	Order, injunctions and prohibitions. ***Environmental protection Act Section 69***	Failure to comply with injunction or prohibition issued pursuant to this Act. ***Environmental Protection Act Section 110(1)(2)*** Failure to comply with the condition of a permit or conditions laid down pursuant to this Act or to rules issued in pursuance thereof. ***Environmental Protection Act Section 110(1)(4)***	Ibid. Recommended level of fines for failure to comply with or to contravene an environmental permit, a fine of at least DKK 10,000 (approximately Euros 1,350) is recommended. For the second time there is a violation of Section 110 paragraph 1, there should generally be a doubling of the indicative level of fines. Examples of jurisprudence on the size of fines: Supreme Court ruling U2001.2045H according to which a company taking over a chemical installation under bankruptcy was fined DKK 800,000 (approximately Euros 120,000) and 40 days of imprisonment for its Director combined with a fine of DKK 300,000 (approximately Euros 40,000) for failure to comply with the conditions set in the permit following several injunctions on disposal of chemical waste. Another example is a ruling by the Eastern High Court where a County was fined DKK 500,000 (approximately Euros 65,000) for failure to comply with the mandatory ELV's for a waste incineration plant and seizure of the saved amount of DKK 4 million (approximately Euros 350,000).

2. Administrative procedure

2.1 General elements on the legal tradition and potential evolution

In 1997 new legislation was introduced with a view to improve enforcement of environmental legislation (the so-called enforcement package). The legislation is intended both to prevent against repeated violations and to provide for more severe sanctions for violations of environment law.

As indicated above, the Environmental Protection Act provides for two types of administrative procedures:

1) Preventive and remedial measures, e.g. the administrative sanctions that the supervisory authority has at its disposal to prevent that negative impact on the environment occurs as a result of future operating conditions. It concerns:

- In case of a new permit, the possibility of refusing an environmental approval and grant special conditions (requiring a financial guarantee) pursuant to EPA Section 34(3), in circumstances where the responsible persons have lost their so-called environmental responsibility pursuant to Section 40a. EPA Section 40a contains an exhaustive list of circumstances when a person or company may lose its environmental responsibility. It includes situations where the person has lost the right to operate the polluting company, or the individual or the corporation is convicted of more serious environmental crimes or failed to pay a major debt to the Authority under so-called self-help action (corrective measures, which are taken at the offender's expense) – e.g. physical or legal persons convicted pursuant to the Criminal Act Section 196, the Environmental protection Act Section 110(2) or similar provisions issued pursuant to this Act. In accordance with Section 40b of the EPA, the Environmental Protection Agency established an Environmental Responsibility Register in which the supervisory authority can access information on whether individuals or corporations have lost their environmental responsibility.
- In case of an existing permit, the possibility of imposing more stringent permit conditions by requiring a financial guarantee or completely revoke an environmental permit pursuant to EPA Sections 41d and 39a. The supervisory authority may in order to prevent repeated violations of environmental legislation (same types or same company or group of persons), use the fact that a company or a person has lost its environmental responsibility to impose more stringent permit conditions or completely revoke an environmental permit.
- The power to issue injunctions and prohibitions – including closure of installation in case of significant pollution and risk thereof, including failure to ensure BAT (EPA Section 41 – 41c). It should be noted that Section 41 to 41d does not apply in case on non-compliance.

2) Enforcement measures to ensure compliance with inter alia legal rules, permits and decisions.
The Environmental Protection Act gives to the competent authority the power to serve orders, injunctions and prohibitions, to ensure compliance with legal rules, permits and decisions (EPA Section 65 – 73, in particular Section 68 – 70). It may also prescribe corrective measures, which are taken at the offender's expense. The competent authority shall also in certain instances report the infringements to the public prosecution authorities.

No administrative fines are provided for.

2.2 Inspections

2.2.1 General information

Permitting and control functions, including inspections are primarily exercised by the municipalities. However the decentralised units of the Environmental Protection Agency (EPA) of which there are three (EPA Aarhus, Odense and Roskilde), [38] are permitting and supervisory authority for many of the larger and/or most polluting installations, approximately 260 installations e.g. those marked with an 's' in Annex I to the Approval Order. For example combustion installations with a rated thermal input exceeding 50 MW, chemical installations for the production of basic organic and inorganic chemicals, industrial plants for the production of paper and card board with a production exceeding 20 tonnes per day and slaughterhouse with a carcase production capacity greater than 50 tonnes per day.

Pursuant to the Environmental Protection Act Section 65 and 66, the supervisory authority (the municipalities or the decentralised EPA units) shall exercise a function of general supervision to ensure that the Environmental Protection Act and the rules laid down by this Act are complied with. To this end the supervisory authority shall assess whether current conditions and permits are sufficient under the applicable law and to assess whether there is a need to prescribe new conditions or to revise existing ones.

The supervisory authority shall also ensure that injunctions and prohibitions are met and that conditions laid down in the permits are observed. Pursuant to the Environmental Protection Act Section 68 the supervisory authority must ensure that instances of non-compliance are brought in compliance unless the instance is of secondary importance, i.e. trifle offence. The administrative sanctions are set out in Section 69 (orders, injunctions and prohibitions – including closure to ensure compliance with legal rules, permits and decisions as well as power to prescribe corrective measures, which are taken at the offender's expense).

Minimum frequency for so-called comprehensive inspections of industrial installations has been set by an agreement from July 2005 between the Minister for the Environment and the Local Government Association (the interest group and member authority of Danish municipalities) with effect from 1st January 2005. It replaces an agreement from 1996. Comprehensive inspection is understood as a review of all environmental consideration of an installation or enterprise. According to the minimum frequency agreement all installations listed in Annex I to the IPPC Directive must have undergone a comprehensive inspection at least within the last 3-year period. The Environmental Protection Agency's Guidelines No. 6 of2006 on Environmental Inspection of industrial installations, contains checklists for the supervisory authority, including on comprehensive inspection. The checklists consist of an indicative list of environmental parameters.

If the minimum frequency for inspections is not met, the Ministry of Environment requests the municipality in question to submit in writing an explanation on how the backlog will be overcome and how the municipality will continue to ensure that minimum frequencies are observed. Municipalities which for several years in a row have not completed the minimum of inspections, is summoned to a meeting of the Environmental Protection Agency to discuss the municipality's inspection efforts. Lists of municipalities not having observed the minimum frequency for inspections are available on internet.[39]

[38] The decentralised units of the EPA were until 31 December 2010 called Environment Centres. The organisational change, which took effect the 1 January 2011, did not entail any changes with regard to competences for permitting and enforcement.
[39] http://www.mst.dk/Virksomhed_og_myndighed/Industri/miljoetilsyn_brugerbetaling/kommunernes_tilsyn/Kommunernes_indsats/

General information on inspection, e.g. the competent bodies, the ratio number of inspectors/number of installations, is reported by the Danish Ministry of Environment in annual reports on inter alia permits for installations governed by Annex I to the IPPC Directive and supervision of these installations. The most recent report 'Environmental Inspection 2009' was published in May 2011.
The report gives details on the activities of the municipalities, Environmental Centres[40] and the Environment Agency in relation to permitting and inspections of enterprises and agricultural facilities. Installations governed by Annex I to the IPPC Directive are reported under a specific heading. It reports inter alia, the ratio number of inspectors/number of installations, the costs related to inspection and supervision, compliance with minimum frequency for supervision and enforcement of environmental legislation, as set out in the agreement with the Minister for the Environment and the Local Government Association (the interest group and member authority of Danish municipalities), mentioned above. 'Environmental Inspection 2009' has been prepared on the basis of annual reports from municipalities and the Environment Centres. All municipal reports are published on www.tilsynsdatabasen.dk.

2.2.2. Key elements of the inspection procedure

The Environmental Protection Agency has issued several guidelines including on key elements of the inspection procedure. They are only available in Danish. The most relevant ones are:

- Guidelines from the Environmental Protection Agency on environmental inspections of industrial installations, No 6, 2006.
- Guidelines from the Environmental Protection Agency on enforcement of the Environmental Protection Act, No 6, 2005.

The guidelines on environmental inspections of industrial installations[41] provide practical instructions for planning, implementation and follow-up of environmental inspections of industrial installations both in terms of the controlling supervision as preventive monitoring work. It is based on practical experience, just as the text is reinforced with examples from environmental administrations. Guidance is thus provided on seven specific aspects of inspections each addressed in individual chapters. The guidelines provide guidance on preparation of the inspection, including collection of information, material and equipment needed, checklists and approaches to inspection.

Practical instructions for the implementation of environmental inspections of industrial installations distinguish between the following types and/or flow of inspections: a) dialogue based inspection; b) inspection taking into account the categorisation of the installation; c) BAT and preventive inspection; d) thematic inspection; e) inspection based on complaint from third party; f) control with the operators' self-monitoring; g) inspection in teams and h) inspections following an accident. The guidelines also outline the specific reporting requirements following inspections and other relevant follow-up activities. The guidelines further set criteria for prioritising between the types of inspections described above and describes the overall framework for drawing up inspection plan(s) based on which the inspectors are deciding on the installation to be controlled ex-officio. Check lists and specific examples of e.g. inspection report, inspection plans are given in the annexes to the guidelines.

The guidelines on enforcement of the Environmental Protection Act[42] provide practical guidance to the supervisory authorities on the application of administrative sanctions, including preventive and

[40] As indicated above, with organisational changes in the Ministry of Environment taking effect as of 1 January 2011, the Environment Centres changed name to the decentralised units of the EPA (EPA Aarhus, Odense and Roskilde).
[41] It is available on the web site of the Danish EPA. http://www.mst.dk/Publikationer/Publikationer/2006/09/87-7052-241-3.htm. The title in Danish is 'Miljøstyrelsens vejledning nr 6/2006 on vejledning om miljøtilsyn med industrivirksomheder'.
[42] It is available on the web site of the Danish EPA. http://www2.mst.dk/udgiv/publikationer/2005/87-7614-833-5/pdf/87-7614-834-3.pdf The title in Danish is 'Miljøstyrelsens vejledning nr 6/2005 om vejledning om håndhævelse af miljøbeskyttelsesloven '.

remedial measures available to the supervisory authority to prevent that negative impact on the environment occurs as a result of future operating conditions and enforcement measures to ensure compliance with inter alia legal rules, permits and decisions. It contains some specific examples of injunctions and prohibitions which can be used as templates. The guidelines further specify cases where the supervisory authority shall report an infringement to the public prosecutors. It also provides directions for cooperation between the environmental authorities and the police/public prosecutors in the cause of criminal proceedings. The guidelines are described further under section 2.2.3 concerning the inspector's enforcement powers.

The environmental inspections and enforcement guidelines are supplemented with a set of Guidelines from the Environmental Protection Agency on the application of the Legal Protection Act in the field of environment, No 7, 2005[43].

Specifically concerning the competencies and obligations of inspectors

Inspections e.g. in the form of on-site visit to installations require as a rule prior notification to the operators (in writing 14 days prior to an inspection) including information such as the purpose of inspection and the visit time and place (Section 5 of the Legal Protection Act). Such prior notification is only required if the inspection involves access to buildings or documents. The notification allows the company to prepare itself, including finding relevant documents and allocate the necessary time and make sure that its appropriate representatives will be present. Moreover notification prior to the inspection is seen as the best basis for a good dialogue with the business.

The requirement for prior notification of inspections may be waived, if it would forfeit the purpose of the inspection. The decisive factor should be whether or not a prior notified inspection would allow inspection of the installation under normal operating conditions. Inspections should at least be conducted un-notified, if the inspectors suspect that irregularities can be corrected or will be hidden in the period leading up to the notified inspection visits, but otherwise will be continued after the visit. See also Section 2.2 in the Guidelines from the Environmental Protection Agency on application of the Legal Protection Act in the field of environment, No 7, 2005.

In case of un-notified inspection, the supervisory authority must bring a letter of notification at the inspection (including visit), explaining why the inspection was not notified prior to the visit.

The supervisory authorities have in accordance with Section 87(1) of the Environmental Protection Act, access to all areas of the industrial installation and/company. If they are refused access, they can under police protection if necessary obtain access. As a general rule, no warrant is required.

It follows from the Environmental Protection Act Sections 65, 66 and 68 that the supervisory authority shall maintain an active control, including undertaking concrete inspection and investigations, when:

- A decision – e.g. an order, injunction or prohibition –requires this.
- Received complaints or other notifications are not clearly unfounded.
- There is a substantiated suspicion of non-compliance and/or illegal conduct pursuant to Section 68.

Obligations of the operator

It follows from Section 87(3) of the Environmental Protection Act that the operator and his employees shall provide the supervisory authority with all necessary assistance to enable them to carry out the inspections within the installation, including to take samples and to gather any information necessary

[43] It is available on the web site of the Danish EPA.) http://www2.mst.dk/udgiv/publikationer/2005/87-7614-835-1/pdf/87-7614-837-8.pdf The title in Danish is 'Miljøstyrelsens vejledning nr. 7/2005 om anvendelse af retssikkerhedsloven på miljøområdet'.

for the performance of their duties. As indicated above, the supervisory authorities have in accordance with Section 87(1) of the Environmental Protection Act, access to all areas of the industrial installation/company. Criminal sanctions may be imposed pursuant to Section 110(1)(9), in cases where the operator opposes to the supervisory authority's access to the installation.
General description of the procedure including any procedural steps before the issuing of a sanction by an administrative authority

A quality management system has been developed to ensure consistency in inspections. It is available at the web site of the Danish Ministry of Environment.[44] According to this system, the following steps are to be undertaken by the inspector during physical inspection (visit at the installation) before the possible issuing of a sanction by the supervisory authority:

- Check extent to what the installation/company complies with the conditions set out in the environmental permits, discharge permits, wastewater permits, injunctions, and where relevant, environmental technical descriptions as well as the Environmental Protection Act and related Ministerial Orders.
- Record whether the actual physical conditions and activities at the company are consistent with the data, the municipality is in possession of.
- The industrial installation/company must be offered a voluntary dialogue with a view to preventing environmental problems and promoting clean technologies and environmentally friendly behaviour.
- Any administrative and/or criminal sanctions need to be communicated orally. The operator must be informed that the inspection report will contain the same enforcement action(s).

The inspection must be planned, implemented and followed-up in accordance with applicable Guidelines on inspection and enforcement of industrial installations etc.

2.2.3 The inspectors' enforcing powers

As indicated above, it follows from Sections 69 to 72 of the Environmental Protection Act and the guidelines from the Environmental Protection Agency on enforcement of the Environmental Protection Act, No 6, 2005, that the following measures can be taken by the inspector in case infringement of permit-related obligations and/or risk to public health or to the environment, in the following order:

- Recommend that instances of non-compliance are brought to an end and at the same time to inform about the possible consequences (injunctions or prohibitions) if this does not happen
- Serve an order: by which an installation is ordered to rectify an instance of non-compliance, e.g. comply with permit requirements and permit conditions, inculcate environmental compliance of a previously notified condition and/or decision, including notify that the instance(s) of non-compliance will be reported to the police/ public prosecutor if it is not rectified
- Send notice of injunction or prohibition, e.g. to restore the original situation or prohibit continued operation and, where required, order the closure of the facility
- Convey an oral injunction - where immediate action is necessary
- Perform self-help action, prescribe corrective measures, which are taken at the offender's expense
- Report the infringements to the public prosecution authorities

[44] See http://www.mim.dk/ministeriet/Lovstof/Kvalitetsstyring/Miljoeprocedurer/M7.htm.

The aim of serving an order and, if relevant, issue an injunction or prohibition would be to:

1. stop offending (with the aim of stopping an illegal activity from continuing/occurring)
2. restore and/or remediate (with the aim of mitigating environmental harm or damage that has already occurred)
3. bring under regulatory control (with the aim of bringing an illegal activity into compliance with the law)

Chapter 10 of the Environmental Protection Act in particular Section 74 contains provisions on the form in which administrative sanction shall be communicated to the addressee and others as relevant.

It follows from Section 68 and 69 of the Environmental Protection Act that the supervisory authority shall report the infringement to the public prosecutors in case the administrative sanction have not resulted in an illegal activity being brought under regulatory control. According to the Guidelines on enforcement of the Environmental Protection Act, certain types of infringement would require that the supervisory authority should report the infringement to the police although the administrative sanction has resulted in the illegal activity being brought into compliance with the law. This would be the case where a new IPPC installation is operated without the required permit or and typically in cases where offender acted deliberately or by gross negligence and the infringement resulted in a damage to the environment or risk of a damage, or actual or intended economic advantages.

An overview on the number of initiated and finished procedures in Denmark IPPC facilities is provided in the tables below.

Table 2.1 Overview of municipal enforcement reactions in relation to IPPC facilities

Year	Number of facilities	Warnings/ recommendations (non-binding)	Orders	Injunctions	Prohibitions	Reports to public prosecutors
2007	372	35	53	6	3	1
2008	308	40	56	11	0	2
2009	283	23	60	7	0	3

Table 2.2 Overview of EPA (decentralised units) enforcement reactions in relation to IPPC facilities

Year	Number of facilities	Warnings/ recommendations (non binding)	Orders	Injunctions	Prohibitions	Reports to public prosecutors
2007	379	131	42	1	0	1
2008	393	70	45	12	0	1
2009	396	57	117	37	3	2

Source: interview with the Danish EPA –Aarhus

These figures show that the number of orders has increased over the years in comparison to the warnings/recommendations. In 2009, they represent by large the most commonly used type of measure. The number of reports to public prosecutors is rather limited, indicating that criminal procedures are the exception, which may suggest that the administrative sanctions are effective.

2.3 Appeal against the administrative decision

Enforcement measures, e.g. an order, injunction or prohibition served pursuant to Section 69 of the Environmental Protection Act e.g. to stop an illegal activity from continuing/occurring, mitigating environmental harm or damage that has already occurred or bringing an illegal activity into compliance with the law cannot be appealed by the operator or by any other person. This follows from Section 69(3) of the Environmental Protection Act.

Preventive measures, including injunctions e.g. to reduce pollution or risk of pollution from an installation pursuant to the Environmental Protection Act Section 41 and 42 can be appealed pursuant to Environmental Protection Act Section 91 to the Environmental Appeal Board by the person (natural or legal) on whom the injunction is served. Pursuant to Section 93, the time limit for making an appeal is not later than for weeks. Pursuant to Section 74, a decision on the injunction (preventive) must contain the necessary appeal guidelines as set out in Section 77.

Under Section 95 appeals against injunctions have suspensive effect unless the appeal – or competent - authority decides otherwise.

3. Judicial procedure (if relevant - with a focus on criminal sanctions)

3.1 General information

Criminal offences relevant to the IPPC Directive are set out in Section 110 to 110b of the Environmental Protection Act. The criminal penalties include imprisonment and additional corporate fines in some circumstances. The Criminal Code also sets up offences and corresponding penalties and sanctions. The provisions of the Criminal Code have precedence if the sanctions it lays down are equal or more severe than those established by the Environmental Code.

As with administrative sanctions, the way in which these provisions are applied and the factors which regulators must take into account when deciding whether or not to prosecute is determined by various guidance documents, including Environment Agency's guidelines on enforcement of the Environmental Protection Act and the Instructions from the Director of public prosecutions concerning judicial procedures for environmental infringement.[45]

3.1.1 Criminal offences

Section 110 of the Environmental Protection Act specifies, as described above in Section 1, Table 2, a range of criminal offences for non-compliance with the Act or legislation issued based on the Act. The most relevant offences to the IPPC Directive are:

- Failure to comply with an injunction or prohibition issued pursuant to this Act (Environmental Protection Act Section 110(1)(2));
- Establish, commence or operate an installation without a permit pursuant to Section 33 from the relevant authority (Environmental Protection Act Section 110(1)(6));
- Failure to comply with or to contravene an environmental permit condition (Environmental Protection Act Section 110(1)(4));
- Failure to submit information or test results pursuant to Section 71 (1) or Section 72[46] (Environmental Protection Act Section 110(1)(7));

[45] Rigsadvokatens meddelse nr. 8/2008 om behandlingen af miljøstraffesager. Only available in Danish see http://www.rigsadvokaten.dk/media/RM_8-2008.pdf;

[46] Section 71(1) is about notification in case of interruption of operation or accidents resulting in substantial pollution or risks of pollution. Section 72 concerns provision of information upon request from the municipality or the EPA which are relevant for assessing the pollution or risks of pollution.

- Failure to apply for a permit in accordance with Rules issued pursuant to Section 7 of this Act or failure to apply pursuant to Section 39 of this Act (Environmental Protection Act Section 110(1)(8));
- Prevent the authorities to access the premises as required by Section 87 (Environmental Protection Act Section 110(1)(9));
- Failure to comply with the permitting – or supervisory authority's decision for provision of a financial guarantee pursuant to Section 39a (Environmental Protection Act Section 110(1)(4) and (14).

3.1.2 Additional (miscellaneous) criminal offences and related measures

- Failure to prevent an imminent threat of pollution or prevent further discharge of pollutants pursuant to Section 71(2) (Environmental protection Act Section 110(1)(17));
- Failure to implement the necessary preventive measures against an imminent threat of environmental damage or all practicable measures to minimise environmental damage and prevent further environmental damage, pursuant to Section 73c (Environmental Protection Act Section 110(1)(18)).

Furthermore the Criminal Code provides for imprisonment of up to 6 years for violations of the environment legislation under aggravating circumstances which result in:

- significant pollution of air, water, soil
- significant harm to the environment due to disposal of waste.

3.1.3 Criminal sanctions

Pursuant to Section 110(4) of the Environmental Protection Act, criminal sanctions are not restricted to the operator, but may be brought against any person (natural or legal) who commits an offence.
The Danish criminal sanctions applicable in case of breach of the legislation transposing the IPPC Directive are set out in the Environmental Protection Act Section 110 and 110b. The Criminal Code also sets up offences and corresponding penalties and sanctions. The provisions of the Criminal Code have precedence if the sanctions it lays down are equal or more severe than those established by the Environmental Code.

The criminal penalties include:

1. Fines including corporate fines in some circumstances (Environmental Protection Act Section 110(1)).
2. Imprisonment for 'serious offences'. For instance serious offences are characterised when an offender acted deliberately or by gross negligence if the infringement resulted in damage to the environment or risk of damage, or actual or intended economic advantages (Environmental Protection Act Section 110(2)).
3. Seizure/confiscation of any profits earned (Section 110(5) of the Environmental Protection Act)
4. Default fines/daily penalty.

Pursuant to Environmental Protection Act Section 110b, the right to carry on an activity covered by Chapter 5 can be revoked by a court order, where a person:

1) has been convicted for violation of Section 196 of the Criminal Code or
2) repeatedly or under otherwise aggravating circumstances have
(i) violated the provisions of the Environmental Protection Act or regulations issued pursuant thereto,
(ii) failed to comply with any prohibition or injunction issued on the basis of the Environmental Protection Act or regulations issued pursuant thereto or

(iii) disregarded permit condition(s) approval issued on the basis of the Environmental Protection Act or regulations issued pursuant to this Act.

The criminal sanctions applied have been assessed on a systematic basis by the Danish Environmental Protection Agency, most recently in a study carried out for the Agency in 2005.[47] The study was initiated to analyse a number of criminal cases[48] on nature conservation, environmental protection and planning legislation with a view to assessing the degree to which the processing of cases and sanctions are satisfactory. The primary objectives of the study were to ascertain whether:

- the level of fines is uniform, and possibly whether these are equivalent to sanctions in other comparable areas e.g. infringements of the working environment legislation
- the provisions in environmental legislation that include the possibility of more severe sentences for serious cases are used when it is possible to do so, e.g. Section 110(2) of the Environmental Protection Act
- confiscation is used to an appropriate degree and whether profits earned or sought are taken into account when setting fines, e.g. Section 110(5) of the Environmental Protection Act
- default fines are used to a sufficient degree and in a uniform manner.

The study concluded inter alia that level of fines within the environmental protection area are characterised by the fact that there is no trace of the large fines that have formerly been imposed in the most serious cases. The largest fine in the material is DKK 150,000 (approximately Euros 20,000). According to the author, there are no cases in the material which ought to have resulted in a significantly higher fine than DKK 150,000. Either the infringements that formerly resulted in large fines do not occur, or the environment authorities do not report them. In general, the fines in the less serious cases are small. This includes cases against both private individuals and against a number of commercial enterprises who have also been sentenced to pay fines of a few thousand Danish kroner (approximately Euros 1,000).[49]

Following the study, the Environmental Protection Act was amended to increase the level of fines.

The amendment,[50] which came into force on 1 April 2008, inter alia, introduced a provision on the factors which must be taken into account when deciding the size of the fine, namely the objectives of the Environmental Protection Act as set out in Section 1 and the fact that the offence is committed in connection with the exercise of a profession should be considered as an aggravating circumstance. The purpose of the amendment was to implement a stricter level of fines in less serious cases of violation of the Environmental Protection Act. With this aim in view, the comments to the Act amending the Environmental Protection Act indicate a number of recommended minimum sizes of the fines, including for the following violations of the IPPC related obligations:

- Establish, commence or operate an installation without a permit pursuant to Section 33 from the relevant authority, a fine level of at least DKK 50,000 (approximately Euros 2,700) is recommended
- Failure to comply with or to contravene an environmental permit, a fine of at least a DKK 10,000 (approximately Euros 1,350) is recommended.

[47] Report from the Danish Environmental Protection Agency 20/2005. Assessing the application of criminal sanctions in criminal cases in the field of nature conservation, environmental protection and planning legislation. (Arbejdsrapport fra Miljøstyrelsen, 20/2005. Undersøgelse af anvendelse af sanktioner m.v. i straffesager på natur-,miljø- og planområdet) http://www2.mst.dk/Udgiv/publikationer/2005/87-7614-831-9/pdf/87-7614-832-7.pdf

[48] A total of 133 criminal cases on infringements of environmental legislation and 112 cases on infringements of planning legislation and nature conservation legislation were analysed. All cases were completed in 2003 and 2004 and resulted in court rulings, agreement to pay a fine in court or to the police.

[49] See p. 11 of the Study of which a summary in English is available at the web site of the Danish EPA: http://www2.mst.dk/Udgiv/publikationer/2005/87-7614-831-9/pdf/87-7614-832-7.pdf

[50] See L2008 173 FT 2007-08 (2.samling): 283,1857, 2024; A9; B133

The second time there is a violation of Section 110(1), there should generally be a doubling of the indicative level of fines. The comment to the amendment comments that it remains the Courts, which ultimately determine what penalty should be decided for any violation of law.

3.1.4 Criminal procedure

The Instructions from the Director of public prosecutions concerning judicial procedures for environmental infringement cases [51] contains instruction for the police and prosecutor's investigation, prosecution, submission of infringement cases for the State Prosecutor, the Danish Environmental Protection Agency and cooperation with other environmental authorities, including during trial. In these Instructions, the existing directives for the criminal procedure for violation of the environmental legislation are updated.

Criminal offences for IPPC-related breaches in Denmark typically include the following steps: the prosecutors representing the Commissioners'[52] lodge applications with the City Courts to obtain warrants, which allow the police and prosecution to undertake certain measures during investigation. These applications are considered by a City Court judge and the defendant is afforded legal representation. All criminal cases for IPPC-related breaches will begin in City Courts.

The Danish system does not include investigating magistrates, but leaves the control of police investigations to the courts and the Prosecution Service. The legal staff of the Commissioner decides in accordance with Section 719 of the Administration of Justice Act whether to prosecute or not. If a defendant is expected to plead guilty, a formal charge is sent to the City Court in the jurisdiction of the defendant's habitual residence. The Court summons the defendant and if he does indeed plead guilty in court and the plea is sustained by corroborating evidence, the presiding City Court judge passes sentence. If the defendant pleads or is expected to plead not guilty, a formal indictment is drawn up and lodged with the City Court in the jurisdiction where the crime is alleged to have been committed. The defendant and witnesses are then summoned by the prosecution. In cases where the prosecution does not request a sanction more severe than a fine, the case will be tried by a single City Court judge. In other cases the judge sits with two lay judges and together they decide the question of guilt and the sentence to be imposed. Witnesses may be examined by the prosecution, the defence and the Court. After the closing remarks by his counsel, the defendant is invited to address the Court before the sentence is passed.

3.2 Possibilities of appeal

Pursuant to Section 902 of the Administration of Justice Act, if found guilty after a trial, the person convicted may appeal to the High Court against the conviction and if he was sentenced a fine of more than DKK 3,000 (app Euros 400). The Prosecution Service may appeal if other penalties than fines or seizure apply. A notice to appeal against the conviction or sentence must be served within 14 days in accordance with Section 904 of Administration of Justice Act.

[51] Only available in Danish "Rigsadvokatens meddelse nr. 8/2008 om behandlingen af miljøstraffesager" at the web site of the Director of public prosecutions: http://www.rigsadvokaten.dk/media/RM_8-2008.pdf.

[52] The organisation of the Prosecution Service is set out in the Administration of Justice Act. The service is structured as a hierarchy of three levels headed by the Director of Public Prosecutions (the General Prosecutor). The second level comprises six units called Regional Public Prosecutors, while at the local level there are 12 Commissioners heading both the local prosecution service and the police.

4. Synergies between administrative and criminal procedures

4.1 Administrative versus criminal procedures

The Danish legislation does not prevent regulatory authorities from applying administrative enforcement measures and criminal sanctions in conjunction. On the contrary, the legislation provides for the use of both measures and regulatory guidance advises the use of either and/or both where it is considered proportionate under the circumstances. The way in which the administrative and criminal sanctions are applied and the factors which regulators must take into account when deciding whether or not to prosecute is determined by various guidance documents, including the Environmental Protection Agency's guidelines on enforcement of the Environmental Protection Act and the Instructions from the Director of public prosecutions concerning judicial procedures for environmental infringement. Administrative measures will thus be used with the option to resort to criminal prosecution where operators have breached their permit conditions or where administrative procedures are not complied with.

The following examples of jurisprudence – as well as the recent case studies described below in Section 4 – illustrate how administrative enforcement measures and criminal sanctions are applied in conjunction:

Supreme Court ruling U2001.2045H: A company taking over a chemical installation under bankruptcy was fined DKK 800,000 (approximately Euros 120,000) and 40 days imprisonment for its Director combined with a fine of DKK 300,000 (app. Euros 40,000) for failure to comply with the conditions set in the permit following several injunctions on disposal of chemical waste.

Another example is *a ruling by the Eastern High Court* where a County was fined DKK 500,000 (approximately Euros 65,000) for failure to comply with the mandatory emission limit values for a waste incineration plant and seizure of the saved amount of DKK 4 mill (app. Euros 350,000). Reported in MAD 2000.334

The Danish Environmental Protection Agency has launched a review of the enforcement of the environmental legislation by the municipalities, the decentralised units of the Environmental Protection Agency and the public prosecution authorities (the police).[53] The project reviews eighty-one enforcement cases, including some concerning violations of the IPPC legislation completed in respectively nine municipalities, one decentralised EPA unit, and three public prosecution/police districts. It should be noted that the project only reviews a rather limited number of enforcement cases and only in some units/districts and that the cases cover different types of violations of the environmental legislation. However, expert opinions of interviewees[54] at Environmental Protection Agency and preliminary findings of the enforcement project suggest:

- that there is a tendency among enforcement authorities to issue recommendations/warnings rather than serve an order;
- the frequency of violations are significantly higher among small facilities/enterprises than larger installations;
- reporting of violations to the public prosecutions authorities is inadequate. The guidance on when reporting of violations should take place as set out in the Enforcement guidelines issued by the Ministry are thus not frequently not followed;

[53] The title in Danish is : 'Kommunernes, miljøcentrenes og politiets håndhævelse af miljølovgivningen'.
[54] The interviewees in the Danish Environmental Protection Agency including one of the decentralized units were Tina Strand Overgaard, Marianne Ripka and Helene Pedersen.

- the criminal procedure is often rather lengthy. It appears that environmental enforcement cases are given a rather low priority and lower than enforcement of animal welfare cases. It should be noted that there are some examples of efficient and expedient criminal cases though;
- the recommended level of fines are frequently not adhered to;
- cooperation between the environmental enforcement authorities and the public prosecutions authorities could be enhanced.

5. Conclusions

The Danish legislation provides for the use of both administrative enforcement measures and criminal sanctions in conjunction. Regulatory guidance advises the use of either and/or both where it is considered proportionate under the circumstances. Interviews with experts at the Danish Environmental Protection Agency, case law and the case studies reviewed above suggest that whilst the range of administrative and criminal sanctions available as a rule are sufficient to ensure that effective and dissuasive penalties can be imposed in case of infringement of IPPC requirements, their application may be enhanced in some cases.

Proportionality

The Danish Environmental Protection Act provides the supervisory authorities with several administrative sanctioning tools in order to ensure compliance with the relevant provisions of the legislation transposing the IPPC Directive. The Environmental Protection Agency and the Director of public prosecutions have issued guidance and instructions to ensure that the regulators' approach is proportionate to the risks posed. Criminal penalties for non-compliance are intended to reflect the nature and gravity of the offence, by providing for convictions either 'summarily' or 'on conviction on indictment', with maximum sentences and fines for both types of offences. Both administrative and criminal penalties may therefore be deemed as fulfilling the criterion of proportionality.

Effectiveness

The administrative tools available to regulators include a range of different orders, injunctions or prohibitions which may be served on the operator, depending on the nature of the breach or level of harm posed to the environment. It follows from Section 68 and 69 of the Environmental Protection Act that the supervisory authority shall report the infringement to the public prosecutors in case the administrative sanction have not resulted in an illegal activity being brought under regulatory control. Furthermore according to the Guidelines on enforcement of the Environmental Protection Act, certain types of infringement would require that the supervisory authority report the infringement to the public prosecutors although the administrative sanction has resulted in the illegal activity being brought into compliance with the law. This would be the case where a new IPPC installation is operated without the required permit or and typically in cases where offender acted deliberately or by gross negligence and the infringement resulted in damage to the environment or risk of damage, or actual or intended economic advantages.

The Danish regulator systematically reviews the effectiveness of enforcement of the environmental legislation, including IPPC legislation, by the municipalities, the environmental centres and the public prosecution authorities. The reviews have several times resulted in amendments to the sanction provisions of the Environmental Protection Act, including amendments aimed at increasing the level of fines. Ways and means to enhance the administrative procedures in particular inspections have also been addressed by agreements between the Minister for the Environment and the Local Government Association (the interest group and member authority of Danish municipalities) on minimum frequency for so-called comprehensive inspections with industrial installations and the Environmental

Protection Agency's Guidelines on inspection and enforcement, e.g. by establishing checklists for the supervisory authority's inspection of industrial installations and providing detailed guidance on the application of the administrative sanctions.

It has not been possible to obtain specific data on the number of the administrative sanctions that have not resulted in an illegal activity being brought under regulatory control and criminal procedures although the administrative sanction has resulted in the illegal activity being brought into compliance with the law. However while data on enforcement cases and expert interviews indicate that overall the administrative enforcement sanctions are effective to ensure that instances of non-compliance of the IPPC legislation are brought into compliance, there seems to be a tendency among enforcement authorities to issue recommendations/warnings rather than serve an order or an injunction/prohibition.

Expert interviews also suggest that the guidance on when reporting of violations should take place as set out in the enforcement guidelines issued by the Ministry are not systematically followed and that reporting of violations to the public prosecutions authorities is in some cases inadequate.

Furthermore, the criminal procedure is viewed as rather lengthy in many cases. It appears that environmental enforcement cases are given a rather low priority, in particular in relation to animal welfare cases for which enforcement is more expeditious. It is noted that there are several examples of efficient and expedient criminal cases though. Specific cases also seem to indicate that the recommended level of minimum fines is not always adhered to. Finally specific cases suggest that cooperation between the environmental enforcement authorities and the public prosecutions authorities may be further enhanced.

Dissuasiveness

The administrative sanctions including the suspension or restriction of activities, variation of the permit conditions or even revocation of the permit are viewed as rather stringent, especially seen together with the supervisory authority's obligation to report certain instances of non-compliance to the public prosecution authorities, although the administrative sanction has resulted in the illegal activity being brought into compliance with the law. Criminal sanctions applied are also seen as dissuasive, due to the sizable fines and sentences which may be imposed.

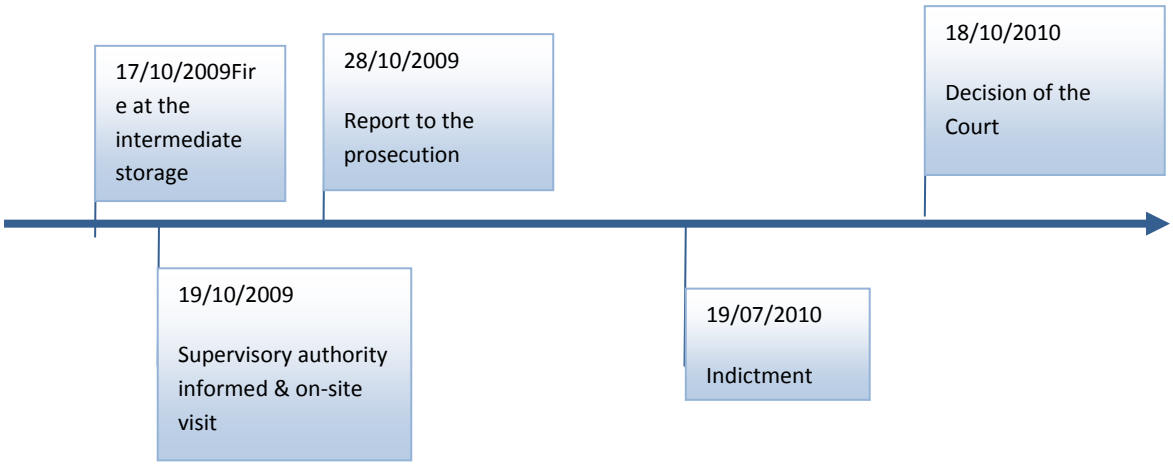
Interviews with experts in the Danish Environmental Protection Agency seem to indicate that the frequency of violations is significantly higher among small facilities/enterprises than larger installations, including IPPC facilities and that although the recommended level of minimum fines (a fine of Euros 1,350) may not always in itself be dissuasive, the risk of bad publicity should a criminal case be opened against an offending facility appears to have a more deterrent effect than the very size of the fine.

Case studies

The Danish Environmental Protection Agency has identified two recent cases, where administrative and/or criminal sanctions have been imposed, to be addressed in this review. Both cases are final (all appeal procedures exhausted). The Danish Environmental Protection Agency has provided information on the background for the cases and description of the procedure from the first measures taken once the infringement was identified. The cases and other possible cases have been discussed during several telephone conferences with three interviewees[55] in the Agency who have provided their opinion as to the proportionality, the effectiveness and the dissuasive character of the sanction imposed.

Case study 1 – administrative and judicial procedure for non-compliance with permit conditions

Timeline of the procedure



Description of the background

The company is a landfill for waste, which by their nature are included in Appendix C Section 105 of the Approval Order in Annex I and is an IPPC activity. As a secondary activity, the facility has within the landfill, an intermediate storage for waste suitable for incineration for which a special approval was granted on 26 October 2006.

On 17 October 2009 the intermediate storage caught fire. The fire was only extinguished after eight days. Heavy smoke affected the residents surrounding the landfill. Large amounts of extinguishing water was discharged through the sewage system to the nearby municipal wastewater treatment plant and caused problems in the purification process.

Only on 19 October 2009 was the supervisory authority, the then Environment Centre Roskilde, informed about the fire by surrounding residents. The authority, however, was never informed about the fire by the operator of the landfill.

Legislation applicable

[55] See footnote 21.

The Environmental Protection Act Section 71(1) provides that:

- anyone responsible for activities likely to cause pollution shall immediately notify the supervisory authority when interruption of operation or accidents result in substantial pollution or risks of pollution.

Concerning the sanction, under the Environmental Protection Act Section 110 (1)-(4) and (1)-(7) as well as paragraphs 2, 4 and 5

- failure to comply with or to contravene an environmental permit condition is subject to a fine, unless a more severe penalty under other legislation would apply (paragraph 1 no 4).
- failure to give notification as specified in section 71 is subject to a fine, unless a more severe penalty under other legislation would apply (paragraph 1 no 7).
- the penalty may be detention when an offender acted deliberately or by gross negligence if the infringement resulted in damage to the environment or risk of damage or achieved or intended economic advantages (paragraph 2)
- the provisions apply to both natural and legal persons alike. The difference is, however, that further financial penalties may additionally apply to businesses (paragraph 4 and 5)

Procedure

On 19 October 2009, the supervisory authority made an on-site inspection following the notification of the fire at the landfill. The on-site inspections assessed that the quantity of waste stored at the intermediate storage, that had caught fire, was larger than the maximum quantity specified in the permit conditions. The operator of the landfill did not object to this. It was also the authority's assessment that the height of waste stored at the intermediate storage exceeded the maximum set in the permit conditions. However, this could not be exactly measured, but merely documented by photographic evidence.

The supervisory authority considered that two of the environmental permit conditions were not met. It was further the authority’s assessment that the company over a few months had knowingly stored larger quantities of waste than permitted at the intermediate storage at the landfill. Consequently an order to comply with the conditions of the permit was served and the infringement was reported to the public prosecution authorities.

The supervisory authorities proposed the public prosecutors the following minimum fines under the existing penalty charges to:

- DKK 20,000 (approximately Euros 2,700) for not having informed about the fire in accordance with the Environmental Protection Act Section 71
- DKK 20,000 (approximately Euros 2,700) for handling waste in a manner that causes pollution in non-compliance with the Environmental Protection Act Section 43
- DKK 10,000 (approximately Euros 1,350) for non-compliance with conditions of permit.

Furthermore seizure/confiscation of the earned profit was recommended (in accordance with Section 110(5) of the Environmental Protection Act) for not having applied for environmental approval for storing a large amount of waste.

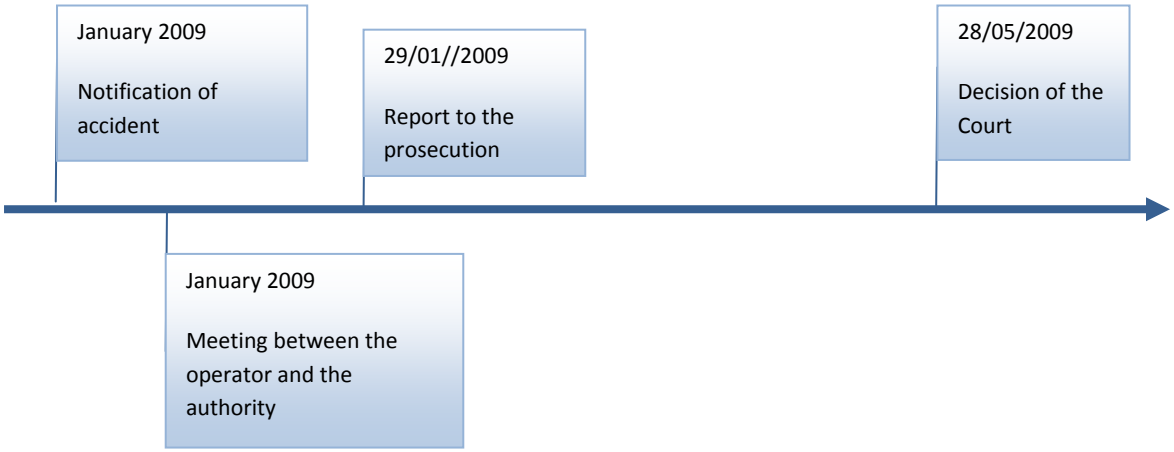
The infringement was reported on 28 October 2009 to prosecutors, who by 19 July 2010 had prepared indictment. The criminal procedure was concluded on 18 October 2010. The company was sentenced to a total fine of 40,000 DKK (approximately Euros 5,400), but was acquitted of confiscation claim for which the recommended amount was DKK 6,968 (less than Euros 1,000). The company was dismissed for failure to comply with conditions of maximum height, but was convicted for all other matters.

General comments on sanctions

The Danish Environmental Protection Agency finds that the enforcement process was sufficient and efficient. The level of fine was in line with the recommended level for fines. Compliance was restored.

Case study 2 – judicial procedure for non-compliance with the permit conditions

Timeline of the procedure



Description of the background

The Dairy produces cheese and yogurt and is a facility covered by the IPPC Directive and the transposing Danish legislation. The dairy has been running since the 1980s. It has a permit which allows for a production of up to 25,000 tonnes of cheese and yogurt per year, equivalent to a consumption of 105,000 tonnes of raw milk.

The Dairy is located in the outskirts of a village in an urban area close to rural areas as well as areas designated for small industrial and craft facilities associated with housing. A residential area is also close to the dairy.

In January 2009, the environmental authority received a notification from the dairy that an environmental accident had occurred at the facility. Two pallet tanks containing 1000 litres of respectively nitric acid and formic acid had been hit by an unknown truck and the contents of both containers had run into the municipal drain and into a close-by brook.

According to the permit the company's raw materials and additives, including detergents must be stored in such a way that there can be no discharge to the public sewer, soil or groundwater.

Legislation applicable

The Environmental Protection Act Section 34 and the Approval Order Section 14 concerning the conditions of the permit stipulate that:

- the permit shall include […] other requirements relating to the design and operation that are necessary to ensure that it does not cause significant environmental pollution, including by accident

Concerning the sanction, under the Environmental Protection Act Section 110 (1)(4) and 110(4) and (5):

- failure to comply with or to contravene an environmental permit condition is subject to a fine, unless a more severe penalty under other legislation would apply (paragraph 1 no 4).

- the provisions apply to both natural and legal persons alike. The difference is, however, that further financial penalties may additionally apply to businesses (paragraph 4 and 5)

Pursuant to the Environmental Protection Act Section 110(2) the penalty may be detention or imprisonment for a maximum term of two years if the offender acted deliberately or by gross negligence and the infringement resulted in:

1) damage to the environment or risk of damage, or
2) actual or intended economic advantages, including savings, for the offender or for others.

The recommended minimum fine for failure to comply with or to contravene an environmental permit condition is DKK 10,000 (approximately Euros 1,350). See also Section 3.1.3 on criminal sanctions.

Procedure

In January 2009, the environmental authority received a notification from the dairy that an environmental accident had occurred at the facility. Two pallet tanks containing nitric acid and formic acid had been hit by an unknown truck and the contents of both containers had run into the municipal drain and into a close-by brook.

Upon request from supervisory authority, the dairy submitted five days after the accident, a report informing the environmental authorities in more details about the accident. The report also contained an action plan to prevent a similar accident. It appeared from the report that an unidentified truck hit some pallet tanks placed on a paved area with drainage to the municipal water drain. The environmental impact of the accident was discharge of 2,000 l of formic acid and nitric acid into the brook next to the dairy.

The environmental permit had been reviewed just prior to the incident. According the conditions of the permit the company's raw materials and additives, including detergents, must be stored in such a way that it cannot be discharged to the public sewer, soil or groundwater. Furthermore it was mentioned in the permit that the rainwater from the actual paved areas should be led to an equalisation tank. Consequently it was considered likely that waste water from a major accident could be retained and treated before discharge or reuse.

Following the incident, a meeting between the municipality and the competent environmental authorities were held to discuss the environmental impact of the accident on the brook.

As the infringement resulted in damage to the environment, on 29 January the supervisory authority reported the infringement to the public prosecution authorities which opened criminal proceedings. The criminal case was closed 28 May 2009 with a fine of Euros 1,341. The supervisory authority was consulted by the public prosecution authorities on the level of the fine.

General comments on sanctions

As it can be seen from the description of the procedure, the enforcement process was efficient and quick. As there was no imminent serious danger to health in the present and no immediate action was required to prevent the spreading of contamination or pollution, the Danish Environmental Protection Agency considered that there was no basis for 'self-help actions' to be made. The level of fine was in line with the recommended level. Although a fine of Euros 1,350 may not in itself be dissuasive, the risk of bad publicity should a criminal case be opened against an offending facility appears to have a more deterrent effect then the very size of the fine (which corresponds to approximately 30% of an average Danish monthly salary).

Annex II- France

Sanctions and procedures applicable to breaches of the legislation on industrial emissions in France

Executive Summary

Both administrative and criminal sanctions can apply for the infringement of the legislation transposing the IPPC Directive in France. These sanctions can be imposed separately on the offender and even be cumulative.

In France, the legal regime of administrative sanctions tends to become similar to the criminal legal regime. However, unlike criminal sanctions, administrative sanctions cannot deprive liberty. Furthermore, administrative sanctions do not have to precisely describe infringements to the laws, the reference to the obligations to be fulfilled is considered sufficient.

Inspectors of classified installations are not empowered to take administrative sanctions but they can issue formal records *(procès-verbaux)* of the infringement to the Public Prosecutor *(Procureur de la Republique)* if there is ground for starting a criminal procedure and to the Prefect (the State's representative in a department or region). There is a general increase in the number of controls from inspectors. In 2010, 94% of priority IPPC installations, 94% of IPPC installations with potential issues, and 80% of the other IPPC installations were inspected.[56]

The Prefect, receiving formal records from inspectors identifying infringements, is bound to send a letter of formal notice to the operator of installations stating that s/he shall comply with specific requirements within a certain time-period (e.g. to complete necessary work on the installation). If the operator does not comply with these requirements in this time-period (the warning period), the Prefect can issue different types of administrative sanctions (e.g. the suspension of the operation, the closure or removal of the facility, the sealing of a facility). This warning period is quite effective, for instance in 2006 only around 10% of the letters on formal notice ended-up in administrative sanctions.

Operators of classified installations can appeal against these administrative sanctions to the administrative Courts together with third parties such as persons, legal entities, municipalities and groups of municipalities that shall be concerned by the drawbacks or hazards the operation of the facility presents for the convenience of the neighbourhood, public health and safety, agriculture, the protection of nature and the environment, the conservation of sites and monuments or elements of the archaeological heritage. The Code of the Environment (CoE) contains provisions facilitating appeals against administrative decisions by environmental associations, which are considered very effective.

The criminal procedure is often initiated by the Public Prosecutor based on information received from inspectors of classified installations or the judiciary police *(police judiciaire).* Victims of the infringements have the option to become private parties *(partie civile)* and file a claim before the Public Prosecutor *(juge d'instruction).* They can lodge this claim only if they have suffered personal damage directly caused by the offense. The CoE facilitates the initiation of criminal proceedings for environmental protection associations and several administrative bodies involved in the management of the environment (e.g. water agencies) that are entitled to exercise the rights recognised as those of the civil party at a criminal court in relation to the acts constituting an infringement of the provisions relating to classified installations.

[56] The French inspection procedure classifies installations depending on their potential risks on health and the environment under three categories: priority IPPC installations (e.g. upper tier SEVESO establishments, waste landfill), IPPC installations with potential issues and other IPPC installations. Priority installations must be inspected at least every year while IPPC installations with potential issues must be inspected at least every three years.

The time period to issue a criminal sanction varies a lot depending on the specificities of each case (about 18 months from the moment the infringement is identified to 5 or 6 years when infringements shall be further investigated by the public prosecutor). The French legislator, however, established in 2004 a 'plead guilty' procedure which is applicable to persons (including legal persons) who have committed a crime punishable by a fine or imprisonment for a time period not exceeding five years. Sanctions for the infringement of provisions on classified installations fall into the scope of this procedure which is much faster than the normal one**.**

The table below indicates the provisions of the IPPC Directive covered by a sanction in France. The category of administrative (quasi) criminal sanctions does not exist in France, thus this column is left blank in the table below.

[57] This is considered to be covered by a general principle of law that requires that true information shall be provided when applying for an authorisation.

1. Applicable sanctions

Both administrative and criminal sanctions can apply to the infringement of environmental law in France. These sanctions are not linked and can be imposed separately on the offender. There are different types of administrative sanctions depending on which provisions of the environmental legislation are infringed. For instance Book V Title I of the Code of the Environment (CoE) on classified installations for the protection of the environment transposing the IPPC Directive contains different administrative sanctions that can be issued by the Prefect (the State's representative in a department or region). These are, the suspension of the operation, the closure or removal of the facility, the sealing of a facility, the deposit of a sum corresponding to the amount of the work to be carried out and the enforcement ex officio of the measures required.

The French Criminal Code does not encompass general sanctions related to harm made to the environment. These criminal sanctions are scattered in specific sectors of the legislation on the environment (e.g. legislation on classified installations,[58] waste,[59] water pollution,[60] and air[61]). French Law provides three categories of criminal offences which are serious offences *(crimes),* offences *(délits)* and petty offences *(contravention).* Most criminal offences related to harm made to the environment are either offences *(délits)* or petty offences *(contraventions).* For instance infringements to certain provisions of Book V Title I of the Code of the Environment (CoE) on classified installations for the protection of the environment transposing the IPPC Directive can lead to one year imprisonment and a fine of Euros 75,000. The 1994 amendment of the Criminal Code established the criminal liability of legal persons in French Law. Pursuant to Article 121(2) of the Criminal Code, legal persons, with the exception of the State, are criminally liable for the offences committed on their account by their organs or representatives. For instance legal persons can be criminally liable to a fine of Euros 375,000 for operating a classified installation without an authorisation.

Table 2 below indicates the types of administrative and criminal offences and related penalties in France for each of the key enforceable obligations under the IPPC Directive.

			The continued operation of a classified facility while failing to comply with the summons to meet, within a set time, the technical stipulations related to evaluations to be done and implementation of remedies required by the prefect that are necessary as a consequence of an accident or incident at the facility or due to the breach of conditions imposed under the legislation on classified installations**.** ***Article L514-11 of the CoE read in conjunction with Articles L512-20 of the CoE***	

2. Administrative procedure

2.1 General elements on the legal tradition and evolution

Administrative sanctions are increasingly used for infringements of environmental law in France. Several factors explain this tendency. Administrative sanctions are seen as a solution to limit the number of cases brought to criminal Courts that are more and more congested. Administrative procedures are quicker and simpler to apply than criminal procedures. Furthermore, it is also considered that administrative bodies are more capable to deal with environmental matters than Courts, which lack technical expertise in this domain.[62]

The legal regime of administrative sanctions tends to become similar to the criminal legal regime. Both administrative and criminal sanctions shall respect the following principles:

- The principle of legality;
- The principle of proportionality of the sanction;
- The principle of personality of penalties;[63]

The main difference between administrative and criminal sanctions mainly lies on the person that issues the sanction. Pursuant to the Constitutional Council, sanctions are unilateral decisions taken by an administrative authority, within the framework of its public power prerogatives, imposing a penalty for the infringement of laws and regulations.[64] Unlike criminal sanctions, administrative sanctions cannot deprive liberty.[65] Furthermore administrative sanctions do not have to precisely describe infringements to the laws, the reference to the obligations to be fulfilled is considered sufficient.[66]

Pursuant to a 1994 report from the Council of State there are around 500 different types of administrative sanctions in France.[67] Several types of administrative sanctions can apply for the infringement of the legislation on classified installations (e.g. closure or removal of the installation, the sealing of the installation, the deposit of a sum corresponding to the amount of work to be done). Prefects have thus the capacity to apply the appropriate sanction for each specific infringement.

In other legal systems these administrative sanctions would not be considered sanctions but injunctive or preliminary measures.

2.2 Inspections

2.2.1 General information

The Ministry for Ecology, Sustainable Development, Transport and Housing[68] is responsible for the inspection of classified installations. Under the authority of the Prefects of Department, inspection and enforcement are mainly carried out for most industrial facilities by the regional directorates for the environment, planning and housing[69] and the regional and inter-departmental directorate for environment and energy[70] in Paris and its surrounding area, the departmental directorates of social

[70] Direction régionale et interdépartementale de l'environnement et de l'énergie

cohesion and protection of the population[71] for farms, slaughterhouses, animal carcass disposal contractors and some food processing activities. These different bodies are designated under the generic name of 'inspection of classified installations'.

There are about 1,500 inspectors (equivalent to 1,150 full-time) (engineers, technicians and veterinary surgeons) all of whom are sworn State officials.[72] They are responsible for controlling all classified installations, including IPPC installations, which include 6,400 installations out of 500,000 installations (as of 31 December 2009).

After the explosion of a nitrate factory in Toulouse in 2001, the Government decided to increase the number of personnel in the regional inspectorates and to implement a programme of reinforcement and modernisation of the inspections. This programme adopted in 2004 covered the period 2004-2007. It included various commitments as to the number of inspections, time for responding to complaints and transparency in the inspection activities.

The strategic plan of the inspection of classified installations for 2008-2012 is now the main policy document setting the key priorities and directions of the inspection.[73] It provides in particular for an inspection at least each 3 years in the installations which present an important risk for human health and the environment, including all IPPC installations. Unplanned inspections in particular concerning emissions will be carried out for 10% of the installations subject to authorisation. This objective is still not reached.[74] Each year, the Ministry defines priority actions for the inspection of classified installations. For instance, one of the priorities for inspectors in 2011 is to focus on measures to be followed by classified installations to contribute to the good status of water bodies in 2015 as required under the Water Framework Directive.[75]

In 2006, 30,170 inspections were carried out (1,462 following a complaint, 4,452 following an accident or accidental pollution, 564 after the closing of an installation, and 27,693 planned). The number of scheduled visits rose significantly with an increase of over 100% in 10 years, from 13,000 to about 27,700 visits. In 2010, 94% of priority IPPC installations, 94% of IPPC installations with potential issues, and 80% of the other installations were inspected.[76]

There is a general increase in the number of controls. This is mainly due to the fact that decision-makers and citizens in France are more aware of the potential risks on health and the environment of classified installations.

2.2.2 Key elements of the inspection procedure

The inspectors have a full and permanent right to obtain from the operator the authorisation to enter the site of a classified installation and to be made available any document relating to the installation. Any action to oppose the carrying out of the inspection is qualified as an offence.

The inspectors are bound by professional confidentiality. They cannot reveal or use the manufacturing information they learnt through acceding to the documents relating to the installation. Disciplinary and criminal sanctions apply if they breach their obligation of confidentiality.

[76] Ministère de l'Ecologie du Développement durable des Transports et du Logement, inspections des installations classées, bilan détaillé des actions nationales 2010 available at: http://installationsclassees.ecologie.gouv.fr/IMG/pdf/bilan_detaille_des_actions_nationales_2010-1.pdf

The inspection's records and findings must be objective and any case of possible non-conformity should be discussed with the operator at the end of the visit. After the visit, the inspector must send to the operator a follow-up letter, which summarizes the inspection findings and describes the measures the inspector plans to propose.

2.2.3 The inspectors' enforcing powers

The main aim of an inspection is to verify compliance of the installation with the conditions set in the permit. When a potential instance of non-conformity is identified, the inspector can initiate an administrative or a criminal procedure. The inspectors have enforcement powers *(pouvoirs de police),* which means that they can issue formal record *(procès verbal)* of the infringement.

If the inspector considers there is ground for starting a criminal procedure, s/he will transmit to the Public Prosecutor *(Procureur de la République),* the formal record of the infringement. It is the Public Prosecutor who decides whether or not to prosecute.

2.2.4 Decision-making process for administrative measures and sanctions

As mentioned above, inspectors have enforcement power through the issuance of formal records but they cannot issue administrative sanctions. Their formal records identifying infringements are sent to the Prefects that are empowered to issue administrative sanctions.

The procedural steps to issue an administrative sanction for infringements to the transposing provisions of the IPPC Directive are covered by Article L.514-1 of the CoE that applies to all classified facilities. This Article provides that regardless of any criminal proceedings that might be brought, and when an inspector of classified installations or an expert appointed by the Minister responsible for classified installations has ascertained a failure to comply with the conditions imposed on the operator of a classified installation, the Prefect serves formal notice to the latter to comply with the said conditions by a set deadline. If, on expiry of the deadline set for performance, the operator has not complied with the said order, the Prefect may then issue administrative sanctions.

The letter of formal notice must take the form of an Order of the Prefect (*Arrêté Préfectoral*). This Order should, as every administrative decision, be motivated and explicitly mention the facts and the legal reasoning on which the decision is based. However the Council of State decided in Case *MEDAD vs. Ste Terrena* of 9 July 2007 that if inspectors identify infringements by operators of classified installations, the prefect has to issue a letter of formal notice requesting the operator to fulfil these requirements.[77] In that case, which represents the majority of cases the Order of the prefect does not have to be motivated.

The letter of formal notice shall specify the appropriate time-frame for the operator to comply with the requirements infringed (e.g. time-frame to complete necessary work on the installation). This time-frame shall not exceed three months and shall only be extended under very specific circumstances. The letter of formal notice cannot include new requirements to be fulfilled by operators.[78] Governmental guidelines recommend that this letter should not only be addressed to the alleged infringer but also to the mayor of the municipality where the installation is located. It also suggests that Prefects should inform interested persons, associations and legal or natural persons about the letter of formal notice (e.g. credit institutions issuing the financial guarantees).[79] Such obligations are however not covered by law.

[77] CE, *MEDAD c. Ste Terrena*, 9 July 2007, n 288367
[78] CE, 15 January 1986, *ministre de l'environnement c/ Société DSB*, req. n° 45118
[79] Circular 98-78 of 18 June related to classified installations for the protection of the environment : letter of formal notice under Article 23 of the Law of 19 July 1976 *(Circulaire n 98-72 du 18/06/98 relative aux installations classées pour la protection de l'environnement: Mise en demeure prévue par l'article 23 de la loi du 19/07/76)*

It is not required in the legislation that the Prefect, before issuing the letter of formal notice, should consult the operator of installations concerned. Several administrative courts have however considered that the letter of formal notice was an individual decision falling under the scope of Article 24 of the Law of 12 April 2000 on the right to citizens in their relationship with the administration.[80] Pursuant to this Article, individual decisions shall be issued only after the interested person was able to present written observations, and on his request oral observations. The Council of State, the highest administrative Court, has however decided in case *MEDAD vs. Ste Terrena* that these observation requirements could not apply to the procedure to issue a formal notice based on infringements identified by inspectors of classified installations.

Therefore the procedure to issue a formal notice was drastically strengthen by the decision of the Council of State in case *MEDAD vs. Ste Terrena* providing less opportunities for the operators to contest the letter of formal notice and reducing the margin of manoeuvre of the Prefect to the setting of the time-frame for the requirements to be fulfilled. The outcome of this case was summarised in a governmental guideline document for Prefects.[81]

It is thus less likely that letters of formal notice for operators of classified installations shall be challenged before administrative Courts because of procedural errors.

Administrative sanctions cannot be issued by the Prefect without prior formal notice to the operator of an installation, unless there is significant threat for health and public order.[82] The letter of formal notice is considered by the jurisprudence as a 'guaranty or last warning' for operators that enable them to regularise their legal situation before the issuance of sanctions.[83] This is confirmed by the fact that 3,000 letters of formal notice were issued in 2006 and only 360 administrative sanctions were imposed (around 10% of the letters of formal notice ended-up in an administrative sanction).

2.3 Appeal against the administrative decision

2.3.1 By the operator

Pursuant to Article L.514-6 (I) (1) of the CoE, administrative sanctions issued by the Prefect for the infringement of provisions of the CoE on classified installations (Article L.514-1) are subject to appeal with unlimited jurisdiction. They may be deferred to the administrative jurisdiction by the applicants for authorisation or operators within a period of two months beginning on the day on which they were informed of the said rulings.

Article L.160-1 of the CoE defines operators as any public or private natural or legal person that effectively exercises or controls, as a professional, an economic activity profitable or non-profitable.

2.3.2 By a person other than the operator

Article L.514-6 (I) (2) of the CoE, provides that administrative sanctions issued by the Prefect for the infringement of provisions of the CoE on classified installations (Article L.514-1) are subject to appeal by the following third parties:

-Persons or legal entities;

[80] CAA Bordeaux, 18 October 2005, *ministre de l'Aménagement du territoire et de l'Environnement c/ société Terrena*, req. n° 02BX00745 et 13 février 2006, *ministre de l'Ecologie et du Développement durable c/ établissements Aubrun*, req.n° 02BX01549)

[81] Circulaire du 03/08/07 relative aux installations classées - Arrêt du Conseil d'Etat du 9 juillet 2007 sur la procédure de mise en demeure

[82] CE, 31 Mai 1989, *Société Corse de Pyrotechnie Socopy et autres*

[83] CAA Nantes 16 December 1998 Arrêt Duliere req.n 96NT00872

-Municipalities or groups of municipalities;

They shall be concerned by the drawbacks or hazards the operation of the facility presents for the interests referred to in Article L. 511-1 (the convenience of the neighbourhood, public health and safety, agriculture, the protection of nature and the environment, the conservation of sites and monuments or elements of the archaeological heritage). They shall lodge a complaint to the administrative Court within a period of one year as of the publication or posting of the said rulings. However, if the installation did not start functioning after 6 months of the publication or posting of the ruling, a complaint can still be lodged 6 months after the start-up.

The time period is reduced to 6 months for quarries and one year to livestock farms and installations of public interest (See Article L.514-6 (II) of the CoE).

Persons in the neighbourhood

Interest parties are defined based on the geographic location of the installation, the nature of the installation, its size and its potential impacts on the interest set in Article L.511-1. It is noteworthy that persons lodging a complaint do not have to prove that they have an interest. It would be either the administration or the operators of the installation that will have to prove that the complainants do not have an interest to lodge a complaint.

Environmental associations

Pursuant to Article 6 of the Law of 1901, any association regularly declared can, without specific authorisation, access justice.[84] An association can only challenge an administrative measure that was based on a legislation that has a direct link with its field of activities (e.g. environmental associations on administrative decisions taken pursuant to the legislation on classified installations). Moreover, to grant *locus standi* the judge shall take into account the geographical area of action mentioned in the Statutes of the association (the geographical element). An administrative sanction issued to an operator of an installation in a specific region of France could only be challenged by an environmental association that includes in its Statutes this region as a geographical area of action. Article L.142-1 paragraph 1 of the CoE specifically provides that any association for the protection of the environment is allowed to initiate a case before the administrative Court for any complaints relating to the association's purposes. These associations shall however demonstrate that they have a legitimate interest to challenge this Act.

Pursuant to Article L.141-1 of the CoE, declared associations that exercise their statutory activities for at least three years, in the field of nature protection and the management of wild fauna, the improvement of the living environment, water protection, air, soils, sites and landscapes, and town planning, or those whose purpose is the control of pollution and nuisances and, in general, those working principally for the protection of the environment may be recognised by the administrative authorities are known as 'approved environmental protection associations'.

Article L.142-1 paragraph 2 provides that these 'approved environmental protection associations' are considered as being entitled to act against any administrative decisions with a direct relation to their purpose and their statutory activities and generating harmful effects on the environment on all or part of the territory for which it is approved. They could, for instance, challenge an administrative sanction related to the infringement of the legislation on classified installations to the administrative Court because they consider that this sanction is not stringent enough to impede potential harmful effects on the environment.

Municipalities or groups of municipalities

[84] Law of first July 1901 related to the association agreement *(Loi du 1er juillet 1901 relative au contrat d'association)*

Municipalities or groups of municipalities are entitled to challenge administrative sanctions issued for the infringement of provisions on classified installations. Pursuant to the French doctrine, their interest is defined based on the degree of exposition to potential nuisances from the installation and not only because the installation is on their territory. This is why the *locus standi* of municipalities was extended to foreign municipalities. For instance in the *Mines de Potasses d'Alsace* case the Council of State considered that some municipalities in Netherlands relying on Rhine water were entitled to challenge Orders of the Prefects related to the discharge carried out by a mining installation in the Rhine river.[85]

3. Judicial procedure (if relevant-with a focus on criminal sanctions)

3.1 General information

3.1.1 Initiation of a case and standing issues

The Public Prosecutor

As already mentioned above, when inspectors for classified installations identify infringements that could lead to a criminal sanction, they transmit this information in their formal record to the Public Prosecutor who decides whether or not to prosecute. The judiciary police *(la police judiciaire*) is also entitled to transmit identification of potential infringements to the Public Prosecutor (See Article L.514-13 of CoE).

Victims

Victims of the infringements can also provide allegations against the operators of classified installations before the Criminal Court *(Tribunal correctionnel)* or the Police. They also have the option to become private parties *(partie civile)* and file a claim before the Public prosecutor *(juge d'instruction*). Article 2 of the Code of Criminal Procedure, however provides that victims can bring this claim only if they have personally suffered damage directly caused by the offence. The jurisprudence strictly applies this causal link because it considers that criminal proceedings initiated by private parties shall remain the exception.

Environmental associations as potential victims

Before the entry into force of the Law of 2 February 1995 *(loi Barnier)*[86], environmental associations were not entitled to initiate criminal proceedings if they did not prove that criminal environmental offences were affecting the assets of the association. This requirement impeded them to initiate criminal proceedings since most of the time it was not their patrimony that was affected but their collective interest (e.g. the protection of the environment). Such situation has changed with the application of this Law, codified in Article L.142-2 of the CoE, which facilitates the initiation of criminal proceedings by environmental protection associations.

Pursuant to this Article, environmental associations declared for at least five years are entitled to initiate criminal proceedings, as private parties, against alleged infringements of provisions on classified installations if their Statutes include the safeguarding of one of the following interests: convenience of the neighbourhood, public health and safety, agriculture, protection of nature and the environment, conservation of sites and monuments or elements of the archaeological heritage.

[85] CE, *mine de potasses d'Alsace*, 15 October 1990 N° 80523

[86] Law n°95-101 of 2 February 1995 on the enhancement of environmental protection *(Loi n°95-101 du 2 février 1995 relative au renforcement de la protection de l'environnement)*

This Article also provides that approved associations, may exercise the rights recognised as those of the private parties with regard to acts which directly or indirectly damage the collective interests that they defend and which constitute an infringement of the legislative provisions relating to the protection of nature and the environment, to the improvement of the living environment, to the protection of water, air, soils, sites and landscapes, to town planning, or those whose purpose is the control of pollution and nuisances, and of the enactments for their application. These infringements would thus include criminal offences related to classified installations.

In other words, this provision gives the opportunity to almost all environmental associations to be constituted as private parties and to initiate criminal proceeding against infringements of provisions on classified installations.

Administrative bodies as potential victims

Several administrative bodies involved in the management of the environment such as:

- the Environment and Energy Management Agency *(L'Agence de l'environnement et de la maîtrise de l'énergie*);
- the Coastal Protection Agency *(le Conservatoire de l'espace littoral et des rivages lacustres);*
- Water Agencies *(les agences de l'eau);*
- the National Hunting and Wildlife Office *(l'Office national de la chasse et de la faune sauvage);*
- the National Monuments Centre *(le Centre des monuments nationaux)*;
- Chambers of Agriculture *(les chambres d'agriculture);*
- Regional Parks *(les parcs régionaux)* and
- Regional Forest Ownership Committees *(les centres régionaux de la propriété forestière);*

may also exercise the rights recognised as those of the civil party at a criminal court in relation to the acts constituting an infringement of the provisions relating to classified installations (See Article L.132-1 of the CoE).

3.1.2 Timing

The time period to issue a criminal sanction varies a lot depending on the specificities of each case. Where the infringements are already identified (e.g. through an official record from inspectors), the alleged offender shall thus directly appear in Court and a first judgement can be issues within one year or 18 months. Where the infringements are not clearly identified and the Public prosecutor *(le juge d' instruction)* shall further investigate, the first judgement can take place four or five years after the infringement. This is mainly due to the fact that several acts taken by the Public prosecutor during the investigation phase *(l'instruction)* can be challenged and subject to an appeal procedure.[87]

[87] Huglo Lepage & Partners, *Criminal Penalties in EU Member States' environmental law* (2003)

It is important to note that the French legislator established in 2004 a 'plead guilty' procedure which is applicable to persons who have committed a crime punishable by a fine or imprisonment for a time period not exceeding five years. The sanctions for the infringement of classified installations fall within the scope of this procedure (e.g. to operate a facility without authorisation can lead for individuals to a fine of up to Euros 75,000 and/or one year imprisonment). Under this procedure the Public Prosecutor can directly propose without trial one or several penalties to a person (including legal persons) that admits the facts and the infringements. The imprisonment penalty proposed by the Public Prosecutor cannot be superior to one year and cannot exceed half of the time period of the one prescribed by law. S/he can also propose a suspension of enforcement. If the offender agrees on the proposal of the Public Prosecutor, this proposal shall be homologated by the President of the Tribunal the same day the proposal was issued. This homologation has the same effect than a judgement (See Articles 495-7 to 495-16 of the Code of Criminal Procedure). Overall this procedure is much faster than the normal criminal procedure.

3.2 Possibilities of appeal

All criminal judgements can be appealed, and the decisions taken by Courts of Appeal *(Chambres correctionnelles des Cours d'appel)* can also be brought to the highest Criminal Court (la chambre criminelle de la cour de cassation) that judges in law. Pursuant to Article 498 of the Code of Criminal Procedure, appeals to the Courts of Appeal shall be issued within 10 days after the judgement was pronounced. Pursuant to Article 568 of the Code of Criminal procedure the decision to appeal the judgement of the Court of Appeal to the highest criminal court shall be issued within five days after the decision of the Court of Appeal was pronounced.

4. Synergies between administrative and criminal procedures

Both administrative and criminal sanctions can apply for the infringement of the legislation on classified installation in France. These sanctions can be imposed separately on the offender and even be cumulative. For instance the non-respect of the requirement set in the letter of formal notice issued by the prefect to close an installation or suspend its activity can both lead to an administrative sanction (Article L.514-1 of the CoE) and a criminal sanction (Article L.514-11 of the CoE). The Constitutional Council considers that the rule of *non bis in idem* does not prohibit the combination of criminal and administrative sanctions incurred for the same facts since these sanctions do not have the same purpose and the interests they aim to safeguard are not identical. The Constitutional Council, however, provides that this cumulation of administrative and criminal sanctions shall be subject to the principle of proportionality. For instance, the total amount of administrative fines and criminal fines issued for the same facts shall not exceed the highest amount possible between these two penalties.[88]

5. Conclusions

Proportionality

Administrative sanctions, issued by the Prefect are: the suspension of the operation, the closure or removal of the installation, the sealing of the installation, the deposit of a sum corresponding to the cost of the work to be carried out and the enforcement ex officio of the measures required. Prefects can apply the appropriate sanction for each specific infringement. Such approach can be assessed as fulfilling the criterion of proportionality.

[88] Constitutional Council Decision No ° 89-260 DC of 28 July 1989, § 16-22.

The criminal offences related to the infringement of classified installations are very detailed in the CoE. Each of these specific offences has corresponding sanctions that can drastically differ from one to another. For instance the failure to notify modifications to the facility can lead to a fine up to Euros 1,500 while the operation of an installation without authorisation can lead to a fine up to Euros 75,000 and up to one year imprisonment. Furthermore Judges have leeway in the setting of criminal sanctions (e.g. up to certain amount or up to certain time-period of imprisonment). Criminal sanctions for the different infringement of provisions related to classified installations should thus be considered proportionate.

Effectiveness

The letter of formal notice is considered by the jurisprudence as a 'guaranty or last warning' for operators enabling them to regularise their legal situation before the issuance of sanctions. This approach is quite effective since almost all operators comply with the requirements set in the letter of formal notice, (for instance, in 2006, only 10% of letters of formal notice related to infringement on classified installations ended-up in an administrative sanction). Specific provisions are set in the CoE that facilitate appeals against administrative decisions related to classified installations by environmental associations and municipalities or groups of municipalities. The role of environmental associations and municipalities in the administrative procedure can concur to a more effective application of administrative sanctions.

Environmental associations, together with several administrative bodies involved in the management of the environment can be constituted private parties and take part in the criminal proceedings against infringements of provisions on classified installations. In 2004, the French legislator also established a plead-guilty criminal procedure. The majority of the criminal sanctions related to classified installations can be dealt with under this procedure which is much quicker than the normal one. The involvement of these private parties in the criminal procedure and the setting of the guilty plea procedure may lead to a more effective application of criminal sanctions related to the infringement of provisions on classified installations.

Dissuasiveness

The administrative sanctions are quite stringent (e.g. the closure or removal of the installation) although they do not comprise fines. The criminal sanctions can lead to a fine up to Euros 75,000 (Euros 375,000 for legal persons) and one year of imprisonment plus specific sanctions for legal persons (e.g. the final closure or a suspension of the installation for a period of five years). Administrative and criminal sanctions can be cumulative. This possibility reinforces their dissuasiveness.

Case studies

Introduction

Information on the two cases was provided by Inspector of IPPC installations of the DRIRE[89] respectively in charge of the Region Languedoc Roussillon and Picardy.
In the first case study, the sanctioning procedure started in January 2001 and ended by a decision of the Criminal Court in April 2010. The operator was considered guilty but the Court decided not to impose a sanction because in the meantime the operator regularised the situation. The sanctioning procedure here was unusually long, more than 9 years. This example demonstrates the necessity for inspectors to have some sanctioning power. This may reduce the length of the sanctioning procedure for IPPC installations in France.
In the second case study, the sanctioning procedure started in December 2005 and ended-up by a criminal sanction issued by the Court in June 2007 almost two years and a half. In the meantime the Prefect requested in April 2006, an administrative sanction which was the suspension of the activity until the operator regularised the situation. This administrative sanction was very effective and the operator quickly complied with the law. This example shows that even though administrative sanctions may not have the dissuasiveness of criminal sanctions, they seem however to be more effective. The sanctioning administrative procedure is less time consuming and more flexible than the criminal procedure.

Case study 1: enforcement procedure for operating without authorisation

Timeline of the procedure

Description of the background

The facility is established since 1986 in the outskirts of Nimes in an industrial zone. It produces and stocks chemical and maintenance products (e.g. liquid soap, swimming pool products, demineralised water). It employs 35 persons. In 2007 it had a turnover of Euros 17 million.

Legislation applicable

This installation requires an authorisation under Title V of the Code of the Environment on classified installation. It is an IPPC installation.

Administrative procedure

In December 2000, an accidental spill of chemicals in the facility caused water pollution in a nearby river. This accident triggered an inspection from the DRIRE of the Languedoc Roussillon Region. This inspection revealed that the facility undergone substantial changes since 1986 and that some of its

[89] General Directorate of Industry, Research and Environment *(Direction Générale de l'Industrie de la Recherche et de l'Environnement)*

activities were falling under the IPPC authorisation regime.[90] The facility, however, was operating without IPPC authorisation.

In January 2001, the Prefect (the representative of the State in the Regions) issued a letter of formal notice requiring the facility to:

- Regularise activities falling under the regime of the IPPC authorisation (storage of flammable liquids, filling facilities, unloading tanks and storage warehouses for plastics);
- Stop the unloading of truck tanks (unauthorized installation and not designed for that purpose);
- Change the design of the area where truck tanks are unloading.

The operators did not comply with the letter of formal notice. However, the prefect did not issue administrative sanctions. Besides, the Inspection Department did not submit a formal record *(procès-verbal)* of the infringement to the Public Prosecutor *(Procureur de la République).*[91]

Only in September 2007, the operator of the facility submitted an application for authorisation to the Prefect. The Prefect sent the application to the Inspection Department for evaluation. The authorisation dossier was considered incomplete and not admissible by the Inspection Department.

In October 2007, the Inspection Department in accordance with Article L-514-13,[92] reported to the Public Prosecutor the infringement of the following Articles of the Code of the Environment:

*Article L512-1:*The facilities that present serious hazards or drawbacks for the interests referred to in Article L. 511-1 [e.g. hazards or drawbacks for public health and safety, or for agriculture, or for the protection of nature and the environment] are subject to authorisation by the Prefect. The authorisation may be granted only if these hazards or drawbacks can be prevented by measures which are specified by the Prefect […].

Article L.511-1: When a classified facility is operated without the declaration or authorisation required by virtue of the present Title, the Prefect serves the operator with official notice to regularise the said situation before a given date limit, by submitting, as applicable, a declaration or an authorisation application […].

This formal record also mentioned that these infringements could lead to the sanctions covered by the following Articles of the Code of the Environment:
Article L.514-9-1: The operation of a facility without the authorisation required is punishable by one year's imprisonment and a fine of Euros 75,000.
Article L.514-11-2: The continued operation of a classified facility while failing to comply with the summons to meet, within a set time, the technical stipulations determined for the application of Articles L. 512-1 [on the obligation of authorisation] […] is punishable by six months' imprisonment and a fine of Euros 75,000.

Result of in-situ analyses requested by the Inspection Department in 2003 showed a pollution of the underground water below the facility by hydrocarbon and ethyl alcohol. In December 2007 the Prefect required the operator of the facility to take urgent necessary measures to stop this water pollution.[93] These measures were consequently taken by the operator.

[90] This facility registered in 1986 under the declaration regime. There are no inspection requirements for facilities falling under this regime.
[91]The Public Prosecutor is in charge of deciding whether or not criminal proceedings must be initiated.
[92]Official translation of Article L514-13: Infringements are officially reported by officers of the judiciary police and classified facility inspectors. These reports are drawn up in duplicate, one copy being sent to the Prefect and the other to the Public Prosecutor. They have probative force unless proven otherwise.
[93]This decision was based on Article L512-7 of the Code of the Environment.

A new application for authorisation was submitted to the Prefect in June 2008. It was again considered as incomplete and not sufficiently developed by the Inspection Department. The Prefect issued a letter of formal notice requiring the facility to comply with all legal requirements on classified installation within a time period of three months.

A new application was submitted to the Prefect in February 2009. The Inspection Department's assessment concluded that the data used related to the emission of solvents were wrong. The Inspection Department required the operator to set a management plan on emission of solvents to justify that they were complying with the relevant emission limit values requirements.

In March 2009, the operator has provided the Inspection Department with a management plan of solvents.

In May 2009, the operator submitted to the Prefect a new application dossier for an IPPC authorization. This dossier was considered acceptable and the public enquiry procedure did not reveal any opposition against the authorization. The authorisation was granted end of 2009.

Criminal procedure

The Department of Inspection in charge of classified installations issued in 2007 a formal record mentioning several infringements to the legislation on classified installations to the Public prosecutor of the Republic. Inspectors considered that there was ground for starting a criminal procedure. The Public Prosecutor decided to initiate a criminal procedure against the operator (natural person) of the facility. No civil parties were involved in the criminal proceedings. The Criminal Court of Nimes pronounced its judgment in June 2010. No appeal was lodged against the decision of the Court.

Information on the sanction

The operator was considered guilty by the Criminal Court of Nimes *(le Tribunal correctionnel)* for the infringement to Articles L.512-1 and L.511-1 of the Code of the Environment (quoted above) for operating a facility without an authorisation and for not complying with the letter of formal notice of the Prefect. However, no sanction was imposed on the operator. The Court decided not to impose sanctions considering the fact that the facility was already complying with the legislation on classified installations before the end of the criminal procedure.

Effectiveness

The interviewee stressed that sanctions could be more effectively applied if inspectors were empowered to issue sanctions like pecuniary fines instead of being only limited to submit formal records to the Public Prosecutor and the prefect. It pointed out that the criminal procedure could sometimes be quite long and thus limit the efficiency of the sanctions. For instance in this specific case the inspector transmitted a formal record to the Public Prosecutor in 2007 and the Criminal Court issued its decision only in 2010, three years later.

He also stated that the role of civil parties in the criminal procedure could be a factor of effectiveness. He mentioned that civil parties were not sufficiently involved in the criminal procedure because they were not aware of the official records submitted by the inspectors to the Public Prosecutor. He

Official translation of Article L512-7: In order to protect the interests referred to in Article L. 511-1, the Prefect may order the evaluations to be conducted or the remedies to be implemented which are rendered necessary either by the consequences of an accident or an incident occurring in the facility, or by the consequences of a failure to comply with the conditions imposed by the present Title, or by any other hazard or drawback interfering or threatening to harm the aforementioned interests. These measures are set out in rulings issued, except in case of an emergency, after an opinion has been given by the competent advisory commission on the level of the department.

underlined that these documents were publically available on request but were not published on internet or posted in a public place.

Proportionality

The interviewee underlined that as 'an internal rule' formal records of infringements to the legislation on classified installations were only submitted to the Public Prosecutor if there was a potential threat for health and the environment. Similarly it mentioned that administrative sanctions such as the suspension of the activity were more likely to be issued when there was no sign of cooperation from the operator to comply with the letter of formal notice and that this non-compliance could potentially lead to a threat for human health and the environment.

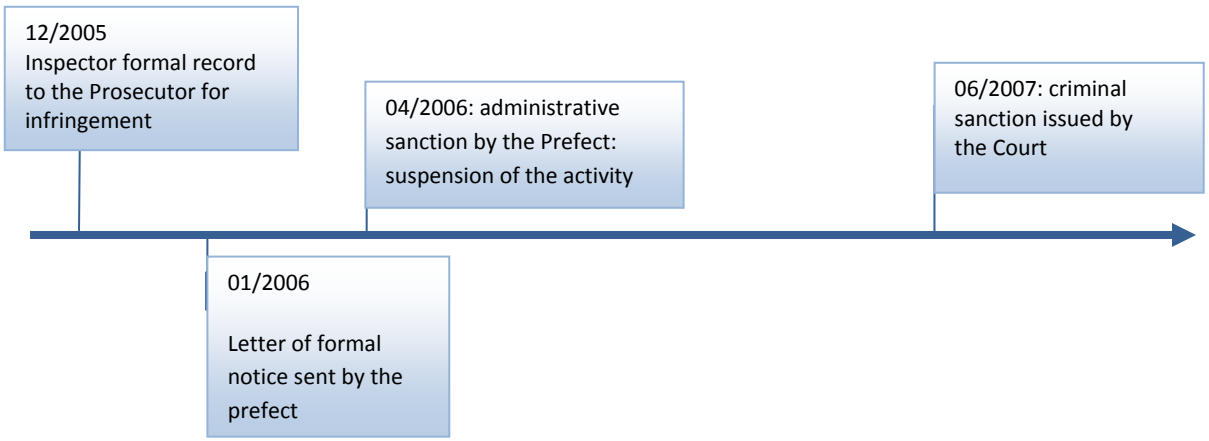
As a general conclusion the interviewee underlined that the protection of human health and the environment was the main priority of inspectors. If there was no such threat and the operators were willing to comply with the legislation it would be unlikely that an administrative or criminal procedure would be initiated. This is mainly to limit the impact of the sanction on other interests such as the economic situation of the facility and its employees.

Dissuasiveness

According to the interviewee, the behaviour of the operator changed from the moment he was aware of the formal record submitted to the Public Prosecutor for the infringement to the legislation on classified installations. The operator pro-actively requested the grant of an IPPC authorisation to comply with the legislation on classified installations. The interviewee also noted that the initiation of the criminal procedure in the case mentioned above had a deterrent effect on the other operators of classified installations in the nearby areas.[94]

Case Study 2: administrative and criminal sanctions for operating without authorisation

Timeline of the procedure



Description of the background

[94] The interviewee explained that part of the deterrent effect was due to the notoriety of the operator of the facility who was the representative of the employer association in the Region Languedoc Roussillon.

The installation is a landfill of non-hazardous waste. When it first started operating in 1998 the site was authorised to store 28,500 tons per year of waste. Now it is authorised to store 100,000 tons per year. It is one of the three main treatment centres of household waste in the L'Aisne (a French Region at the North of Paris). Its activity was extended several times, the last extension being in 2008.
A first IPPC authorisation was granted for three sections of the landfill site. When these sections were full the operator built another section without requiring an authorisation. This section was authorised retrospectively but for a limited period of time. The operator then requested an authorisation for ten sections. An authorisation was granted for these ten sections. The operator started building these ten sections but could not finish on time and therefore continued operating the newly built section even though the time period for the authorisation ended. In other words this section was used without authorisation.

Legislation applicable

This installation requires an authorisation under Title V of the Code of the Environment on classified installation. It is an IPPC installation falling under Point 5.4 of Annex I to the IPPC Directive.[95]

Procedure

In December 2005 the Department of Inspection of the DRIRE in Picardy visited the site of the facility. The inspectors discovered that one section of the landfill was in use without authorisation. A formal record was sent to the Public Prosecutor mentioning this infringement. The gendarmerie (a military force charged with police duties among civilian population) heard the operator. The Public Prosecutor sought the opinion of the Department of inspection. He/she finally decided to initiate criminal proceedings against the operator.

Beginning of 2006, the Prefect sent a letter of formal notice to the operator with an injunction to regularise its legal situation. In April 2006, since the operator did not comply with the letter of formal notice, the Prefect decided, as an administrative sanction, to suspend the operation of the section until an authorisation was granted.
In June 2007, the case was heard at the Criminal Court who issued its decision in September 2007. The operator was considered guilty to operate a facility without authorisation and was imposed a criminal fine of Euros 10,000.

General comments on sanctions

The interviewee considered that the operation of an installation without an authorisation was one of the most serious offence *(délits)* related to the legislation on classified installations. This offence could lead to one year's imprisonment and a fine of Euros 75,000. This is the reason why the Public Prosecutor decided to initiate criminal proceedings at the Criminal Court *(Tribunal Correctionnel)* which is dealing with offences and not at the Police Tribunal *(Tribunal de Police)* which is dealing with petty offences *(contravention).*

He pointed out that compared to other countries inspectors of IPPC installations in France did not have sanctioning power.

Effectiveness

The interviewee underlined that the criminal sanction was issued after the infringement ended. The operator was granted an authorisation before the decision of the Criminal Court was issued. He

[95]Landfills receiving more than 10 tonnes per day or with a total capacity exceeding 25,000 tonnes, excluding landfills of inert waste.

considered that the administrative sanction, to suspend the operation of the activity by the Prefect until the authorisation was granted, was very effective since the operator promptly regularized its situation.

Proportionality

Pursuant to Article L.514-9 of the Code of the Environment, the operation of a facility without the authorisation required is punishable by one year's imprisonment and a fine of Euros 75,000. In that case the Criminal Court decided to impose a criminal sanction on the operator of Euros 10,000. The interviewee indicated that the sanctions and their level were never motivated by the Court. He, however, supposed that the sanction was not so high because the operator regularized its situation before the end of the criminal procedure. He also mentioned that the fact that incoming household waste had to be treated anyway might have been considered as a mitigating circumstance, to operate a section without authorisation.

Dissuasiveness

The interviewee said it was extremely difficult to assess the dissuasiveness of such a sanction on the operator and on operators of similar installations. He, however, mentioned that inspectors visited the site several times (two to three visits per year) since the issuance of the sanction and they did not notice any infringements to the legislation on classified installations.

Annex III- Germany

Sanctions and procedures applicable to breaches of the legislation on industrial emissions in Germany

Executive Summary

In Germany, measures to respond to infringements of IPPC related obligations consist of administrative (quasi) criminal penalties, criminal penalties and administrative measures. Whereas the penalties aim to punish the perpetrator, administrative measures are aimed to prevent or eliminate infringements of IPPC-related obligations.

The Federal Immission Control Act, the Federal Waste Management Act and the Federal Water Act mainly transpose the IPPC Directive and provide for administrative (quasi) criminal sanctions in relation to almost all IPPC related obligations.

The legislation of the 16 Federal States (Länder)[96] complements the transposition of the IPPC Directive and provides for a few additional administrative criminal penalties for infringements.

Federal and Länder administrative (quasi) criminal penalties range from Euros 5 to 50,000. Irrespective of this, the fine should be higher than the economic benefit that the perpetrator has drawn from the perpetration of the administrative (quasi) criminal offence. Hence, a fine may be much higher than Euros 50,000.

In the light of the discretionary principle, it is left to the discretionary power of the competent regulatory authorities, whether or not they prosecute an administrative (quasi) criminal offence.

The environmental criminal law, regulated on the federal level, punishes infringements of major IPPC-related obligations, e.g. infringements of the permit requirement, with up to three years of imprisonment or a fine. In addition, the general environmental criminal law punishes infringements of IPPC-related obligations, if these infringements cause significant damage to the environment, i.e. flora and fauna, soil, water or air with up to five years of imprisonment or a fine. In application of the principle of mandatory prosecution, the regional public prosecution offices must prosecute criminal offences.

The Federal Immission Control Act provides the competent regulatory authorities of the Länder with various measures to enforce compliance with IPPC related obligations, the most stringent of which are the closure or removal of the installation and the withdrawal of the permit. The Federal Waste Management Acts of the Länder provide for similar measures in relation to IPPC landfills. A permit to discharge waste water from IPPC installations (or a permit for other IPPC related water usages) can be withdrawn on the basis of the Federal Water Act.

To monitor the operator's compliance, the competent authorities of the Länder are entitled to inspect the installation and the operational premises, to audit operational documents and to take samples without prior notification to the operator. The operator is obliged to cooperate with the inspectors and to provide them with the requested information. Operators can challenge administrative (quasi) criminal penalties and criminal penalties before the criminal courts and administrative measures before the administrative courts. In the case of administrative (quasi) criminal penalties and administrative measures, the procedural rules require that the administrative decision is first reassessed by an administrative authority before a court procedure may be initiated (hierarchical recourse).

[96] This study not exhaustively reflects the Länder legislation, but presents examples of different Länder. It focuses on the legislation of North-Rhine Westphalia.

Neither individuals nor non-governmental organisations are entitled to join the administrative (quasi) criminal or the criminal procedure. Neighbours are entitled to challenge a permit for an IPPC installation if this installation violates their property rights or health. The Court of Justice of the European Union decided with judgement[97] of 12 May 2011 that the national legislation regulating the standing of non-governmental organisations in court procedures infringes Directive 2003/35/EC and that, as a minimum, non-governmental organisations must have standing to enforce all national provisions based on European environmental legislation.

The table below indicates the Articles of the IPPC Directive covered by sanctions/measures in Germany.

1. Applicable sanctions

National measures to respond to an infringement of IPPC-related obligations consist of administrative (quasi) criminal penalties, criminal penalties and administrative measures. While administrative (quasi) criminal penalties and administrative measures are regulated in the legislation transposing the IPPC Directive, i.e. the Federal Immission Control Act,[99] the Federal Waste Management Act,[100] the Federal Water Act[101] and the complementing Länder legislation, the criminal penalties are laid down in the German Criminal Code,[102] in the chapter concerning environmental criminal law. Administrative (quasi) criminal penalties and criminal penalties are aimed to punish the perpetrator.[103] Administrative measures, on the other hand, are aimed to prevent or eliminate an infringement of IPPC-related obligations and to restore legality if the infringement has already taken place.[104]

1.1. Administrative (quasi) criminal and criminal penalties

Administrative (quasi) criminal penalties cover the infringements of all enforceable provisions of the IPPC Directive, whereas criminal penalties only cover its main obligations (see Table 1 above). Criminal and administrative (quasi) criminal offences follow the same structure, e.g. they require that the perpetrator committed the offence deliberately or negligently. However, administrative (quasi) criminal offences and environmental criminal offences differ in terms of applicable penalties. Whereas administrative (quasi) criminal offences are punished with a fine, criminal offences are punished with imprisonment and/or a fine.[105] Furthermore, in general, administrative (quasi) criminal penalties are aimed to punish petty offences while criminal penalties are applicable in the case of more severe crimes.[106]

To differentiate exactly between administrative (quasi) criminal and criminal penalties is important, because criminal law and administrative (quasi) criminal law diverge in many aspects. Some penalties are only available under criminal law, e.g. imprisonment or the ban to carry out a certain profession. In addition, where it is left to the discretionary power of the competent authority to prosecute an administrative (quasi) criminal offence (§ 47 of the AdministrativeCriminal Offences Act – OWiG), the public prosecutors are obliged to investigate and prosecute a criminal offence under the principle of mandatory prosecution (§ 152 of the Code of Criminal Procedure – StPO). Finally, the procedural rules are regulated in different procedural acts and differ substantially. The procedural rules for the prosecution and punishment of administrative (quasi) criminal offences are regulated in the Administrative Criminal Offences Act and the procedural rules for the prosecution and punishment of criminal offences are regulated in the Code of Criminal Procedure.[107] This section at first outlines the applicable administrative (quasi) criminal penalties and in its second part deals with IPPC-related criminal penalties.

[107] With regard to the practical differences between criminal and administrative (quasi) criminal law see: Mitch, *Law of administrative (quasi) criminal offences*, § 3 paragraph 1.

1.1.1. Administrative (quasi) criminal penalties

The Federal Immission Control Act, the Federal Waste Management Act and the Federal Water Act mainly transpose the IPPC Directive and set the applicable administrative (quasi) criminal penalties.

Most IPPC installations are subject to the permit procedure under the Federal Immission Control Act that sets the regulatory framework for the protection from emissions into the air. Therefore, this act includes most of the administrative (quasi) criminal penalties for infringements of IPPC related obligations. Some sanctions are also regulated in the Federal Waste Management Act and the Federal Water Act that set the regulatory framework for the management of waste and the protection of water bodies and complement the Federal Immission Control Act in transposing the IPPC Directive.

Only IPPC landfills are subject to the permit procedure under the Federal Waste Management Act. This act and the Federal Landfill Ordinance set the main regulatory requirements for IPPC landfills and sanction infringements of IPPC related obligations. Complementary obligations and sanctions are regulated in the Federal Immission Control Act and the Federal Water Act.

In order to comply with the water related IPPC requirements operators of all IPPC installations need a permit for the discharge of waste water from these installations and for additional water usage under the Federal Water Act; the discharge of waste water and the usage of water without permit is sanctioned. Besides penalties, as additional measure to limit the discharge of waste water, Germany has adopted a waste water charge (Federal Waste Water Charges Act – AbwAG). The scale of this charge depends on the types of polluting substances concerned.

The administrative (quasi) criminal penalties cover almost all infringements of national obligations transposing the IPPC Directive. The applicable fines ('*Bußgelder*') range from Euros 5 to Euros 50,000. Whereas severe offences are sanctioned with maximum fines of Euros 50,000 (e.g. the operation without a permit) less severe offences are sanctioned with maximum fines of Euros 10,000 (e.g. the non-provision of information to inspectors). In case of a negligent perpetration the scale of the fine is reduced by half. Legal persons can be fined to the same extent as individuals if their representatives commit the offence.

The amount of the fine imposed on the perpetrator for committing a specific offence is determined by an assessment of the severity of the offence, the level of guilt of the perpetrator and his financial situation (§ 17(3) OWiG). Irrespective of these criteria, the fine should be higher than the economic benefit that the perpetrator has drawn from the perpetration of the administrative (quasi) criminal offence. Hence, a fine may be much higher than Euros 50,000 (§ 17(4) OWiG). 'Should' must be interpreted so that the competent authority is required to apply this rule in typical cases, however, is enabled to derogate from it in a-typical cases.

In addition, the Länder specifies the scale of fines by adopting indicative catalogues of fines. According to the catalogue of fines for infringements against environment related provisions of North-Rhine Westphalia ('*Bußgeldkatalog Umwelt*') of 2006[108] the scale of fines for the construction of installations (including IPPC) without permit (i.e. unauthorised construction) depends on the value of the constructed installation:

- If the value of the installation is less than Euros 50,000 ,the fine ranges between Euros 510 and 2,600;
- If the value of the installation is between Euros 50,000 and 500,000 ,the fine ranges between Euros 510 and 5,100;

[108] The fine catalogue environment of North-Rhine Westphalia of 2006 was established by the Ministry for the Environment, Nature Conservation, Agriculture and Consumer Protection of North-Rhine Westphalia and is available at: http://www.kreisjaegerschaft-coesfeld.de/red/ges-bussgeldkatalog-umwelt-nrw-2010-02-27.pdf

- If the value of the installation is between Euros 500,000 and 5,000,000 ,the fine ranges between Euros 2,600 and 25,600; and
- If the value of the installation is more thatn 5,000,000 , the fine ranges between 5,100 and 50,000.

The catalogue contains indicative fines for many other infringements.

To enforce the payment of the fine the convicted person may be arrested for a maximum of six weeks if one offence has been committed and for a maximum of three months if several offences have been committed (§ 96 OWiG). However, these measures only serve to enforce the punishment and are not measures of punishment per se. The alleged perpetrator has two weeks to appeal against the fine after he has received the fine notice. If he does not appeal against the fine, he must pay the fine four weeks after the receipt of this notice (§ 66 OWiG).

Note that the Länder legislation includes complementary legislation to transpose the IPPC Directive that also provides for administrative (quasi) criminal sanctions. All 16 Länder have adopted laws that regulate the requirement to provide for an emission declaration in relation to the discharge of waste water. Some laws sanction the lack of, late or incorrect notification of this declaration to the competent authority with a fine (e.g. § 14 of the Bavarian IPPC-Wastewater-Ordinance that provides for a fine of up to Euros 5,000). In addition, some of the waste management acts of the Länder provide for complementary provisions and sanctions, e.g. the failure to report accidents of IPPC landfills and other IPPC waste disposal facilities to the competent authority is sanctioned by North-Rhine Westphalia with a fine of up to Euros 50,000 (§ 44(1) no.9 and (2) of the Waste Management Act of North-Rhine Westphalia).

1.1.2. Criminal penalties

The environmental criminal law sanctions the operation of or significant changes to an IPPC installation without permit or the infringement of essential permit requirements,[109] e.g. infringements of mandatory emission limit values (§ 327(2) no.1 (3) of the Criminal Code – StGB).[110] In case of an intentional perpetration of these offences the penalty is imprisonment for a maximum of three years or a maximum fine of 360 daily units and, where legal persons are liable for their representatives, up to an amount of Euros 1,000,000. In case of negligence the penalty is imprisonment for a maximum of two years or a maximum fine of 360 daily units and, where legal persons are liable for their representatives, up to an amount of Euros 500,000. The same penalties apply to operators that run a landfill in the meaning of the Waste Management Act without a permit or in non-compliance with essential permit requirements (§ 327(2) no.3, (3) of the national Criminal Code).

If these offences are committed under aggravated circumstances the punishment is between six months and 10 years (§ 330(1) no.1 StGB). Environment-related aggravated circumstances are met if the unauthorised operation is carried out deliberately and seriously and permanently pollutes a river, soil or protected areas, if it endangers the water supply or, lastly, if endangered species of fauna and flora are permanently damaged.

It is left to the discretionary power of the criminal judge to determine the penalty taking into account the severity of the crime and the personal guilt of the perpetrator. In relation to the financial penalties the judge is entitled to impose penalties between a minimum of three and a maximum of 360 daily units. The judge determines the amount of one daily unit while taking into account the economic background of the convict. The amount of one daily unit is a minimum of Euro one and a maximum of Euros 30,000.

[109] See Fischer, *Legal commentary to the Criminal Code*, § 327 paragraph 12.
[110] Ibid.

Additionally, German environmental criminal law contains a number of provisions (§ 324-330d StGB) that sanction the violation of administrative provisions if these violations lead to serious negative impacts on the environment. In accordance with § 325(1) of the Criminal Code for example the operation of an installation in violation of duties under administrative law that causes air pollution which can harm human health, animals, plants or other property of significant value shall be punished. The perpetrator is liable to imprisonment for a maximum of five years or a maximum fine of 360 daily units in case of an intentional perpetration and to imprisonment for a maximum of three years or a maximum fine of 360 daily units in case of negligence (liability of legal persons for intentional perpetration: maximum fines of Euros 1,000,000; liability of legal persons for negligence: Euros 500,000).

In addition to penalties, the court is entitled to confiscate the profit of the operator made by the perpetration of the environmental crime (§§ 73 ff. of the Criminal Code).

It is noteworthy that the principle of administrative accessoriness applies to environmental criminal law.[111] In accordance with this principle, the offences are only punishable under the condition that the perpetrator violates an administrative obligation, e.g. operates an installation without a permit. The legitimacy of the application of this principle is controversially discussed in Germany.[112] However, in accordance with the opinion of the national courts and the majority of legal scholars[113] the application of this principle does not breach the Constitution and is considered as legitimate.

It should be also mentioned that the current environmental criminal law is subject to reform in the framework of the transposition[114] of Directive 2008/99/EC on the protection of the environment through criminal law.[115]

Table 2 below indicates the main administrative (quasi) criminal and criminal offences and related penalties applicable at the federal level in Germany for each of the key enforceable obligations under the IPPC Directive.

[111] This principle does not apply in the context of § 330a of the Criminal Code. Under certain conditions this provision sanctions anyone who diffuses or releases substances which contain or can generate poisons.
[112] However, in accordance with the opinion of the national courts and the majority of legal scholars[112] the application of this principle does not breach the constitution and is necessary.
[113] See Thomas Fischer, *commentary to the Criminal Code*, 57 edition 2010, prior to § 324 paragraph 6
[114] The transposition deadline expired on 26 December 2010.
[115] Available at: http://dipbt.bundestag.de/dip21/btd/17/053/1705391.pdf - To initiate the legislative procedure, the federal government submitted its bill to the federal parliament where the bill received its first reading on 7 July 2011. Three readings are necessary before it can be adopted.

Table 2: Directive 2008/1/EC (IPPC Directive): types of offences and related administrative (quasi) *criminal and criminal penalties in Germany*

	Administrative (quasi) **criminal**		**Criminal**	
	Offences	**Penalties (intentional/negligent)**	**Offences**	**Penalties (intentional/negligent)**
Obligation to apply for a permit for new or existing installations	Intentional/ negligent construction of or making substantial changes to IPPC installations that require a permit under the Federal Immission Control Act without permit. ***§ 62(1) no.1 and (3) in conjunction with § 4 and § 16 Federal Immission Control Act (BImSchG)***	Maximum fine of Euros 50,000/25,000 identical fines for legal persons.	Intentional/ negligent operation of or substantial change to an IPPC installation. ***§ 327(2) no.1 and no.3, (3) StGB***	Maximum imprisonment of 3 years or a maximum fine of 360 daily units/ maximum imprisonment of 2 years or a maximum fine of 360 daily units, legal persons: Maximum fines of Euros 1,000,000/ Euros 500,000.
	Construction of or substantial changes to landfills without plan approval. ***§§ 61(1) no.2a, § 31(2) of the Federal Waste Management Act (KrW-/AbfG)***	Maximum fine of Euros 50,000/25,000 identical fine for legal persons.		
	Discharge of waste water from installations without a permit. ***§ 41(1) no.1 of the Federal Water Act.***	Maximum fine of Euros 50,000/25,000 identical fine for legal persons.		
Obligation to supply information for application for permits	Obligation to provide specific information for permit application under the Federal Immission Control Act. ***§§ 4, 4a of the Federal Ordinance on the Permit Procedure (9.BImSchV)***	The infringement of these obligations does not lead to sanctions, but as a consequence of this infringement the authority will not grant the permit.	N/A	N/A
	Obligation to provide information within the plan approval procedure for waste facilities that are subject to an Environmental Impact assessment on the other hand. ***§§ 73(1) of the Administrative Procedure Acts of the Länder***			
Obligation to notify the competent authority of any changes in the operation of an installation	Intentional/ negligent non-notification, incorrect, incomplete or late notification of any changes to an installation that requires a permit under the Federal Immission Control Act (not for landfills). ***§ 62 (2) no.1 and (3) in conjunction***	Maximum fine of Euros 10,000/5,000 identical fine for legal persons.	N/A	N/A

	Administrative (quasi) criminal		Criminal	
	Offences	**Penalties (intentional/negligent)**	**Offences**	**Penalties (intentional/negligent)**
	with § 15(1) BImSchG			
Obligation to comply with the conditions set in the permit or mandatory ELVs	IPPC-installations (without IPPC landfills): Intentional/ negligent non-compliance, incorrect, incomplete or belated compliance with enforceable conditions or obligations set in the permit (or a licence for premature beginning) or with subsequent administrative acts that are aimed to enforce the compliance with the requirements of the BImSchG for IPPC installation. ***§ 62(1) no.3 and (3) in conjunction with § 8a(2) sentence 2 or 12(1) BImSchG; § 62(1) no. 5 and (3) in conjunction with § 17(1) BImSchG***	Maximum fine of Euros 50,000/25,000 identical fine for legal persons.	Intentional/ negligent violation of essential requirements of the permit for an IPPC installation. ***§ 327(2) no.1 and no.3, (3) StGB***	Maximum imprisonment of 3 years or a maximum fine of 360 daily units/ maximum imprisonment of 2 years or a maximum fine of 360 daily units, legal persons: Maximum fines of Euros 1,000,000/ 500,000.
	To non- incorrectly, incompletely or lately inform inspectors; to prohibit inspections, non- provision of documents for inspectors in case of inspections; to refuse to allow inspectors to take samples in case of inspections or that they scrutinise the level of emissions. ***§ 62(2) no.4 and no.5 in conjunction with § 62 (3) and § 52 BImSchG***	Maximum fine of Euros 10,000/5,000 identical fine for legal persons.		
	Non-reporting of the results of the measurements of the emissions or non-storing of recordings based on the results of the measuring devices. ***§ 62(2) no. 3 and (3) in conjunction with § 31 sentence 1 BImSchG***	Maximum fine of Euros 10,000/5,000 identical fine for legal persons.		
	Non-, incorrect, incomplete or late reporting to the authority that an accident has taken place (mainly transposes Seveso II Directive).	Maximum fine of Euros 25,000/12,500 identical fine for legal persons.		

	Administrative (quasi) criminal		Criminal	
	Offences	**Penalties (intentional/negligent)**	**Offences**	**Penalties (intentional/negligent)**
	§ 21(1) no.15 and § 19(1) and (2) of the Federal Major Accident Ordinance in conjunction with § 62(1) no.2 and (3) of the BImSchG			
	<u>IPPC landfills:</u> Non-compliance with conditions set in the permit for a landfill or with administrative acts. ***§§ 61(1) no.2b, 32(4) KrW-/AbfG***	Maximum fine of Euros 50,000/25,000identical fine for legal persons.		
	Non-information of the authority should emission thresholds be exceeded, triggering the obligation of the operator of the landfill to inform the competent authority. ***§ 27(1) no.27 of the Federal Landfill Ordinance (DepV) in conjunction with § 61(1) no.5 KrW-/AbfG***	Maximum fine of Euros 50,000/25,000 identical fine for legal persons.		
	Non-reporting to the authority on accidents that lead to a significant malfunction of the landfill operation. ***§ 27(1) no.32 of the DepV in conjunction with § 61(1) no.5 of the KrW-/AbfG***	Maximum fine of Euros 50,000/25,000 identical fine for legal persons.		
	Non-, incorrect, incomplete or late provision of information on landfills and their operation, if requested for by inspectors. ***§ 61(2) no.3 and (3) KrW-/AbfG***	Maximum fine of Euros 5,000/10,000 identical fine for legal persons.		
	To prohibit inspectors from entering the installation, premises or accommodation, auditing operating documents or carrying out technical measurements. ***§ 61(2) no.4 and (3) KrW-/AbfG***	Maximum fine of Euros 5,000/10,000 identical fine for legal persons.		

*ELVs: Emission Limit Value

1.2. Administrative measures

Besides penalties, the national legislation provides for administrative measures to enforce the compliance with the permit and the legislation on IPPC installations (administrative measures).

In urgent cases the police forces of the Länder are entitled to take administrative measures based on the police and regulatory laws of the Länder. These acts enable the police forces to carry out the necessary measures to prevent and eliminate infringements of IPPC related obligations.[116]

In non-urgent cases the competent regulatory authority of the Länder (competent authority) is responsible to address infringements of IPPC related obligations set under the Federal Immission Control Act, the Waste Management Act and the complementary Länder legislation.[117] The most lenient administrative measure to enforce compliance is to order the operator to comply with the requirements set by law and the permit in a formal procedure (§ 17 BImSchG). If the operator continues the unlawful operation, the competent authority has several options to enforce compliance. The competent authority is entitled to stop the operation of an installation if the operator does not comply with the installation related requirements or administrative measures (§ 20(1) BImSchG) until the operator ensures compliance. The competent authority is obliged to close or remove an installation if the installation has been constructed or significantly changed without a permit (§ 20(2) BImSchG). As a further measure, the competent authority can withdraw the permit, e.g. if the operator does not comply with requirements set in the permit or if the authority would be entitled not to grant the permit due to circumstances that have occurred after the granting of the permit (§ 21(1) no.2 and no.3 BImSchG).[118]

It is noteworthy that the competent authority is also authorised to stop the operation of an IPPC installation if it comes to the conclusion that the operator is deemed not trustworthy to run an installation in compliance with provisions ensuring environmental protection and that the cessation of operations is required for the reason of public interest (§ 20(3) BImSchG).

The Federal Water Act entitles the competent authorities to withdraw a permit for the discharge of waste water from IPPC installations and for other installation related water usages under the conditions mentioned in relation to the withdrawal of permits for IPPC installations (§ 18(2) of the Federal Water Act).

Provided that an operator refuses to comply with administrative measures, the competent authority is entitled to coerce the operator to comply with these measures on the basis of the administrative enforcement laws of the Länder.[119] Under these laws the competent authority is entitled to carry out the required measure instead of the operator and charge him with the costs of this operation (substitute performance), to impose a fine ('*Ordnungsgeld*'), to coerce the operator to comply with the measures and, if approved by the court, to take the perpetrator into custody as a last resort. These measures can be applied cumulatively and repeatedly until the operator complies with the measure.

[116] For example § 3 paragraph 1 of the Police and Regulatory Act of Hamburg.
[117] This study only includes administrative measures applicable under the Federal Immission Control Act. The Federal Waste Act does not provide for such a differentiated set of measures. However, it entitles the competent authorities to take all necessary measures to enforce its requirements.
[118] This paragraph only indicates the measures regulated in the Federal Immission Control Act for IPPC installations falling under its scope. Measures in relation to IPPC landfills falling under the scope of the Federal Waste Management Act are regulated in the Länder legislation and are not indicated in this paragraph.
[119] Milieu and Huglo Lepage; *National Study on Germany as part of the Study on measures other than criminal ones in cases where environmental Community law has not been respected in the EU Member Länder*; p. 14.

2. Administrative procedure

2.1. General elements on the legal tradition and potential evolution

Regarding the administrative procedure it must be distinguished between the prosecution of administrative (quasi) criminal offences on the one hand and the issuing of administrative measures that enforce the compliance with IPPC related obligations on the other hand, because they are subject to different procedural rules.

2.1.1 Administrative measures

In urgent cases the police forces of the Länder and in non-urgent cases the competent regulatory authorities of the Länder are responsible for the enforcement of the Federal Immission Control Act, the Federal Waste Management Act and the Federal Water Act. The Länder determine the competent regulatory authority either by legal act (*'Zuständigkeitsverordnungen'*)[120] or by administrative regulation.[121] For example, according to the law that determines the competent authorities in the area of environmental protection of North-Rhine Westphalia[122] the responsibility is divided between the district governments (*'Bezirksregierungen'*)[123] and the counties and cities (*'Kreise und Kreisfreie Städte'*).[124] ´The district governments have jurisdiction to monitor compliance of highly pollutant IPPC installations with the Federal Immission Control Act, e.g. waste incineration plants, chemical installations, energy plants, industrial plants for the production of timber and paper and glass and installations for the production and processing of metals, whereas the counties and cities monitor other IPPC installations.[125]

The administrative procedure acts of the Länder regulate the procedural rules for implementing the administrative measures. In non-urgent cases these laws require the hearing of the operator of an installation before an administrative measure is issued, to provide for a statement of reasons that explains the administrative measure and to inform the addressee of his rights to appeal against the administrative decision.[126]

2.1.2 Administrative (quasi) criminal penalties

The competent regulatory authorities of the Länder also prosecute administrative (quasi) criminal offences (see above). The procedure for the prosecution of administrative (quasi) criminal offences is regulated under the Administrative Criminal Offences Act (*'Ordnungswidrigkeitengesetz'*). These offences are only punishable on the basis of laws that were in force before the perpetration of the offence; their perpetration is only punishable once; and the alleged perpetrator has the right to challenge a fine imposed by the competent regulatory authority before the criminal court.

Due to its proximity to the criminal law, the Administrative Criminal Offence Act frequently refers to the Code of Criminal Procedure that regulates the prosecution of criminal offences. In contrast to the

[120] Brandenburg, Baden-Wuerttemberg, Bremen, Hessen, Mecklenburg-Western Pomerania, Lower Saxony, North-Rhine Westphalia, Rheinland-Pfalz, Saxony, Schleswig Holstein, Saarland and Thuringia adopted legal acts to determine the competent authorities in relation to the Federal Immission Control Act.
[121] These are regulations that specify and substantiate the administrative procedure for the authorities, but have only limited legal effects towards the operator of an installation.
[122] Ordinance on the Distribution of Competences in the Field of Environmental Protection of 11 December 2007 (NRW Law Gazette 2007 p. 662) last amended by the Ordinance of 21 December 2010 (Law Gazette NRW. p. 700) – *Zuständigkeitsverordnung Umweltschutz*.
[123] These are higher authorities in the hierarchy of the Länder authorities that are responsible for environmental protection.
[124] These are lower authorities in the hierarchy of the Länder authorities that are responsible for environmental protection.
[125] See website of the district government Arnsberg: http://www.bezreg-arnsberg.nrw.de/themen/g/genehmigung_anlagen_bimschg/index.php
[126] Compare for example, §§ 28, 39 and 41 of the Administrative Act of North-Rhine Westphalia and § 58 of the Federal Code of Administrative Court Procedure.

criminal procedure it is left to the discretionary power of the competent authority whether or not to prosecute an administrative (quasi) criminal offence and a fine is imposed without a preceding oral hearing.

2.2 Inspections

The Federal Immission Control Act, the Federal Waste Management Act and the Federal Water Act entitle and oblige the competent authorities of the Länder to monitor the compliance of IPPC installations with the regulatory requirements (see above). To enable the competent authorities to carry out the monitoring, owners and operators of installations are obliged to allow inspectors to access installations, the operational premises and, in urgent cases, homes. Inspectors are also entitled to inspect operational documents and to take samples, e.g. to measure emissions.[127]

The competent authorities of the Länder (see section 2) are responsible for carrying out the inspections. Several Länder provide for laws or administrative regulations that complement the inspection requirements of the Federal Immission Control Act,[128] e.g. Mecklenburg-Pomerania, North-Rhine Westphalia and Schleswig-Holstein, that regulate the inspection procedures for IPPC installations falling under this Act.[129] Some laws and regulations require a certain number of announced and unannounced inspections. For example the administrative regulation of Mecklenburg-Pomerania requires regular on-site checks and examinations.[130] The administrative regulation of North-Rhine Westphalia requires the competent authorities to carry out unannounced inspection and to immediately investigate any complaints brought to them about installations.[131] If other authorities of North-Rhine Westphalia learn that an installation is operated in non-compliance with regulatory provisions, these authorities must immediately inform the competent authority. Subsequent to the start of the operation of an installation and after a significant change to an installation, the administrative regulation of North-Rhine Westphalia requires that 'installations should be inspected' by the competent authority.[132] Länder laws also set complementary requirements for the inspection procedure regulated in the Federal Waste Management Act for landfills and in the Federal Water Act for installations discharging waste water.

As regards the human resources allocated to the inspection of IPPC installation, a representative of the district government of Cologne reported that each inspector is responsible for about 25 installations (IPPC and non-IPPC installations) taking into account that more complex installations are covered by a higher average of inspectors. He emphasised that the current number of inspectors is not sufficient to ensure an effective control of IPPC installations, however, that North-Rhine Westphalia plans to increase this number. According to a representative of the Länder Agency for Agriculture, the Environment and Rural Areas of Schleswig-Holstein, 250 IPPC installations are covered by 10 to 15 persons.

Actual figures of the financial resources allocated to the inspection of IPPC installations are not available.

[127] § 52 BImSchG and § 40 KrW-/AbfG.
[128] Administrative regulations are procedural rules for authorities that have no external effect.
[129] Federal Republic of Germany, *Report on the recommendations of the European Parliament and the Council from 4 April 2001 to identify the minimum standards for environmental inspections in the Member Länder (2001/331/EC), 2003* p. 29ff.
[130] Administrative regulation regarding the regular monitoring of installations subject to a permit pursuant to the Federal Immission Control Act- Mecklenburg-Pomerania of 2 October 2009 (MV Law Gazette 2009, p. 842) – *Richtlinie zur Regelüberwachung der genehmigungsbedürftigen Anlagen nach dem Bundes-Immissionsschutzgesetz*.
[131] Administrative regulations to § 52 of the Federal Immission Control Act (inspections) of North-Rhine Westphalia of 1 September 2000 (MBl. NRW 2000 p. 1180), paragraph 4.1 – *Verwaltungsvorschriften zum Bundes-Immissionsschutzgesetz – Nordrhein Westphalen*
[132] See above, paragraphs 24.1.1 - 24.1.3.

Figures of 2002 on the financial and human resources available for general environmental inspections in the 16 Länder can be found in the Report of the Federal Republic of Germany on national environmental inspections.[133]

Some of the Länder provide for inspection plans. For instance the inspection plan of Schleswig-Holstein of 2002[134] and the administrative regulation of Mecklenburg Pomerania of 2009[135] include the requirement to establish inspection plans. In addition, the Ministry for Climate Protection, the Environment, Agriculture and Consumer Protection of North-Rhine Westphalia adopted an administrative regulation ('*Erlass*') on the criteria for the risk-based planning of cross-media environmental inspections, that requires the competent surveillance authorities to establish inspection and which was disseminated to the competent authorities on 3 January 2011.

A desk-research did not identify requirements of the Länder to provide trainings for inspectors in the legislation or administrative regulations of the Länder. As reported by representatives of the district government of Cologne, North-Rhine Westphalia provides its employees with the option to use a wide range of trainings ('*Fortbildungen*'). These trainings also address subjects relevant for inspectors. A representative of the Länder Agency for Agriculture, the Environment and Rural Areas of Schleswig-Holstein pointed out that, if necessary, it carries out internal or authorises external trainings.[136]

Note that the inspections carried out by the competent authorities of the Länder are complemented by self-inspection requirements of the operators and by inspections carried out by private audit companies.[137] Examples for self-inspection requirements under the Federal Immission Control Act are the obligation of the operator to measure emissions and to submit emission declarations to the competent authority as well as to appoint immission control advisers and hazardous-incident officers that advise the operator on these issues. An example for the involvement of private audit companies is the entitlement of the competent authority under the Federal Immission Control Act to require the operator of an IPPC installation to have the level of emissions resulting from its operations controlled by a private audit company (§ 26 of the Federal Immission control Act).

2.3 Appeal against the administrative decision

Appeals against administrative measure and appeals against administrative (quasi) criminal penalties must be distinguished. In each case the Federal Basic Law (GG) guarantees the right of every person that has been violated by an administrative body to have recourse to the courts (Article 19(4) sentence 1 GG).

2.3.1 Appeal against administrative measures

Operators of IPPC installations are entitled to appeal against administrative measures, e.g. the closure of an IPPC installation in preliminary proceedings before a local or regional administrative authority, usually the next higher authority (*'Widerspruchsbehörde'*).[138] However, many Länder have partly, temporarily or indefinitely abolished the institution of preliminary proceedings in an attempt to reduce bureaucracy and administrative costs, e.g. Bavaria, Mecklenburg-Western Pomerania, Lower Saxony, North-Rhine Westphalia and Saxon-Anhalt. In these cases the operator must directly challenge the

[133] Federal Republic of Germany, *Report on the recommendations of the European Parliament and the Council from 4 April 2001 to identify the minimum standards for environmental inspections in the Member Länder (2001/331/EC), 2003, p. 3.*

[135] Administrative regulation regarding the regular monitoring of installations subject to a permit pursuant to the Federal Immission Control Act- Mecklenburg-Pomerania of 2 October 2009 (MV Law Gazette 2009, p. 842), paragraph 5 – *Richtlinie zur Regelüberwachung der genehmigungsbedürftigen Anlagen nach dem Bundes-Immissionsschutzgesetz.*.
[136] Information received on the basis of questionnaires and interviews.
[137] Federal Republic of Germany, *Report on the recommendations of the European Parliament and the Council from 4 April 2001 to identify the minimum standards for environmental inspections in the Member Länder (2001/331/EC),* 2003 p. 25.
[138] See Section 68 and Section 73 of the Code of Administrative Court Procedure.

decision before the local administrative court of first instance. The time limit for filing an appeal against the administrative measure before the next higher authority or the administrative court of first instance is one month after the measure was announced to the operator if the operator has been informed in writing of the possibility to appeal; if not, the time limit for filing an appeal is one year. The decision of the next higher authority can be challenged before the local administrative court of first instance. The operator is entitled to appeal against the judgement of the administrative court of first instance on points of facts and law (*'Berufungsverfahren'*) before the regional administrative court of second instance (the higher administrative courts), where the operator is allowed to present new facts and to challenge the application of the law as carried out by the judge of first instance. The judgement of the court of second instance can be challenged before the Federal Administrative Court on points of law only, i.e. the operator is not entitled to present new facts. In both cases appeals are only admissible if the court grants the appeal. Disputes concerning the construction and operation of certain IPPC installations, e.g. power stations utilising furnaces for solid, liquid or gaseous fuels with a furnace heat output of more than 300 megawatts, are litigated, in first instance, before the (regional) higher administrative courts. In this case appeals on points of law can be brought before the Federal Administrative Court.

The operator has standing to challenge administrative measures before the administrative authorities and the courts. If a permit violates property rights or health of people living close to the installation (neighbours), these neighbours are entitled to challenge the permit. Under very restricted conditions neighbours are also entitled to legally force the competent authority to take administrative action against the operator[139] or to carry out inspections[140] if these measures are necessary to avert risks to their health or property from emissions or other pollutions.

Non-governmental organisations are entitled to challenge a permit under specific conditions as laid down in the Law on supplementary provisions governing actions in environmental matters under Directive 2003/35/EC (UmwRG). According to this law recognised non-governmental organisations must, inter alia, assert that the permit 'contravenes legislative provisions which seek to protect the environment, which confer individual rights and which may be relevant to the decision' (§ 2 point 1 of the UmwRG) to have standing before the court. The European Court of Justice decided on 12 May 2011 that this requirement infringes Directive 2003/35/EC and that, as a minimum, non-governmental organisations must have standing in national court procedures to enforce all national provisions based on European environmental legislation. The court also decided that, as long as national legislators have not amended the relevant provision, non-governmental organisations can directly refer to Directive 2003/35/EC to ensure their standing.[141]

2.3.2 Appeal against administrative (quasi) criminal penalties

The appeal procedure is different if the operator challenges a fine that the competent authority has imposed upon him under the criminal administrative law. The addressee of the fine is entitled to lodge an objection against this administrative decision within two weeks after the fine has been announced to the addressee (§ 67 OWiG). In preliminary proceedings the competent authority scrutinises whether this objection is admissible and reassesses its decision. If the competent authority adheres to its assessment that the imposition of a fine is justified, it transfers the case to the competent regional public prosecution office that, based on its own assessment of the case, either terminates the proceedings or, by indicting the alleged perpetrator, initiates the court procedure. The objection is litigated before the criminal court of first instance, the local court (§ 68 OWiG), where the operator is entitled to present new facts. The general rules for this procedure are stipulated in the Administrative

[139] Giesberts/Reinhardt, *Environmental Law (online legal commentary*), § 17 BImSchG, paragraphs 90pp. and § 20 paragraph 46.
[140] Controversially discussed, in favour of this opinion: Giesberts/Reinhardt, *Environmental Law (online legal commentary)*, § 52 BImSchG, paragraphs 33pp.
[141] Judgement of the European Court of Justice of 12 May 2011, in case C-115/09, Friends of the Earth Germany (BUND) vs. district government Arnsberg.

Offences Act and the Code of Criminal Procedure. This procedure deviates in some points from the criminal procedure because it takes certain specifics of the administrative (quasi) criminal law into account, e.g. the competent authority that imposed the fine has standing to give its assessment of the situation in the legal hearing (§ 76 OWiG). Under certain conditions the alleged perpetrator is entitled to appeal against the judgement of the court of first instance by means of filing a legal complaint before the higher regional courts (§ 79 OWiG) where the judgment of the previous instance is only scrutinised in relation to the correct application of law. The reference to new facts is not admissible.

3. Judicial procedure (if relevant-with a focus on criminal sanctions)

3.1 General information

The main principles of the judicial procedure are stipulated in the German Basic Law (GG): Extraordinary courts are prohibited and the alleged perpetrator has the right to an independent judge (Article 101 GG); alleged perpetrators have the right to be heard before the court; offences are only punishable on the basis of laws that were in force before the commission of the offence (nulla poena sine lege); and criminal behaviour is only punishable once (ne bis in idem) (Article 103 GG). These and other principles of the Basic Law are substantiated and complemented in the Code of Criminal Procedure (StPO) that constitutes the procedural rules for the prosecution of criminal offences.

In accordance with these rules only the competent regional public prosecution office has the authority to indict an alleged perpetrator (Article 152(1) StPO) and thereby to initiate court proceedings (Article 151 StPO). This office is obliged to open investigations if there are sufficient factual indications that a criminal offence has been committed (Article 152(2) StPO). In its investigations, the regional public prosecution office is supported by the police force (Article 161 StPO). In first instance the Court Constitution Act predominantly assigns environmental criminal law cases to the jurisdiction of the local courts (§§ 24 and 74 of the Court Constitution Act – GVG). After the indictment, the judge of first instance presides over the oral hearing, where representatives of the regional public prosecution office, the alleged perpetrator, his/her lawyer and the judge participate. At the end of the oral hearing, taking into account information gathered through the hearing and the collected evidence, the judge decides the case independently. NGOs or other individuals are not entitled to join the criminal procedure as accessory prosecutors. The catalogue of criminal offences, in the context of which individuals are allowed to join the procedure as accessory prosecutors, does not include environmental criminal offences. This may be justified by the fact that these offences do not protect individuals.[142]

3.2 Possibilities of appeal

The operator of an IPPC installation can challenge the judgement of the court of first instance (the local courts) before the court of second instance (the regional courts). This appeal on facts and law ('*Berufungsverfahren*') enables the alleged perpetrator to present new facts and to challenge the application of the law as carried out by the judge of first instance (Section 312pp. StPO). The operator may challenge the judgement of the court of the second instance before the Federal Court of Justice ('*Revisionsverfahren*'), however, before this court the operator is restricted to objections against the application of the law as carried out by the judge of the court of second instance (Section 333pp StPO).

4. Synergies between administrative and criminal procedures

[142] Fischer, *Legal Commentary on the Criminal Code*, Prior to § 324, paragraph 3a.

The prosecution of administrative (quasi) criminal offences and the prosecution of criminal offences are intertwined. The same behaviour of the perpetrator can only be punished once and accordingly either as a criminal offence or a criminal administrative offence.[143] If the behaviour of the perpetrator meets the conditions of a criminal offence and an administrative (quasi) criminal offence simultaneously the regional public prosecution office must prosecute the criminal offence and the competent authority must stop the prosecution of the administrative (quasi) criminal offence (§ 21(1) OWiG). This is, for example, the case when the operator of an installation for the production of basic organic chemicals runs the installations without a permit.

There is a further connection between criminal and administrative (quasi) criminal offences due to the fact that the national environmental criminal law is based on the principle of administrative accessoriness. Following this principle the conditions of an environmental criminal offence are only met, if the perpetrator infringes an administrative regulatory provision and, if provided for by the environmental criminal law, meets the additional conditions of the criminal offence, e.g. significantly pollutes the soil (§ 324a StGB).

It is noteworthy that North-Rhine Westphalia has adopted an administrative regulation ('*Erlass*') that regulates the cooperation between environment protection authorities and regional public prosecution offices.[144] This administrative regulation requires that periodic meetings are held between representatives of the competent public prosecution offices, the competent police forces and the authorities responsible for environmental protection; that these authorities inform the competent regional public prosecution offices of any suspicion of an environmental criminal offence; and that, vice-versa, these offices enable the competent authorities to participate in the prosecution of such offences.

5. Conclusions

Proportionality, effectiveness and dissuasive character of the penalties

The administrative (quasi) criminal penalties and the criminal penalties in relation to IPPC installation are assessed as proportionate, effective and dissuasive.

The penalties are assessed as proportionate. Fines between Euros 5 and 50,000 and the possibility to confiscate the economic benefit are assessed as proportionate means to address administrative (quasi) criminal offence. The available range of fines leaves room to punish an infringement on the basis of the severity of the individual violation. The possibility to siphon off the profit is assessed as balanced taking into account that the perpetrator would not have gained this benefit, if he had complied with the law.

Furthermore, it is assessed as proportionate that the violation of the permit obligation or the essential permit requirements leads to criminal penalties of a maximum of three years of imprisonment and/or a fine considering the major risks that may result from these unlawful operations.

The penalties are assessed as effective, because the administrative (quasi) criminal penalties cover all national obligations transposing the IPPC Directive and the criminal penalties cover the major obligations of this Directive. Furthermore, the procedural rules in relation to the prosecution of

[143] In favour of this: Jarass/Pieroth, *Legal Commentary to the Basic Law of the Federal Republic of Germany*, Article 103, paragraph 74.
[144] This administrative regulation is available at: https://recht.nrw.de/lmi/owa/br_bes_text?anw_nr=1&gld_nr=3&ugl_nr=3214&bes_id=2601&val=2601&ver=7&sg=&aufgehoben=N&menu=1

criminal and administrative (quasi) criminal offences are assessed as effective to implement these penalties.

The penalties are assessed as dissuasive, because administrative (quasi) criminal and criminal penalties combined are sufficiently stringent to deter potential perpetrators. Especially, the option to confiscate the economic benefit provides for deterrence.

Representatives of the district government of Cologne responsible for the surveillance of IPPC installations assessed the available sanctions under the legislation as proportionate.

They pointed out that North-Rhine Westphalia provides for an indicative catalogue of fines for infringements against environment related provisions (*'Bußgeldkatalog Umwelt'*)[145] that supports the competent surveillance authorities in finding proportionate sanctions. This catalogue specifies the scale of fines as provided for by the legislation. For instance, in accordance with the Federal Immission Control Act, the construction of an IPPC installation without permission is subject to a fine of up to Euros 50,000. The catalogue specifies this scale in relation to installations worth less than Euros 50,000. In North-Rhine Westphalia these installations are subject to fines between Euros 510 and 2,600.

They also assessed the practical implementation as effective and dissuasive.

They believe that it is important to enforce the administrative sanctions to ensure effectiveness and deterrence. Nevertheless, in their experience, it was often sufficient to inform the responsible operators of possible fines to make them stop the infringement.

They also assessed the penalties applied as deterrent. This was concluded from the fact that after operators had been fined, they did not repeat the infringements. To make operators comply with permit requirements and legislation after an infringement, they considered it as an effective approach to precisely inform the operator and his employees of the infringement and the necessary means to eliminate it.

However, they identified a lack of human resources to carry out inspections, so that not all IPPC installations are subject to a regular control.[146] This was considered as ineffective in relation to the procedure to identify infringements. It was added, that North-Rhine Westphalia plans to recruit 300 employees in the field of the environment during the next years, to address the problem of understaffing.

[145] The fine catalogue environment of North-Rhine Westphalia of 2006 was established by the Ministry for the Environment, Nature Conservation, Agriculture and Consumer Protection of North-Rhine Westphalia and is available at: http://www.kreisjaegerschaft-coesfeld.de/red/ges-bussgeldkatalog-umwelt-nrw-2010-02-27.pdf

Case studies

Introduction

Case studies one and two are good examples to depict that the imposition of very high fines as well as of very low fines can be proportionate, effective and dissuasive. In the first case the competent authority sanctioned a company running an installation with a fine of Euros 155,000 because it had made a huge profit by not complying with legal requirements. Therefore the competent authority assessed it as proportionate and dissuasive to calculate the fine on the basis of this profit. In the second case the competent authority sanctioned the project manager that had notified a non-essential change to an installation late with a fine of only Euros 200. The competent authority also considered this fine as proportionate and dissuasive taking into account that the change had served safety purposes; that the project manager had admitted the perpetration; and that the operator of the installation had taken measures to prevent further infringements. In both cases the fine was accepted without appeal and the perpetrators did not repeat the infringements.

Case study 3 illustrates the interplay between administrative measures, in this case the closure of an installation, and criminal penalties, when the operator infringes major obligations related to IPPC installations.

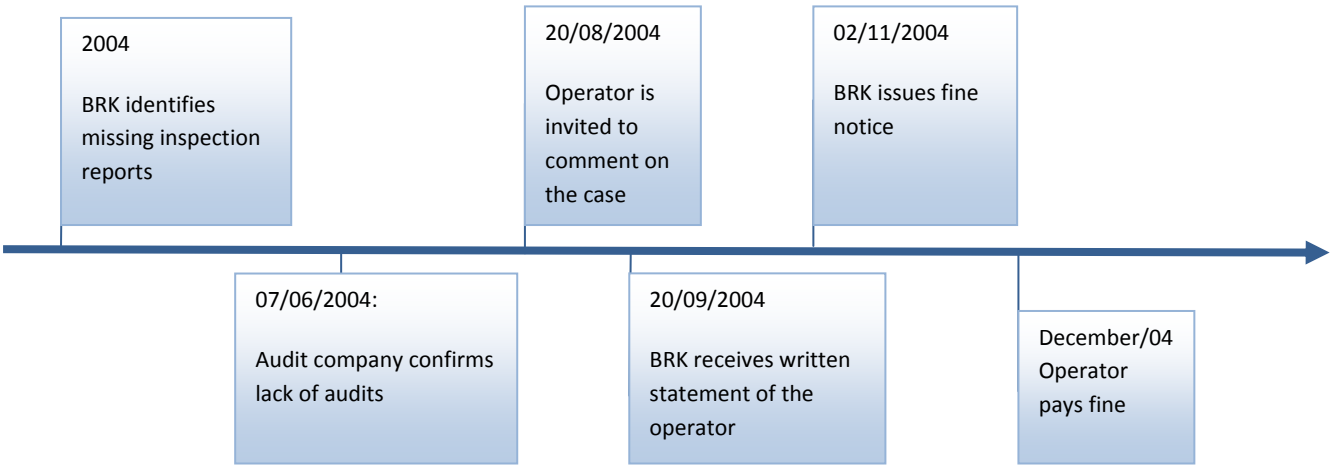
Timeline of the procedure



BRK: district government of Cologne, North Rhine-Westphalia

Description of the background

This case deals with a fine imposed on the operator of eight storage tanks for petroleum products (ancillary plants) connected to an oil refinery. Under North-Rhine Westphalia's Ordinance on Installations for Handling of Substances Hazardous to Water (VAwS),[147] the operator is obliged to commission a private audit company to carry out regular inspections of these tanks. These companies have to report the results in form of inspection reports to the district government of Cologne (BRK) as competent authority.

When controlling these inspection reports, the BRK came to the conclusion that, between the years 2000 and 2004, the operator of the storage tanks for petroleum products had not complied with the requirement under the VAwS to have these tanks inspected by an audit company. On request, the audit company normally commissioned by the operator confirmed this conclusion on 7 June 2004.

Legislation applicable

Under North-Rhine Westphalia's Ordinance on Installations for Handling of Substances Hazardous to Water in conjunction with North-Rhine Westphalia's Water Act the competent surveillance authorities are entitled to impose fines of up to Euros 50,000 (§ 16 no.7 of the VAwS in conjunction with § 61 paragraph 1 no.4 of North-Rhine Westphalia's Water Act). According to § 17(4) of the Administrative Criminal Offences Act the fine should be higher than the economic benefit that the perpetrator has drawn from the perpetration of the administrative (quasi) criminal offence. Hence, a fine may be much higher than Euros 50,000.

The competent authority must hear the alleged offender before imposing the fine (§ 55 of the Administrative Criminal Offences Act (OWiG)). In simple cases, the competent authority complies with this obligation by enabling the alleged perpetrator to comment on the allegations in written form within a time limit of two weeks. The competent authority may prolong this time limit on request.

The alleged perpetrator has two weeks to appeal against the fine after he has received the fine notice. If he does not appeal against the fine, he must pay the fine four weeks after the receipt of this notice (§ 66 OWiG).

The procedure

The district government of Cologne provided the operator of the installation with the possibility to comment in writing on the allegations on 20 August 2004 setting a time limit of two weeks and received comments of the operator on 20 September 2011 after it had prolonged the time limit for submitting the comments once.

On the basis of its investigations and the written comments of the operator, the BRK decided to fine the company. In accordance with § 17 paragraph 4 of the Administrative Criminal Offences Act, it calculated a fine of Euros 155,000 taking into account the profit that the company had made by not carrying out the periodic inspections. The fine notice was issued on 2 November 2004.

The BRK did not consider taking administrative measures in order to eliminate the infringement, since the infringement had taken place in the past and did not perpetuate. In addition, the offence was not punishable under the environmental criminal law. As a consequence, the BRK did not transfer the case to the competent regional public prosecution office.

Assessment

[147] Note that this law does not directly transpose obligations of IPPC installations. However, the control of these obligations is based on the same provisions as the control of IPPC obligations.

The fine of Euros 155,000 is assessed as proportionate, because the operator would have been obliged to spend this money, if he had complied with the requirement to carry out inspections of the storage tanks.

This penalty is assessed as dissuasive, since after the imposition of the fine, the operator complied with all regulatory provisions.

The administrative procedure that led to the fine is also assessed as effective, in particular, because the BRK responded quickly to the offence. It can be derived from the timeline of the procedure that it only took the BRK five months to punish it. After the audit company had confirmed on 7 June 2004 that the operator had not carried out the obligatory inspections of the tanks, the BRK issued the fine notice at the beginning of November.

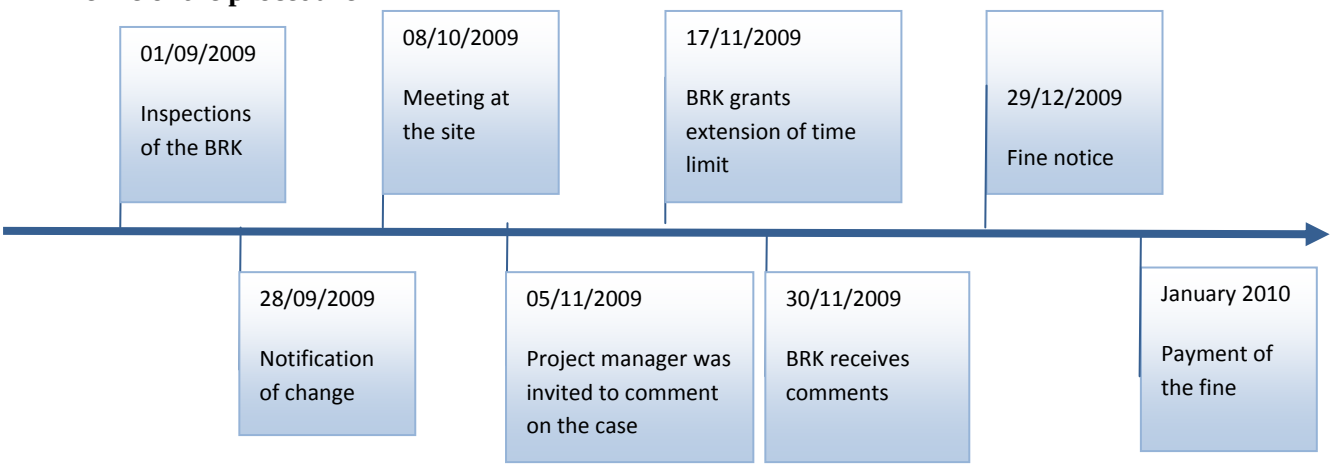
Case study 2: Administrative (quasi) criminal fine of Euros 200

Interview with and completion of a questionnaire by – Dr Horst Büther
Organisation and position:

1. District government of Cologne (department 53, immission protection), head of department
2. Member of the board of IMPEL (European Union Network for the Implementation and Enforcement of Environmental Law)

Telephone number: + 49 221 147 2252
Date of interview: 5 May 2011

Timeline of the procedure



BRK: district government of Cologne, North Rhine-Westphalia

Description of the background

During safety inspections of the district government of Cologne (BRK) in 2009 (1 January 2009), inspectors noticed that a storage tank for petroleum products (ancillary plants) that pertained to an oil refinery[148] was subject to maintenance measures (changes). These measures sought to enhance the safety of this tank. When, at a later point in time (28 September 2009), the operator notified a non-essential change to the installation to the BRK, the authority decided to investigate the circumstances of this change in more detail. For this, it scheduled a meeting at the installation (8 October 2009). During this meeting, the suspicion was confirmed, that the change measures had directly followed the

[148] Case 1 and case 2 deal with different oil refineries.

maintenance measures and that these change measures had already started before they were notified to the BRK.

Legislation applicable

Under the Federal Immission Control Act the late notification of non-essential changes to an installation subject to authorisation (including IPPC installations) can be sanctioned with fines of up to Euros 10,000 (§ 62(2) no.1 and § 15 of the Federal Immissions Control Act in conjunction with § 17 (1) and (2) of the Administrative Criminal Offences Act).

The competent authority must hear the alleged offender before imposing a fine (§ 55 of the Administrative Criminal Offences Act (OWiG)). In simple cases, the competent authority complies with this obligation by enabling the alleged perpetrator to comment on the allegations in written form within a time limit of two weeks. The competent authority may prolong this time limit on request.

The alleged perpetrator has two weeks to appeal against the fine after he has received the fine notice. If he does not appeal against the fine, he must pay the fine four weeks after the receipt of this notice (§ 66 OWiG).

The procedure

The BRK enabled the project manager to comment in writing on the allegations on 5 November 2009 setting a time limit of two weeks. After it had granted an extension of the time limit on 17 November 2009, it received a written statement of the perpetrator, in which he admitted the infringement, on 30 November 2009. On the basis of its own conclusions and the written comments of the project manager, the district government of Cologne sanctioned the responsible project manager with a fine of Euros 200. The fine notice was issued on 29 December 2009.

The BRK justified this low fine on the following grounds. The project manager had admitted to having committed the offence; the operator of the installation had recalled to the project manager, who had failed to notify the change to the installation timely, and to all other project managers working in the installation, the obligation to notify non-essential changes in time; and the non-notified change measure had served to enhance the safety of the installation.

The BRK had immediately ruled out administrative measures to eliminate the infringement, since the infringement had taken place in the past and did not perpetuate. In addition, the offence was not punishable under environmental criminal law. As a consequence, the BRK did not transfer the case to the competent regional public prosecution office.

The project manager paid the fine within the legal time limit (before the end of January 2010). From this time onwards, all notifications were carried out in time by all responsible project managers working at this installation.

Assessment

The fine of Euros 200 is assessed as proportionate and dissuasive. It is assessed as proportionate because the BRK took due account of the following mitigating circumstances. The responsible project manager had admitted the offence; the operator of the installation cooperated with the BRK by taking measures to avoid further infringements; and the change measures had served to improve the safety of the installation. Hence, there was no need to impose a more severe penalty. The fine is assessed as dissuasive since, after the BRK had imposed the fine, all project managers working at the installation notified non-essential changes timely and did not otherwise infringe regulatory obligations.

The administrative procedure that led to the fine is also assessed as effective, in particular, because the BRK responded quickly to the offence. It can be derived from the timeline of the procedure that it took the BRK only four month to punish it. The procedure started in September 2009 and the BRK issued the fine the end of December 2009.

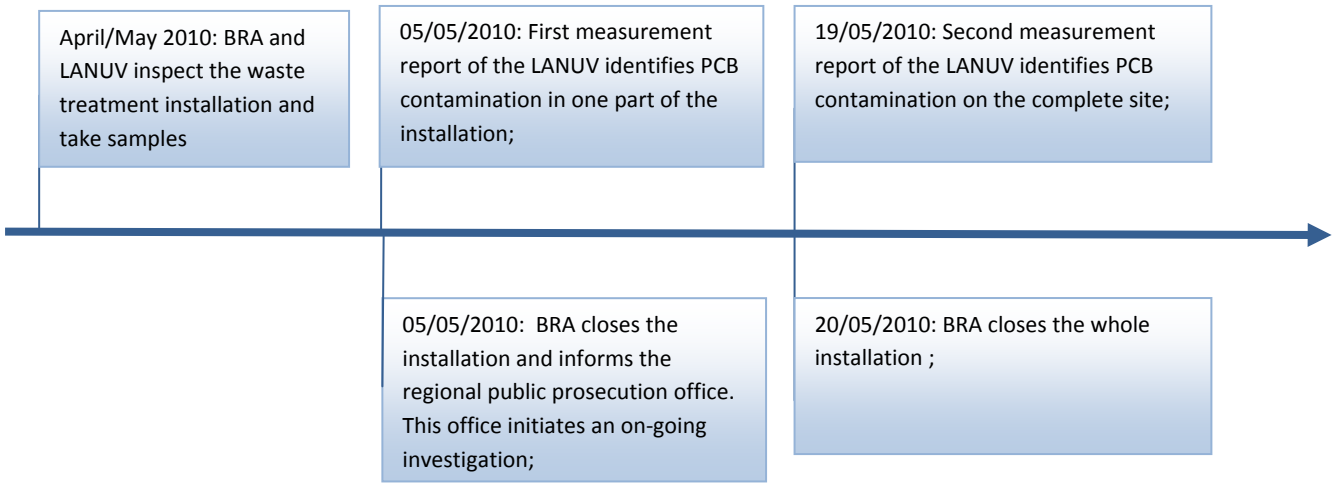
Timeline of the procedure



LANUV: Agency for Nature Conservation, Environment and Consumer Protection of North Rhine-Westphalia
BRA: district government of Arnsberg, North Rhine-Westphalia

Description of the background

In 1985, the (then) competent authority responsible granted an authorisation for a waste treatment installation to a predecessor company of the ENVIO Recycling GmbH & Co. KG (ENVIO), the latter of which is the main party in this case.

ENVIO took over the waste management plant in 2004 and notified the competent authority for the first time in October 2004 that it processed transformers from an underground landfill containing PCBs (polychlorinated biphenyls).[149]

From 2007 on, the Agency for Nature Conservation, Environment and Consumer Protection of North Rhine-Westphalia (LANUV) reported significantly higher levels of PCBs in green cabbage in the surroundings of Dortmund. As a consequence, the competent surveillance authority, the district government of Arnsberg in North-Rhine Westphalia (BRA), initiated measures to identify the polluter. Inter alia, it inspected various installations in Dortmund's harbour including ENVIO's waste treatment installation, however, without finding the source.

In September 2008 the BRA received an anonymous complaint. The complainant informed BRA that, ENVIO had been carrying out unlawful activities as regards the processing of PCB-contaminated materials for several years The BRA promptly investigated these allegations, but did not identify any evidence to prove them.

Legislation applicable

In accordance with § 20 paragraph 2 sentence 1 of the Federal Immission Control Act the competent authority is obliged to close an installation if the operator carries out an unauthorised essential change to the installation.

Pursuant to the national environmental criminal law the local criminal court may punish an unauthorised essential change to an installation with a maximum imprisonment of three years or a maximum fine of 360 daily units, in case of intentional perpetration, and, in case of negligent perpetration, with imprisonment of a maximum of two years or a maximum fine of 360 daily units (§ 327(2) no.1 and (3) no.2 of the Federal Criminal Code).

The local or regional[150] criminal courts may punish unauthorised essential changes that are carried out deliberately and cause serious and permanent pollution of the environment with imprisonment between six months and ten years (§ 330 (1) of the German Criminal Code). If this change places a large number of people in danger of injury, the criminal court can impose imprisonment of between one and ten years.

The unauthorised essential change of an installation also constitutes an administrative (quasi) criminal offence that is punishable by the competent authority with a fine of up to Euros 50,000 (§ 62(1) no.4 and (3) and § 16 of the Federal Immission Control Act). However, in accordance with § 41 of the Federal Administrative Criminal Offences Act the competent surveillance authority must transfer the case to the competent regional public prosecution office and stop its own investigations, if it identifies indications that a criminal offence was committed. This office then involves the competent authority in its investigations. An administrative regulation (Erlass) of North-Rhine Westphalia in detail

[149] Note that the waste management plant does not fall under the scope of the current IPPC Directive. However, it will fall under the broader scope of the Industrial Emissions Directive.

[150] If the regional public prosecution office expects the court to sentence the perpetrator with more than 4 years of imprisonment, it indicts the alleged perpetrator before the competent regional court.

regulates the cooperation between authorities and regional public prosecution offices before and after these investigations.[151]

The procedure

In April/May 2010, in a renewed attempt to identify the polluter of PCBs that had been identified in the surroundings of Dortmund, inspectors of the LANUV and the BRA inspected ENVIO's installation and took samples on-site.

On 5 May 2010 the LANUV released its first measurement report, based on samples taken during this inspection that revealed high concentrations of PCB on metalwork in one part of the installation.

Under these conditions the BRA assessed the handling of the transformers and the inherent emission of PCBs as an unauthorised essential change to the installation and thus closed the affected part of the installation on the same day.

Also on 5 May 2010 the BRA informed the regional public prosecution office of the suspicion that ENVIO had committed an environmental crime. Its investigations are still on-going.

The second measurement report of the LANUV dating from 19 May 2010 revealed that the complete installation site was contaminated. As a consequence, the BRA ordered the immediate and complete closure of the installation.[152]

Assessment

Taking into account that § 20 paragraph 2 sentence 1 of the Federal Immission Control Act requires the competent authority to close an installation that has been subject to an unauthorised essential change, the BRA did not have any discretionary power whether or not to close the installation. The legal obligation to close the installation in these cases is assessed as proportionate and dissuasive considering the severity of this offence. In addition, after having learned of the contamination, the BRA closed the installation on the same day. This is assessed as an effective response to the offence.

It should be noted that under the national legislation the closure of an installation is not assessed as a penalty but as an administrative measure to enforce compliance with the national legislation. Hence, from a formal standpoint, these national measures are not subject to the requirement of being proportionate, effective and dissuasive as laid down for example by Directive 2010/75/EU on industrial emissions.

In addition, in accordance with the Administrative Criminal Offences Act, the BRA had to transfer the case to the regional public prosecution office.

If the regional public prosecution office indicts responsible managers and employees and the criminal court comes to the conclusion that the operation of the installation caused a serious damage to the environment or that it placed a large number of people in the danger of injury it is entitled to impose sentences of up to 10 years imprisonment.

Since the case is still pending, an assessment of the proportionality, effectiveness and dissuasiveness of the potential criminal penalties is not yet possible.

[151] This administrative regulation is available at: https://recht.nrw.de/lmi/owa/br_bes_text?anw_nr=1&gld_nr=3&ugl_nr=3214&bes_id=2601&val=2601&ver=7&sg=&aufgehoben=N&menu=1

[152] The summary of the events is based on the final report of the Prognos AG, *the case ENVIO/ Dortmund's harbour – Clarification of further questions in the context of immission protection and waste management*, 28 March 2011, p. 17ff., available at: http://www.umwelt.nrw.de/ministerium/pdf/envio_abschlussbericht.pdf

It is noteworthy, that the Ministry for Climate Protection, Environment, Agriculture, Nature Conservation and Consumer Protection of North-Rhine Westphalia (MKULNV) questioned whether a more effective and better coordinated control of the installation, before the infringements were discovered, could have prevented or mitigated the contamination. Therefore, they carried out an examination of whether the competent surveillance authorities worked and cooperated effectively together to control the installation. As part of this examination they commissioned the Prognos AG to prepare reports analysing the structure and organisation of the authorities and immissions protection and waste management related questions. These reports, inter alia, criticised the lack of a central body to coordinate the control as well as the provision of insufficient human resources at the time when the relevant events took place.[153]

[153] See Ministry for Labour, Integration and Social Affairs of the Land North-Rhine Westphalia and Ministry for Climate Protection, Environment, Agriculture, Nature Conservation and Consumer Protection of North-Rhine Westphalia, *the case ENVIO/ PCB in Dortmund, Overall assessment of the ministries*, 7 April 2011, p. 12., http://www.umwelt.nrw.de/ministerium/pdf/envio_gesamtbewertung.pdf

Annex IV- Hungary

Sanctions and procedures applicable to breaches of the legislation on industrial emissions in Hungary

Executive Summary

In case of breaching the requirements laid down in the transposing legislation of the IPPC Directive (Government Decree No. 314/2005 (XII. 25.)) on Environmental Impact Studies and Integrated Environment Use Permits ('IPPC Decree'), administrative procedures can be conducted against IPPC installations. In addition to the administrative liability, IPPC installations may be subject to criminal or administrative (quasi) criminal liability. [154] However, in Hungary, criminal and administrative (quasi) criminal environmental offences are broad and cover general offences. In other words, the Criminal Code[155] and the Act on Petty Offences[156] (also called as administrative (quasi) criminal offences) do not contain specific sanctions for the infringement of the transposing provisions of the IPPC Directive. This suggests that in these cases the general rules of criminal and administrative (quasi) criminal procedures are applicable.

Administrative procedures can be conducted alongside with criminal or administrative (quasi) criminal procedures. [157] However, administrative (quasi)criminal and criminal procedures cannot be conducted at the same time. [158]
In practice, most of the environmental penalties with regard to industrial installations are administrative in nature. Criminal procedures conducted against IPPC installations are rare.

The central administrative authorities responsible for environmental protection are the Ministry of Rural Development and the National Inspectorate for Environment, Nature and Water. The Ministry is responsible for supervising the activities of the National Inspectorate and the regional inspectorates. The day-to-day matters and regulatory issues are dealt by the regional inspectorates at first instances and by the National Inspectorates at second instance.

On the basis of the interviews conducted and in accordance with the current legislative framework, administrative/ administrative (quasi)criminal/criminal sanctions in Hungary are deemed to be proportionate, effective and dissuasive. As an example to the interpretation of the principle of proportionality, the amount of administrative fines imposed on IPPC installations needs to be adjusted to the severity of the environmental damage caused, the environmental pollution and the periodicity of the illegal conduct.

With regard to the principle of effectiveness, most of the interviewees emphasised that a sanction is effective if *e.g.* it contributes to achieve the aim of the legal act and/or forces the operator to fulfil his/her legal obligations.

A sanction is considered as dissuasive, if it prevents the defendant and/or other operators from any illegal activity in the future.

The table below indicates the provisions of the IPPC Directive covered by a sanction in Hungary. Criminal and administrative (quasi) criminal sanctions are not listed in the table as there are no specific sanctions in the Criminal Code, or in the Petty Offences Act, which would punish the

1. Applicable sanctions

The Hungarian Constitution[159] recognises and implements everyone's right to a healthy environment. In line with the Constitution,[160] Article 101(1) of the Environmental Protection Act[161] sets that 'whoever endangers, pollutes or harms the environment with his activity or omission, or performs his activity breaching environmental requirements shall bear the criminal, civil,[162] administrative or administrative (quasi)criminal responsibility defined by this Act or by other laws.' Those who breach this general prohibition shall *inter alia* cease their misconduct, mitigate and remedy the damage caused and restore the environment either to its prior state or to the state prescribed by law. The polluter may also be held liable pursuant to Article 101(2) of the Environment Act for the cost of prevention. Moreover he/she is obliged to inform the authorities of the polluting activity and refrain from engaging in activities posing an imminent threat or causing damage to the environment.

Most of the environmental penalties with respect to industrial installations are administrative in nature. The classification of administrative offences and sanctions related to environment are set in the Environmental Protection Act and other sector specific legislation, such as in the IPPC Decree. In line with Article 106 of the Environmental Protection Act, administrative liability applies when the competent authority have not authorised the activity of an installation or the activity is performed in a way that breaches environmental legislation or the decision of the competent authority. If the operator fails to comply with environmental requirements, the competent authorities can impose administrative sanctions, including a fine/or requiring the operator to perform or abstain from certain activity. The level of fines often varies according to the level, weight and recurrence of the environmental pollution and environmental damage caused.[163] Administrative sanctions can be imposed both on legal and natural persons. The Environmental Protection Act operates with a strict liability system making the entities causing environmental damages responsible irrespective of negligence or fault.

The IPPC Directive is transposed by Government Decree 314/2005 (XII. 25.) on Environmental Impact Assessment and Integrated Environment Use Permits ('IPPC Decree'), which sets *inter alia* offences provisions and their related administrative sanctions.

According to the transposing legislation, the imposed administrative sanctions can lead to a fine (up to Euros 1,826 or Euros 365 per day)[164] and the limitation, suspension or prohibition[165] of the continuation of the illegal conduct.[166] The competent authorities may also oblige the operators to comply with the conditions set in the permit, prepare a programme of measures or carry out an environmental review. Moreover, the competent authorities may withdraw the environmental or integrated environmental permit of the operator.

Table 2 below indicates the types of administrative and criminal offences and related penalties in

[159] Article 18 of Act XX of 1949 - Constitution of the Republic of Hungary.
[160] It is noted that in January 2012 a new Constitution will enter into force.
[161] Act LIII of 1995 - Environmental Protection Act.
[162] Civil liability is not subject to the current legal study.
[163] Act No LIII of 1995 - Article 106(1).
[164] Rules applied for imposing fines: (1) In accordance with Article 26(3) and Article 26(1) of the IPPC Decree, when an installations is operating without an integrated environmental permit or without an environmental permit, the competent authority, having regard to the danger of illegal conduct to the environment may impose a fine of Euros 182 to 365 per day for the period the installation was operating without a permit. (2) In accordance with Article 26(4) when an installation fails to comply with the permit conditions while carrying out activities, or do not comply with the administrative decisions the competent authorities may *inter alia* oblige the operator to pay a fine of Euros 730- 1,826.
[165] The main difference between prohibition and suspension is that while suspension is temporary in nature, prohibition is something definitive
[166] IPPC Decree Article 26(1): in case of operating without integrated environmental permit, or without an environmental permit (Article 26(1) and (2)); endangering the environment or causing environmental pollution or non-compliance with administrative decision (Article 26(5)); non-compliance with administrative decisions (Article 26(5)).

Hungary for each of the key enforceable obligations under the IPPC Directive.

	Administrative		Criminal/ Administrative (quasi) criminal	
	Offences	**Penalties**	**Offences**	**Penalties**
Obligation to apply for a permit for new or existing installations	Operating without integrated environmental permit, or without an environmental permit. ***26 § (1) and (2) Government Decree 314/2005 (XII.25)***[167]	Depending on the degree of impact on the environment, the competent authority may, a) limit; b) suspend; or c) prohibit the continuation of the illegal conduct. ***26 § (1) Government Decree 314/2005 (XII.25)*** In addition, the competent authority shall, having regard to the danger of the illegal conduct may have on the environment, impose a fine of Euros 182 to 365/day (HUF 50,000 to 100,000) for the period when the installation was operating without a permit. ***26 § (3) Government Decree 314/2005 (XII.25)***	**Administrative (quasi)criminal offence:** See description below the table.	**Administrative (quasi)criminal penalty:** See description below the table.
Obligation to supply information for application for permits	N/A	N/A	N/A	N/A
Obligation to notify the competent authority of any changes in the operation of an installation	N/A	N/A	N/A	N/A
Obligation to comply with the conditions set in the permit or mandatory ELVs	Infringement or non-compliance with the following requirement: Obligation of the operator to comply with the permit conditions while carrying out activities. ***26 § (4) Government Decree 314/2005 (XII.25)***	The competent authority can oblige the operator to: a.) pay a fine of Euros 730-1,826 (HUF 200,000 to 500,000) b.) require the operator to comply with the conditions set in the permit, c.) within a six months period prepare a programme of measures or carry out an environmental review. ***26 § (4) Government Decree 314/2005***	**Administrative (quasi)criminal offence:** See description below the table. **Criminal offence:** See description below the table.	**Administrative (quasi)criminal penalty**: See description below the table. **Criminal penalties:** See description below the table.

[167] Article 26(2): 'Operating without an integrated environmental permit in case of activities specified in Article 1(3)(a)' Article 1(3) refers to those activities which are listed in Annex I of the Government Decree.

	Endangering the environment or causing environmental pollution or non-compliance with administrative decision. ***26 § (5) Government Decree 314/2005 (XII.25)***	Depending on the degree of influence on the environment, the competent authority may: a) limit; b) suspend; or c) prohibit the continuation of the illegal conduct. ***26 § (1) Government Decree 314/2005 (XII.25)***		
	<u>Infringement or non-compliance with the following requirement:</u> Obligation of the operator to comply with administrative decision. ***26 § (5) Government Decree 314/2005 (XII.25)***	Depending on the degree of influence on the environment, the competent authority may: a) limit; b) suspend; or c) prohibit the continuation of the illegal conduct. ***26 § (1) Government Decree 314/2005 (XII.25)*** 'Or' Withdraw the environmental or integrated environmental permit. ***26 § (5) Government Decree 314/2005 (XII.25)*** The competent authority can require the operator to: a.) pay a fine from Euros 730 - 1,826 (HUF 200,000 to 500,000), b.) comply with the conditions set in the permit, c.) within a six months period prepare a programme of measures or carry out an environmental review. ***26 § (4) Government Decree 314/2005 (XII.25)***		

Illegal activities or omissions can constitute petty offences (also called administrative (quasi)criminal offences). The sanctions imposed for administrative (quasi)criminal offences are similar to those for criminal offences; therefore sanctions could for example include imprisonment or fines.[168] With regard to the IPPC installations, the so-called 'environmental protection petty offence' is the most relevant.[169] According to Article 148 of the Petty Offence Act, a fine up to Euros 547 (HUF 150,000) can be imposed in cases of operating without an environmental permit or non-complying with its conditions. According to the Hungarian legal system, only natural persons can be liable for petty offences. In case a legal person breaches its legal obligations, the person whose act or omission caused the breach will be liable.

For most serious breaches of environmental obligations, criminal liability may arise. Typical sanctions pursuant to Hungarian criminal law can include principle and supplementary punishments, such as imprisonment or a fine.[170] The Hungarian Criminal Code does not cover offences which relate specifically to infringements of the IPPC Directive, but it includes general offences which can be of relevance, such as 'damaging the environment',[171] 'damaging the nature',[172] 'illegal deposition of waste'[173] and 'danger to the public'. [174]

As an example, in case of the offence 'damaging the environment', a person responsible for any pollution of the earth, the air, the water, the biota (flora and fauna) and their constituents, resulting in (i) their endangerment (ii) damage to such an extent that its natural or previous state can only be restored by intervention, or (iii) damage to such an extent that its natural or previous state cannot be restored at all, is guilty of a felony and can be punishable of imprisonment up to 8 years.

The criminal liability of legal persons was introduced in the Hungarian legal system in 2001, by Act CIV of 2001.[175] Three different sanctions can be imposed for crimes committed by legal persons: (1) the dissolution of the legal person, (2) constraining the activity of the legal person and (3) fines.[176]

The way the fines are calculated is as follow: three times the benefits of the legal person from the illegal conduct, but at least HUF 500 thousands (Euros 1,862.85).

2 Administrative procedure

2.1 General elements on the legal tradition and potential evolution

Since the reform of the Hungarian criminal law in 1955, administrative sanctions and offences have

[168] Article 13(1) of Act LXIX of 1999: Penalties applicable for petty offences: a.) imprisonment, b.) fine. Measures applicable for petty offences: a.) prohibition from driving, b)confiscation of goods, d.) notification, e.) expulsion.

[169] List of petty offences which could be relevant with regard to IPPC installations:

- Environmental protection petty offence (Act LXIX of 1999, Article 148);
- Nature protection petty offence (Act LXIX of 1999, Article 147);
- Water pollution petty offence (Government Decree 218/1999 (XII. 28.), Article 126);
- Petty offence of breaching water law requirements (Government Decree 218/1999 (XII. 28.), Article 125); and
- Petty offence of breaching flood protection and/or inland flood protection requirements (Government Decree 218/1999 (XII.28.), Article 127).

[170] Criminal Code Article 38: (1) Principal punishments are: 1. imprisonment, 2. labour in the public interest, 3. Fine 4. Prohibition from profession 5. Prohibition from driving vehicles and 6. Expulsion. Supplementary punishments are: 1. prohibition from public affairs and 2. Banishment.

[171] Act IV of1978, Article 280.

[172] Act IV of 1978, Article 281.

[173] Act IV of 1978, Article 281/A.

[174] Act IV of 1978, Article 259.

[175] Act CIV of 2001 on Criminal Measures Applicable against Legal Persons.

[176] Article 2(1) and Article 3 of Act CIV of 2001.

been separated from criminal law.[177] Administrative sanctions can be imposed by competent administrative authorities within the framework of administrative procedures to address unlawful activities. Administrative sanctions are onerous in nature and can be executed.

On the basis of their functions, administrative sanctions can be grouped as follow:

- Administrative sanctions enforcing administrative provisions: *e.g.* Article 26(4) of Government Decree 314/2005 (XII. 25.) - complying with the conditions set in the permit;
- Preventive administrative sanctions: *e.g.* Article 101(2) of Act LIII of 1995.- being liable for the costs of prevention of the polluting activity;
- Repressive administrative sanctions: *e.g.* Article 26(1) of Government Decree 314/2005 (XII. 25.) - limiting the illegal conduct;
- Compensatory administrative sanctions: *e.g.* Article 26(4) of Government Decree 314/2005 (XII. 25.) - paying a fine of Euros 730- 1,826.

2.2 Inspections

2.2.1 General information

In Hungary, environment related inspections are performed by administrative bodies for environmental protection.[178] The main administrative authorities for environmental protection at country level are the Ministry of Rural Development[179] and the National Inspectorate for Environment, Nature and Water.[180] The National Inspectorate for Environment, Nature and Water and the regional inspectorates are responsible for the day-to-day matters and regulatory issues, whereas the Ministry of Rural Development supervises such activities.[181] At first instance, environment-related matters are mainly managed by the ten Regional Environment, Nature and Water Inspectorates.[182] Most of the control carried out by the inspectorates takes place according to annual plans. In Hungary inspection plans are not generally available to the public.[183]

The ten regional inspectorates are competent for the enforcement of the transposing legislation of the IPPC Directive. In 2010, the estimated number of staff members working on IPPC related inspections was 145. The number of IPPC installations subject to administrative control was about 1119.[184] In 101

cases, the administrative authorities required the operators to take actions and in 134 cases imposed administrative fines.[185]

2.2.2 Key elements of the inspection procedures

Regional inspectorates can gather information about the activities of the IPPC installations through regular administrative control. Act CXL of 2004 on the general rules of public authority procedures and services, sets the main rules for administrative control. Environment related inspections are regulated by Act LIII of 1995 on Environmental Protection,[186] whereas the IPPC Decree lays down specific rules applicable to the administrative control of IPPC installations.

General rules on administrative inspections

In order to investigate and assess the environmental impacts of the specific activities and check if the operator complies with the legal requirements, environmental audits can be carried out.[187] If as a result of the audit, the regional inspectorate detects that environmental damage was caused, or there was a risk of such damage, it may fully or partially restrict or suspend the activity of the installation.[188]

In addition to the environmental audit, the operator might evaluate its own environmental performance in form of the so-called 'environmental protection performance evaluation' and request the regional inspectorates to approve it.[189]

Moreover, operators shall inform the regional inspectorates on any significant changes concerning the activity of the installation.[190] In case of non-compliance with this obligation, the regional inspectorates may suspend the activity of the operator. The regional inspectorates shall also inspect ex-officio the changes in the conditions of the environmental permit. In case the conditions significantly deviate from the conditions existing at the time of permitting, the inspectorate shall order an environmental audit.[191]

IPPC specific rules on administrative inspections

In addition to the general rules, the IPPC Decree lays down specific rules applicable to the administrative control of IPPC installations. In accordance with Article 22(1) of the IPPC Decree, the regional inspectorates may introduce a so-called 'trial operation' for the installations. Before the end of the 'trial operation', but at the latest six months after it started, the competent authorities shall examine if the operation of the installation is in compliance with the requirements of the integrated environmental permit. For this purpose, the operator is required to provide the authorities with the following documents: document listing the equipments used in the installation, documents proving that the installation operates in compliance with the requirements of the integrated environmental permit.

Integrated environmental permits are valid for a period of at least 5 years but the installations get permits for a period more than 5 years as well. However, each 5 years the Regional Environment,

[185] Note that the numbers are estimated numbers, gathered through an interview with a representative of the Ministry of Rural Development.
[186] International Comparative Legal Guide Series, Environment Law, 2007, Hungary: According to Article 64 of the Environmental Protection Act, the enforcement of the administration of environmental protection is included within the scope of the administration of environmental protection.
http://www.iclg.co.uk/khadmin/Publications/pdf/1177.pdf
[187] Article 73(1) of Act LIII of 1995.
[188] Article 74(3) of Act LIII of 1995.
[189] Article 77 of Act LIII of 1995.
[190] Article 82(1) of Act LIII of 1995.
[191] Article 82(2) of Act No LIII of 1995.

Nature and Water Inspectorates have to carry out an administrative control in accordance with the rules applicable to the environmental audit.

In accordance with Article 22(3) of the IPPC Decree, the administrative authorities shall carry out 'site- visits' on a yearly basis in order to examine the execution of the requirements of the integrated environmental permit. At the end of the proceeding, the competent authorities shall prepare a report of proceedings. As the IPPC Decree does not specify the rules of site inspections, the general rules of Act CXL of 2004 are applicable.[192] As a general rule,[193] the operator shall be informed about the inspection in advance. Unless stated differently,[194] the person concerned can attend the inspection, which in principle is carried out during the operation of the installation.[195] The following table summarizes the rights and obligations of the inspectorates during the site inspection:

Table 3: Rights and Obligations of inspectors

Rights and obligations of inspectors[196]	
Rights	Obligations
11. entry 12. access to the file 13. monitor/examine the working process or other objects 14. request for information 15. record image and sound 16. sampling 17. seizure 18. other	5. preparing a report of proceedings 6. returning documents and physical evidences to the persons concerned or submitting them to the competent authorities

According to the IPPC Decree, depending on the result of the different type of administrative controls, the competent authorities may take the following administrative measures:

- Administrative measures laid down in Article 20(9) and (10):
  - obliging the operator to carry out environmental performance review; or
  - amending the requirements of the integrated environmental permit.
- Administrative measures laid down in Article 26:
  - imposing sanctions (see above in Table 1).

2.2.3. The inspectors' enforcing powers

There is no specific provision identified with regard to the inspectors' enforcing powers in the IPPC Decree, thus the rules of Act LIII of 1995 and Act CXL of 2004 are applicable.

In accordance with the general rules of Act CXL of 2004, the regional authorities may order temporary safety measures in form of seizure or pledging for cases when there is a risk that the operator does not fulfil his legal obligations.[197]

Moreover, during the inspection, the operators are obliged to provide the inspectors with access to the installations.[198] If it is necessary for the safe proceeding or the success of the administrative procedure,

[192] Procedural rules applied on site visits are laid down in Article 56- 57/B and 88-92 of Act CXL. of 2004. Note that Article 56-57/B regulates a specific type of inspections ('szemle') which is applicable when the observation of the person, movable property or immovable property is required in order to cleaning up the matters of fact. In accordance with Article 88(4), procedural rules laid down in Article 56-57/B are also applicable to on the spot/site inspections.

[198] Article 57/A(3) of Act CXL of 2004.

the regional inspectorates may ask the police to attend.[199] In case the person concerned with the administrative procedure impedes the investigation, the regional inspectorates can seize the relevant physical evidences[200] and impose administrative fines on the person.[201] Moreover, if immediate actions are required (*i.e.* in case of danger of death) the regional inspectorates may enter in the installations without the agreement of the persons concerned.[202] This kind of control would require the approval of the public prosecutor, and the attendance a police official and an official witness, unless the process of asking for the approval of the public prosecutor would cause significant delays.

Enforcement of the decision of administrative authorities

As a general rule, the regional inspectorates shall ex-officio check if the operators fulfilled their obligations set by an administrative decision. In case of concern, the regional inspectorates may carry out an administrative control.[203] If the operator does not comply with the administrative decision, the regional inspectorates may start the execution procedure. The execution procedure might *inter alia* aim at:

- enforcing the fulfilment of a pecuniary obligation, such as payment of an environmental fine;[204] or
- ensuring that the operator carries out certain activity, such as compliance with the conditions set in the permit.[205]

The general rules of execution procedures are laid down in Act LIII of 1994 on judicial enforcement procedures.

As a specific rule, the decisions of the administrative authorities made concerning emergencies that pose hazard to or damage the environment shall be executed without delay, regardless of the appeal procedure.[206]

2.3. Appeal against the administrative decision

Any action or decision taken by the regional inspectorates can be appealed before the National Inspectorate for Environment, Nature and Water or a judicial court. The IPPC Decree does not include provisions on appeals against administrative provisions, thus the general rules of Act CXL of 2004 are applicable. Appeal procedures can start on the operator's request and/or ex-officio. The following table summarizes the different appeal proceedings identified. These are further described below.

Table 4: Appeal proceedings against administrative decisions

Appeals against administrative decisions	
Appeals on operator's request	Ex officio appeals
Appeal proceeding: *Articles 98- 108*	Proceeding within the competence of the authority taking the administrative decision : *Article 114*
Judicial review of administrative suit: *Articles 109- 111*	Surveillance procedure: *Article 115*
Retrial procedure: *Articles 112-113*	Proceeding on the basis of the decision of the Constitutional Court: *Article 117*
	Proceeding on the basis of the objection of the prosecutor:

Article 118-119
Appeals on the request of the operators/ ex officio
Request for: - Revision of an administrative resolution - Complementing an administrative resolution - Replacement - Annulment

2.3.1 By the operator

Appeal proceeding: The operator might appeal against any first instance decision of a regional inspectorate. The appeal shall be filed to the regional inspectorates,[207] which submit the appeal together with the supporting documents to the National Inspectorate for Environment, Nature and Water within 8 days. The National Inspectorate may approve, amend or annul the first instance decision. In case of annulment, the regional inspectorates may be ordered to conduct a new administrative procedure.

Judicial review of administrative suit: Any final decision of the competent authorities might be reviewed by judicial courts, based on the request from the operator or other actors of the procedure within 30 days. The competent administrative court might annul the final administrative decision and in case of need may order the administrative authority to conduct a new procedure.

Retrial proceeding: The operator might ask for the retrial of the procedure within 15 days from the appearance of *e.g.* a new information or fact. The request for retrial is decided by the regional inspectorates, which may amend or withdraw the final administrative decision or take a new decision.

2.3.2 By a person other than the operator

Proceeding within the competence of the authority taking the administrative decision: Both first and second instance authorities may amend or withdraw their decisions ex-officio in case of non-compliance with the legal requirements, within one year from communicating the decision with the parties.

Surveillance procedure: Within its ex-officio monitoring activities, the National Inspectorate may annul or amend the unlawful decisions of the regional inspectorates.

Proceeding on the basis of the decision of the Constitutional Court: Within its competence, the Constitutional Court may declare that a legal act is unconstitutional and thus exclude its application retrospectively. Following such decision, anyone can use his/her right of complaint and ask the administrative authorities to amend or annul their decisions.

Proceeding on the basis of the objection of the prosecutor: The public prosecutors might object to any decision, proceeding or omission of the competent authorities.

In addition, both the competent authorities and the parties might ask for the annulment, replacement, revision and/or completion of an administrative decision.[208]

3 Judicial procedure (if relevant-with a focus on criminal sanctions)

[207] Unless the regional inspectorate decides to correct, complement, amend, withdraw its decision, or dismiss the appeal without examination (*e.g.* belated appeal).
[208] Article 121 of Act CXL of 2004.

3.1 General information[209]

As noted above, there is no specific IPPC related criminal offence. Consequently, the general rules of criminal procedures are applicable, which are laid down in Act XIX of 1998 (Criminal Procedure Act). In practice, criminal procedures against IPPC installations are rare. Therefore, the rules described below are rather theoretical.

The court may only ascertain the criminal liability of an operator against whom an accusatory instrument was filed and only for acts contained in such instrument.[210] In principle, the following actors have the right to initiate and conduct a criminal procedure: court, public prosecutor,[211] the investigative authorities[212] and under certain circumstances the substitute private accuser.[213] The regional inspectorates shall ex-officio inform the investigative authorities in case of detecting the suspicion of a criminal offence. In 2010, there was only one case when a regional inspectorate initiated a criminal procedure against an IPPC installation.[214]

The operators are entitled the following rights during the different stages of the criminal procedure:

Table 5: Rights of operators during the criminal procedure

Operator/ Defendant	Stage of the criminal procedure	Rights
Suspect	In the course of investigation.	Article 43(2) of the Criminal Procedure Code: - receiving information on the suspicion, on the charge and any changes, - be present at actions and inspects, - be granted sufficient time and opportunity for preparing the defence, - file for legal remedy, - receiving information on his rights and obligations during the criminal proceeding, - present facts at any stage of the procedure, make motions and objections.
Accused	In the course of court procedure.	Article 43(3) of the Criminal Procedure Code: - contacting the defence counsel (if foreign the consulate) and communicate with them without control, - written and verbal communication with relatives under certain control, or with other persons under legal conditions laid down in Article 43 (3)(b).

Relevant facts for the application of criminal statutes and legal regulations on criminal proceedings are covered by evidences.[215] Inspection can be ordered and conducted by the court or the prosecutor to serve as evidence.[216] [217] In order to ensure the effectiveness of the criminal proceedings, coercive

[209] Special rules are applicable to the criminal proceedings against *inter alia* juvenile offenders (Part 5 of the Criminal Code), Military criminal proceedings (Chapter XXII) Procedures based on private accusation (Chapter XXIII), procedures against absent defendants (Chapter XXV) and Procedures against persons enjoying immunity (Chapter XXVIII).
[210] Article 2(3) of Act XIX of 1998.
[211] Article 28(1) of Act XIX of 1998: 'The prosecutor act as the public accuser'.
[212] Article 6(1) of Act XIX of 1998 : It is the responsibility of the court, the prosecutor and the investigating authority to initiate and conduct the criminal proceedings if the conditions set forth in this Act prevail.
[213] Article 53(1) of Act XIX. of 1998: '[…] the victim may act as a substitute private accuser if: (a) the prosecutor or the investigating authority rejected the report or terminated the investigation, (b) the prosecutor partly omitted the indictment, (c) the prosecutor dropped the case, (d) the prosecutor did not state any criminal offence that should be prosecuted based on the public accusation, consequently he did not file a charge, nor did he take over the representation of the indictment […], (e) the prosecutor dropped the charge in the trial because in his judgement, the criminal offence should not be prosecuted based on a public accusation.'
[214] More information on the case is included in one of the case-studies.
[215] The following constitute means of evidence in the Criminal Procedure Act: witness, expert opinion, physical evidence, documents and pleadings of the defendant.
[216] Rules on inspections are described under Article 119(1) of Act XIX of 1999.

measures can be applied.[218]

Unless otherwise stated in the Criminal Procedure Act, criminal proceedings start with an investigation. Investigation is ordered and carried out by the public prosecutor and/or the investigating authorities [219] on the basis of the data coming to the cognisance of the prosecutor, or the investigating authority within their official competence or in via a complaint.[220]

The investigation must commence as soon as possible, and in principle must be concluded within 2 months.[221] As an investigatory action, the prosecutor and/or the investigating authority may inter alia:

- collect data;[222]
- interrogate the operator.[223]

In principle, anyone affected may challenge the decision of the prosecutor and/or the investigating authority within 8 days.[224]

The prosecutor is responsible for filing the indictment to the court. The filing of the indictment cannot be subject to appeal. If the prosecutor has rejected the protest of the victim concerning the dismissal of the complaint or the termination of the investigation, a substitute private accusation may be lodged. Moreover, if the prosecutor has partially omitted the indictment, the victim may stand as a substitute private accuser.[225]

The court holds a trial to establish the criminal liability of the accused. The panel of the court adopts its decision after deliberation by way of voting. [226]

3.2 Possibilities of appeal

Act LI of 2006 introduced a tertiary appeal system in Hungary. In accordance with Article 13 of Act XIX of 1998, local courts and county courts are the first instance courts.
Second instance courts are:

- County courts in cases falling within the competence of local courts,
- Court of appeals (tribunals)[227] in cases falling within the competence of county courts,
- The Supreme Court in cases when the law allows appeal proceedings against the decisions of the courts of appeal (tribunal).

Third instance courts are:

- Courts of appeals (tribunals) in cases that were decided at the county courts at the second instance,

[217] Other evidentiary procedures are: Questioning on the scene, Reconstruction, Presentation for identification, Confrontation, and Concurrent hearings of experts.
[218] Coercive measure can infringe or restrict the fundamental rights of the citizens; in particular, coercive measures might restrict the freedom of movement, ownership, property rights, right to personal liberty. Under the Criminal Procedure Act, the following coercive measures can be imposed: custody, pre-trial detention, home curfew, house arrest and keeping away, temporary involuntary treatment in a mental institution, measure to warrant the prohibition to travel abroad, bail, search, body search and seizure, order to reserve date recorded by a computing technical system, sequestration and precautionary measures and securing the order of proceedings.
[219] Investigation falls under the exclusive competence of the public prosecutor in certain criminal offences listed in Article 29, which includes inter alia the following criminal offences: criminal offences committed by persons enjoying immunity due to holding a public offence, murder against a judge, criminal offences committed by a sworn members of the police.
[220] Article 170(1) of Act XIX of 1998.
[221] Rules of the deadlines for carrying out inspections are laid down in Article 176(1) and (2) of Act XIX of 1998.
[222] Applicable rules are laid down in Article 176(1) and (2) of Act XIX of 199.
[223] Applicable rules are laid down in Articles 179-180 of Act XIX of 1998.
[224] Article 195(1) of Act XIX of 1998
[225] Applicable rules are covered by Article 229(1) of Act XIX of 1998.
[226] Article 256(3) of Act XIX of 1998.
[227] The total number of courts of appeals (tribunals) in Hungary is 5: Tribunal of the capital, Tribunals of Pécs, Győr, Debrecen and Szeged.

- The Supreme Court in cases where the court of appeals (tribunals) decided on second instance.

Appeal procedure: The judgement of the court of first instance or any non-conclusive ruling of the court may be appealed[228] at the court of second instance.[229] The court of second instance may uphold, modify or repeal the judgement of the court of first instance, or reject the appeal.[230] The conclusive decision of the court of second instance might be appealed[231] at the court of third instance.[232] The court of third instance might uphold, modify, or repeal the judgement of the court of second instance contested with the appeal, or reject the appeal.[233]

Re-trial: The final judgment of the court may be subject to re-trial if ***e.g.*** new evidence is found which makes if probable that the defendant shall be acquitted.[234] Depending on the outcome of re-trial, the competent court might repeal the judgement or reject the re-trial if it is found unsubstantiated. [235]

Review: The final conclusive decision of the court might be subject to the review of the Supreme Court.[236] [237] The Supreme Court may uphold in effect, modify or repeal the contested decision.[238]

Legal remedy on legal grounds: The Prosecutor General may report a legal remedy to the Supreme Courts, which may reject the legal remedy, or find that the legal ground of the remedy is substantiated and thus ***i.e.*** acquit the defendant, or order the court to conduct a new procedure.[239]

Harmonisation procedure: If as a result of its harmonisation procedure, the Supreme Court finds that a doctrine on which the court established the criminal liability of the operator is unlawful it may repeal the unlawful disposition, acquit the defendant and terminate the criminal procedure.[240]

3.3 Administrative (quasi) criminal procedures

General information

There is no specific IPPC related administrative (quasi) criminal procedure, thus the general rules of Act LXIX of 1999 are applicable.

Administrative (quasi)criminal procedures start with a complaint or ex-officio by the relevant administrative authorities. With regard to IPPC related petty offences, the main administrative authorities are the notaries (e.g. for 'environment protection petty offence')[241] and the nature

[228] The following parties might be entitled to appeal: a.) accused, b.) the prosecutor, c.) the substitutive private accuser, d.) the counsel for the defence, e.) the heir of the accused, against orders granting a civil claim, f.) the legal representative, the spouse or common-law spouse of an accused of legal age against an order for involuntary treatment in mental institution, g.) private party, against whom a disposition has been made in the verdict, in respect of the relevant order, h.) those against whom a disposition has been made in the verdict, in respect of the relevant order.
[229] Article 347(1) of Act XIX of 1998.
[230] Article 370(1) of Act XIX of 1998.
[231] The following parties have the right of appeal under Article 367/A (1): the accused, the prosecutor, the substitutive private accuser, the defence counsel and the legal representative, spouse or common-law souse of the accused of legal age, against the order of involuntary treatment in a mental institution.
[232] Article 367/A(1) of Act XIX of 1998.
[233] Article 396(1) of Act XIX of 1998.
[234] Article 408(1) of Act XIX of 1998.
[235] Article 415(1) of Act XIX of 1998.
[236] Article 416(1) of Act XIX of 1998.
[237] As an example, the final conclusion of the court is subject to review if the defendant was acquitted of the procedure terminated, the criminal liability of the defendant established or the involuntary treatment in mental institution ordered in violation of the criminal substantive law.
[238] Article 426-428 of Act XIX of 1998.
[239] Article 431-438 of Act XIX of 1998.
[240] Article 439- 445 of Act XIX of 1998.
[241] Article 32 of Act LXIX of 1999.

protection authorities (e.g. for 'nature protection petty offence').[242] In principle, the deadline for completing administrative (quasi) criminal procedures is 30 days. [243]

Enforcement powers

If the administrative authorities notice the illegal conduct during an administrative control, they can impose a fine and process the administrative (quasi) criminal procedure on the site, unless additional evidence is required. [244]

Appeals

Complaint against decisions related to administrative proceedings: The operator and his/her legal representative as well as any person subject to administrative fine might lodge a complaint against the procedural decision of a competent administrative authority. The public prosecutor may decide reject or withdraw the administrative decision.[245]

Complaint against the administrative decision: The operator, his legal representative or the defence counsel might object the decision of the administrative authorities.[246] On the basis of the objection, the administrative authority may withdraw or amend the decision. If the administrative authority does not agree with the objection, it submits the motion to the competent local courts which may maintain or amend the decision of the administrative authorities.[247]

Review: The final conclusive decision of the court might be subject to judicial review. The competent first instance court might maintain or withdraw the decision of the court of first instance.[248]

Proceeding on the basis of the objection of the prosecutor: Based on the objection of the public prosecutor, the administrative authority may withdraw its decision. In case of disagreement, the administrative authority submits the objection to the competent courts. The court may approve the objection of the prosecutor and order the administrative authorities to conduct a new procedure in accordance with the objection of the prosecutor.[249]

4 Synergies between administrative, administrative (quasi) criminal and criminal procedures

As noted above, administrative procedures can be conducted alongside with criminal or administrative (quasi) criminal procedures. However, administrative (quasi)criminal and criminal procedures cannot be conducted at the same time.

The table below summarizes the procedural link-if any- between administrative, administrative (quasi) criminal and criminal procedures.

Table 6: Procedural links between administrative, administrative (quasi) criminal and criminal procedures

	Administrative	Administrative	Criminal

[242] Article 35 of Act LXIX of 1999.

[249] Article 91 of Act LXIX of 1999.

		(quasi)criminal	
Administrative		+	+
Quasi-criminal	+		-
Criminal	+	-	

Administrative (quasi) criminal and criminal procedures: In accordance with Article 1(2) of Act LXIX of 1999 on petty offences, no petty offence can be if the action constitutes a crime. Moreover, Article 83(1)(e) of the Petty Offence Act requires the administrative authorities to cancel administrative (quasi) criminal procedure if there is an on-going criminal procedure in place against the operator for the same illegal conduct, or the liability of the operator for the same illegal conduct has already been declared within a previous criminal procedure. In accordance with Article 6 of the Criminal Procedure Code, no criminal proceeding can be conducted against an operator who has been declared liable in a court decision within the framework of an administrative (quasi)criminal procedure.

Administrative and administrative (quasi)criminal/criminal procedures: According to Article 107 of the Environmental Protection Act, the imposition of an environmental fine does not free anyone from criminal, administrative (quasi)criminal or civil liability, or from being obliged to limit, suspend or halt an activity; realizing protective measures or restoring the natural/previous state of environment'. Thus, an administrative procedure can be conducted along with criminal and/or administrative (quasi)criminal procedures.

There is no legal rule applicable to the procedural links between administrative and criminal/quasi-criminal procedures. In practice, criminal/administrative (quasi) criminal procedures often follow administrative procedures. This can be explained by the fact that the suspicion of a criminal offence/ administrative (quasi) criminal offence is often a result of an administrative procedure or becomes evident within the framework of an administrative procedure, *e.g.* during administrative control. Lodging a criminal/ administrative (quasi)criminal procedure does not suspend on-going administrative procedures, in other words the different procedures can be conducted in parallel.[250]

Based on the findings of the structured interviews it seems that the main reason for the limited number of criminal procedures against IPPC installations is the lack of knowledge. In other words, in most cases administrative authorities are not aware of the possibility of initiating criminal procedures. Moreover, no specialised unit exists within the office of the public prosecutor/investigated authorities dealing with environmental criminal offences. This situation will be changed in the future according to one of the judges of the Supreme Court, who emphasized that it is planned to set up a department within the Prosecution Office of the Prosecutor General dealing exclusively with environment related offences.

It is noted, that court procedures against IPPC installations often take place in form of administrative court procedures. In accordance with Article 109 of Act CXL of 2004 on administrative procedures, IPPC installations may appeal against the conclusive administrative decision before the competent administrative courts. According to Article 326(9) of Act III of 1952 on civil procedures, the competent administrative courts at first instance are the county courts. In principle there is no possibility to appeal against the decision of the court. However, on the legal basis of Article 340/A(2) of Act III of 1952, the Supreme Court may review the decision of the administrative court. In accordance with Article 340/A(3) of Act III of 1952, the IPPC installations may also ask for retrial.

[250] Information for this section was gathered through conducting interview with a representative of the Ministry of Rural Development.

5 Conclusions

Proportionality

Article 106 of the Environmental Protection Act requires the administrative authorities to adjust the amount of administrative fines to the severity of the environmental damage caused, the environmental pollution and the length and periodicity of the illegal conduct. The IPPC Decree also states that the level of fines should be proportionate to the negative environmental impacts of operators' activities.

In line with this above requirement, the competent authorities may impose fines/day for the period while the installation was operating without an environmental permit or without the performance of the preliminary environmental impact assessment.[251]

In addition to these legal conditions, some authorities suggested to take into consideration the financial capacity of the IPPC installations while imposing sanctions. They argued that in case of too high sanctions, the operators may close down the installations without restoring the environment, which is contrary to the main aim of the IPPC Decree.

One of the regional inspectorates argued that authorities shall impose more stringent sanctions on IPPC installations than on installations not falling under the obligation of obtaining an integrated environmental permit. According to the interpretation of the regional inspectorate, IPPC installations often cause more severe damage to the environment, than non-IPPC ones. The authority illustrated its argument through the following example:

In the given case, a chicken farm did not fill in the waste register. For this illegal conduct, the regional inspectorate imposed a fine of Euros 746 (HUF 200,000) on the chicken farm (IPPC installation). In case of a non-IPPC installation, this fine could have been disproportionate with regard to the insignificant character of the illegal conduct.

According to most of the practitioners,[252] the Hungarian legislation provides enough room for adjusting the sanctions to the illegal activity of the IPPC installation; however some argued that sanctions would be more efficient if taking the benefits gained from the illegal conduct and/or the costs of restoring the environment into consideration.

Those practitioners who did not find the current system of administrative sanctions proportionate enough argued that Euros 730 (HUF 200,000) as a minimum limit is too strict for some minor cases of non-compliances with permit conditions, whereas the maximum limit of Euros 1,826 (500,000) is too low for more serious breaches, or breaches which are repeated periodically.[253] In other word, the range of possible fines set by the legislation is too narrow.

According to Article 23 of the Petty Offences Code, sanctions and measures must be adjusted to the severity of the illegal conduct. While imposing administrative (quasi)criminal sanctions, the authorities must take into consideration the personal circumstances of the defendants and check if the operator has carried out similar or identical administrative (quasi)criminal offence during the past two years.

The Criminal Code reflects the principle of proportionality as it requires criminal sanctions to be

[251] Article 26 (3) of the IPPC Decree.

[252] Information gathered through the results of an informal questionnaire sent to the regional authorities.

[253] This example refers to the provisions of Article 26 §(3) of the IPPC Decree.

proportionate to the danger of the illegal conduct to the environment and the society, the degree of culpability and to other aggravating and mitigating circumstances.[254]

Effectiveness

According to most of the regional inspectorates, an administrative sanction can be seen as effective if:

- it contributes achieving the aim of the legal act;
- it forces the operator to fulfil his/her legal obligations;
- it shortly follows the illegal conduct; and
- it is personalised to the given operator.

In addition to the above listed criteria, it was one of the main findings of Case Study I (see in Annex) that a sanction cannot be seen as effective if it restrains the operator from restoring the state of environment on the site and/or from repairing the damage caused.

Dissuasiveness

According to the answers received from the regional inspectorates, a sanction is deemed to be dissuasive if it prevents the defendant and/or other operators from any illegal activity. The deterrent effect of administrative sanctions is well illustrated through the following example:

> In 2010, one of the regional inspectorates conducted a site visit in a chicken farm. As a result, the regional inspectorate noticed that the number of chickens was higher than 40,000 during 33 days of the year. Above the limit of 40,000 chickens, farms fall under the scope of IPPC Decree (Annex II (11) (a)), thus require an integrated environmental permit.
>
> On the legal grounds of operating an IPPC installation without an integrated environmental permit, the regional inspectorate imposed a fine of Euros 6,166 (HUF 1,650,000). Following this decision, the operator applied for an integrated environmental permit.

According to most regional authorities, warning the operators about the potential legal consequences of their illegal conduct is often preventive enough. In other words operators often start complying with their legal obligations before more severe sanctions would be imposed. Therefore, it is rare that criminal sanctions are imposed against operators, although the possible sanction of privation of freedom may have the most deterrent effect on the operator.

Based on the main findings of Case-study I, it can be argued that a sanction leading to the closure of the installations cannot be seen as dissuasive. Logically a given sanction has no preventive effect on an operator who terminated its activities due to the sanction imposed.

> In the given case, the IPPC installation was carrying out activities without a valid integrated environmental permit. Following a site-visit, the regional inspectorate prohibited the illegal activity of the IPPC installation. The IPPC installation appealed against the first-instance decision.
>
> A few months after taking the first-instance decision, the regional inspectorate carried out a regular site-visit on the site and noticed that the operator stopped its economic activities on the site. In other words the decision of the administrative authority led to the closure of the IPPC installation.

More details on the case are provided in the Annex of this Case-study.

[254] Article 83(1) of the Criminal Code.

Case studies

The cases studies below illustrate the nature of administrative sanctions (*i.e.* effective, dissuasive, and proportionate) applicable to IPPC installations and the procedural links between administrative and court procedures.

The first case study shows the lack of dissuasive character of the administrative sanction imposed. In the given case, the competent regional inspectorate prohibited the activity of the installation. Following the decision, the IPPC installation terminated its economic activities. The conclusion of the case is that a sanction cannot be seen as dissuasive, if as its consequence the operator stops the economic activities on the site.

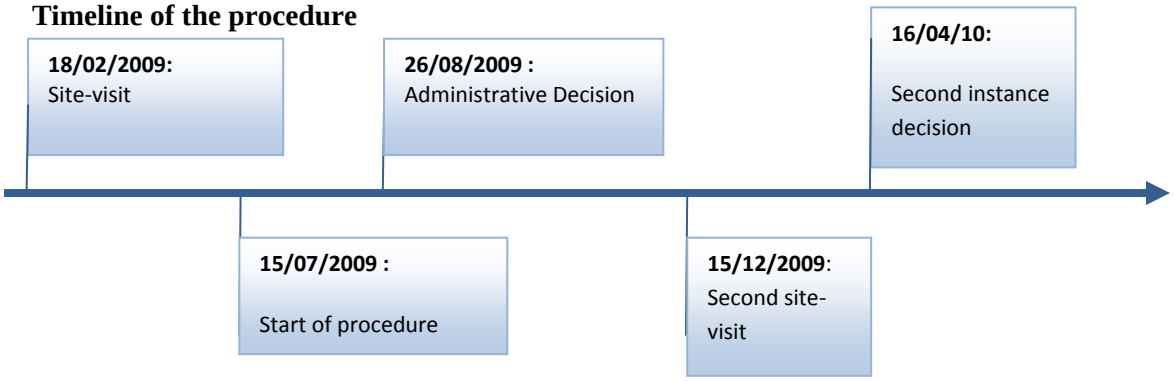
In the second case-study due to the administrative sanction imposed the IPPC installation stops the illegal conduct, cleans the site and installs the necessary equipment to prevent such illegal activities.

The third case illustrates the procedural link between administrative and court procedures. It also gives an example to cases when the administrative authorities apply different rules than those provided in the IPPC Directive (and its implementing IPPC Decree) for cases when an IPPC installation does not comply with its legal obligations. It is noted and explained below that such interpretation of the law by the competent administrative authority was wrong.

Case Study I: Administrative sanctions applicable to IPPC installations

Interviewee – Ms Gyöngyi Bejenaru-Sramkó[255]
Organisation and position: Ministry of Rural Development, Chief Counsellor (Environment Conservation and Development Department)
Telephone number: +36-1-795-2444
Date of interview: 15/04/2011

Timeline of the procedure



Description of the background

[255] With regard to the first two case studies, it must be noted that information was gathered through an interview with the Chief Counsellor of the Ministry of Rural Development (Ms Bejeranu- Sramko). When additional information was required on the case, the competent regional authority was contacted (Regional Environment, Nature and Water Inspectorate of Kozep-Dunavolgy) with the support of the Ministry of Rural Development, in the form of questionnaires. In certain instances, the regional authority was unable to provide information on the dates of the procedural steps, or the level of information provided was not sufficient to judge the nature of the sanction imposed (i.e. effectiveness, proportionality and dissuasiveness).

'B' Plc. was carrying out activities with a valid integrated environmental permit, which was amended by three administrative decisions during the period of 2006 and 2008.

In January 2009, 'B' Plc informed the Regional Environment, Nature and Water Inspectorate of Kozep-Dunavolgy (hereinafter referred to as regional inspectorate) about terminating its activities from the end of January. The company also notified the inspectorate about its intention of subletting the site to 'F' Ltd.

The scope of activities carried out by 'F' Ltd. was identical to the past activities of 'B' Plc, which covered *inter alia* the manufacture and placing on the market of chemical substances on their own, in mixtures, in preparations and in articles. These activities fall within the scope of Government Decree No. 314/2005 (XII. 25.) on Environmental Impact Studies and Integrated Environment Use Permits (hereinafter referred to as IPPC Decree) and are listed in its Annex II. It is important to note that while 'B' Plc possessed a valid integrated environmental permit, 'F' Ltd started its activities without such a permit.

In order to verify the above described situation, the regional inspectorate carried out a site visit on 18 February 2009.

On the basis of the main findings of the site visit the regional inspectorate started two administrative procedures, one against 'B' Plc and a second against 'F' Ltd.

Legislation applicable

Article 26(1) and 26(2) of the IPPC Decree: in case an installation operates without an integrated environmental permit, or without an environmental permit, the authorities may limit, suspend or prohibit the continuation of the illegal conduct. The decision of the authority depends on the decree of influence of the illegal conduct on the environment.

Procedure

On 15 July 2009, the regional inspectorate started the administrative procedure against 'F' Ltd's IPPC installation, on the legal basis of Article 26 of the IPPC Decree. This was communicated to the installation on the 17 July 2009. Following the official notice, 'F' Ltd declared the fact that it was carrying out activities without an integrated environmental permit.
The regional inspectorate did not accept the reasoning of the installation. It argued that during the site visit (18 February 2009) it was notified to 'F' Ltd that it was carrying out IPPC activities without an integrated environmental permit. Moreover, the installation was warned several times that no IPPC activity could be carried out without an integrated environmental permit.

Shortly after the regional inspectorate started the administrative procedure, 'F' Ltd requested to change the integrated environmental permit with regard to the name of the installation carrying out the IPPC activities on the site. This request was under consideration, when the regional inspectorate took its decision.

In its decision (26 August 2009), the regional inspectorate prohibited the operation of the installation on the legal basis of Article 26(1)(c) and informed the parties about their right of appeal. In the legal notice, the regional authority also informed the parties about the possibility of imposing additional sanctions (*i.e.* fine) in the future, on the legal basis of Article 26(3) of the IPPC Decree.

On 15 December 2009, the regional inspectorate carried out a site-visit and noted that the installation terminated all its activities on the site. The company also terminated the sublet on the site.

General comments on sanctions

While imposing the administrative sanction, the regional authority strictly interpreted the provision of Article 26(1) of the IPPC Decree. The main reason for prohibiting the activity of the installation was that 'F' Ltd carried out its activity without an integrated environmental permit.

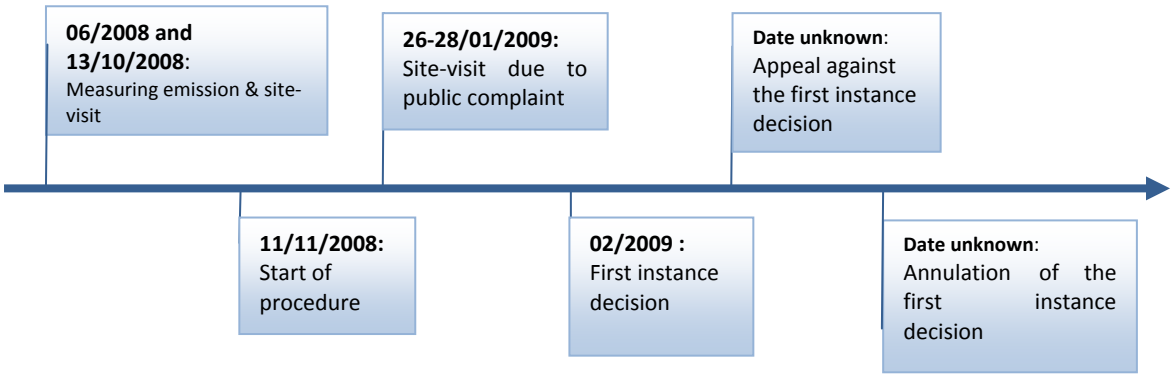
Following the decision of the regional inspectorate the company terminated the sublet and stopped all its economic activities on the site. With regard to this point the regional inspectorate stated that the given decision did not have a deterrent effect. In other word a sanction cannot be seen as dissuasive, if as its consequence, the operator stops its economic activities on the site.

Finally, it is important to note that 'F' Ltd appealed against the first instance decision of the authority. On the 16 April 2010, the decision of the first instance regional inspectorate was approved by the National Environment, Nature and Water Inspectorate as second instance administrative authority. As noted above, by the time the second instance decision was taken, the IPPC installation terminated its activities on the site.

Case Study II: Administrative sanctions applicable to IPPC installations

Interviewee – Ms Gyöngyi Bejenaru-Sramkó[256]
Organisation and position: Ministry of Rural Development, Chief Counsellor (Environment Conservation and Development Department)
Telephone number: +36-1-795-2444
Date of interview: 15/04/2011

Timeline of the procedure



Description of the background[257]

The main activity of 'E.' Ltd. was to prepare equipment from recycled metal for rail companies. The company possessed a valid integrated environmental permit, in accordance with Government Decree 314/2005 (XII. 25.) on Environmental Impact Studies and Integrated Environment Use Permits (hereinafter referred to as 'IPPC Decree'). The activity of the installation, namely 'foundry with a production capacity of over 20 tonnes per day' was listed in Annex II, point 2.4. of the IPPC Decree.

[256] Ms Bejeranu- Sramko also acted as a contact person while sending the structured interview questions to the competent regional inspectorates and to the national inspectorate. Through a written questionnaire the Regional Environment, Nature and Water Inspectorate of Kozep-Dunavolgy provided information for the above case-study.
[257] Where in the time-line the dates are indicated as unknown, it means that during the interviews no information was provided on dates.

Following a public complaint (from citizens), the Regional Environment, Nature and Water Inspectorate of Kozep-Dunavolgy measured the Carbon Monoxide (CO) emission from the foundry. As a result of measurement, the regional authority confirmed that the foundry exceeded the CO emission limit values set by the integrated environmental permit.

In addition to the activity of measuring the IPPC installation's CO emission, the regional inspectorate carried out a site-visit on the 13 October 2008. Following the site visit (and also in compliance with the findings of the previous environmental audit), the regional authority confirmed that blue gas was emitted to the ambient air from the installation. It was assumed that this coloured gas was the by-product of the recycling process.

Following the site-visit, the regional authority informed the operator about the fact that its operation was not in compliance with the provisions of the integrated environmental permit and started the administrative procedure.

Legislation applicable

Article 26 (5) of the IPPC Decree: if an installation endangers the environment or causes environmental pollution or does not comply with an administrative decision, the authorities may impose the legal sanctions listed in Article 26(1) of the IPPC Decree.

Article 26(1) of the IPPC Decree: the administrative authorities may limit, suspend or prohibit the activity of an IPPC installation, depending on degree of influence of the illegal conduct on the environment.

Procedure

As noted above, the administrative procedure was preceded by an activity of measuring the CO emission from the site, which was carried out in June 2008 and by a site visit in October 2008. The administrative procedure was launched in November 2008. The regional inspectorate communicated its decision to the IPPC installation and asked the installation to notify any remarks within 3 days from the communication of the legal notice.

Following the legal notice received, the IPPC installation informed the regional inspectorate about terminating the emission which had previously exceeded the limit values set by the integrated environmental permit. In order to prove this fact, the installation enclosed an expert opinion, which underpinned that the CO emission of the installation was below the limit values set by the integrated environmental permit.

Following further public complaints, the regional inspectorate decided to measure the emission of the installation. During the second measurement (26-28 January 2009), the installation temporary ceased its operation and argued that the high level of CO emission was a result of the temporary malfunctioning of the installation.

As a result of the second measurement of emissions, the regional authority notified that the activity of the installation was not in compliance with the integrated environmental permit. Consequently the regional inspectorate ordered the installation to install an equipment to constantly measure the emission from the installation and automatically stop the production in case of exceeding the emission limit values set by the integrated environmental permit.[258]

[258] By installing such equipment, the IPPC installation has become subject to a constant administrative control. The legal basis for imposing constant administrative control on the installation was Article 8 of Ministerial Decree No. 17/2001 (VIII.

In addition to the above listed, the regional inspectorate noticed that hazardous waste was disposed of on the site of the installation. The integrated environmental permit explicitly prohibited the installation from accepting or treating hazardous waste on its territory. Consequently the activity of the installation did not comply with the requirements of the integrated environmental permit.

General comments

In its first instance decision, the regional inspectorate suspended the activity of the installation, on the legal basis of Article 26(1) and (5) of the IPPC Decree.

The main criteria which determined the sanction imposed was the infringement of the requirements of the integrated environmental permit. The fact that the installation did not comply with the obligation imposed by the authority with regard to the establishment of a measuring instrument, was also taken into consideration. In addition, the IPPC installation treated hazardous waste, which was considered as the infringement of the first point of the integrated environmental permit.

The installation appealed against the first instance decision of the regional inspectorate and asked the National Environment, Nature and Water Inspectorate as second instance authority to cease the first instance decision and list its obligations along with their respective deadlines.

The National Environment, Nature and Water Inspectorate annulled the first instance decision of the regional authority. The legal reasoning behind this decision was not communicated by the interviewee.

The decision of the regional inspectorate to suspend the activity of the operator was effective. This can be underpinned by the following factors: (1) the industrial installation cleaned the site of the hazardous waste; (2) it installed an equipment to constantly measure the emission from the installation. With regard to this last point it must be noted that the order of the administrative authority (namely the order to install measuring equipment) took place before the first instance decision, but based on the information received from the interviewee the industrial installation decided to install this equipment only after the decision. This point is important, that it shows the effect of the administrative decision on the industrial installation, namely that it started to comply with its legal obligations and with the main objective of the IPPC Decree (*i.e.* protecting the environment).

Case Study III: Procedural link between administrative procedures and procedures before courts

Interviewee: Dr Peter Darak and dr Fruzsina Bogos[259]
Organisation and position: Supreme Court, judge; Court of the Capital, judge
Telephone number: 06 30 328 90 30; (06-1) 458 5449
Date of interviews: 10/05/2011; 11/05/2011[260]

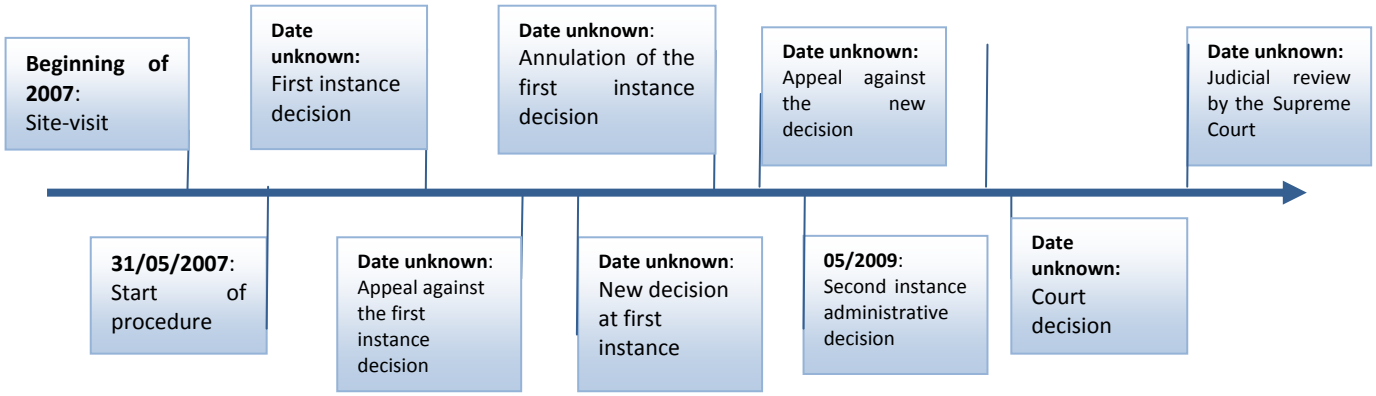
Timeline of the procedure

Date unknown: Appeal against the administrative decision

3.) on the rules applicable to the administrative control and evaluation of the environmen f stationary pollution sources.

[259] The interviewees were not aware of the dates of all procedural steps or could not provide su formation to judge the nature of the sanction imposed (e.g. proportionate, effective and dissuasive). These aspects are reflected in Case study III.

[260] Where in the time-line the dates are indicated as unknown, it means that during the interviews no information was provided on dates.



Description of the background

The industrial installation started its activities in 2003. At that time, it possessed a valid environmental permit. On 1 January 2006, the legislation transposing the IPPC Directive (96/61/EC) entered into force, in form of Government Decree 314/2005 (XII. 25.) on Environmental Impact Studies and Integrated Environment Use Permits (hereinafter referred to as 'IPPC Decree'). In accordance with the IPPC Decree, existing installations needed to apply for integrated environmental permit before October 2007. In compliance with this requirement, the industrial installation continued the same activities as before, but with an integrated environmental permit.

The scope of activity of the installation covered the treatment and the recovery of waste. According to the integrated environmental permit, the installation was entitled to treat 1000 tonnes/year of cinder, slag and furnace dust, and 1550 tonnes/year land waste containing land and stone. The activity of the installation covered two counties, with the exception of 7 settlements. As regards to the capacity of the installation and the territorial coverage of its activity, the industrial installation could be considered as large.

In this case the installation was carrying out waste treatment activities in contravention of the conditions set by the environmental permit. Following a site visit, the Regional Environment, Nature and Water Inspectorate (hereinafter referred to as the 'regional inspectorate') started the administrative procedure against the installation.

Legislation applicable

The IPPC installation was carrying out activities with an integrated environmental permit. As described above, the industrial installation did not comply with the conditions of the permit, while carrying out waste-treatment activities. According to the practice followed and in compliance with Article 26(4) of the IPPC Decree, the regional inspectorate should have imposed the legal consequences listed in Article 26(4). This Article states that if an operator does not comply with the permit conditions, the regional inspectorate may impose a fine; oblige the operator to comply with the permit conditions; or order the operator to prepare a programme of measures/carry out an environmental review within 6 months from the communication of the decision. The regional inspectorate imposed a waste-treatment fine on the operator,[261] on the legal basis of Article 49(1) of Act XLIII of 2000 on Waste Treatment (hereinafter referred to as 'Waste Treatment Act'). The interviewee assumed that the main reason for imposing the fine on the legal basis of the Waste Treatment Act and not on the IPPC Decree was the novelty of the IPPC Decree.

[261] In case of waste-treatment fines, there is not fixed fine (minimum or maximum fine) that the authorities can impose on operators. The amount of fine often varies depending on the size of the installation and the severity of the illegal conduct etc.

Procedure

Within its competence of administrative control, the regional inspectorate carried out a site-visit at the beginning of 2007. Following the site-visit, the regional inspectorate started an administrative procedure against the installation on 31 May 2007. As a result of the first instance procedure, the regional inspectorate imposed a waste-treatment fine of 5,530,887 HUF (Euros 20,786) on the industrial installation.

The first instance decision of the regional inspectorate was appealed before the second instance authority (National Environment, Nature and Water Inspectorate) on the legal basis of Article 98 of Act CXL of 2004 (Administrative Procedures Act), which annulled the first instance decision. The interviewee could not specify the legal reasoning behind the decision of the second instance authority. However, the interviewee assumed that it was probably due to procedural mistakes made during the first instance administrative procedure. This can be underpinned by the fact that shortly after the annulment of the first instance decision a second fine (same amount as the first fine) was imposed on the industrial installation. The regional inspectorate did not carry out additional procedural steps before imposing the fine.

This administrative decision was appealed by the installation, but was kept in force by the national inspectorate in May 2009.

Following the second instance administrative decision, the industrial installation appealed against the first instance decision of the regional inspectorate before the competent court, on the legal basis of Article 109 of Act CXL of 2004. In case of administrative litigations, the competent first instance court is the county court. In the particular case, the competent court was the County Court of Szabolcs-Szatmar-Bereg (hereinafter referred to as country court). The county court upheld the decision of the defendant (regional inspectorate) and rejected the request of the plaintiff (industrial installation). In cases, when there is an appeal procedure against the decision of the administrative authorities, the county court can take the final conclusive decision. Against such decision there is no possibility to appeal.

On the legal basis of Article 340/A of Act III of 1952 on Civil Procedures, the Supreme Court reviewed the decision of the administrative court. As result of the judicial review, the judgement of the administrative court was approved.

General comments

On the basis of the information received the criteria determining the amount of the sanction imposed by the regional inspectorate is not clear. However, it can be assumed that the main reason was the large size of the installation and the severity of the infringement. This argument would be in line with the reasoning of the Supreme Court's judgement, which stated that there was no possibility to decrease the amount of fine imposed on the industrial installation, as the infringement of the operator was not marginal. The Supreme Court also considered the fact that the activity endangered the environment moreover it referred to the speciality of the case, namely the size of the installation.

It is important to emphasize, that the industrial installation was providing services in two counties. With regard to the size of the installation, the amount of the fine imposed cannot be seen as proportionate. Based on the information received, it is not possible to judge if the sanction was effective and/or dissuasive.

Thus it is not possible to compare if a waste treatment fine or a fine under the regime of the IPPC Decree could have been more dissuasive, proportionate and effective.

Annex V- Spain

Sanctions and procedures applicable to breaches of the legislation on industrial emissions in Spain

Executive Summary

In Spain, criminal environmental offences are broad and cover general crimes (e.g. against natural resources, flora fauna and domestic animals). The Criminal Code does not contain any specific criminal sanctions for the infringement of the transposing provisions of the IPPC Directive, nor regarding to any other specific environmental legislation. These infringements can only be considered criminal offences if they, for instance, seriously endanger the balance of natural systems through emission, discharge of pollutants in the environmental media. In contrast, environmental administrative offences are much more precise. The classification of administrative offences and their related sanctions are set in each specific sectors of the environment legislation.

An administrative procedure and a criminal procedure cannot be initiated in parallel when the same facts and persons are involved. Administrative and criminal sanctions cannot be cumulative. The administrative procedure shall end if it is considered that the infringement is a criminal offence *(non bis in idem principle).*

The sanctioning power of the administration is strictly regulated in order to protect the right of the defence (three procedural steps: initiation, investigation, resolution). The time to issue an administrative sanction cannot exceed six months from the initiation of the administrative procedure.
Apart from issuing sanctions, the administration is empowered to set interim emergency provisional measures in order to stop the continuation of the damage or situation of risk such as the temporary, full or partial closure of the installation, the cessation of installation operations, and the temporary suspension of the permit which is considered to be a very effective measure. These measures can be agreed before the initiation of the sanctioning administrative procedure. The administration can also require the offender, without prejudice to the criminal or administrative sanction, to restore the environment to the previous state, as well as pay the damages; in case the offender does not obey this obligation, the competent authority can agree on the imposition of coercive fines.

There are several possibilities to appeal against the decision of the administration (either before the authority issuing the sanction, the higher authority or before the administrative Courts in last resort). Together with the operator of a classified establishment; other interested parties can appeal against the decision of the administration. This is the case for environmental NGOs, but they have to fulfil very specific requirements that limit their enforcing power.

Criminal procedure is often initiated by Nature Protection Services of the Guardia Civil (the federal police force), together with the municipal police that provide information on potential environmental crimes to the Public Prosecutor *(Ministerio Fiscal).* However, it is important to note that pursuant to the popular action *'accion popular'* both natural and legal persons, whether or not offended by a criminal offence can lodge a complaint to the Criminal Court. The standing requirements are much less stringent than the ones under the administrative procedure. Environmental criminal offences can be resolved under a fast-track criminal procedure, although the procedure does not seem to be made for such crimes. There is no equivalent under the administrative procedure.

The Autonomous Communities (CCAA) are competent for the inspection and enforcement of environmental legislation. Even though inspection procedures for classified establishments are not harmonised in all CCAA, several inspection requirements are similar (e.g. necessary assistance and collaboration from the operator during the inspection visits).

The Table 1 below indicates the provisions of the IPPC Directive covered by administrative sanctions in Spain. Criminal sanctions are not listed in the table as there are no specific sanctions in the Criminal Code, which would punish the infringement of the transposing provisions of the IPPC Directive (see Section 3.1 for more details). Moreover, the category of administrative (quasi) criminal sanctions does not exist in Spain, thus this column is left blank in the table below.

Table 1: Enforceable provisions covered by penalties in Spain

14 (c)	Article 32(1)(b) of the Law 16/2002		

1. Applicable sanctions

The Spanish Constitution (CE) recognises everyone's right to an adequate environment and duty to preserve it. Article 45(3) specifies that for those that violate this duty, there should be criminal or, where required, administrative sanctions, as well as the obligation to restore the damage caused. It is the only case for which the Constitution foresees the establishment of sanctions in case of breaches of a Constitutional duty.

Administrative sanctions are the most common tools for the enforcement of environmental legislation in Spain. The classification of administrative offences and their related sanctions are set in each specific sectors of the environment legislation (e.g. Law 16/2002 on classified installations,[262] Law on water,[263] and Law 10/1998 on waste[264]) that list the different offences classified as petty offences (*faltas leves*), serious offences (*faltas graves*) and very serious offences (*faltas muy graves)* and their corresponding administrative sanctions. The IPPC Directive is transposed by the Law 16/2002 of 1st July 2002 on classified installations, which sets offences provisions and their related administrative sanctions that can lead to a fine (up to Euros 2,000,000), definitive or temporary closure of all or part of the installation, the prohibition to exercise a professional activity for a certain time period, the revocation or suspension of the approval for a certain time period and the publication of the sanctions.

Environmental sectoral laws do not list any specific criminal offences. Criminal environmental offences and their related sanctions are only mentioned in Chapter III Title 16 of the Spanish Criminal Code. These offences are broad and cover general crimes against natural resources and the environment and also crimes related to the protection of the flora, fauna and domestic animals. The Code does not contain any specific criminal sanctions for the infringement of the transposing provisions of the industrial emission Directives, nor regarding any other specific environmental legislation. Environmental criminal offences can lead to financial penalty (maximum Euros 300,000) or imprisonment (maximum four years)

The Table 2 below details the different types of offences and related administrative penalties in Spain. Criminal offences and sanctions are not listed as there is no criminal sanction specific to breaches of industrial emission legislation.

[262] Law 16/2002 concerning integrated pollution prevention and control *(Ley 16/2002, de 1 de julio, de prevención y control integrados de la contaminación.)*
[263] Royal Decree 1/2001 approving the consolidation of the Law on water (Real Decreto Legislativo 1/2001, de 20 de julio, por el que se aprueba el texto refundido de la Ley de Aguas)
[264] Law 10/1998 on waste *(Ley 10/1998, de 21 de abril, de Residuo).*

Table 2: Directive 2008/1/EC (IPPC Directive): types of offences and related administrative penalties in Spain

	Administrative sanctions	
	Offences	**Penalties**
Obligation to apply for a permit for new or existing installations	Very serious offence Operate an installation or conduct a substantial modification of the installation without the integrated environmental authorisation provided that there has been a serious injury or damage to the environment or such situation seriously endangered the health or safety of people. ***Article 31(2)(a) of the Law 16/2002***	Sanctions related to very serious offences - Fine from Euros 200,001 to 2,000,000; - Definitive closure of all or part of the installation; - Temporary closure of all or part of the installation not less than two years and not more than five years; - Prohibition to exercise this activity for a period not less than one year not more than two years; - Revocation or suspension of the approval for a period not less than one year no longer than five years; - Publication, through the means considered appropriate, of the sanctions, once they have become definitive. ***Article 32(1)(a) of the Law 16/2002***
	Serious offence Operate an installation or conduct a substantial modification of the installation without the integrated environmental authorisation without incurring damage or serious deterioration to the environment nor seriously endangering the safety or health of people. ***Article 31(3)(a) of the Law 16/2002***	Sanctions related to serious offences - Fine from Euros 20,001 to 200,000; - Temporary closure of all or part of the installation for a maximum period of two years; - Prohibition to exercise this activity for maximum one year; - Revocation or suspension of the approval for a maximum period of one year. ***Article 32(1)(b) of the Law 16/2002***
Obligation to supply information for application for permits	Serious offence Hide or modify maliciously the information required in the procedures regulated in this Law. ***Article 31(3)(c) of the Law 16/2002***	Sanctions related to serious offences - Fine from Euros 20,001 to 200,000; - Temporary closure of all or part of the installation for a maximum period of two years; - Prohibition to exercise this activity for maximum one year; - Revocation or suspension of the approval for a maximum period of one year. ***Article 32(1)(b) of the Law 16/2002***
	Petty offence Failure to comply with the requirements established in this Act or rules adopted pursuant thereto, unless it is classified as very serious or serious offence. ***Article 31(4)(b) of the Law 16/2002***	Sanctions related to petty offences Fine up to Euros 20,000. ***Article 32(1)(c) of the Law 16/2002***

	Administrative sanctions	
	Offences	**Penalties**
Obligation to notify the competent authority of any changes in the operation of an installation	Very serious offence Operate an installation or conduct a substantial modification of the installation without the integrated environmental authorisation provided that there has been a serious injury or damage to the environment or such situation seriously endangered the health or safety of people. ***Article 31(2)(a) of the Law 16/2002***	Sanctions related to very serious offences - Fine from Euros 200,001 to 2,000,000; - Definitive closure of all or part of the installation; - Temporary closure of all or part of the installation not less than two years and not more than five years; - Prohibition to exercise this activity for a period not less than one year not more than two years; - Revocation or suspension of the approval for a period not less than one year no longer than five years; - Publication, through the means considered appropriate, of the sanctions, once they have become definitive. ***Article 32(1)(a) of the Law 16/2002***
	Serious offence Operate an installation or conduct a substantial modification of the installation without the integrated environmental authorisation without incurring damage or serious deterioration to the environment nor seriously endangering the safety or health of people. ***Article 31(3)(a) of the Law 16/2002*** Not communicating the competent authority the non substantial modifications made in the installations. ***Article 31(3)(a) of the Law 16/2002***	Sanctions related to serious offences - Fine from Euros 20,001 to 200,000; - Temporary closure of all or part of the installation for a maximum period of two years; - Prohibition to exercise this activity for maximum one year; - Revocation or suspension of the approval for a maximum period of one year. ***Article 32(1)(b) of the Law 16/2002***
Obligation to comply with the conditions set in the permit or mandatory ELV's	Very serious offence Failure to comply with the conditions established in the integrated environmental authorisation provided that there has been a serious injury or damage to the environment or such situation seriously endangered the health or safety of people. ***Article 31(2) (b) of the Law 16/2002***	Sanctions related to very serious offences - Fine from Euros 200,001 to 2,000,000; - Definitive closure of all or part of the installation; - Temporary closure of all or part of the installation not less than two years and not more than five years; - Prohibition to exercise this activity for a period not less than one year not more than two years; - Revocation or suspension of the approval for a period not less than one year no longer than five years; - Publication, through the means considered appropriate, of the sanctions, once they have become definitive. ***Article 32(1)(a) of the Law 16/2002***
	Serious offence Failure to comply with the conditions established in the integrated	Sanctions related to serious offences - Fine from Euros 20,001 to 200,000;

	Administrative sanctions	
	Offences	**Penalties**
	environmental authorisation without incurring damage or serious deterioration to the environment nor seriously endangering the safety or health of people. ***Article 31(3) (b) of the Law 16/2002***	- Temporary closure of all or part of the installation for a maximum period of two years; - Prohibition to exercice this activity for maximum period of one year; - Revocation or suspension of the approval for a maximum period of one year. ***Article 32(1)(b) of the Law 16/2002***

Article 149(1)(23) of the Constitution of 1978 provides that the State has exclusive competence on matters related to the protection of the environment without prejudice to powers of the Autonomous Communities *(Comunidades Autonomas)* (CCAA) to take additional protective measures. In other words, the CCAA can provide more stringent and detailed environmental measures than the environmental legislation issued by the State which is regarded as a minimum legislation. With regard to environment, the CCAA pursuant to Article 148(1)(9) of the Constitution of 1978 are competent in the management of environmental matters. This provision implies that the CCAA are competent for the inspection and enforcement of environmental legislation and that they have sanctioning power.[265] For instance the Law 16/2002 on classified installations explicitly provides that the Autonomous Authorities are competent to take measures on control and inspection for the enforcement of this Law (the State being competent for the control of discharges in basin shared by different CCAA). It also states that the offences encompassed in its Article 31 shall be without prejudice to the ones that can be established by the Autonomous authorities.

Several CCAA (e.g. Cataluña, Andalucía, Cantabria, Pais Vasco) but not all of them (e.g. Asturias, Madrid Community) have established their own administrative sanctioning regime for the infringement of environmental legislation. Related to classified installations the majority of the CCAA refer to the same offences that the ones listed in Law 16/2002 on classified installations (e.g. the operation of an activity without the integrated environmental permit, or failure to comply with the conditions set in the integrated environmental permits). However the sanctions sometimes differ from the ones set in Law 16/2002. For instance the failure to comply with the conditions established in the integrated environmental authorisation provided that there has been a serious injury or damage to the environment or such situation seriously endangered the health or safety of people can lead to a fine up to Euros 3 million in Cantabria,[266] Euros 2,4 million in Andalucía,[267] Euros 2,5 million in Aragon,[268] while under Law 16/2002 the same offence can lead to a fine of a maximum of Euros 2 million.

It is important to note that even though CCAA are competent to establish their own administrative sanctioning regime for the infringement of environmental legislation, the sanctions they apply shall never be less stringent than the ones set at the State level. Furthermore the Constitutional Tribunal has stressed that administrative sanctions issued by CCAA should not introduce unreasonable and disproportionate differences with the legal regimes applied in other parts of the territory.[269]

2. Administrative procedure

2.1 General elements on the legal tradition and potential evolution

Article 25(1) of the Spanish Constitution (CE) provides that no one may be convicted or sentenced for actions or omissions which, when committed, did not constitute a criminal offence, misdemeanour or administrative offence under the law then in force. Article 25(3) of the CE specifies that the Civil Administration may not impose penalties which directly or indirectly imply deprivation of freedom. Finally as mentioned above Article 45(3), related to the protection of the environment, specifies that criminal or, where applicable, administrative sanctions shall be imposed, under the terms established by the law.

[265] See decision of the Constitutional Court *(Tribunal Constitucional) STC 102/1995, FJ 2 y18)*
[266] Law of Cantabria 17/2002 on integrated environmental controls *(Ley de Cantabria 17/2006, de 11 de diciembre, de Control Ambiental Integrado)*
[267] Law 7/2007 on integrated management of the environment *(Ley 7/2007, de 9 de julio, de Gestion Integrada de la Calidad Ambiental)*
[268] Law 7/2006 on the environment protection in Aragon *(Ley 7/2006 de 22 de junio de proteccion ambiental de Aragon)*
[269] See decision of the Constitutional Court *(Tribunal Constitucional)* 87/1985

These Articles of the CE set the basis of the sanctioning power of the administration in Spain. The Jurisprudence of the Constitutional Tribunal has developed general principles on this sanctioning power which can be summarised as follows:[270]

- The sanctioning power of the administration shall be subject to the principle of legality and shall be mentioned in laws;
- The administration cannot issue penalties that deprive personal freedom except for the military disciplinary regime;
- The respect for the rights of the defense enshrined in Article 24 of the CE shall apply to the sanctioning administrative procedures;
- The sanctioning power of the administration shall be subordinated to the authority of the Judiciary, (e.g. the administrative jurisdiction *(Jurisdiccion contencioso-administrativa)* is empowered to control the legality of the administrative sanctions);[271]

The Supreme Tribunal *(Tribunal Supremo)* stressed that administrative and criminal sanctions could be considered equivalent since they were both part of the same *ius puniendi* of the State. It however outlined the specific characteristics of administrative sanctions as follows:

- Subjective element: the administrative sanction is imposed by the administration; the criminal sanction is imposed by the criminal judge.
- Formal element: the administrative sanction is imposed after an administrative procedure while the criminal penalty is imposed after a criminal procedure. The difference is not only in the process as such, but also in the powers given to the instructed authority and the regime applicable for the suspension of the immediate execution nature of the sanction, which is much more favourable towards the individual in criminal law than in administrative law.
- Objective element: the content of administrative sanctions does not basically differ from the content of criminal ones, with the exception of imprisonment which can never be an administrative sanction. However there is a difference in the effects, as administrative sanctions do not have the social recrimination component present in criminal sanctions. This is emphasised by the fact that criminal sanctions will be entered on the personal record of the individual.
- Liability: in criminal law only physical persons can be held individually liable, whereas administrative law admits the liability of legal persons, and joint and several liabilities of physical persons.

In Spain, the administrative authority having sanctioning power, apart from sanctions, can also issue coercive measures and interim measures.

Interim measures or provisional orders can be imposed once the sanctioning procedure has been initiated or under certain circumstances even before. The objectives of the interim measures are, on the one hand, to ensure the efficiency of the possible final decision and, on the other, to protect the public interest, including stopping the negative effects derived from the infringement. Pursuant to Article 35 of the Law 16/2002 on classified installations the competent authority, can order to stop the continuation of the damage or situation of risk, the temporary, full or partial closure of the installation, the cessation of installation operations, the temporary suspension of the permit.

Coercive measures are considered means of forced execution. These measures imply the use of force and are based on the previous infringement of the sanction or obligation of restoration imposed by the

[270] Sentencia del Tribunal Supremo 77/1983

[271] Article 24 of the CE reads as follows: All persons have the right to obtain effective protection from the judges and the courts in the exercise of their rights and legitimate interests, and in no case may there be a lack of defence.
Likewise, all have the right to the ordinary judge predetermined by law; to defence and assistance by a lawyer; to be informed of the charges brought against them; to a public trial without undue delays and with full guarantees; to the use of evidence appropriate to their defence; not to make self-incriminating statements; not to plead themselves guilty; and to be presumed innocent. The law shall specify the cases in which, for reasons of family relationship or professional secrecy, it shall not be compulsory to make statements regarding allegedly criminal offences.

administration. Their aim is to override non-compliance and force the offender to comply with the due behaviour. For instance Article 36 of the Law 16/2002 on classified installations provides that when the offender does not fulfill the obligation of replacement or restoration […], the competent authority may decide to impose coercive fines which shall not exceed one third of the fine prescribed for the infringement.

Finally the competent authority can or must impose accessory measures (e.g. revocation of a permit, impossibility for the company to obtain public subsidies). It is not clear whether these accessory measures are considered sanctions or not.[272] They can only be imposed as complements to a main sanction. Consequently, they are conditioned by the imposition of a main sanction.

The sanctioning power of the administration is very coercive in Spain. Administrative sanctions are in many aspects similar to criminal sanctions. They are very strict (e.g. to operate a classified installation can lead to a fine up to Euros 2,000,000) and can be considered as coercive measures. As mentioned above together with criminal sanctions they are part of the iuris puniendi of the State. This sanctioning power is however strictly controlled and regulated through the Law 30/1992 and its implementing Order that sets several procedural steps in respect of the right of the defence. There was no major reform related to the administrative sanctioning procedure since Law 30/1992 has been in force.

2.2 Inspections

2.2.1 General information

As mentioned above, the CCAA pursuant to Article 148(1)(9) of the CE are in charge of the management of environmental matters. This provision implies that the CCAA are competent for the inspection and enforcement of environmental legislation. The CCAA are the most important actors in the domain of environmental inspection in Spain. At national level the Ministry of Internal Affairs *(Ministerio de Interior)* is in charge of the inspection of installations falling under the SEVESO II Directive while SEPRONA *(Servicio de Proteccion de la Naturaleza- Service for the protection of nature),* the section of the Civil Guard (*Guardia Civil*-sort of federal quasi-military police) specialised in environmental issues provides technical support to the inspection bodies of the CCAA.

The inspections of installations falling under the scope of the IPPC Directive are thus carried out at the CCAA level. Information on the number of inspectors involved in the inspection of classified installation, the ratio number of inspectors/number of installations, number of visits per year, are not available for all Spain. This information can however be found for each CCAA. The CCAA elaborate inspection plans and programmes where this information can be available. For instance pursuant to its 2011 inspection programme, Andalucia is planning to carry out 178 inspections on IPPC installations this year.

2.2.2 Key elements of the inspection procedure

Legal requirements for the inspectors and operators during the inspections differ from one CCAA to another since they are competent to set their own inspection procedures.

Here are examples of different environmental inspection procedures in CCAA that apply for the enforcement of the transposing provisions of the IPPC Directive.

i) Andalucía

[272]If the legislator has not expressly classified these measures as accessory measures or sanctions it will depend on the Constitutional Tribunal and Supreme Tribunal to decide whether these measures are a sanction or not. It is noted that they are normally considered as sanctions as they imply the loss of an advantage.

The environmental inspection procedure in Andalucía is regulated under Article 130 of the Law 7/2007.[273]

Competencies and obligations of inspectors
Inspectors shall provide the description of the relevant facts and especially those that could constitute an administrative infringement. They shall take also into account the allegations made by the person responsible for the activity or facility. Inspectors are allowed to request any information necessary to perform their inspection.

Obligations of the operator
Operators shall provide necessary assistance and collaboration and enable entry into the facilities to those engaged in the activities of surveillance, inspection and control.

The inspectors' enforcing powers
The Law 7/2007 does not provide administrative measures that can be taken by inspectors in case of infringement or endangerment of public health or of the environment (e.g. closure or sealing of the installation).

ii) Pais Vasco

The environmental inspection procedure in Pais Vasco is regulated under Articles 106 and 107 of the Law 3/1998.[274]

Competencies and obligations of inspectors
Inspectors shall be authorised to access the facilities covered by this Law, if necessary without notice, after identification. Inspectors shall provide the description of the relevant facts that can potentially lead to an infringement. They shall take also into account the allegations made by the persons in charge of the activity or facility inspected.

Obligations of the operator
This Law does not mention any specific obligations to be fulfilled by operators.

The inspectors' enforcing powers
This Law does not provide any specific enforcing power to inspectors. It however states that under exceptional circumstances and prior to the initiation of the sanctioning administrative procedure, the competent authority may adopt preventive measures such as suspension of the operation of the activity, the sealing of apparatus, equipments or vehicles, and any other relevant measures to prevent the spreading of environmental damage.

iii) Cataluña

The environmental inspection procedure in Cataluña is regulated under Articles 74, 75, 76 and 77 of the Law 20/2009.[275] This procedure is very detailed.

Competencies and obligations of inspectors
Inspectors shall verify whether the environment conditions set in the environmental permits are fulfilled. Inspections can take place at any time, regardless of any regular inspection planning. Inspectors are empowered to access installations without prior notice to the operators. They are empowered to investigate, and do any examinations they consider necessary to verify whether the laws

[273]Ibid. Page 2
[274] Law 3/1998 on the protection of the environment in Pais Vasco *(Ley 3/1998, de 27 de febrero, general de protección del medio ambiente del País Vasco*)
[275] Law 20/2009 on the prevention and environmental control of activities *(Ley 20/2009, de 4 de diciembre, de prevención y control ambiental de las actividades)*

and regulations are correctly observed. They can also take samples of the pollutants produced by the activity. They can require information from the owner and/or the staff of the activity as deemed necessary to clarify facts that are subject to inspection. Reports of the inspection shall be issued in presence, where possible, of the individual owner or the authorised representative of the activity concerned.

Obligations of the operator
The owners of the activities shall provide necessary assistance to duly authorised staff of the administration during the inspection, especially to collect samples and necessary information.

Inspectors' enforcing powers
This Law does not provide any specific enforcing power to inspectors. It however states that inspectors are authorised to be present in case of the sealing, partial or total closure of activities.

In Spain, inspectors are not specifically empowered to issue administrative sanctions.

The sanctioning power of the administration is regulated by Law 30/1992 and it's implementing Order.[276] This Law applies to the Administration of the State *(La Administración General del Estado),* the administrative authorities of the CCAA *(las administraciones de la communidades autonomas)* and to the local administration bodies *(Las Entidades que integran la Administración Local).* In other words the same general sanctioning power rules apply to the different types of administrative authorities across the country (but the CCAA's laws can be always more restrictive). This law is, however, applied as a subsidiary instrument where a given administrative law does not provide a specific regime as regards the imposition of sanctions or interim measures. Title IV of the Law 16/2002 which transposes the IPPC Directive sets specific sanctioning regimes for the infringement of the provisions of the law, including temporary, total or partial closure of the installation.

The infringement procedure shall be transparent and interested parties have the right to know the current state of the procedure and to access and obtain copies of the documents contained therein. This procedure contains three steps, the initiation *(la iniciacion),* the investigation *(instruccion)* and finally the resolution *(resolucion).*

It shall be initiated by the competent administrative authority either on it own initiative, based on a request from an administrative body higher in the hierarchy, a reasoned request from an other administrative body not competent, or a complaint from a member of the public. During the investigation the parties concerned have 15 days to provide any arguments, documents or information deemed relevant and, where appropriate, propose concrete proof justifying their allegations, then the competent authority shall formulate a draft resolution determining the infringements and the sanctions. This draft resolution shall be notified to the persons concerned that have 15 days to formulate arguments and present orally the documents they consider relevant to the competent authority. The resolution, which contains the decision whether or not to impose a sanction, shall be adopted within 10 days of the reception of the draft decision, documents allegations, information provided during the procedure. The time limit to issue a resolution cannot exceed six months from the initiation of the procedure.

2.3 Appeal against the administrative decision

2.3.1 By the operator

[276] Law 30/1992 on the legal regime of public administrations and the administrative procedure *(Ley 30/1992, de 26 de noviembre, de Régimen Jurídico de las Administraciones Públicas y del Procedimiento Administrativo Común y el Real Decreto 1398/1993)*

Recipients of the administrative sanction can appeal this decision before the relevant hierarchical administrative authorities. Such appeal *(recurso administrativo de alzada)* can only be used when administrative sanctions do not put an end to the administrative procedure. This appeal must be resolved and the decision notified within three months. When the decision notified on the appeal is not satisfactory or there is no decision, an appeal may be lodged before an administrative court within two months or within 6 months in case of silence from the administration.[277]

In case the administrative sanctions put an end to the administrative procedure then the recipients of the administrative sanctions can appeal this decision directly before the administrative courts *(recurso contencioso-administrativo)* within two months or six months in case the administration did not provide decision. Alternatively the recipients of administrative sanctions can appeal before the competent authority issuing the sanction *(recurso potestativo de reposicion).* This appeal must be notified within one month only then the recipients of the administrative sanction are allowed to lodge an appeal before the administrative courts within two or six months, depending on whether there was an express or a tacit decision on the appeal.[278]

CCAA have their own Courts (e.g. Administrative Courts) and a Supreme Tribunal for cases under their competences, but these are enshrined in the national system and are hierarchically inferior to the State Supreme Tribunal. If the administrative decision affects more than one CCAA or falls under the competence of the State then an appeal shall be lodged to the Central Administrative Court *(Juzgado Central de lo Contencioso Administrativo).*

The procedure before the administrative Court is quite long. It often happens that the final decision is adopted two or three years after the action was brought before the Court.[279]

2.3.2 By a person other than the operator

Pursuant to Article 31 of the Law 30/1992 interested parties that can initiate an administrative procedure are:

- Those who promote the administrative action as holders of legitimate individual or collective interest and rights,
- Those who have not initiated a procedure but whose rights may be affected by the decision taken in the procedure,
- Those who have not initiated a procedure but whose legitimate individual or collective interests may be affected by the decision and become a party to the procedure before the final decision on the procedure is made;

Associations representing economic and social interests would be deemed to have a collective interest as laid down in the legislation.

Pursuant to Article 19 of the Law 29/1998 regulating the administrative court procedure, the following interested parties can challenge an administrative decision before an administrative court:

- Legal or natural persons having legitimate individual or collective interests and rights;
- Corporations, associations, unions which are affected or are legally entitled to protect collective rights and interest;

[277] See Article 46 of the Law 30/1992
[278] Ibid.
[279] E. Pozo Vera, *Study on measures other than criminal ones in cases where environmental Community law has not been respected in the EU Member States, National, Report Spain*, Milieu Ltd, Brussels (2004)

- The State administration when holding rights or interests to challenge acts and provisions of the Administration of the Autonomous Communities, and the administration of the CCAA when holding rights or interests to challenge acts and provisions of the State administration.

Pursuant to Article 22 of the Law 27/2006 transposing the Aarhus convention,[280] the acts and where appropriate, omissions attributable to public authorities which contravene requirements related to the environment (e.g. the protection of water and soil, air pollution, chemical substances, waste management) may be appealed by environmental NGOs, that shall meet specific criteria in accordance with the administrative appeal procedure set in Law 30/1992 and the administrative Court procedure set in Law 29/1998.

These criteria are as follows:

- The aims in its by-laws expressly include the protection of the environment in general or of any particular element thereof;
- It was legally established at least two years before the action is brought and has been actively pursuing the aims provided in its by-laws;
- It performs its activity pursuant to its by-laws in a territory that is affected by the administrative act, or if applicable, omission.

It is important to note that administrative acts and omissions from natural or legal persons assuming public responsibilities, exercising public functions or providing public services related to the environment under the responsibility of the State or CCAA Government or State and CCAA administrations are exempted from Article 22 of the Law 27/2006 and environmental NGOs will not be directly entitled to challenge these acts and omissions.

As a conclusion, not only the operators of an activity falling under the scope of the IPPC Directive that received an administrative sanction can lodge an appeal against this decision. For example environmental NGOs fulfilling strict criteria are entitled to challenge it. The State administration, having legitimate interest, can also challenge before the Court the administrative sanctions set by a CCAA administration. Conversely the CCAA administration, having legitimate interest, can challenge to the Court administrative sanctions set by a State administration.

3. Judicial procedure

3.1 General information

As already mentioned above criminal environmental offences and their related sanctions are only mentioned in Chapter III Title 16 of the Spanish Criminal Code. These offences are broad and cover general crimes against natural resources and the environment and also crimes related to the protection of the flora, fauna and domestic animals. This Code does not contain any specific criminal sanctions for the infringement of the transposing provisions of the IPPC Directive.

Article 325 of the Criminal Code, however provides that, the infringement of laws and other general provisions, which aims are to protect the environment, leading to emissions, discharges, radiations, extractions or excavations, silting, noise, vibration, injection, deposit, in the atmosphere, soil, subsoil or inland water, groundwater, sea, including high sea, catchments that could seriously undermine the balance of natural systems shall be considered as a criminal offence.

[280] Law 27/2006 of 18 July regulating the rights to access information, the participation of the public and access to justice in environmental matters *(Ley 27/2006, de 18 de julio, por la que se regulan los derechos de acceso a la información, de participación pública y de acceso a la justicia en materia de medio ambiente (incorpora las Directivas 2003/4/CE y 2003/35/CE).*

In other words infringements of the transposing provisions of the IPPC Directive (e.g. the emission limit value standards), can lead to a criminal sanction, if they can seriously endanger the balance of natural systems.[281]

Article 326 amongst other provisions considers as aggravating circumstances of the criminal offences mentioned above the fact that activities were operating without obtaining the required authorisation or administrative approval or disobeyed the orders of the administrative authority for correction or suspension of the activities or provided wrong environmental information or impeded the administration inspection activities.

These aggravating circumstances are similar to certain administrative offences related to the infringement of the transposing provisions of the IPPC Directive.

Criminal Law in Spain sets two types of criminal offences either misdemeanours *(faltas)* or crimes *(crímenes)* depending on the seriousness of the criminal offences.

There is no specific criminal procedure for environmental criminal offences. The relevant criminal procedure and the competent criminal Courts are determined by the types of criminal offences. The Magistrate Court *(Juzgado de Instrucción)* of the district is competent for misdemeanours. When dealing with crimes different judicial bodies are competent. The Magistrate Court of the District where the crime took place carries out the investigation. In very serious cases the Central Court of Instruction (*Juzgado de Instrucción Central)* does the investigation. Depending on the seriousness of the crime are competent to issue a judgement, the Juror Court *(tribunal del Jurado),* the Court of Criminal *(Juzgado Penal)* or the Provincial Penal Court *(Sala de lo Penal de Audiencia Provincial),*

Most of the time the Nature Protection Service of the Guardia Civil, together with the municipal police and forest guards are the ones that provide information on potential environmental crimes to the Public Prosecutor *(Ministerio Fiscal)* that reports the criminal offence to the Magistrate Court, the judicial body competent to instruct the investigation. In case the Magistrate Court considers that the facts constitute a crime, the Public Prosecutor can formulate the accusation to initiate the trial.

It is however important to note that pursuant to Articles 101 and 270 of the Law on criminal procedure, any person, whether or not offended by a criminal offence can lodge a complaint to the Judge of the Magistrate Court, the so called 'popular action'*(acción popular)*. [282] The Jurisprudence of the Supreme Tribunal *(Tribunal Supremo)* has interpreted these provisions in a way that not only natural persons can lodge this popular action but also legal persons, public institutions and organisms.[283]

In other words environmental NGOs are entitled to lodge a complaint to the judge of the Magistrate Court when they consider that an environmental criminal offence was committed.

The criminal procedure for criminal offences related to flora and fauna is shorter than the procedure for criminal offences endangering the balance of natural systems. Crimes against flora and fauna are easier to prove than crimes against natural systems, which require much more scientific analyses (e.g. on impact of pollutants and chemicals) and different expert opinions. Such elements are often used as a strategy by the defence to extend the length of the procedure.

[281] The jurisprudence of the Supreme Tribunal considers that this type of crime is based on an abstract endangerment (See Sentencias Tribunal Supremo 14 February 2001 and 25 October 2002)
[282] Law of criminal procedure *(Ley de Enjuiciamento Penal)*
[283] Sentencia Tribunal Supremo 79/99

Finally, Articles 795 to 803 of the Law on criminal procedure set a fast-track criminal investigation and prosecution for offences punishable by imprisonment not exceeding five years, or with any other sanction, not exceeding ten years, whatever its pecuniary amount, provided, that criminal proceedings are initiated under a police report and the judicial police has arrested a person and made him/her available to the Police Court *(Juzgado de Guardia)*.

The environmental criminal sanctions enshrined in the Criminal Code do not exceed five years of imprisonment. Therefore this fast-track procedure can apply to those who have committed environmental criminal offences under Chapter IV of the Criminal Code. This requires, however, a policy report and the arrest of the alleged person that committed the environmental offence. This fast track procedure was designed for 'in flagrante delicto' criminal offences and it is less likely to apply for environmental crimes relate to the infringement of the IPPC requirement because of the difficulty to prove them.

3.2 Possibilities of appeal

Appeals *(recurso de apelación)* against the judgement of the Court of Criminal jurisdiction can be lodged either by the public prosecutor, the offender, and other parties (e.g. environmental NGOs) before the Penal Chamber of the Provincial Court *(Sala de lo penal de Audencia Provincial)* within a timeframe of 10 days from the issue of the judgement.[284]

The decision of the Penal Chamber of the Provincial Court can then be appealed to the Second Chamber of the Supreme Tribunal *(recurso de casacion)* by the public prosecutor, parties involved in the case and their heirs within a time-frame of five days from the issue of the judgement. Parties involved shall be present at the Second Chamber of the Supreme Tribunal respectively 15 days after the issue of the judgement of Penal Chamber of the Provincial Courts (20 days for Isla Baleares, 30 days Canarias y Ceuta y Melilla).[285]

No specific time-frames are set for the issue of the judgements.

4. Synergies between administrative and criminal procedures

Pursuant to the principle of *ne bis in idem* (not twice for the same), there cannot be accumulation of administrative and criminal sanctions for the same facts. If an administrative procedure has been initiated with the objective of imposing a sanction, and the competent authority considers that the facts could constitute a criminal offence, it should stop the procedure and transfer the case to the criminal jurisdiction.[286] Only if the criminal jurisdiction considers that the situation cannot be qualified as a crime, the administrative body is empowered to continue the administrative procedure. The imposition of a criminal penalty excludes the possibility of imposition of an administrative sanction if it involves the same facts and same persons.

5. Conclusions

5.1 Preliminary conclusions

Proportionate

[284] See Book V of the Law on criminal procedure *(Libro V de la Ley de Enjuiciamento Penal)*
[285] Ibid.
[286] Article 7 of the Law 30/1992 on administrative procedure

The Law 16/2002 transposing the IPPC Directive provides different administrative offences classified as petty offences *(faltas leves),* serious offences *(faltas graves)* and very serious offences *(faltas muy graves)* and their corresponding administrative sanctions. Such gradation of offences leaves room to punish an infringement on the basis of the individual severity of the violation and can be assessed as fulfilling the criterion of proportionality.

Effective

The administration is empowered to set interim emergency measures in order to impede the continuation of the damage or situation of risk such as the temporary, full or partial closure of the installation, the cessation of installation operations, and the temporary suspension of the permit.[287] These measures are considered to be quite effective.[288]The administrative procedure to issue a sanction contains several procedural steps in order to respect the right of the defence; it shall not exceed 6 months. Sanctions can be appealed before the administration itself and then to the Administrative Courts. The overall procedure is quite long and thus may lack of effectiveness (e.g. administrative court proceedings can last two or three years after the action was lodged). Environmental NGOs can challenge administrative sanctions (or their omissions) but they have to fulfil very strict criteria which limit their role in the procedure.

The Criminal Court procedure can be quite long and thus not very effective. Environmental criminal offences can however be resolved under a fast-track criminal procedure, although this procedure does not seem to be made for such crimes. One of the positive aspects about the Spanish criminal procedure improving its effectiveness is that any person, whether or not offended by a criminal offence can lodge a complaint before Criminal Courts under the 'popular action'.

Dissuasive

The administrative sanctions are quite stringent, they can lead to a fine (up to Euros 2,000,000)[289], definitive or temporary closure of all or part of the installation, the prohibition to exercise a professional activity for a certain time period, the revocation or suspension of the approval for a certain time period and the publication of the sanctions. They can thus be considered dissuasive. It is significant to note that the dissuasive aspect of administrative sanctions was particularly taken into account by the Spanish legislator under Article 32(2) of the Law 2002/2 that provides that when the amount of the fine is lower compared to the benefit of the infringement, it shall be increased at least up to twice the amount the offender has benefited.

Criminal fines are less dissuasive than the administrative ones (maximum Euros 300,000). Environmental criminal offence can however lead to imprisonment penalties. The privation of freedom (maximum four years) has a significant deterrent effect compared to administrative sanctions.

[287] Article 35 of the Law 16/2002 on classified installations

[288] E. Pozo Vera, *Study on measures other than criminal ones in cases where environmental Community law has not been respected in the EU Member States, National, Report Spain*, Milieu Ltd, Brussels (2004)

[289] Even more in certain CCAA (e.g. 3 million euros in Cantabria[289], 2.4 million euros in Andalucía[289], 2.5 million euros in Aragon[289], while under Law 16/2002 the same offence can lead to a fine of 2 million euros.

Case studies

Case Study 1

Introduction

For this case study information was provided by Javier Vera Janín, Director of the Section on inspection and control of the Environmental Department of the Government of the Autonomous Community of Navarra. This case study covers an IPPC installation, but the sanctioning procedure mentioned here deals with the infringement of the transposing provision of Article 9(1) of Directive 1999/13/EC[290] (Volatile Organic Compounds Directive) requiring operators to demonstrate to the Competent Authorities that they comply with emission limit values in waste gases, fugitive emission values and total emission limit values.[291]

Article	Key enforceable provisions of the Volatile Organic Compounds Directive
Article 5(2)(a)	Installations shall comply with the emission limit values and other requirements laid down in Annex IIA;
Article 5(2)(b)	Installations shall comply with the reduction scheme requirements specified in Annex IIB.
Article 5(4)	For installations not using the reduction scheme, any abatement equipment installed after 1999 shall meet all the requirements of Annex IIA.
Article 5(5)	Options for installations where two or more activities are carried out, each of which exceeds Annex IIA thresholds, (e.g. each activity must meet specified requirements individually).
Article 5(6)	Substances or mixtures classified as Carcinogenic, Mutagenic or toxic to Reproduction (CMR) because of VOCs content shall be replaced, as far as possible by less harmful substances or mixtures within the shortest possible time.
Article 5(8)	Certain discharges of halogenated VOCs assigned risk phrases R40 or R68 where the mass flow is $\geq$ g/h shall comply with emission limit value of 20 mg/Nm3.
Article 5(9)	Discharges of VOCs classified as CMR or assigned risk phrases R40 or R68 after Directive enters into force have to comply with the para. 7 & 8 ELVs within shortest possible time.
Article 5(10)	All appropriate precautions to be taken to minimise emissions during start-up & shut down.
Article 9(1)	Operators have to demonstrate compliance to the satisfaction of the Competent Authorities with: — ELVs in waste gases, fugitive emission values & total ELVs, — the requirements of the reduction scheme under Annex IIB. Solvent management plans according to Annex III can demonstrate compliance. Gas volumes added to waste gas for cooling or dilution purposes shall not be considered when determining mass concentration of the pollutant in the waste gas.
Article 9(2)	Compliance shall be re-verified following a substantial change.
Article 10 (a)	The operator shall inform the competent authority and take measures to ensure that compliance is restored within the shortest possible time

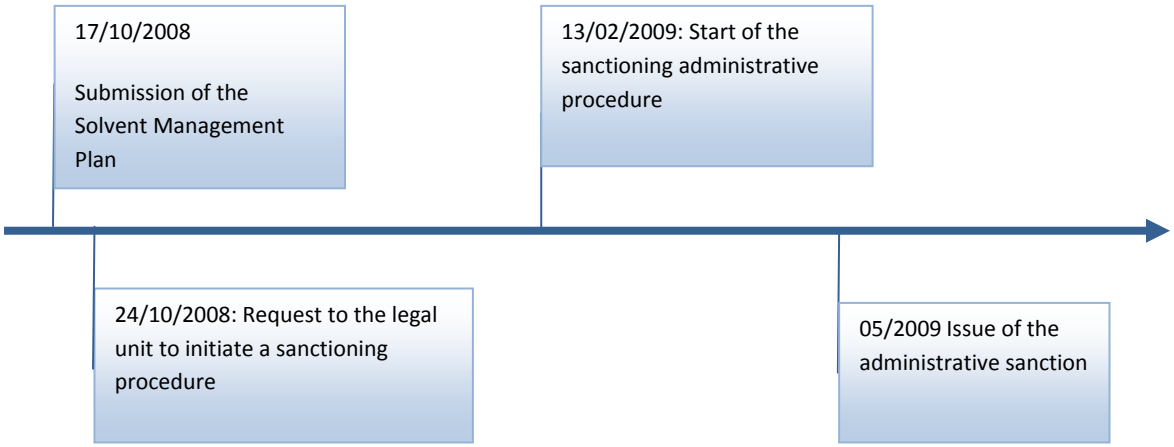
The sanctioning procedure started in October 2008 and ended by an administrative sanction in May 2009. The operator did not appeal the sanction to the administrative Court. Overall the time period

[290] Directive 1999/13/EC on the limitation of emissions of volatile organic compounds due to the use of organic solvent in certain activities and installations

[291] No case studies were provided on the sanctioning procedure for the infringement of a transposing provision of the IPPC Directive by the environmental departments of the Autonomous Communities, in charge of enforcement of environmental law in Spain.

from the establishment of the infringement and the issuance of the sanction was quite short, nearly 8 months. The operator did not lodge an appeal to the administrative Court.

Timeline of the procedure



Description of the background

The facility is an industrial plant that produces aluminium car rims. The installation is located in Navarra. It was granted an integrated permit in 2007.[292]

The operator sent to the competent authority its 2007 Solvent Management Plan. The Competent Authority established infringements to the provisions of Directive 1999/13/EC on Solvents[293] and the corresponding transposing legislation in Spain.

Legislation applicable

The legislation applicable here is the Directive on Volatile Organic Compounds, and its transposing legislation in Spain, the Royal Decree 117/2003.[294] These rules establish that the operator shall demonstrate to the competent authority that it complies with emission limit values in waste gases, fugitive emission values and total emission limit values of solvents.

Infringements to the Royal Decree 117/2003 can be sanctioned according to the Law 16/2002 concerning integrated pollution prevention and control.[295] However, as already mentioned in the country detailed study, the Autonomous Communities are competent for the inspection and enforcement of environmental legislation and are entitled to set their own regime of sanctions related to the environment. This is the case in Navarra where infringements to the Royal Decree 117/2003 are sanctioned under the Law of Navarra 4/2005 of March 2005.[296]

This law sets a range of pecuniary sanctions:

[292]This is equivalent to an IPPC authorisation.
[293]Council Directive 1999/13/EC of 11 March 1999 on the limitation of emissions of volatile organic compounds due to the use of organic solvents in certain activities and installations, *OJ L 85, 29.3.1999, p. 1–22.*
[294]Royal Decree 117/2003 of 31 January, on the limitation of emissions of volatile organic compounds due to the use of organic solvents in certain activities and installations *(Real Decreto 117/2003, de 31 de enero, sobre limitación de emisiones de compuestos orgánicos volátiles debidas al uso de disolventes en determinadas actividades).*
[295]Law 16/2002 concerning integrated pollution prevention and control *(Ley 16/2002, de 1 de julio, de prevención y control integrados de la contaminación.)* Royal Decree 117/2003 does not contain any sanctions but for sanctions refers to the Law 16/2002.
[296] Regional Law 4/2005 22 March on intervention for the protection of the environment *(Ley Foral 4/2005, de 22 de marzo, de intervención para la protección ambiental).*

Euros 20,000 for minor infringements;
Euros 200,000 for serious infringements;
Euros 2,000,000 for very serious infringements;

In this particular case the legal department of the competent authority considered the infringement as minor.

The procedure

The operator submitted to the competent authority its 2007 solvent management plan on October 17, 2008.

The solvent plan showed that fugitive emissions exceeded the threshold limit value of the solvents directive. Fugitive emissions were 69% of solvent input whereas the limit set by the Directive is 20%.

The unit in charge of the Solvent Directive made a request to the legal unit to initiate a sanctioning procedure on October 24, 2008. Following the procedure set in the Law of Navarra 4/2005, the legal unit informed the municipality about the infringement.

The municipality decided not to initiate the sanctioning administrative procedure due to lack of technical and legal resources.

Finally, the regional Government of Navarra initiated the sanctioning administrative procedure on February 13, 2009. The regional Government proposed a sanction in the procedure of Euros 10,000.

The operator pleaded not guilty on March 29, 2009 because by the end of 2008 he had built a new painting installation with a thermal unit to oxidize the volatile organic compounds.

The legal unit considered the allegations partially and finally imposed a sanction of Euros 5,000. The operator did not lodge an appeal against this administrative decision to the Court. The procedure ended on May 13, 2009.

General comment

The legal unit considered the infringement as minor because the amount of solvents used by the operator in 2007 was under the threshold of the IPPC Directive (200 Tm/year).[297]

The punishment was established taking into account that the range for minor offenses is up to Euros 20.000. The Government of Navarra decided that the sanction should be in the middle of the range. Finally the allegations made by the operator were partially considered during the sanctioning administrative procedure.

The sanction has deterred the perpetrator from repeating infringements and since 2009 the operator complies with all permit conditions.

[297] Annex I point 6(7) of the IPPC Directive on categories of activities covered by this Directive: Installations for the surface treatment of substances, objects or products using organic solvents, in particular for dressing, printing, coating, degreasing, waterproofing, sizing, painting, cleaning or impregnating, with a consumption capacity of more than 150 kg per hour or more than 200 tonnes per year.

Annex VI- The Netherlands

Sanctions and procedures applicable to breaches of the legislation on industrial emissions in the Netherlands

Executive summary

In the Dutch legal system, both criminal and administrative penalties can be imposed for a breach of the legislation on industrial installations. In principle, these two enforcement systems have different aims - ensuring compliance (i.e. administrative penalties) and a punishment (i.e. criminal penalties) function respectively. Administrative fines are the exception, as they have a punitive character.

Since 1st October 2010, administrative measures related to breaches of rules implementing the IPPC directive in the Netherlands have been primarily taken on the basis of the Act on General Provisions Environmental Law (Chapter 5 on enforcement). Before this date, such administrative measures were regulated by the Environmental Management Act (Chapter 18 on enforcement).

The General Administrative Law Act was and is still applicable next to the abovementioned acts. This framework act contains general rules of Dutch administrative law, for instance definitions. It provides a comprehensive toolkit of enforcement measures to the competent authorities. The Act lists four types of administrative sanctions for offences that can apply to both natural and legal persons:

- administrative order subject to a financial payment (dwangsom); a restorative (reparation) measure which aims at full or partial reversing the effects of the violation; it is a non-punitive coercive measure that in practice is used far more than the other measures
- administrative enforcement / coercive order (bestuursdwang); a non-punitive coercive measure
- administrative fines; a punitive sanction for minor offences
- revocation of the permit; this can be a punitive sanction as well as non-punitive measure

As for enforcement through criminal law, the public prosecutor's office can instigate criminal proceedings against cases in which environmental law obligations are violated. Violations of the rules as laid down in the main pieces of environmental law (notably working without a permit or in violation of the conditions of a permit under the Act on General Provisions Environmental Law and the Environmental Management Act) are punishable as economic offences in the Economic Offences Act. It is within the Dutch public prosecutor's discretion to decide whether to prosecute or not (whether it is 'opportune' to do so). The policy line agreed upon in this respect is to prosecute only violations of core provisions of environmental legislation (as set out in the Instruction on enforcement of environmental law). Some cases are subject to transaction between the prosecutor and the perpetrator while other cases are brought into court.

The table below indicates the Articles of the IPPC Directive covered by sanctions in the Netherlands. The category of administrative (quasi) criminal sanctions does not exist in the Netherlands, thus this column is left blank in the table below.

Introduction

This report describes the procedures relating to enforcement of the IPPC Directive[298] under Dutch law. It is based on jurisprudence, background articles, guidelines, interviews and examples from case studies. Furthermore, the report provides an overview of the administrative and criminal procedures as applied in the Netherlands.

Until recently, the Environmental Management Act (WM)[299] was the only primary legislation in the Netherlands regulating industrial installations. In October 2010, however, the Act on General Provisions Environmental Law (WABO)[300] entered into force, which created an integrated licensing system regarding several activities that affect the physical environment. The Act regulates the issuing of permits concerning construction, housing, monuments, space, nature and environment, which previously fell under separate permit regimes. The obligations established under the WABO are further detailed in the Decree on the Law on Environment (BOR)[301] and the Ministerial Regulation on the Law on Environment (MOR).[302]

Before the enactment of the WABO, Chapters 8 (installations) and 18 (enforcement) of the WM and the Water Act governed the issuing of permits related to the IPPC Directive. The functions of the WM with regard to the enforcement of environmental law are transferred to the WABO (Article 18.1a WM). The other WM provisions, and the provisions of the Water Act covering direct discharge in surface waters, remain in force. Whereas the WABO only recently started operating, this report will primarily focus on enforcement of the IPPC Directive and applicable sanctions under the WM.

1. Applicable sanctions

1.1. Introduction

In the Dutch legal system, both administrative and criminal measures can be taken when a breach of the legislation on industrial installations occurs. These two enforcement systems have different aims (respectively ensuring compliance and punishment). Consequently, offences may be determined as either being administrative and/or criminal in nature. Administrative measures are primarily enforced pursuant to WABO (Chapter 5 on enforcement) and the WM (Chapter 18 on enforcement). With regard to IPPC installations, all enforcement provisions fall under Chapter 5 WABO since October 2010 (Article 18.1a WM).

Besides the specific rules in the WABO and WM, the general rules of Dutch administrative law apply. The General Administrative Law Act (AWB) provides a comprehensive toolkit of enforcement measures to the competent authorities. It lists four types of administrative sanctions for offences that apply to both natural and legal persons (Article 5.1(3) AWB). It distinguishes between administrative coercion measures and administrative punitive sanctions; the latter are defined as administrative sanction intended to inflict harm on the violator (art. 5.2(1)(c) AWB).

Breaches of a number of provisions of the WABO, the WM and other acts have been qualified as criminal offence or crime (depending on the seriousness of the infringement) in the Law on Economic

[298] Directive 2008/1/EC of the European Parliament and of the Council of 15 February 2008, PB L24, 29.1.2008, pp. 8-29. On 7 January 2014, this Directive will be repealed by Directive 2010/75/EC, which provides for an integrated approach to prevention and control of emissions into air, water and soil, to waste management, to energy efficiency and to accident prevention.

Offences (WED),[303] by listing the relevant provisions. For instance, Articles 1 and 2 of the WABO requires that IPPC installations only commence operations after having obtained a permit from the competent authorities (i.e. municipality or province). Infringements to Articles 1 and 2 WABO are qualified as offences in the WED. The WED also established the maximum amount of a penalty for each offence. It is up to the Dutch judiciary to decide on the actual penalty. The maxima in the WED should be observed, but no minima apply. In addition, the Public Prosecutor's Office can offer a transaction to offenders, by which the payment of a fine is meant, in 'simple' minor cases. The transaction serves as a penalty and avoids the need to go to court. In practice, this offer is often accepted, meaning that only a minority of cases in which the Public Prosecutor is involved actually reach the courts. If a company does not agree with the penalty and refuses the transaction, the case may be brought to the criminal court in first instance. If the company is convicted, it may appeal that decision and – on matters of interpretation of the law – it may appeal to the High Court[304] for its view on the matter in cassation.

A report issued in January 2010 (Report on Environment Monitor Permitting, Control and Enforcement tasks, Rapportage Milieu Monitor Vergunningverlening, toezicht en handhaving (VHT)-taken) shows that there were some 616 IPPC installations for which provinces are the competent authority in the Netherlands in the year 2008 (not including those situated in the Province Noord-Holland and in Amsterdam). Inspections were carried out an average of 2,8 times per IPPC installation in 2008.

The following table shows statistics for the total number of installations for which the provinces are competent authority, for the year 2008. Statistics specific to IPPC installations are not available and these numbers and percentages relate both to IPPC and non-IPPC installations for which the provinces are the competent authority. Similar overviews for permits issued by municipal authorities were not identified.

Warnings were issued for 23 per cent of the installations (and 70 per cent of the violations). Thirteen per cent of these cases resulted in an administrative measure, which led to payment (in the sense that the payment actually had to be made because the company did not abide by the order) in 2,2 per cent of the cases. It was also noted that in 98 per cent of the cases, issuing a warning brought about that the perpetrators changed their behaviour and the breaches came to an end.

Table 1: Statistics on Inspections and Administrative Measures and Sanctions

Number of installations	Number of inspections	Number of offences identified	Number of warnings	Number of administrative measures	Number of payments made
Over 4,000 including 14% IPPC installations	9,318	1,426	994	169	32

From the IPPC inventory managed by Infomil, it follows that on 16 September 2009 a total of 2,743 IPPC installations existed in the Netherlands. Municipalities were the competent authority in most of the cases, namely for 2,149 installations. The provinces and the Environmental Protection Agency Rijnmond[305] were responsible for 599 installations, and a remaining category of four installations fell under the supervision of the State. Another overview undertaken at the same time showed almost the same result, namely a total of 2,752 installations, while differentiating between new and existing

[303] Wet economische delicten,
[304] Hoge Raad
[305] Dienst Centraal Milieubeheer Rijnmond is the regional environmental agency of the local and regional authorities operating in Rijnmond, the larger 'Port of Rotterdam'-area in the Netherlands.See http://www.dcmr.nl/en/index.html

installations and indicating which category of IPPC installation it concerned. The latter data were presented to the Commission as part of the obligations under Directive 2008/1.[306]

A representative of the Province of Zeeland noted that 48 IPPC installations were located in the Province in the year 2010. In the same year, the Province has issued some 24 formal warnings and 13 administrative orders subject to a financial payment. Ten of these orders concerned IPPC installations. In the vast majority of these cases, the orders had the desired effect and the violation was terminated by the company in question. In three cases, the companies had to make the financial payment as they did not abide by the order.

It is worth noting that after the serious accident at an installation that stores and manages chemicals in Moerdijk at the start of 2011, a quick scan was made of 416 installations that manage chemicals. Out of the 416 installations that were investigated, 71 scored badly on one of the five investigated aspects, 25 scored badly on two or more aspects, and only 13 scored reasonably well or well on all aspects. The Minister responsible for Environment informed the Parliament that he did not want to identify the companies scoring badly for the time being, but he did announce that if the situation would not improve before the summer of 2011 he would consider making a list of the 25 top perpetrators public and thus "naming and shaming" them.[307]

The following sections describe the available measures and sanctions.

1.2. Administrative order subject to a financial payment (last onder dwangsom)

The administrative order subject to a financial payment (in Dutch: 'dwangsom', which could be translated literally as 'coercive sum') is a remedial (reparation) sanction which aims at reversing the effects of the offence (Article 5.31d AWB). According to Article 5.32a AWB, the administrative order describes the remedial action to be taken. The administrative authority shall determine the payment either as a lump sum, or as a sum payable per unit of time in which the order has not been complied with or for each violation of the order (Article 5.32b(1) AWB). The amounts shall be reasonably proportionate to the gravity of the interest violated and to the intended effect of the penalty (Article 5.32b(3) AWB). This amount is established by the competent authority. In the province Zeeland, internal guidelines are used in order to establish the appropriate amount of the payments. Amongst other things, the profits from non-compliance with the legal obligations are taken into account, as are the frequency of violations, the type of violation and its nature (for instance, does it concern only one missing wall that is fire-resistant or does it concern a large number of containers that are not properly suited to store dangerous substances). The higher the payment that is requested, the better the reasons for imposing such a sum are to be as companies are inclined to go to court on this issue. Thus, with these guidelines in mind, each case is considered separately in order to define the amount that is reasonably necessary in order to ensure that the violation is remedied. The administrative order subject to a financial payment is considered to be an effective measure to ensure results. As already mentioned above, in 2010, the order was complied with ten times out of the 13 times such order was imposed on companies in Zeeland.

To ensure legal certainty for the permit holder, Article 5.23b(2) AWB requires the competent authority to indicate the maximum total amount of the penalty that can be imposed under the administrative order. An administrative authority may opt not to issue an order subject to a financial payment if this is incompatible with the interest which the rule violated aims to protect. (Article 5.32(2) AWB). This rule aims at ensuring that the measure of issuing an administrative order subject to a financial payment is not used instead of issuing an administrative coercive order (see below) in cases where the interests

[306] See p. 27 in the Report, available at http://circa.europa.eu/Public/irc/env/ippc_rev/library?l=/implementation_2006-2008/ms_factsheets&vm=detailed&sb=Title and at http://www.infomil.nl/onderwerpen/duurzame/bbt-ippc-brefs/rapportage-database/rapportage-2009/

[307] VROM Totaal 25 March 2011, Sancties dreigen voor onveilige chemiebedrijven, http://www.vromtotaal.nl/nieuws/2011/maart/sancties-dreigen-voor-onveilige-chemiebedrijven.8661.lynkx?tid=375&stid=0

of the environment would be harmed, for instance in cases of serious damage to the environment. In practice, the Dutch judiciary does not easily assume that an administrative order subject to a financial payment cannot be issued for this reason.[308]

1.3. Administrative coercive order (last onder bestuursdwang)

Administrative coercive measures are part of the instruments competent authorities have at their disposal against violations of the law. Article 5.21 of the AWB defines administrative coercive orders (in Dutch 'bestuursdwang') as a reparation measure which includes (a) the obligation to fully or partially repair damages caused by the offence, and (b) the competence of the competent authority to carry out the order itself if it is not carried out or not carried out in time by the operator. The municipality and province boards are authorized to use this measure pursuant to respectively Article 125 of the Municipalities Act and Article 122 of the Provinces Act. The administrative coercive order is used to bring the illegal situation back in line with the standards required by law, in other words to end the violation.

If the permit holder does not repair the damages or does not do so in time, the competent authority may carry out the order itself and use 'actual measures' in order to remedy the breach (for example by demolishing an illegal structure). Before doing so, the competent authority must send a written warning to the offender, informing him/her to remedy the breach within a specified time period. It the offender fails to do so, the competent authority may proceed to take the actual measures to remedy the illegal situation. The written notification is subject to appeal. The decision specifies which regulation and law is being violated (Article 5.24 AWB). The cost of performing the 'actual measure' (such as removal of the illegal structure) may be recovered from the offender (Article 5.25 AWB).

This administrative measure is far less popular than the administrative order subject to a financial payment. The interview with a representative of the Zeeland Province showed that the latter order is far easier to use for the administration in practice.

1.4. Administrative fine (*'bestuurlijke boete'*)

The administrative fine (in Dutch: '*bestuurlijke boete*') is a punitive sanction. This is in contrast to the other administrative measures described above which are not designed to punish a violation but to restore a situation which constitutes a breach of legal requirements, or to prevent their repetition. The administrative penalty does not necessitate that the competent authority sends a notification (warning) to the offender. Once a violation is detected (for example by inspectors), the competent authority can apply administrative fines immediately. The administrative fine is intended to tackle minor inconveniences caused in violation of general municipal ordinances (in Dutch: Algemene Plaatselijke Verordening, APV) such as littering.

This instrument was introduced only recently and thus, no data on initiated and finished procedures is available yet. Because of the scope of the instrument (notably its limitation to violations of general municipal ordinances), it is unlikely that it would be used for non-compliance with legislation on industrial emissions.

1.5. Revocation of the permit

If an offence is committed by the holder of a permit, the competent authority can fully or partially withdraw the permit. The law and regulations under which the permits are issued establish the rules concerning the revocation of the permit. Since 1 October 2010, the rules regarding revocation of IPPC permits are to be found in § 2.6 WABO when the revocation is a non-punitive measure, and in chapter 5 WABO where it is intended to be a punitive sanction. Article 2.33(1)(d) WABO requires the

[308] Van Buuren 2007, p. 268

competent authority to revoke a permit if the installation causes inacceptable environmental damage. Note that it is not merely a competence of the authorities to decide whether or not to revoke the permit in such cases, but a requirement for them to do so.[309] Before October 2010, the WM regulated this measure; there, the authorities were left with more discretion whether or not to revoke permits. In practice, the revocation of IPPC permits seems to be rare. It is rather used as a threat in some serious cases, like the chemicals company Thermphos (a phosphor producer which was exceeding its dioxin emission limits and committing other breaches of environmental regulation). The competent authority, the Province of Zeeland, threatened to revoke the permit but the company was very slow in adapting its practices to its permit conditions. The details of this case are provided in Annex IV. A recent report on this case claims that the authorities could have done more to ensure compliance.[310]

1.6. Criminal sanctions

When the public prosecutor decides to investigate a violation of environmental law and finds that the installation and/or the persons in charge are guilty of these violations, several options are available. The prosecutor can offer an out-of-court financial settlement (transaction) or bring the case to a court. The maximum amount that a fine for each particular category of offences can take is laid down in the Economic Offences Act (WED) *juncto* Article 23 of the Criminal Code. The Economic Offences Act also identifies the provisions in other acts like the WABO and WM, the breach of which constitutes an offence or a crime (depending on the seriousness of the infringement), and identifies the category of fines applicable to such violations.

Obligation to supply information for application for permits	In addition to Article 4.2 AWB, Article 4.4 BOR requires the applicant to provide the necessary information. ***Article 4.4 BOR*** *[Chapter 5 of WABO on enforcement sets sanction for non-compliance with implementing decrees eg BOR – see introduction]*	On the basis of Chapter 5, the competent authority (inspector) can apply administrative sanctions (see obligation 1 above and introduction). ***Article 5.19 WABO and Article 5.1(3) AWB***	N/A	N/A
Obligation to notify the competent authority of any changes in the operation of an installation	Article 2.1(1)(e)(2) requires a permit to change the installation or its operation. ***Article 2.1(1)(e)(2) WABO***	On the basis of Chapter 5, the competent authority (inspector) can apply administrative sanctions (see obligation 1 above and introduction). ***Article 5.19 WABO and Article 5.1(3) AWB***	Article 2.1(1)(e)(2) requires a permit to change the installation or its operation. Acting contrary to the requirements for a permit (Article 2.1(e) WABO), the WED applies through Article 1a (1). ***Article 2.1(1)(e)(2) WABO***	Article 6 WED establishes the maximum fines/ years in prison (see obligation 1 above).
Obligation to comply with the conditions set in the permit or mandatory ELVs	Article 5.3 of the BOR requires that BAT apply to activities covered by Article 2.1(e) WABO. According to Article 5.4 BOR, the competent authority sets the BAT, including the nature, effects and volume of the emissions (5.4(1)(f) BOR). Article 5.5 BOR requires instructions on emissions limits for installations referred to in Article 2.1(1)(e) WABO. Annex I to the MOR lists BAT documents that are relevant for IPPC installations. A failure to comply with these requirements *may be considered* an offence (see introduction). ***Article 2.1(e) WABO, Article 5.5 BOR***	On the basis of Chapter 5, the competent authority (inspector) can apply administrative sanctions (see obligation 1 above and introduction). ***Article 5.19 WABO and Article 5.1(3) AWB***	Article 2.3 WABO requires that the permit holder acts in compliance with the conditions set out in the permit. Article 1a sub 1° WED makes it an economic offence not to do so.	Article 6 WED establishes the maximum fines/ years in prison (see obligation 1 above).

*ELVs: Emission Limit Value

2. Administrative procedure

2.1. General elements on the legal tradition and potential evolution

It was generally felt in the 1980's that criminal enforcement was not effective enough in tackling environmental problems caused by industry. Administrative enforcement was seen as better suited to deal with many cases in which companies were not complying with environmental law in the Netherlands.

It turned out that other issues also needed to be addressed, notably setting priorities[313] and tackling the situations in which breaches of environmental law are allowed to continue (in Dutch: *'gedogen'*, literally to tolerate, i.e. in exceptional cases not adopting enforcement measures against violations of environmental law by the authorities that are legally entitled to, and capable of, adopting such measures). Furthermore, a more integrated approach to enforcement was sought for, both in terms of the organization of enforcement as well as of the use of the available instruments. As for the organizational aspects of a more integrated approach towards enforcement, the cooperation between different authorities was and remains of concern.

A critical report by the committee Mans from 2008 (advising on the necessity of a revision of the environmental law enforcement system) showed that enforcement in the Netherlands needed major improvements.[314] The Dutch central government accepted that there was a need for improved cooperation between competent authorities, notably municipalities, provinces, public prosecutors and the police. In June 2009, the organizations representing municipalities (VNG) and provinces (IPO) agreed with the central government that regional executive bodies ('*regionale uitvoeringsdiensten*', rud's) responsible for issuing environmental permits, control and enforcement, would be created and start their operations as of 1 January 2012. It recently became apparent that progress is slow and meeting the deadline unlikely. The responsible ministers demanded in a letter to the provinces to achieve interim results by the summer of 2011.[315]

An example of the present organisation of enforcement in one of the Dutch provinces is presented in box 1 below.

Box 1: Enforcement of environmental law in the province of Zeeland [316]

In the 2007 enforcement memorandum *'Oog op Zeeland'* the province of Zeeland elaborates on its enforcement strategy. The main objective was to better prevent infringements, and limit their consequences. Awareness-raising amongst citizens and industry is considered as a key instrument. The memorandum noted supervision to establish infringements in an early stage as the essence of enforcement. Permit holders who abide by the rules, will be inspected less frequently than those who did not do so in the past. Several sanctioning actions can be taken when an infringement is established:

- Applying administrative coercive measures : the Province intervenes to end a certain behavior
- Issuing an administrative order : the Province forces the perpetrator to end a certain behavior before a certain time limit
- Revocation of the permit which prohibits the activities of the perpetrator from that moment on.

[316] Provincie Zeeland, *Oog op Zeeland: Nota handhaving natuur en milieu*, Directie Ruimte, Milieu en Water, 20 February 2007.

In deciding the course of action, the administrative authority will take into account: whether a follow-up inspection is possible; how long the infringement lasted; the level of urgency of the action; whether it concerns a 'core provision' (see Section 3.2); and whether the perpetrator is generally known as 'abiding by the rules'.

In extraordinary situations, the administrative authorities can opt to tolerate certain cases of infringement, but only 'actively', meaning that the authorities need to issue a written statement, usually accompanied with conditions, allowing a certain behavior.

Besides administrative actions, criminal procedures are at the disposal of the competent authorities. In order to discourage particular dangerous types of behavior, the Public Prosecution (OM) can, in agreement with the administrative authorities, start criminal procedures. Usually an out of court financial settlement (transaction) is imposed (see Section 3.2.2).

2.2. Inspections

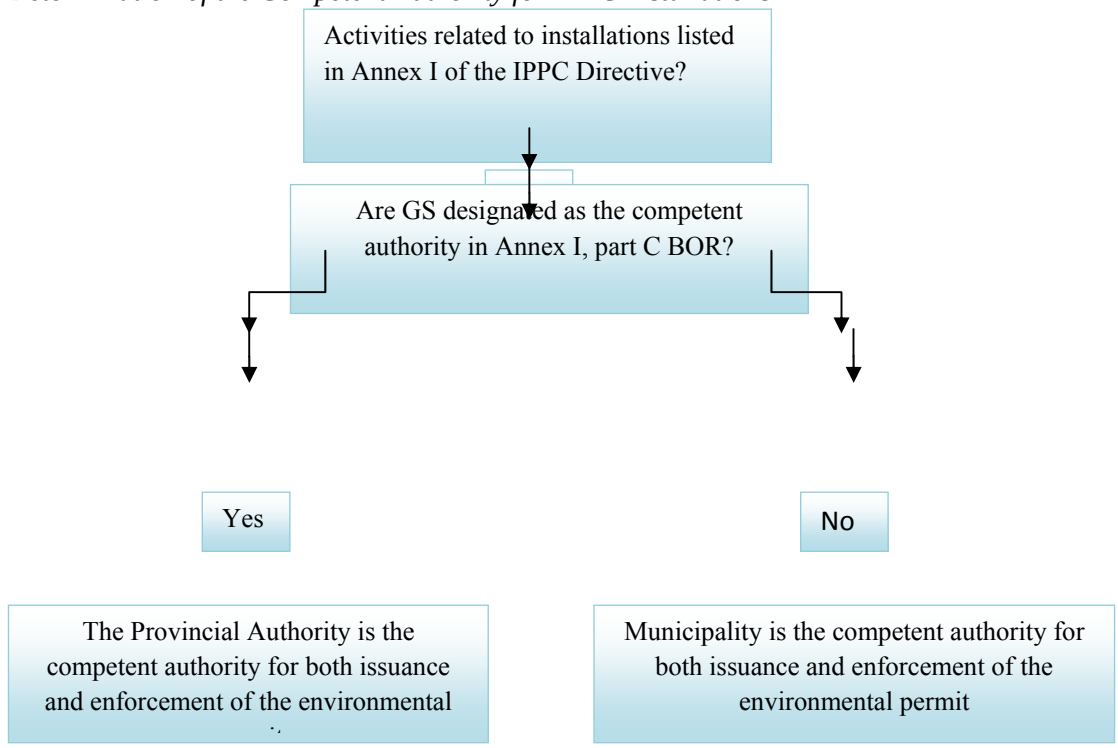
2.2.1. General information

As defined in the WM (chapter 8) and WABO (chapter 5), the competent authority is a body responsible for taking a decision in relation to a request for an environmental permit, as well as in relation to the enforcement and inspections relating to permits that are already granted. In case of non-compliance with the requirements set out in the legislation, these competent authorities can make use of their administrative enforcement powers described above. To be more exact, the provincial and municipal executive authorities designate officials charged with the implementation of the environmental legislation; these officials are also in charge of monitoring compliance with the provisions laid down by or pursuant to the Act concerned within their jurisdiction. These officials are a part of the environmental agencies (milieudiensten).

The activities for which the provincial authorities (in Dutch: Gedeputeerde Staten) rather than municipalities are the designated competent authority are listed in Annex I, part C BOR. The following figure explains how to establish the competent authority for IPPC installations:[317]

[317] Information retrieved from http://www.infomil.nl/algemene-onderdelen/uitgebreid-zoeken/@113407/inleiding/?PrvBslItmIdt=112833, 28 March 2011.

Figure 1: Determination of the Competent Authority for IPPC installations



Examples of installations for which the provinces are competent authority are installations processing 5 million kg per year or more of phosphor, ammoniac, chlorine or other dangerous substances mentioned, and steel processing plants. Consequently, installations with smaller capacities will fall under the competence of the municipalities. When provincial or municipal authorities are designated as the competent authority, they assume this role for the issuance and enforcement of the entire environmental permit (through the environmental agencies, see above).[318]

The Province is responsible for monitoring whether rules are abided by and, where necessary where violations are discovered, for enforcement. Enforcement is a discretionary competence. The decision whether to enforce or not needs to be reached by a proportionate balancing of interests. The interest of enforcement forms one of the issues to weigh, albeit in principle an important one. Furthermore, the interests of the company violating the norm and of third parties play a role. From Dutch jurisprudence it follows that normally, enforcement action needs to be taken when violations occur. In other words, there is a principle duty to enforce. Only in special circumstances authorities may decide to not enforce. Such circumstances can include the fact that the violation will end within a foreseeable period of time, or when legalisation in the form of new permit conditions is imminent. In such cases enforcement does not serve a reasonable purpose. These special circumstances occur regularly in Dutch legal practice. According to the committee Mans,[319] the authorities always need to check whether legalisation is possible. Also, enforcement is not to take place when this would be disproportionate. For instance, a violation of a minor nature and/or interests of third parties have not been violated in a manner that is worth mentioning, no action will be taken.

Another actor is the '*VROM-inspectie*', an inter-administration supervising agency that oversees the manner in which the competent authorities implement their permitting and enforcement competences. Since 1 January 2009, the '*VROM-inspectie*'has been assigned an additional task in the programme Priority companies (Prioritaire bedrijven), namely overseeing the functioning of competent authorities

[318] As an aid in determining which authority is competent, a website provides information and an electronic aid system. See http://www.infomil.nl/algemene-onderdelen/uitgebreid-zoeken/@113407/inleiding/?PrvBslItmIdt=112833 .
[319] Committee Mans 2011

in respect of major companies, notably the approximately 800 large IPPC companies. Within these companies, the '*VROM-inspectie*'prioritizes the major air emissions and largest safety hazards, bringing the total down to some 400 companies. The '*VROM-inspectie*' can request the competent authorities to take enforcement action, and as an ultimate remedy it can do so itself instead of the competent authorities if the Council of State agrees to this drastic step. The '*VROM-inspectie*'does not have the competence to directly intervene in the functioning of a company, however.

In 2008, the Dutch provinces (not including Noord Holland and Amsterdam) spend 402,946 hours on enforcement, which equals to 268 full time equivalent (fte).[320] If the figures are extrapolated for the two missing entities, the total amount of fte in all Dutch provinces in 2008 amounted to some 320 fte. The costs of enforcement were Euros 33 million.[321] As for the province of Zeeland, the interview suggested that in 2010 some 150 inspections took place, 50 of which (exceptionally) concerned Thermphos. Compared to other regions in the South of the Netherlands with which there is a cooperation that is to be intensified further, notably in anticipation of the new structure for permitting and enforcement (the 'RUD's'), Zeeland was carrying out more inspections per installation.

Part 5.2 AWB deals with to the control of compliance with administrative law. When an administrative authority has been designated as the competent authority, it acquires the powers enshrined in this part of the AWB and, possibly, extra prerogatives laid down in special legislation.[322] Some key elements of the competences of inspectors, laid down in Part 5.2 AWB are, amongst others:

- Article 5.13 AWB: An inspector only uses his power for the fulfilment of his duties;
- Article 5.15 AWB: An inspector can enter all premises, except for a residence without permission of the inhabitant;
- Article 5.16 AWB: An inspector can force cooperation in acquiring information;
- Article 5.17 AWB: The inspector can force access to documents and financial statements;
- Article 5.20 AWB: Everyone is obliged to cooperate with the inspector in the execution of his duties within a reasonable term.

Article 5.11 WABO declares the articles mentioned applicable to the enforcement of the WABO by the competent authority.

2.2.2. Inspection Strategies

Inspections are intended to enforce compliance with the law. Setting priorities is essential, whereas it is impossible to verify compliance in its totality. Therefore, the competent authorities need to draw up inspection strategies which can be altered annually, depending on the focus of the authority. As a starting point, periodical inspections should be held. Based on findings herein, other types of inspections e.g. audits or in-depth inspections could be carried out.

The competent authorities can design their own inspection strategies. Table 3 provides an overview of several types of inspections, and when these are used in the Dutch province Noord-Brabant.

Table 3: Inspection strategy of the province of North-Brabant[323]

Type of inspection	Risk involved
Periodical inspection	High, medium, low
Quick scan, industry specific inspection	Medium, low

[320] 1 fte amounting to 1,500 working hours

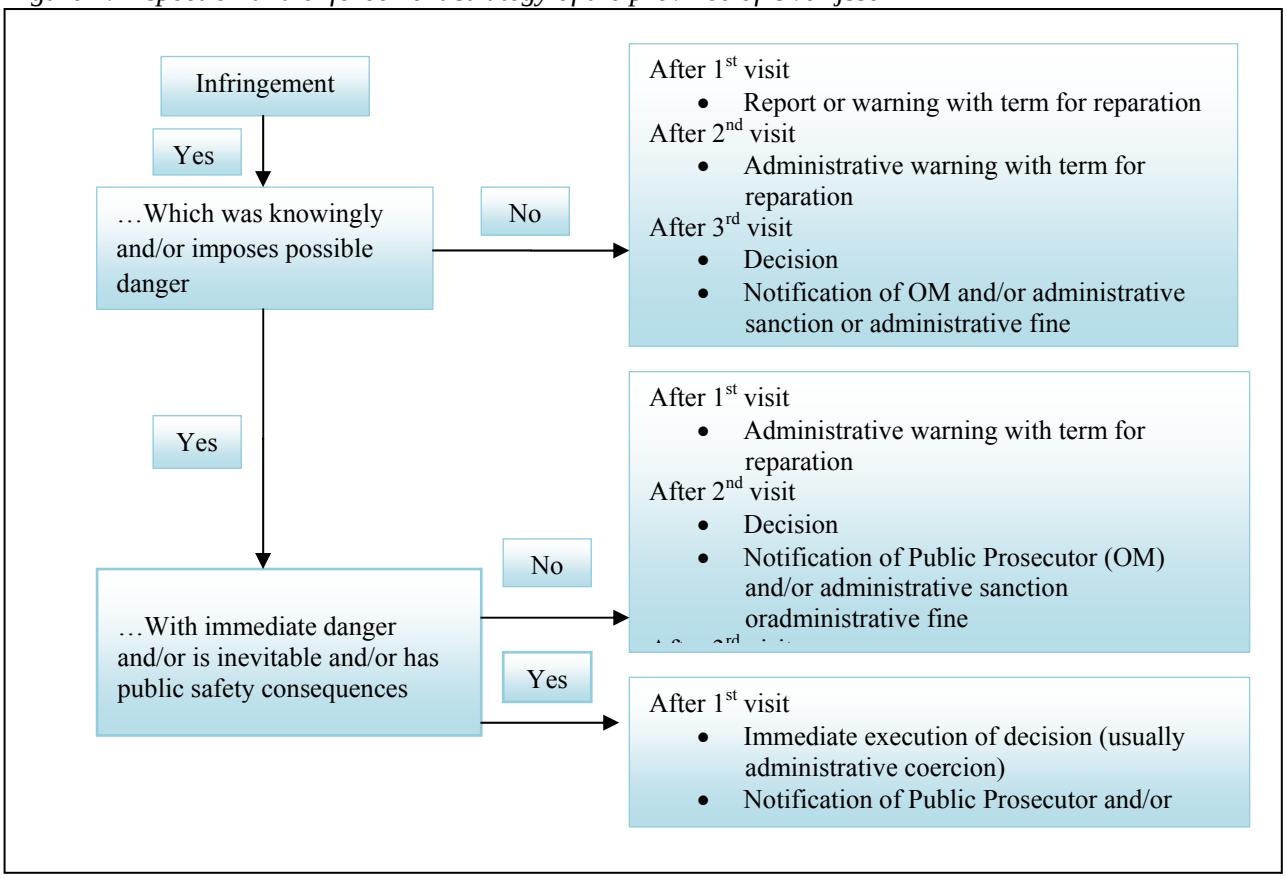
Chain oversight,[324] in depth inspections and inspections of records	High
Verification, audits	Generally supportive
Incidental inspections after complaints have been received or calamities	High, medium, low

The enforcement strategies of several provinces all indicate that perpetrators who commit infringements more than once can expect more visits from the inspecting authorities. A permit holder, who generally complies with the permit, needs less oversight than notorious infringers.[325] Thermphos with 50 inspections in 2010 forms a case in point here.

Figure 2. Inspection and enforcement strategy of the province of Overijssel[326]



Both an administrative order subject to a financial payment (dwangsom) and an administrative coercive order ('*bestuursdwang*') constitute decisions that can be asked to be reconsidered. Requesting reconsideration is a procedural pre-condition to further legal steps (Article 6.13 AWB) which can be taken when this reconsideration is without success for the applicant. First the administrative judges at the district court ('*rechtbank*') can be asked to annul the decision and finally an appeal is possible at the Council of State (Article 6.4 AWB).

Where administrative orders subject to a financial payment are concerned, Article 5.34(1) of the AWB regulates that the operator can request for the annulment of the order, the temporary suspension of the period within which the action needs to be taken, the reducing of the amount of payments in case of impossibility for the operator to meet the demands of the order. At the request of the operator, the administrative body that imposed the order can annul it if the order has been in force for over a year

[324] Inspections focussed on installations in the highest risk category, which monitor a certain product or a certain type of waste throughout the entire production process. The results can be used for future decisions on focus of the inspections. Usually multiple authorities are competent, so external coordination is necessary. Definition retrieved from the Enforcement Strategy of the Region Haaglanden (The Hague and surroundings), November 2004.

[326] Ferwerda, C., *Handhaven of gedogen, dat is de vraag*, Handhaving 2010, no. 4.

but the payment was not done within that period (Article 5.34(2) AWB). The actual payment needs to be decided upon via a separate decision (Article 5.37 AWB). A request for reconsidering and appeal covers both the latter decision as well as the general one (Article 5.39 AWB). Similar rules apply for the administrative enforcement order (bestuursdwang). In this instance, the fact that the request for reconsidering and the appeal are covering both decisions is laid down in Article 5.31c AWB.

3. Criminal procedures

3.1. General information

In the Netherlands, the '*Openbaar Ministerie*' (OM), or Public Prosecution Service, has sole discretion in deciding whether or not to bring criminal proceedings against legal or natural persons suspected of committing infringements of the law. In doing so, the OM can make use of the "opportunity principle". This means that the OM can refrain from prosecution if it deems criminal procedures not 'opportune' with regard to the general interest.[327] With the help of the Instruction on enforcement of environmental law, the Public Prosecution Service sets out in detail which issues are to be taken into account when deciding on prosecuting or not, and when prosecution is called for, which elements are to be taken into account. This section describes and the criminal procedure as applied to cases involving IPPC installations, including the considerations taken into account by the OM with regard to initiating prosecution in environmental cases.

3.2. Criminal procedures and environmental cases

The OM has the task of dealing with criminal aspects of environmental law enforcement procedures in cooperation with the administrative and investigative authorities. According to the 'Instruction on enforcement of environmental law', the two main aspects herein are:

A) Endorsing norms established to protect:
   - The environment or the public health;
   - Credibility (trustworthiness) of the norm-setting government;
   - Fair competition markets, especially when the infringement results in clear competitive advantage, or;
   - The possibility of government control.

B) Limitation of damage and restoration of urgent damage, notably where administrative authorities cannot act.[328]

In the light of these purposes, the OM deems initiating criminal proceedings appropriate only in case of infringement of 'core provisions' (kernbepalingen) of specific environmental provisions, in principle. These are the provisions which are the essence of the interests the regulation aims at protecting. With regard to IPPC installations, the most important core provisions are article 1.1(3) WABO (ex article 8.1 WM), setting the obligation to apply for a permit; article 5.19 WABO (ex. Chapter 8 WM in general), concerning compliance with the permits issued under the WABO.

3.3. Criminal procedures in the investigative phase

When infringement of a core provision has been established, an official report (proces-verbaal, a written report on what has been observed by a government official) will be communicated to the (legal or natural) person who allegedly infringed environmental law, unless the public prosecutor (Officier van Justitie) deems that the infringement was:

[327] Information available at: www.om.nl.
[328] Openbaar Ministerie, Strategiedocument, Aanwijzing handhaving milieurecht, Den Haag, 2010. , (2010A004). Published in Official Gazette (Staatscourant) 2010, nr. 2953.

- Unintentional, and;
- Incidental, and;
- Had only minor consequences, and;
- The person *in casu* took adequate action to cease the infringement and prevented any further damages (note that the above form cumulative conditions);

Or when,

- Considering an incidental or structural agreement between the OM and the administrative authorities, there is no role for criminal proceedings, whereas the administrative measure(s) to restore previous conditions is considered as a sufficient 'sanction'.

In case of an infringement of a non-core provision, initiating criminal procedures is in general not deemed opportune, unless there are, from a criminal perspective, relevant circumstances. These are, amongst others: a direct and significant threat of the environment, public health or government credibility; damage to the functioning of the market; a threat of increase in scale of infringement when no action is taken.[329]

3.4. Criminal procedures in the prosecution phase

A distinction is made between simple and more complicated cases. Simple cases are defined as environmental cases often occurring that are relatively simple by nature or constitutes only a minor violation of the interests that are to be protected. It is estimated that simple cases represent two third of the environmental cases.

Simple cases

In a simple case, an out-of-court financial settlement (transaction) may be reached between the OM and the perpetrator. Taking into account extraordinary circumstances enables the OM to adjust the settlement to the specific situation of the perpetrator. When the perpetrator has a history of multiple infringements, settlement might not be the suitable course of action.

In the majority of cases, reaffirming the law and discouraging certain behaviour will be the main target of the OM. Adequate decision making is important to attain these goals. Therefore, the OM will inform the perpetrator as soon as possible, but within three months at the latest, about its decision concerning the prosecution.

Other public bodies are also entitled to offer such settlements. Based on Article 37 of the Economic Offences Act ('*Wet op de Economische Delicten*',WED), these bodies, which include certain provincial and communal public bodies and certain civil servants, are allowed to use their competence within the limits set by the Ministry of Justice in the Decree on Transactions for environmental offences ('*Transactiebesluit milieudelicten*').

Complicated cases

The OM strives to reach a decision concerning prosecution in more complicated cases within six months after submission of the notice ('*proces-verbaal*'). The decision involves a proposal for a settlement, or a subpoena. Typically, the OM will take into account the role which natural persons played during the infringement, and whether prosecuting them instead of the legal person is of added value with regard to future prevention. Furthermore, the following considerations have to be taken into account by the OM:

[329] Aanwijzing handhaving milieurecht (2010A004), available at www.om.nl.

- If the behaviour was intended or executed in bad faith, the decision should focus on discouragement, punishment and limiting the possibilities to continue the behaviour;
- The more 'history' the perpetrator has with the OM, the more focus should be on punishment;
- In case of damage to the environment, the OM should consider if, and how, criminal sanctions should be imposed aimed at restoration of the environment. In order to determine this, communication with the administrative authorities is important;
- The OM could decide to prosecute in the public interest, to give a signal to the industry.[330]

3.5. Possibilities of appeal

The OM, taking into account the considerations mentioned above, can thus come to the conclusion that prosecution is the right course of action. Article 38 WED confers the power to hear economic crime cases in first instance to courts only, and more specifically to economic chambers within a court. Against a judgment, containing a verdict related to a crime, appeal can be lodged at a court of appeal (Gerechtshof)[331] by both the public prosecutor and the suspect who has not been completely acquitted of the indictment.[332] For minor infringements other rules apply,[333] but considering the enforcement strategy of the OM, only major environmental crimes would be prosecuted, which renders these rules irrelevant for present purposes. The appeal should be filed within 14 days after the judgment was delivered.[334]

Article 427 SV ('*Wetboek van Strafvordering*') provides for the possibility of cassation (cassatie) at the Dutch Supreme Court (Hoge Raad) against judgments of courts of appeal within 14 days after the delivery of the judgment in appeal.[335]

4. Synergies between administrative and criminal procedures

Administrative and criminal enforcement are two separate systems with different functions each. However, effective enforcement of environmental law is only possible with an integrated approach. Starting point should be that administrative action and criminal action, each keeping in mind its own purpose independently as well as combined, should aimed at ensuring a certain level of adherence and at limiting the consequences of possible infringements.

Relatively few environmental cases end up before a criminal court. However, if the OM deems criminal prosecution appropriate for certain environmental infringements, it needs to communicate these to the administrative authorities. These authorities will have in turn to inform the OM if such an infringement has taken place. Permanent communication between criminal and administrative authorities and a pro-active attitude of both is thus required. Furthermore, whereas the OM does usually not have the in-house environmental expertise necessary to bring a case before a criminal court, communication with the administrative enforcement authority becomes even more important.

The manner in which the authorities responsible for criminal and for administrative enforcement need to coordinate their respective actions within their competences has not been regulated. In practice, the coordination between the Public Prosecutor's Office and Administrative authorities is considered as needing improvement, as for instance is explained in the report of the Committee Mans from 2008 discussed above. In Zeeland, in spite of a longstanding discussion on the need for structural coordination, ad hoc coordination remains the manner in which in individual cases issues of

[330] Aanwijzing handhaving milieurecht (2010A004), available at www.om.nl.
[331] Article 52 WED.
[332] Article 404(1) Wetboek van Strafvordering (Sv).
[333] Article 404(2) Sv.
[334] Article 408(1) Sv.
[335] Article 432(1) Sv.

administrative and/or penal measures with regard to a company are dealt with. In Groningen, regular coordination meetings do take place between the Public Prosecutors Office and the administration.[336]

5. Conclusions

Proportionality

As outlined in this report, a wide range of measures is at the disposal of the competent authorities to ensure compliance with the relevant provisions that transpose the IPPC Directive in the Netherlands. In practice, however, the administrative measures usually consist of orders subject to a financial payment and criminal measures remain the exception. Complementing guiding documents and legal provisions ensure the proportionality of the administrative and criminal measures imposed in case of non-compliance, based on the nature and gravity of the infringement.

Where criminal procedures are concerned, the guidance document (Instruction on enforcement of environmental law) stresses that in principle, these will only be initiated in case of a breach of 'core provisions' of environmental legislation, except when the behaviour was according to the Public Prosecutor a) unintended and incidental and did not have major environmental consequences; and ceased immediately after adequate action of the operator (cumulative conditions) or b) if criminal law has no function in the case at hand because *de facto* the administrative measure(s) already constitute a sufficient 'punishment', in light of *ad hoc* or structural agreements between the Public Prosecutors Office and the administration. In principle, where non-core provisions were violated, no prosecution is to take place, except in cases when the Public Prosecutor finds that special circumstances prevail (for instance relating to a direct substantial threat to the environment or public health) that makes it necessary to prosecute.

Another example of integrating elements of proportionality into the criminal enforcement procedures related to the IPPC Directive is the division of the level of fines into six categories, being a maximum of: first category, Euros 380; second category, Euros 3,800; third category, Euros 7,600; fourth category Euros 19,000; fifth category, Euros 76,000; sixth category, Euros 760,000.[337] The maximum amount of these fines is subject to revision every two years and is adapted to the development of the consumer price index; the next revision is scheduled for 1 January 2012.[338]

Article 2.3 WABO requires that the permit holder acts in compliance with the conditions set out in the permit. Article 1a sub 1° WED makes it an economic offence not to do so. Article 6(1)(1) WED states that crimes, mentioned in Article 1(1) and/or 1a(1) WED, are punished with six years imprisonment, community service or a fine of the fifth category (Euros 76,000). The Dutch criminal code furthermore provides for the possibility to raise the fine by one category if the case concerns legal entities, and the actual applicable category of fines does not provide for adequate punishment.[339] The administrative enforcement procedures also provide for opportunities to adapt enforcement action to the nature and gravity of the infringement. For example, Article 5.32b(2) AWB states that the level of a fine 'shall be reasonably proportionate to the gravity of the interest violated and to the intended effect of the penalty'.

Effectiveness

While this study shows that both the order with a financial payment (*'dwangsom'*) and criminal sanctions can be effective in achieving results, the examples investigated reveal that improvements are

[336] Information provided by public prosecutor Steven Pieters in a meeting on 8 June 2011.
[337] Article 23(4) Sr.
[338] Article 23(9) Sr.
[339] Article 23(7) Sr.

still necessary. The same conclusions were also drawn in the critical report of the Committee Mans on the effectiveness of Dutch enforcement of environmental law[340] issued in 2008. That report claimed that although improvements were visible on both the State and the decentralized levels, the initiatives undertaken to improve effectiveness were still unsatisfactory. Especially the decentralization and integration of tasks and competences of administrative bodies on the one hand, and the ongoing Europeanization and internationalisation on the other hand caused problems.[341] The Dutch structure was deemed too fragmented, which subsequently resulted in inefficient enforcement of environmental law.342 The solution was sought in a restructuring of the institutional enforcement system, by creating regional enforcements services, which in the future will deal with the major part of environmental law in a certain region. The plans of the government implement the majority of the recommendations of the Report. The *'Regionale Uitvoeringsdiensten'* (RUDs) are expected to become operative in the coming years.

It is worth mentioning another Dutch study as well in this respect. Struiksma, De Ridder and Winter 2006 investigated effectiveness of environmental enforcement in the Netherlands. Protection of the environment is the ultimate (more difficult to measure) goal of enforcement of environmental provisions, but intermediate goals (easier to measure) can also be distinguished like prevention (general and specific), termination of the offence, restoration of the harmful effects, the promotion of compliance after an offence, compensation for damage done and punishment of the offender. The degree to which the environment benefits from enforcement is important but hard or impossible to answer in individual cases. Hence the research concentrated on four measurable intermediate:

- Is the offence terminated?
- Are the harmful effects of the offence restored?
- Was the offence repeated e.g. did the Prosecutors Office or the administrative authorities took further enforcement measures?
- Can the change in the behaviour of the offender be determined (compliance)?

Fifty eight cases were studied in which enforcement was conducted in three different modes: criminal prosecution (11), administrative sanctioning (12) and through a mix of both type of instruments (35). The selected cases vary in several ways (complexity, competent authorities, provisions concerned, domains of environmental protection – ranging from storage of firework and other dangerous materials, pollution to agriculture). In all selected cases the offence was – when possible – terminated. The offender behaves in accordance with the standards. In this respect environmental enforcement is effective. The other standards for effective enforcement were not fully reached. In eighteen out of eighty five (31%) cases sanctioning is not (entirely) effective. Criminal prosecution is effective in ten out of eleven cases; administrative sanctioning is effective in eight out of fourteen cases and the combination of the two enforcement instruments is effective in twenty two out of thirty three cases. This was seen as an indication that criminal enforcement succeeds in reaching a relatively high score on effectiveness. The researchers stressed that this does not mean that criminal enforcement is systematically more effective than administrative enforcement. Situations in practice always contain combinations of several features. For the choice of a certain instrument to be effective, a careful and thorough judgement of all the features is necessary. This leads to a decision-making model that reflects the assumptions that can be made in this respect. The model can be seen as a hypothesis on the effectiveness of criminal law and administrative law in the enforcement of environmental law. In two third of the cases the expected enforcement instruments were used. The most common deviations from the model are that only administrative sanctioning has taken place, while the model indicated the choice of a mix. In half of these cases the offence was repeated. The administrative authority only succeeds in a temporary change in the offender's behaviour; criminal prosecution could have prevented recurrence of the offence. However, criminal prosecution is not always effective due to low

[340] 'De Tijd is Rijp', Commissie Herziening Handhavingsstelsel VROM-regelgeving, Den Haag, July 2008, hereafter, Report.
[341] Report, p. 5.
[342] Report, p. 8.

penalties with low or zero preventive effect, and to the long interval of time between the moment the offence was committed and the conviction. In addition, the deficient implementation of enforcement by administrative authorities plays a role. Another factor is the lack of cooperation between the Public Prosecutors agency and administrative authorities (in only three out of the total of 58 cases, they coordinated their policies; in all other cases, no joint policy was developed, and sometimes information was not even shared). The researchers concluded that administrative measures seem to have a lower preventive effect than criminal law measures. Besides, criminal law would probably be more effective if higher fines were imposed.

Table 4 summarises the results of the study.[343]

Table 4: Results of the study on effectiveness of environmental enforcement

	Criminal prosecution	Administrative sanctioning	Mix of criminal prosecution / adm. sanctioning	Total
Effective	10 = 91%	8 = 57%	22 = 67%	40 = 69%
Partly effective		3 = 21%	1 = 3%	4 = 7%
Not effective	1 = 8%	3 = 21%	10 = 30%	14 = 24%
Total	**11**	**14**	**33**	**58**

The interview with the Province of Zeeland civil servant revealed that, by 2010, the Province issued about 24 formal warnings and 13 administrative orders subject to a financial payment. Ten of these orders concerned IPPC installations. In the vast majority of these cases, the orders had the desired effect and the violation was terminated by the company in question. In three cases, the financial payment was effectuated because the company did not abide by the order. The interviewed person concluded that the effectiveness of administrative interventions was quite satisfactory.

Dissuasiveness

The administrative order subject to a financial payment (Article 5.31d AWB) can be considered an effective tool to dissuade operators of installations from continuing their behaviour. According to Article 5.32a AWB, the administrative order describes the remedial action to be taken for the order to be lifted. The administrative authority shall determine the payment either as a lump sum, or as a sum payable per unit of time in which the order has not been complied with or for each violation of the order (Article 5.32b(1) AWB). The amount can (and must) be proportionate to the gravity of the interest violated and to the intended effect of the penalty (Article 5.32b (3) AWB), ensuring its dissuasiveness (and proportionality and effectiveness).

As concluded in an earlier stage, in the Netherlands criminal sanctions are generally used for punitive purposes instead of enforcing compliance. However, it is likely that criminal sanctions do have dissuasive effects on future behaviour of operators.

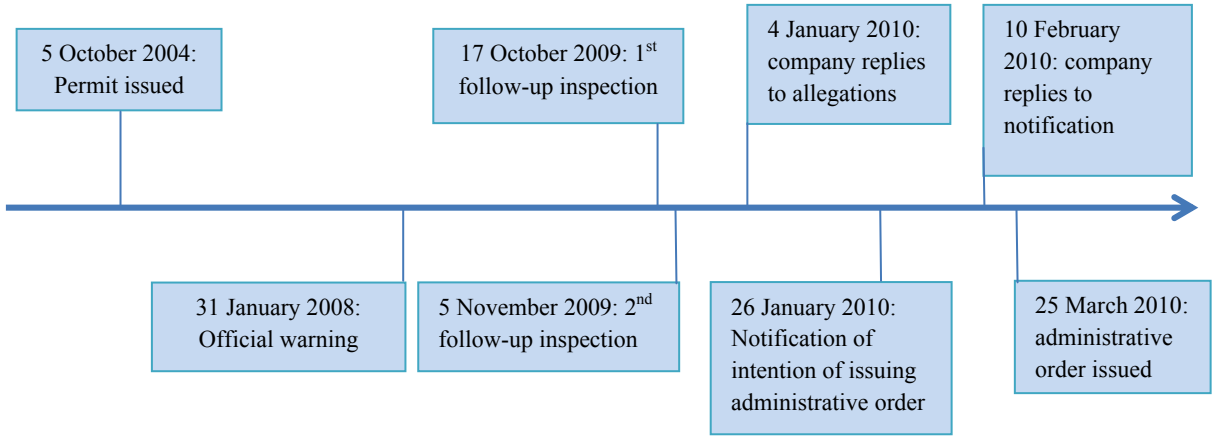
Case Studies

Case study 1: waste management company in the Province Zeeland

Interviewee and provider of documentation: G.A. Gabriëlse
Function: Coordinator cluster Industry and Measurements, Department Enforcement Nature and Environment of the Directorate Spatial Planning, Environment and Water, Province of Zeeland
Date of interview: 7 June 2011

Timeline of the procedure



Background

This case concerns an industrial waste management firm located in the Province of Zeeland, operating under a permit issued in 2004. On 31 January 2008, two inspectors of the Environmental Enforcement Department of the Province of Zeeland established an infringement of, amongst others, provision 4.7(b) of the permit in which it is specified that volatile liquid substances are not to be mixed with each other. It appeared that the firm had repeatedly mixed volatile liquid substances, although this is prohibited by the quoted permit condition.

Applicable legislation

A violation of an environmental permit issued under the Environmental Management Act constitutes a violation of Article 2.3 WABO. Article 2.3 WABO requires that the permit holder acts in compliance with the conditions set out in the permit. Various administrative measures can be taken in case of infringement (administrative order subject to financial payment, coercive order, revocation of the permit). In addition, breach of Article 2.3 WABO is qualified as an economic offence under Article 1a sub 1° WED and, as such, subject to fines or imprisonment, namely a maximum of one year imprisonment, community service or a fine of the fourth category (up to Euros 19,000) or, if it is qualified as a crime, a maximum of six years imprisonment, community service or a fine of the fifth category, which can be up to Euros 76,000.

Procedure

After the establishment of the infringements, an official warning was issued. The warning notified the firm that an administrative order subject to a financial payment might be issued if it appears that after eventual follow-up inspections the infringements has not ceased. In October 2009, the inspectors

concluded that the infringing behaviour was still ongoing. A second inspection in November 2009 resulted in a similar conclusion.

The company responded to the findings of the inspectors in a letter to the Provincial Authorities. However, the Authorities did not see any reason to refrain from taking administrative enforcement measures based on this letter. Subsequently, a notification of the intention to issue an administrative order subject to a financial payment was communicated to the company on 26 January 2010. Again, the company sent a reply, and again, no arguments in favour of refraining from enforcement action were found. To substantiate their decision, the Provincial Authorities stressed the repetitive character of the infringements. Finally, the administrative order subject to a financial payment was issued on 25 March 2010.

The amount of the financial payment was set at Euros 5,000 - per infringement with a maximum of Euros 50,000. For any case in which a violation is to be found occurring after that week, a sum of Euros 5,000 was to be paid.

Effectiveness, proportionality and dissuasiveness

It is unclear whether the company had enjoyed financial benefits resulting from the infringing behaviour or not. Therefore, this aspect could not be calculated with certainty when setting the amount of financial payment attached to the order. The term of one week was deemed a reasonable period to restore compliance with the permit (i.e. sufficient to ensure that no more violations will occur after that week).

The company complied with the order and no financial payments were made as a result. It could be concluded that, considering the fact that the company did not agree with the findings of the inspectors throughout the procedure, the prospect of a fine dissuaded the company from further infringement of the permit.

Case study 2: An example of successful criminal sanctions imposed on an IPPC installation: Corus Staal B.V.

Note: no interview could be carried out for this case, therefore it was not possible to obtain sufficient details to follow the case study format.

Corus Staal B.V. is a producer of steel located in IJmuiden. Since 2007 it is part of Tata Steel, one of the world's largest producers of steel.[344] To be able to operate its plant, the company held several environmental permits issued under the 'Wet Milieubeheer' (Environmental Management Act) and the 'Wet verontreiniging oppervlaktewateren' (Pollution of Surface Waters Act). It forms an IPPC installation. Based primarily on inspections and written police reports, the company was accused of violating its permits on several counts in the period of June 2003 to June 2005. Amongst others, Corus Staal B.V. was accused of, intentionally or not, violating provisions on: [count 1] discharging wastewater with a certain concentration of iron; [count 3] discharging sewer cleaning waste in surface waters; [count 4] discharging oil-polluted wastewater in unprotected soil; [count 6] discharging acidic water in or on the soil; [count 8] having unquenched chalk present on the floor of the permitted installation; [count 9] loading a truck with substances in such a manner that visual diffusion took place; [count 11] having large quantities of a certain raw material necessary for the production of 'raw iron' present near the permitted installation; [counts 2, 5, 7] reporting these incidents as soon as possible to the competent authority.

[344] http://www.tatasteel.nl/profiel/historie1.html.

The case was decided by the Penal chamber of the District Court Haarlem in the Netherlands on 23 April 2009 (Case 15/098026-4, LJN BI2184). The judge started with asserting that, according to then applicable Dutch procedural law, for counts of minor offences to be admissible before a court of law, prosecution should be initiated within two years after the infringement took place. In the present case, this meant that three out of the eleven counts included were inadmissible with regard to the non-intentional variant. Neither did the Court find enough evidence to prove 'intent' and thus Corus Steel B.V. was acquitted with regard to counts 1, 3 and 4.

For the other counts, however, the Court found proven that Corus Staal B.V., intentionally infringed multiple provisions of the Environmental Management Act (notable: Articles 17.2, 18.18 and former 8.1 WM) and the Pollution of Surface Waters Act (notably: Article 30a Wvo). The following considerations were especially of relevance. The Court found that Corus Staal B.V., on multiple occasions, failed to report certain unusual operations and discharges of waste, therewith preventing the water quality manager from obtaining insight in these operations and discharges. Furthermore, the company failed to report unusual circumstances twice, therewith preventing the competent authority to act upon them. Attempting to restore compliance with the permits and only then report the circumstances is no ground for moderating the penalty according to the judge. The requirement to report the incident 'as soon as possible' serves important public interests and operates independently from the company's own priorities. To conclude, Corus Staal B.V. did not ensure the prevention of diffusion of harmful substances, therewith endangering the health of people living in neighbouring properties. The Court deemed a fine of Euros 12,500 appropriate. However, considering the time elapsed between occurrence of the offences and prosecution, the Court moderated the fine to Euros 10,000.

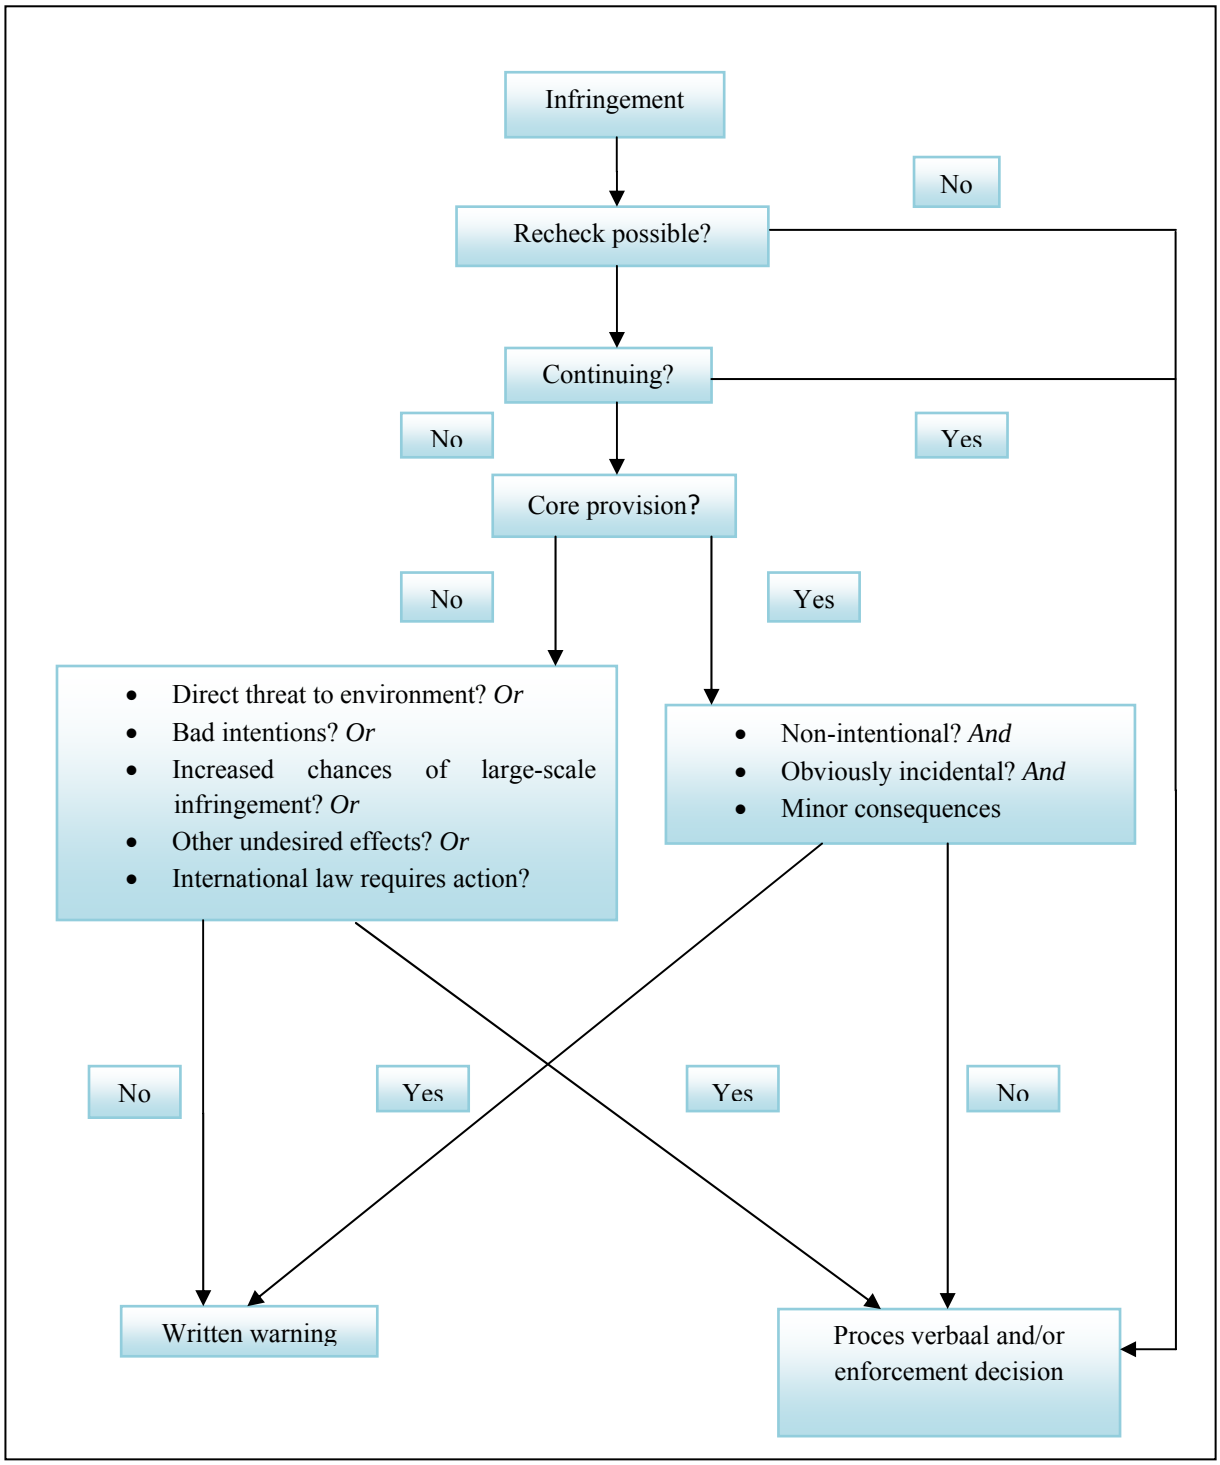
Enforcement schedule of the National Platform on Environmental Enforcement (Landelijk Overleg Milieuhandhaving)



The Thermphos case as explored by the Committee Mans: highlighting enforcement issues

Thermphos, located in the Dutch Province of Zeeland, is one of the largest phosphor producers in the world. The installation was granted two permits in 1993 (with addendum in 2002) and in 1994 for the production of phosphor.

Between 2000 and 2007, no more than ten complaints were received about odours and respiratory disorders from the neighbouring population. The number of complaints increased regularly to reach 351 in 2010. Investigations in the direct vicinity of the plant showed concentrations in the air that were above the limits. Several times, Thermphos also exceeded it cadmium emission limits.

In February 2004 the province issues a formal warning as Thermphos has exceeded its cadmium emission limits. The warning requested that the company ended the infringement by 1st July 2004 at the latest. In case of non-compliance after this deadline, administrative sanctions would be instigated. In August 2004 Thermphos indicated it was unable to reduce its emissions of heavy metals in the short term, and requested a less stringent temporary limit until the end of 2006, when it was expected a structural solution could be achieved. A plan to do so is presented in November 2004 in the form of the Cadmium Reductionproject (CaRe). In March 2005 the province issued a temporary permit allowing for more emissions of heavy metals, as a bridge towards a structural solution that was to be reached by the end of 2006. On 24 November 2006, Thermphos asked for an extension of the temporary permit until 1 November 2007 because of delays in the CaRe project, and for the permission to emit an extra 6000 kilo of zinc. The Province agreed on 20 March 2007. It can already be noted that it would take until the end of 2010 before CaRe finally brought about the required decrease in heavy metals emissions.

In December 2007, another formal warning is issued when inspection shows that the measurement and registration systems of Thermphos were not sufficiently documented. The company was given until 1 April 2008 to solve the problems, otherwise one or more orders for periodic penalty payments would be issued. The Public prosecutor's office also issued a warning, stating that if the company would not abide by the warning of the Province, it would order the police to issue a (written) report

On 11 March 2008, a revised permit was issued that complies with the IPPC directive. The permit did not contain limits for dioxins, in spite of requests on behalf of environmental NGOs to do so. One NGO protested against the permit at the Council of State, notably about the lack of investigations on dioxin emissions and about emission limits for heavy metals. The Province explained that the new processes meant a reduction in water pollution but an increase in air pollution as a result.

On 4 December 2008 the province issued an order for periodic penalty payments because Thermphos has exceeded its cadmium emission limit. The company was to pay 25,000 euro for each violation of the monthly maximum amount, with a maximum of 300,000 euro.

On 22 April 2009, the Council of State annuled the permit issued in March 2008 considering, inter alia, that the Province decided on the emission limits in an incorrect manner. As a result, the old permits (of 1993 and 2002) became valid again and the penalty payment issued for cadmium was annulled.

Meanwhile, the company temporarily halted its production due to the economic crisis, but planned to resume work in June 2009. When dioxin emissions were measured, the Province requested to resume operation only after the company had explained which measures it would take to prevent further dioxin emissions. Satisfied that the company will meet these conditions, operation restarted in mid June 2009. RIVM examinations show in October 2009 that dioxin emissions did not bring about any acute dangers for public health.

In November 2009, the company requested a (temporary) permission not meet the legal norms for a specific amount of time and a new permit that would allow for dioxin emissions of 0.4 ng/m^3. The province allowed for a maximum emission of 0.3 ng/m^3 on 6 April 2010. In January 2010, two persons living nearby Themphos had requested the province to enforce the norms for inter alia dioxins and for ammonia. The requests were declared admissible but at the same time they were denied. The Province argued that although the company was not complying with legal requirements, legalisation was imminent as the province was to issue a positive decision with regard to the company's request for a temporary permission and amendments to the permit.

On 20 April 2010, an order for periodic penalty payments was imposed on Thermphos because of its zinc emissions in 2009. The company had one year to comply with the order. But as the new permit was issued in November 2010, the order has never been enforced. Meanwhile, following an inspection, that showed inter alia a lack of supervision, a large number of incidents and gaps in the emergency plans, on 26 April 2010, the VROM-inspectie addressed to the province a letter in which it is explained that the situation was very serious, calling for strict enforcement. It added that the VROM-inspection would otherwise consider issuing a formal request for enforcement. The Province answered that it did not understand the critique as to enforcement.

On 22 June 2010, an order for periodic penalty payments was issued because of exceedance of the cadmium emission limits. Because the validity was one year and a new permit was issued before the end of this time period, again the order is not executed. On 6 July 2010, another order was issued because of safety violations. The company had until August 2010 to take necessarymeasures. For each violation, 5,000 euro was to be paid. This leads to the payment of 10,000 euro.

In mid 2010, the Public Prosecutors office decides to start criminal investigations on violations of the Environmental Management Act by Thermphos in relation to dioxins and heavy metals emissions.

On 15 July 2010, a draft permit to carry out changes was subject to public consultation. This was followed by public discussion, in particular within the media and discussions in the Provincial Executive. Consequently, the tolerance permit of 6 April 2010 for emissions of dioxins was revoked on 19 November 2010. According to the civil servant responsible for enforcement, this was a first step towards closing down the plant (Minutes of DG Provincial Executive, 19 November 2010). It was decided to carry out an independent investigation. At the end of October 2010, an investigation into the oduors emitted showe very high levels with limits for residential areas exceeded by a factor four. Measurements of dioxin emissions by an independent certified bureau revealed that the company'emissions were below the permit conditions as well as below emission limits set in the Dutch emission guideline.[345]

CaRe brought about results only four years after the initially agreed deadline. Among the reasons for the delays were complications in the implementation of new techniques reducing cadmium emissions. According to some, the company did not have a sense of urgency in the CaRe project implementation, but this did not bring about any enforcement actions from the side of the province. Instead, the province allowed for the delays and only issued a couple of formal warnings and orders for periodic penalty payments. According to the committee Mans, the way in which the matter was dealt with shows that the civil servants felt too much that they were owning the problem and that they were too close to Thermphos' interests. Mans also noted that the Provincial Executive only got involved in the matter after the television shows. When asked in February 2007 by an NGO about dioxins measurements, the province answered that no such measurements took place because it was expected that the emissions would be very low, while, measurements by Thermphos in October 2008 showed dioxins emissions. This was confirmed by measurements made by the National Institute for Public Health and the Environment, which showed that there was no acute risk for public health.

[345] Nederlandse emissierichtlijn, NeR

Nevertheless, the province put pressure on the company to reduce its dioxin emissions. In the end, however, the company was granted a considerable amount of time - namely until 2015 - to meet the dioxin emission limits.

The committee Mans concluded that the province did not adequately used its permitting, supervising and enforcement competences in the Thermphos dossier, notably because it did not deal with the matter in a coherent and consistent manner. The focus was on partial solutions to parts of the problems, rather than on an integral and adequate solution. The Committee also doubted whether the civil service of the province has enough 'in house' expertise on issues like public health, toxicology and medical environmental science, or not.

The Committee also concluded that the Province did not act in a resolute way when rather than enforcing the emission limits, it allowed twice for relaxation of the limits. The company was not encouraged to reduce the emissions of dangerous substances in the short term as a result. Another conclusion is that the civil service was steering the process to a large extend, instead of the Provincial Executive steering the civil service. Also, the Provincial Council was not alert enough.

The main recommendation by the committee Mans is that issuing permits and enforcement is to be regarded as a public task rather than a service to companies. The committee also recommended that special circumstances in an enforcement procedure should be primarily considered as a problem for the company at stake rather than as a problem of the province. It also recommended a better coordination with the public prosecutor's office in cases of serious violations.

Annex VI- United Kingdom

Sanctions and procedures applicable to breaches of the legislation on industrial emissions in the UK

Executive Summary

Until recently, 'administrative sanctions' as they exist in most EU Member States were not available in the UK for breaches of environmental legislation. The recent introduction of 'civil sanctions' in the UK has given regulators additional administrative powers to deal with environmental offences, however currently these do not extend fully to the IPPC regime. For the purposes of this analysis, 'administrative enforcement measures' and 'criminal sanctions' remain the primary enforcement measures available for breaches of IPPC legislation.

Unlike the legal systems in many EU Member States, there is no separate 'administrative code' in the UK for applying administrative sanctions in the event of non-compliance with IPPC obligations. Administrative enforcement measures and criminal sanctions relating to IPPC installations are primarily determined by one piece of legislation, the Environmental Permitting (England and Wales) Regulations 2010, as amended by the Environmental Permitting (England and Wales) (Amendment) Regulations 2010 ('the EP Regulations'), and to a lesser extent by the Environment Protection Act 1990 and the Water Resources Act 1991. This legislation provides the regulator with a range of administrative powers to carry out its enforcement functions. These functions include the power to serve notices for a breach or a likely breach of a permit condition. UK legislation also provides for criminal sanctions to be imposed for specific breaches, such as operating a regulated facility in breach of an environmental permit condition or for failing to comply with an administrative notice.

The way in which these sanctions are applied in practice is determined by reference to various regulatory guidance and criminal procedure documents. These documents provide regulators with clear guidance on the factors to be taken into account when deciding what sanctions to impose. In the UK, the Environment Agency (EA) has its own 'outcome-focused' procedure and guidance, which it uses to determine the sanctions it will apply with reference to the outcome to be achieved. This includes the use of administrative measures such as issuing advice, warnings, and notices, as well as applying the criminal procedure to prosecute where it is deemed appropriate. Where a prosecution may be deemed ineffectual, the regulatory authority may apply to the court for a court order or injunction to stop a particular activity from being carried out.

More recently, new civil sanctioning powers were introduced in the UK pursuant to the Environmental Civil Sanctions (England) Order 2010 and the Environmental Civil Sanctions (Miscellaneous Amendments) (England) Regulations 2010. This legislation was made under powers given to the Secretary of State for the Environment in the Regulatory Enforcement and Sanctions Act 2008 and provides regulators with additional enforcement options for certain breaches of environmental law. These include the power to impose Fixed Monetary Penalties (FMP's), Variable Monetary Penalties (VMP's) and Stop Notices. These civil sanctioning powers do not currently apply to breaches of the EP Regulations.

The table below indicates the Articles of the IPPC Directive covered by a sanction in the UK. The category of administrative (quasi) criminal sanctions does not exist in the UK, thus this column is left blank in the table below.

Table 1: Enforceable provisions covered by penalties in the UK

Article	Administrative measures and sanctions	Criminal sanctions	Administrative (quasi) criminal sanctions
IPPC Directive

1. Applicable sanctions

1.1. Overview of UK legislation

UK legislation is composed of three different jurisdictions: i) England and Wales, ii) Scotland and iii) Northern Ireland. Each jurisdiction has separate secondary legislation, enforcement bodies and procedures. For the purposes of this study, however, the 'UK' specifically refers only to the legislation and legislative procedures in England and Wales.

UK legislation in respect of industrial installations has undergone significant change in recent years. The first phase of changes to the 'environmental permitting' regime was introduced by the Environmental Permitting (England and Wales) Regulations 2007, which established a common permitting programme for waste and pollution permitting and control regimes, replacing 41 separate sets of regulations.[346] In 2010, The Environmental Permitting (England and Wales) Regulations 2010 ("the EP Regulations") were introduced as a second phase of environmental permitting. These Regulations revoked the 2007 Regulations and extended the common permitting system to bring all permitting regimes under a single system. The Regulations set out the obligations of operators as well as the powers and enforcement tools available to the regulators for handling instances of non-compliance.

Furthermore, prior to April 2010 the UK legal system was different from the continental legal systems of other EU Member States in that 'civil sanctions' were not available as a means of enforcing environmental legislation. However, major legislative changes in April 2010 introduced new powers for the regulators to impose civil sanctions for a range of environmental offences. Although these powers are not currently applicable to industrial installations, an understanding of these new enforcement powers along with their development and policy background will be considered here.

The majority of IPPC installations (approximately 90%) are regulated by the EA[347], the remainder are regulated by local authorities. Pursuant to Regulation 32 of the EP Regulations 2010, the EA is responsible for Part A(1) installations, Part A(1) mobile plant and certain Waste Operations. Local authorities are responsible for the regulation of Part A(2) installations and Part A(2) mobile plant[348] as well as Part B installations and Part B mobile plant. Local Authorities are not responsible for waste operations (unless it is part of a Part B activity). The full scope and classification of installations are set out in Schedule 1, Part 2 to the Regulations.

The EA guidance defines "sanction" as an enforcement requirement (such as a notice), a binding legal agreement or even a penalty applied by them or by a court.[349]

1.2. Description of administrative sanctions in the UK

Regulations 32 to 35 of the EP Regulations set out the regulator's discharge of functions in relation to a regulated facility. For example, Regulation 34 requires the regulator to periodically review environmental permits and make appropriate periodic inspections of regulated facilities. Regulation 35 applies specific provisions to those regulated facilities which require environmental permits. These provisions are specified in the Schedules to the EP Regulations, of which Schedules 7 and 8 are of specific relevance to IPPC installations. For example, paragraph 4 of Schedule 7 requires the regulator to ensure that every application for the grant of an environmental permit includes the information specified in Article 6(1) of the IPPC Directive. Paragraph 5 of Schedule 7 also requires the regulator to

[346] Environmental permitting summary: http://www.defra.gov.uk/environment/policy/permits/documents/ep2010booklet.pdf
[347] Assessment of the Implementation of the IPPC Directive in the UK, Final Report, ENTEC, January 2008 page 19
[348] The Environmental Permitting (England and Wales) Regulations 2010, Regulation 32. Also see local authorities general guidance manual: http://www.defra.gov.uk/environment/quality/pollution/ppc/localauth/pubs/guidance/manuals.htm
[349] Environment Agency, Enforcement and Sanctions – Guidance, Page 3

exercise its 'relevant functions' so as to ensure compliance with specific provisions in the IPPC Directive. A failure of the operator to comply with any of the specified provisions will trigger the statutory power of the regulator to 'exercise its relevant functions' . The 'Relevant functions' of the regulator are set out at Regulation 9 and include the power to serve:

- *Enforcement notices* (Regulation 36 of the EP Regulations) to restore or remediate harm or damage or to bring an activity or operation under regulatory control. This may be served where an operator has contravened, is contravening or is likely to contravene an environmental permit condition.
- *Suspension notices* (Regulation 37 of the EP Regulations) to stop offending or to bring an activity or operation under regulatory control. They may also include remediation steps;
- *Prohibition notices* in respect of Groundwater activities (Schedule 22, Paragraph 9 of the EP Regulations) to stop a specific activity which has a certain polluting effect on groundwater. These may be served on any person who is carrying out or proposing to carry out an activity that might lead to a direct or indirect discharge to groundwater;
- *Variation notices* (Regulation 20(1) of the EP Regulations) in order to bring a permitted activity or operation under regulatory control. This authorises the regulator to vary a permit on the application of the operator or on its own initiative, e.g. where the regulator believes that a permit condition does not address an issue as clearly or specifically as it could.[350]
- *Revocation notices* (Regulation 22(1) of the EP Regulations) in order to stop offending. This may be used where other enforcement tools have failed to protect the environment (however it is rarely used in practice)[351];
- *Notices requiring a permit* (Schedule 22, paragraph 10 of the EP Regulations). This may be used in order to stop offending for a specific groundwater activity. It allows the regulator to serve a notice on any person who is, or is intending to carry out an activity on or in the ground that might lead to the direct or indirect discharge of pollutants to groundwater, and require them to hold an environmental permit.

Table 2 below indicates the types of offences and related penalties in the UK for each of the key enforceable obligations under the IPPC Directive. It should be noted that there are no specific administrative penalties in the UK for each of the four obligations. However, please refer to sections 1.5 and 1.6 on the administrative sanctions which are available to the regulator.

[350] Environment Agency Regulatory Guidance Series No 11, Enforcement powers, point 3.16
[351] Environment Agency Regulatory Guidance Series No 11, Enforcement powers, point 3.57

Table 2: Directive 2008/1/EC (IPPC Directive): types of offences and related criminal penalties in the UK

	Criminal	
	Offences	**Penalties**
Obligation to apply for a permit for new or existing installations	Failure to operate a regulated facility with an environmental permit, or to knowingly cause or permit the contravention of s12(1) ***Regulation 38(1) Environmental Permitting (England and Wales) Regulations 2010***	A person guilty of an offence under Regulation 38(4) (failure to comply with a notice under Regulation 60(1) requiring the provision of information) is liable: • on summary conviction to a fine not exceeding £50,000 (Euros 59,772) or imprisonment for a term not exceeding 12 months, or to both; or • on conviction on indictment to a fine or imprisonment for a term not exceeding 5 years, or to both. ***Regulation 39(1) Environmental Permitting (England and Wales) Regulations 2010***
Obligation to supply information for application for permits	No specific offence for failure to supply information on the application, but the Regulation requires regulator to ensure that application includes the relevant information under the Directive. ***Schedule 7Para 4(1)*** Failure to comply with a notice under Regulation 60(1) requiring the provision of information. ***Regulation 38(4)***	• on summary conviction to a fine not exceeding £50,000 (Euros 59,772) or imprisonment for a term not exceeding 12 months, or to both; or • on conviction on indictment to a fine or imprisonment for a term not exceeding 5 years, or to both. ***Regulation 39(1)***
Obligation to notify the competent authority of any changes in the operation of an installation	No specific offence for failure of operator to notify, but Regulation requires regulator to ensure compliance with the relevant provisions of the Directive. ***Schedule 7, Paragraph 5(1)*** For example, pursuant to Regulation 34, the regulator must periodically review environmental permits and make appropriate periodic inspections. If the regulator considers that the operator has contravened a permit condition, then they may serve an Enforcement Notice. Failure to comply with the requirements of an enforcement notice constitutes an offence. ***Regulation 38(3)***	No specific penalties for failure of operator to notify, but Regulation requires regulator to ensure compliance with the relevant provisions of the Directive. ***Schedule 7, Paragraph 5(1)*** A person guilty of an offence under Regulation 38(3) (failure to comply with the requirements of a notice specified in that Regulation, such as an Enforcement Notice) is liable: • on summary conviction to a fine not exceeding £50,000 (Euros 59,772) or imprisonment for a term not exceeding 12 months, or to both; or • on conviction on indictment to a fine or imprisonment for a term not exceeding 5 years, or to both. ***Regulation 39(1)***
Obligation to comply with the conditions set in the permit or mandatory ELV's	Failure to comply with/contravene an environmental permit condition ***Regulation 38(2)***	• on summary conviction to a fine not exceeding £50,000 (Euros 59,772) or imprisonment for a term not exceeding 12 months, or to both; or • on conviction on indictment to a fine or imprisonment for a term not exceeding 5 years, or to both.

		Regulation 39(1)

*ELVs: Emission Limit Value

1.3. Additional (miscellaneous) administrative powers include:

- *Remediation notices* (Regulation 57 of the EP Regulations) in order to prevent or remedy pollution. This gives the regulator the power to arrange for steps to be taken to remove a risk of pollution where the operation of a regulated facility under a permit involves a serious risk. It also gives the regulator the power to remedy the effects of pollution if the commission of certain offences (e.g. operating without a permit) cause pollution, or it suspects that an offence is being or has been committed and pollution is being or has been caused as a result. If the Regulator arranges for steps to be taken, it may recover the cost of taking those steps from the operator;

- *The power to obtain enforcement by the High Court* (Regulation 42) This may be in the form of:
    - a court order to either stop an activity or to carry out a particular activity. If the regulator considers that proceedings for a breach of notice (constituting a criminal offence) would afford an ineffectual remedy, it may take proceedings in the High Court in order to secure compliance with the notice; or
    - an injunction to restrain any criminal act, particularly where a fast response is required;[352]

- *Stop notice* (Section 46 of the Regulatory Sanctions and Enforcement Act 2008 (RESA)). This provides regulators with new civil sanctions, where they reasonably believe that an offence under section 33(1) of the Environmental Protection Act 1990 has been or is likely to be committed (by any natural or legal person) for the unauthorised or harmful deposit, treatment or disposal etc of waste, and where they reasonably believe that the activity is causing, or poses a significant risk of causing, serious harm to human health or the environment. A stop notice prohibits a person from carrying out of an activity until the steps specified in the notice have been taken. It should be noted that while Stop notices are not currently available as a means of enforcement for breaches of the EP Regulation, the 'suspension notice' power (identified in section 1.4 above) essentially amounts to the same thing.

- *Information notice* (Regulation 60 of the EP Regulations, Section 71 of the Environmental Protection Act 1990 in relation to waste, and Section 202 of the Water Resources Act 1991), requiring any person to provide such information within such period as specified in the notice.

- *Anti-Pollution Works notice* (Section 161A Water Resources Act 1991) – to prevent or remedy pollution of controlled waters. It requires the person on whom it is served to carry out specified works or operations, where it appears that any poisonous, noxious or polluting matter or waste is present in any waters or any controlled waters are being/have been/likely to be harmed.

- *Statutory Nuisance* (Part III Environmental Protection Act 1990, (EPA)). Where a local authority is satisfied of the existence or of the likely occurrence or recurrence of a statutory nuisance, it must generally serve an abatement notice in accordance with section 80(2) of the EPA. An abatement notice may be served on the person responsible for the nuisance, on the owner of the premises (where the nuisance arises from any structural defect), or on the owner or occupier of the premises (where the person responsible cannot be found or the nuisance has not yet occurred). The notice may require the abatement of the nuisance or prohibit or restrict its occurrence or recurrence, or require the execution of works and the taking of other steps as may be necessary (section 80(1)). The EPA lists those activities which are deemed to be statutory nuisances, the basic requirement being that the activity must be considered either a

[352] Environment Agency Regulatory Guidance Series No 11, Enforcement powers, point 4.2.

nuisance or prejudicial to human health.[353] Statutory nuisances may include: smoke emitted from premises, any dust, steam, smell or other effluvia, any accumulation or deposit or noise emitted from premises.

Most notices under the EP Regulations may only be served on the 'operator' of the regulated facility. Pursuant to regulation 7 of the EP Regulations, the 'operator' is the person who has control over the regulated facility. However, prohibition notices, stop notices, information notices, anti-pollution works notices, notices requiring a permit and abatement notices may be served on any relevant 'person' (natural or legal).

Table 3: Number of EA prosecutions, formal cautions and enforcement notices issued 2008 – 2010

Year	Number of prosecutions commenced	Number of prosecutions successful	Formal cautions issued	Enforcement Notices issued
2008	5	5	3	29
2009	6	5	6	10
2010	3	3	5	5

2. Administrative procedure

2.1 General elements on the legal tradition and potential evolution

2.1.1 Regulatory guidance

Although UK legislation lays down the administrative powers of the regulators, the way in which these powers are applied in practice is determined by reference to various guidance documents. These include documents by the Department of the Environment and Rural Affairs (DEFRA),[354] as well as the Regulators' Compliance Code[355], and the Cabinet Office Enforcement Concordat[356] which '*contain important safeguards to ensure that any enforcement action taken is proportionate to the risks posed to the environment and to the seriousness of any breach of the law.*'"[357] These documents include guidance on risk assessment, compliance, enforcement and inspections of regulated facilities.

2.1.2 Aims of administrative sanctions/measures

The Regulators' Compliance Code (RCC) which is incorporated into the Environment Agency's

[353] Environmental Protection Act 1990, Section 79.
[354] DEFRA: Core Environmental Permitting guidance (v 3.1) - updated March 2010. Contains guidance for those operating, regulating or interested in facilities that are covered by the Environmental Permitting (England and Wales) Regulations 2010 SI 2010 No.675 (as amended) ('the Regulations'). http://www.defra.gov.uk/environment/policy/permits/documents/ep2010guidance.pdf. Also see local authorities general guidance manual: http://www.defra.gov.uk/environment/quality/pollution/ppc/localauth/pubs/guidance/manuals.htm

This document incorporates the Hampton principles of effective inspection and enforcement, available at http://www.berr.gov.uk/files/file22988.pdf
[356] Enforcement Concordat, 1998 //www.berr.gov.uk/bre/inspection-enforcement/implementing-principles/regulatory-compliance-code/enforcement/page46822.html
[357] DEFRA: Core Environmental Permitting guidance (v 3.1) - updated March 2010, page 56

enforcement policy[358] provides guidance to regulators on appropriate compliance and enforcement actions. Regulation 8.3 of the RCC states that when devising and implementing regulatory policies, regulators are required to ensure that their sanctions and penalties policies are consistent with the Macrory Penalty Principles (see *section 2.1.3* below).[359] This means that their sanctions and penalty policies should:

i) Aim to change the behaviour of the offender;
ii) Aim to eliminate any financial gain or benefit from non-compliance;
iii) Be responsive and consider what is appropriate for the particular offender and regulatory issue, which can include punishment and the public stigma that should be associated with a criminal conviction;
iv) Be proportionate to the nature of the offence and the harm caused;
v) Aim to restore the harm caused by regulatory non-compliance, where appropriate;
vi) Aim to deter future non-compliance.

2.1.3 Environment Agency approach to regulation

As well as following the Macrory Penalty Principles, the Environment Agency sets out 5 principles underlying their commitment to 'firm but fair regulation':

- proportionality in the application of law and in securing compliance;
- consistency of approach;
- transparency about how the Environment Agency operates and what those they regulate may expect from them;
- targeting of enforcement action; and
- accountability for the enforcement action the they have taken;[360]

The Environment Agency has its own enforcement and sanctions guidance to help decide the appropriate course of action which it will take in cases of non-compliance with the law.[361] This includes an 'Offence Response Options' document which EA staff use when considering what responses are available to achieve its outcomes.[362] The term 'enforcement' includes any action where it suspects an offence has occurred or is about to occur. The EA explains its approach in applying the legislation as follows:

'*We will use the full range of enforcement and sanctioning tools that are available to us, in combination if necessary, to achieve the best outcomes for the environment and for people. This may range, for example, from providing advice and guidance through to prosecution. Within this overall approach, where an offence has been committed we will consider issuing some form of sanction as well as any other preventative or remedial action taken to protect the environment and people*'.[363]

The primary purpose of the EA's approach to compliance monitoring and enforcement is to ensure that an unacceptable risk of harm or pollution does not occur or will not be repeated and that legitimate business is not undermined.[364] Its approach to enforcement is described as 'outcome-

[358] Environment Agency Regulatory Guidance Series No 11, Enforcement powers, point 1.6

[363] Environment Agency, Enforcement and Sanctions Guidance, Page 3
[364] Environment Agency Regulatory Guidance Series No 11, Enforcement powers, point 1.16.

focused' " i.e. it considers the environmental outcomes to be achieved when deciding which enforcement and sanctioning tools to use.[365]

i) Advice and Guidance: As an initial enforcement measure, the EA will normally provide advice and guidance after the commission of an offence or where an offence is likely to be committed, unless this would have the effect of undermining any enforcement action.[366] The primary aim of providing such advice and guidance is to assist the operator in complying with its legal obligations. In cases of minor infringement, this may merely involve pointing out the issue to the operator. However, unless the offence is very minor and the operator can demonstrate its compliance as soon as reasonably practicable the EA is likely to take additional enforcement measures. Moreover, its guidance states that any advice or guidance is provided without prejudice to any of the EA's other enforcement responses in the event of non-compliance.[367]

ii) Warnings: A warning or site letter may also be deemed appropriate in response to a minor breach of a condition or where an offence is suspected to have taken place. A warning may be issued with the aim of achieving any of the four types of environmental outcomes described below (see section *iii* '*other measures'* below).[368] A Compliance Assessment Report (CAR1) form may also be used to record details of the breach, and an action plan with timescales may be agreed and recorded on the form.[369]

iii) Other measures: Where issuing advice and guidance or a warning do not achieve the objective, or in more serious cases, it may be considered more proportionate to consider other measures such as an enforcement notice or criminal sanctions. In more serious cases, a suspension notice or even a revocation notice may be more appropriate.[370] As part of the EA's 'outcome-focused' approach to enforcement, these other measures (and corresponding tools) are divided into four categories:[371]

Outcome/Aim	Prescribed action
1. To stop offending (with the aim of stopping an illegal activity from continuing/occurring):	• Suspension notice (Regulation 37) • Prohibition notice (Schedule 22, paragraph 9) • Notice requiring a permit (Schedule 22, paragraph 10) • Revocation notice (Regulation 22) • Anti-Pollution Works notice (section 161A of the Water Resources Act 1991) • Court Order (Regulation 42) • Injunction (Regulation 42)
2. To restore and/or remediate (with the aim of putting right environmental harm or damage that has already occurred):	• Enforcement notice (Regulation 36) • Remediation notice (Regulation 57)
3. To bring under regulatory control (with the aim of bringing an illegal activity into compliance with the law):	• Variation notice (Regulation 20) • Enforcement notice (Regulation 36) • Suspension notice (Regulation 37) • Remediation notice (Regulation 57)

[365] For the purposes of the Environment Agency's own guidance, a sanction is defined as an 'enforcement requirement (such as a notice), a binding legal agreement or even a penalty applied by us or by a court'.
[366] Environment Agency Regulatory Guidance Series No 11, Enforcement powers, point 2.3.

[370] Environment Agency, Regulatory Guidance Series number 11, point 1.18
[371] Environment Agency, Enforcement and Sanctions Guidance, Page 4. The prescribed actions specified here are those which are relevant to IPPC obligations

4. To deter and/or punish (with the aim of punishing an offender and/or deterring future offending):	• Offences (see section below on criminal sanctions) • Injunction (see above under Outcome/Aim 1) • Stop notice (Section 46 of the Regulatory Sanctions and Enforcement Act 2008)

iv) Public interest factors: The EA will also take a number of 'Public interest factors' into consideration when deciding on the type and severity of sanction. These include:

- Intent of the operator: Offences committed deliberately, recklessly or with gross negligence are more likely to result in prosecution.

- Foreseeability: Where the circumstances leading to the offence could reasonably have been foreseen and no avoiding/preventative measures were taken, the response will normally go beyond advice/guidance or a warning.

- Environmental effect: The response will address the potential and actual harm to people and environment. Normally, where an offence is classified as category 1 or 2 under the Common Incident Classification Scheme (CICS) or Compliance Classification Scheme (CCS) (*see section 2.2.5 iii) below*), the EA will consider a prosecution, caution or Variable Monetary Penalty (VMP, a civil sanction).

- Nature and seriousness of the offence: e.g. providing false or misleading information or outright criminal activity will normally lead to a prosecution.

- Financial implications: e.g. where profits are made or costs are avoided, this will normally lead to a VMP or prosecution.

- Deterrent effect: on the offender and others will be taken into account when choosing a sanction.

- Previous history and repeat offending: The degree of offending and/or non-compliance will be taken into account

- Attitude of the offender: A poor attitude towards the offence or uncooperativeness with investigation or remediation will normally lead to a prosecution or VMP.[372]

The EA's general approach to enforcement is set out in its Enforcement and Sanctions Guidance, which includes a 'Sanctions decision tree' to help its staff decide the best course of action to take (Annex I).

2.1.4 Development of a new approach to civil sanctions[373]

In 2005, a report by Sir Philip Hampton set out principles for better regulation.[374] These are now incorporated in the Regulator's Compliance Code (as mentioned in *Section 2.1.2* above) to which Regulators must have regard. The report concluded that sanctions were not a deterrent to serious non-compliance and proposed a review of penalty regimes (which was subsequently carried out by Professor Richard Macrory in 2006). The resultant report, 'Regulatory Justice: Making Sanctions Effective' concluded that the existing system was too heavily reliant on criminal prosecutions which

[372] Environment Agency's Enforcement and Sanctions Guidance, page 12
[373] Civil sanctions are expected to extend to the Environmental Permitting (England and Wales) 2010 from April 2011.
[374] Philip Hampton, 'Reducing administrative burdens: effective inspection and enforcement'. This document sets out the Hampton principles of effective inspection and enforcement

were not always a proportionate response to the seriousness of the offence. The report recommended a broad 'toolkit' of civil sanctions for regulators to promote and enforce regulatory compliance. Among its recommendations included the extension of flexible administrative monetary sanctions and the strengthening of statutory notices to work alongside the criminal law in combating non-compliance. It was believed that such regulatory sanctions would provide a more flexible and proportionate approach to non-compliance and help to resolve many cases more quickly and effectively. In response, the Regulatory Enforcement and Sanctions Act (RES) 2008 was introduced to create enabling powers for a range of civil sanctions. These civil sanctions include:

- Compliance notice: A requirement to take specified steps within a stated period to secure that an offence does not continue or happen again.

- Restoration notice: A requirement to take specified steps within a stated period to secure that the position is, so far as possible, restored to what it would have been if no offence had been committed.

- Enforcement undertaking: enabling a person, whom a regulator reasonably suspects of having committed an offence, to give an undertaking to a regulator to take one or more corrective actions set out in the undertaking.

- Fixed monetary penalty (FMP): A requirement to pay a monetary penalty of a fixed amount.

- Variable monetary penalty (VMP): A requirement to pay a monetary penalty of an amount determined by the regulator reflecting the circumstances of the offence.

- Third party undertaking: enabling a person who has received a regulator's notice of intent to impose a VMP, for example, to give a commitment to take action to benefit a third party affected by the non-compliance.

- Stop notice: A requirement for a person to stop carrying on an activity described in the notice until it has taken steps to come back into compliance.

On 6th April 2010 the Environment Agency received new formal powers pursuant to the Environmental Civil Sanctions (England) Order 2010 and The Environmental Sanctions (Miscellaneous Amendments) (England) Regulations 2010. These new powers allow regulators to impose the above civil sanctions for a range of environmental offences.[375] Currently these new civil powers are not directly applicable to the Environmental Permitting (England and Wales) Regulations 2010. However, they may be applied where the regulator has reasonable grounds to believe an offence under section 33(1) of the Environmental Protection Act has been or is likely to be committed (for the unauthorised or harmful deposit, treatment or disposal etc of waste). For example, a Stop Notice pursuant to Section 46 of the Regulatory Enforcement and Sanctions Act (RES) 2008 may be served to prohibit a person from carrying out of an activity until steps specified in the notice have been taken. The aim of these civil sanctions is to provide flexibility as well as a more proportionate and effective response to non-compliance.[376]

2.3 Inspections

2.2.1 General information

[375] Currently the instruments only apply to England. The Welsh Assembly Government is considering introducing similar instruments which would enable the Environment Agency to use civil sanctions in Wales.
[376] See DEFRA document: Civil sanctions for environmental offences, Guidance to regulators in England on how the civil sanctions should be applied, and draft guidance for Wales, January 2010

According to the Environment Agency, a total of 2481 facilities[377] fall within the scope of the Environmental Permitting (England and Wales) Regulations 2010, for which are currently 246 dedicated Pollution Prevention and Control (PPC) officers and approximately 3000 warranted officers who play a role in inspection and/or enforcement activities relating to IPPC installations. In 2010, the Environment Agency conducted between 6000-6500 inspections, and spent a total of 223,460 hours on inspection and enforcement of IPPC facilities. During the same period, a total of £28,9 million was generated from these facilities by way of the Environment Agency's 'Subsistence charge' (*see Section 2.2.2 b ii) below*).

2.2.2 Key Elements of the inspection procedure

The inspection powers of UK regulators are determined by legislation and policy guidance. Regulation 34(1) of The Environmental Permitting (England and Wales) Regulations 2010 requires the regulator to periodically review permits, while regulation 34(2) states that the regulators must undertake periodic inspections of regulated facilities. However the EP Regulations do not provide specific requirements on how or when inspections or a review of permits should take place.

In certain cases, the regulator may be able to exercise specific inspection powers where it is deemed reasonable to do so. Section 108 of the Environmental Protection Act 1995 (EPA) provides powers of entry to an enforcing authority (which includes the Environment Agency and local authority) to investigate, where there are reasonable grounds to believe it is necessary, for any one the following three purposes:

1. To determine whether pollution control law is being complied with;
2. To exercise or perform one or more of the pollution control functions of that authority;
3. To determine whether and if so, how such a function should be exercised or performed;

Pursuant to section 108(1) of the EPA, an inspecting person must be authorised in writing and must act in accordance with that authorisation. Section 108(4)(a) states that entry must be at a reasonable time, or at any time in the event of an emergency. Section 108(4)(c) states that the authorised person is permitted to carry out such examination and investigation as may be necessary. This may include the taking of measurements, photographs and making such recordings as considered necessary for the purposes of such examination or investigation, pursuant to s108(4)(e). The authorised person may also, on giving at least seven days' notice, carry out experimental borings and install, keep or maintain monitoring and other apparatus. Such notice is not required in an emergency (Section 108(5) and (6)).[378]

a) Policy Guidance

The ways in which regulators exercise their inspection powers are also derived from policy guidance. The Hampton Report lays down the basic principles relating to inspection and enforcement to which regulators must have regard. The first principle states that '*Regulators should use comprehensive risk assessment to concentrate resources on the areas that need them most* '. It also states that '*No inspection should take place without a reason*' .[379]

Regulation 6 of the Regulatory Compliance Code states that ' *Regulators should ensure that inspections and other visits, such as compliance or advice visits, to regulated entities only occur in accordance with a risk assessment methodology…except where visits are requested by regulated entities, or where a regulator acts on relevant intelligence.*'[380]

[377] Excluding farms and "Low Impact Installations" (LII's)
[378] The Environment Protection Act 1995, section 108
[379] Philip Hampton, Reducing administrative burdens: effective inspection and enforcement', page 7
[380] The Regulators' Compliance Code p 14

In addition, DEFRA, in its Core Environmental Permitting Guidance, states that risk-based compliance assessment should:

- Target facilities that: pose the greatest risk to the environment or human health; have poorer standards of operation; fail to comply with terms and conditions of the permit; or have a greater adverse impact;
- Reduce the regulatory burden on operators whose standard of operations are consistently high; and
- Take into account the different stages in the lifetime of a facility;

DEFRA also states that checking compliance with the terms and conditions of the permit is the principle way of assessing the operator's performance in relation to its responsibility for ensuring that the regulated facility does not cause pollution.[381] The inspection process can include reviewing information from the operator as well as carrying out independent monitoring, site inspections, in-depth audits and other compliance-related work. DEFRA also makes it clear that the regulator's policies and procedures for the environmental permitting regime should have regard to the Recommendation of the European Parliament and of the Council (2001/331/EC).[382]

b) Environment Agency Approach

The EA's approach to inspections reflects their risk-based methodology for compliance assessment. Operators are primarily responsible for providing information for permit applications and for self-monitoring of their activities. This is supported by the EA's sector-specific and technical and regulatory guidance, which sets out its approaches for identifying and assessing the risks associated with particular activities.[383]

The EA also uses its Pollution Inventory to provide an annual record of pollution in England and Wales from selected activities. Pursuant to section 60(1) of the EP Regulations, operators are required to complete a pollution inventory reporting form, providing the EA with data on annual emissions. Some of this data is available on the EA's website on its 'What's in your backyard' service.[384] In addition, the EA uses a number of tools to monitor compliance and to assess the risk from facilities. The Operator Monitoring Assessment (OMA) enables the Environment Agency to assess the quality and reliability of self-monitoring, while inspections are based on Operational Risk Appraisal (OPRA), The Common Incident Classification Scheme ('CICS'), Compliance Classification Scheme (CCS), and Compliance Assessment Plans (CAPs).[385] The information gathered from these tools is used to identify those facilities which pose the greatest risk and can be used as a basis for inspections.

i) Operator Monitoring Assessment (OMA)

An OMA is carried out by an EA Officer who interviews relevant site personnel, views appropriate documentation and inspects the monitoring location. The EA records relevant information that reflects the quality and reliability of operators' self-monitoring and associated issues. The results are used to assess operator's self-monitoring and to provide an indication of required improvements. They are also used to help prioritise and target the EA's independent monitoring/auditing of point source emissions.[386] The OMA applies the Monitoring Certification Scheme (MCERTS), which provides the

[385] National Audit Office, Effective Inspection and enforcement: Implementing the Hampton vision in the Environment Agency, page 29 Available at http://www.nao.org.uk/publications/0708/hampton_environment_agency.aspx
[386] Environment Agency, Guidance on undertaking an Operator Monitoring Assessment of emissions to air and /or water, Version 3, 2009 http://publications.environment-agency.gov.uk/pdf/GEHO0409BPZD-e-e.pdf. A list of monitoring guidance documents used by the Environment Agency can be found at http://www.environment-agency.gov.uk/static/documents/Business/mon_guide_summary.pdf

framework for the Environment Agency's quality requirements by monitoring activities that affect the environment.[387]

ii) Operational Risk Appraisal

Operational Risk Appraisal (Opra) is a screening tool used to assess the risk to the environment from sites that are regulated with environmental permits. Opra uses five elements to assess the level of risk of the activities carried out at the site, each of which is graded from A (low risk) to E (high risk):

- **Complexity** (e.g. activities carried out, potential for accidents; size; public confidence);
- **Location** (e.g. proximity to habitation; proximity to sensitive sites; potential for direct releases to water; flooding; air quality management zones);
- **Emissions** (e.g. type and quantity; media; impact);
- **Operator performance** (e.g. presence/ absence of management systems; enforcement history);
- **Compliance rating** (e.g. compliance with permit conditions; potential impact of non-compliance; additional effort to manage; non-compliance).[388]

Each activity carried out at the installation is converted to an Opra-band rating of A-E, or A-F for compliance rating, depending on the complexity of the operation and the level of 'regulatory effort' required.[389] The information is used to inform the EA's decisions on resource allocation, thereby allowing it to target facilities which pose the greatest risk. The bands are also used to calculate the operator's annual subsistence charge payable to the EA.[390] The subsistence charge is an annual fee charged by the EA used to recover the costs incurred through ongoing regulation.

iii) Compliance Classification Scheme

The Compliance Classification Scheme (CCS) is a compliance tool used to classify offences for non-compliance with permit conditions. The scheme categorises non-compliance based on the potential of the facility to cause environmental damage. The different categories of non-compliance are:

- Category 1 – likely to lead to a major pollution
- Category 2 – likely to lead to significant pollution
- Category 3 - likely to lead to some (minor) pollution
- Category 4 – no or negligible impact

For example, a CCS category 1 would indicate non-compliance with a condition that, if classified as an incident, would have the potential to have a major environmental impact. Similarly, a CCS category 2 would indicate non-compliance with a condition that, if classified as an incident, would have the potential to have a significant environmental impact. As specified in section *2.1.3 iv) public interest factors* (above), Category 1 or 2 incidents are more likely to result in a prosecution, formal caution, or Variable Monetary Penalty.[391] [392]

iv) Compliance Assessment Plans (CAPs)

CAPs are used for planning compliance assessment work. They set out specific objectives along with the Environment Agency resources assigned to each of the compliance activities (including

[387] For further information on the Environment Agency's approach to monitoring emissions, see http://www.environment-agency.gov.uk/business/regulation/31829.aspx

[388] Environment Agency, Environmental Permitting Regulations Operational Risk Appraisal Scheme (Opra for EPR); Opra for EPR version 3.5 Annex A, Opra scheme for installations, April 2010 http://www.environment-agency.gov.uk/pdf/GEHO0410BSFB-e-e.pdf

[389] See: Opra for EPR version 3.5 Annex A, Opra scheme for installations, page 3

[390] Effective Inspection and enforcement: Implementing the Hampton vision in the Environment Agency, page 16

[391] Currently the only offence to which Civil Sanctions may applicable to IPPC installations is a stop notice issued pursuant to Section 46 of the Regulatory Sanctions and Enforcement Act 2008

[392] Environment Agency, Enforcement and Sanctions Guidance, page 12

inspections and audits). Sector CAPs contain objectives relevant for a particular industry sector and set out the proportion of effort that should be directed to each of the five generic compliance activities.[393]

c) Local Authority Approach

It is not possible here to provide details of the inspection approach adopted by each local authority. However, DEFRA has published general guidance in respect of Local Authority Integrated Pollution Prevention and Control (LA-IPPC) for (A2) installations and Local authority Pollution Prevention and Control (LAPPC) for Part B processes. This includes guidance on when and how permit conditions should be reviewed, as well as the requirements for inspection, monitoring and reporting.[394] As with the Environment Agency, there are risk-based inspection methodologies which should be applied by local authorities.[395] These include assessing each installation against specified criteria, which falls into two categories: i) Environmental impact appraisal and ii) Operator performance appraisal.[396] Both categories are evaluated by scoring the process against a number of different components, which are listed in the relevant methodology. The four main steps involved in the methods are:

STEP 1: desk-based scoring of processes
STEP 2: use of score sheets during inspection visits
STEP 3: use of scoring to determine regulatory effort and charges
STEP 4: review scores on a regular basis

The guidance states that scores for each process should be reviewed on a regular basis, and at least annually. In particular, it advises that scores should be reviewed following visits, any changes to the permit, receipt of complaints, or when enforcement action is taken. Under each method, installations are rated as 'high' 'medium' or 'low' risk. The required minimum required levels of inspection are attributed according to the risk, reflecting the regulatory effort involved. ' Regulatory effort' refers to the full range of activities needed to regulate the process: not just inspection, but time spent at the office preparing for inspections, writing reports and reviewing data supplied by operators.

2.2.3 The inspectors' powers

The main powers of inspectors are primarily determined by two pieces of legislation, the Environment Act 1995 and The Environmental Damage (Prevention and Remediation) Regulations 2009. Sections 108 and Regulation 31 respectively provide the following powers:

An authorised officer, for the purpose of:

- Determining whether and how any power of duty conferred on the Environment Agency should be exercised of performed; or
- Exercising any such power or duty; or
- Ascertaining whether any pollution control provision is being or has been complied with,

May carry out the following:

- enter premises with other officers and equipment if need be by force;
- Make necessary examinations and investigations, and direct that premises or property remain undisturbed for that purpose;
- Take measurements, photographs, recordings and samples;

[393] National Audit Office, Effective Inspection and enforcement: Implementing the Hampton vision in the Environment Agency, page 29
[394] DEFRA General Guidance Manual on Policy and Procedures for A2 and B Installations http://www.defra.gov.uk/environment/quality/pollution/ppc/localauth/pubs/guidance/manuals.htm
[395] The methods can be found at http://www.defra.gov.uk/environment/quality/pollution/ppc/localauth/fees-risk/index.htm
[396] Operator performance appraisal applies to all sectors. It should be noted however that several sectors have additional sector-specific risk tests which apply.

- Require the giving or production of information relevant to any examination or investigation;
- Require another to give such facilities or assistance as are within that persons control or responsibility.
- Test, dismantle or detain items likely to cause pollution or harm to health.

Section 109 Environment Act 1995 permits an authorised officer acting under Section 108 to seize and render harmless items causing imminent danger of serious pollution or serious harm to health.

Section 110 Environment Act 1995 states that any person obstructing an authorised officer in the exercise or performance of his powers or duties or who fails to comply with any requirements of section 108 of the Environment Act 1995 or fails to provide facilities or assistance or information or prevents any other person appearing before an authorised officer or answering a question to which an authorised person has required an answer, commits an offence.[397]

The Regulators' enforcement powers upon inspection are set out above in *Section 1.5* above. Under Part III of the EPA 1990 the local authority also has a duty to inspect its area from time to time to detect any statutory nuisances and to take such steps as are reasonably practicable to investigate any complaint of a statutory nuisance made by a person living within its area[398] (see also *Section 1.6* above). Where the local authority is satisfied of the existence or of the likely occurrence or recurrence of a statutory nuisance it must generally serve an abatement notice in accordance with section 80(2) of the EPA 1990. A failure to comply with an abatement notice is a criminal offence (Section 80(4)) and may result in court proceedings. However, Section 79(10) EPA 1990 specifies the particular circumstances in which the Secretary of State or Welsh Ministers' consent is required before a local authority can initiate summary proceedings. These include:

- smoke emitted from premises so as to be prejudicial to health or a nuisance (Section79(1)(b));
- any dust, steam, smell or other effluvia arising on industrial, trade or business premises and being prejudicial to health or a nuisance (Section79(1)(d));
- any accumulation or deposit which is prejudicial to health or a nuisance (Section 79(1)(e));
- artificial light emitted from premises so as to be prejudicial to health or a nuisance (Section79(1)(fb)); or
- noise emitted from premises so as to be prejudicial to health or a nuisance (Section79(1)(g));

The reason for the consent requirement under section 79(10) is to avoid 'double jeopardy' double jeopardy for operators, where they may already be subject to criminal proceedings under the EP Regulations. Court proceedings relating to activities not covered by the EP Regulations may be taken under the statutory nuisance provisions without such consent.[399]

2.3 Appeal against the administrative decision

2.3.1 By the operator

Under regulation 31 of the EP Regulations, a person whose application is refused or who is aggrieved by a decision to impose an environmental permit condition or on whom an enforcement notice, revocation notice, suspension notice, prohibition notice is served, can appeal. In most cases, this will be the operator, i.e. the person (natural or legal) who has control over the regulated facility (Regulation 7). However, in the case of a prohibition notice, will be the person (natural or legal) on whom the notice is served. Pursuant to Schedule 6 of the EP Regulations, the time limit for making an appeal for a refusal is not later than six months from the date of refusal or deemed refusal to grant a permit. In respect of an enforcement notice, a regulator-initiated variation or a suspension notice, the appeal

[397] Environment Agency Form LPR08, Notice of Powers and Rights
[398] Environmental Protection Act 1990 (c.43) section 79(1)
[399] DEFRA: Core Environmental Permitting guidance (v 3.1) - updated March 2010. Contains guidance for those operating, regulating or interested in facilities that are covered by the Environmental Permitting (England and Wales) Regulations 2010

dead-line is no later than 2 months after the date of the variation or notice. In relation to a prohibition notice, the time limit is no later than 21 days after the date of the notice. For appeals against a revocation notice, the time limit is any time before the revocation notice takes effect.[400]

Under regulation 31(9) and (10) of the EP Regulations, an appeal does not have the effect of suspending a decision or notice, except in the case of a revocation (in which case the notice does not take effect until the final determination or the withdrawal of the appeal). If an appeal is made the operator is required to state the grounds, i.e. they must justify why they served the notice.[401]

Appeals are normally made to the Planning Inspectorate. However, an appeal against the service of a stop notice under the Regulatory Enforcement and Sanctions Act 2008 (for a breach of 33(1) of the Environmental Protection Act 1990), or refusal to issue a Completion Certificate under such a notice are made to the First-tier Tribunal, which hears appeals in respect of civil sanctions.[402] As already noted, this is currently the only potential sanction applicable to IPPC installations. Stop notices (as well as any of the other civil sanctions under RESA 2008) are not currently available for breaches of the EP Regulations 2010.

2.3.2 By a person other than the operator

As specified in *Section 2.3.1* above the right of appeal is limited to persons directly affected by decisions or notices (as set out in), third parties (including individuals and NGO's) may challenge the decision of a regulator by way of judicial review. Judicial review is the procedure by which a party can seek to challenge the decision, action or failure to act of a public body such as a government department or a local authority or other body exercising a public law function.[403] The time limit for judicial review is not later than three months after the grounds upon which the claim is based first arose.[404] An example of a judicial review claim would be on the alleged procedural unfairness by the regulatory authority leading to the grant of a permit.[405] Judicial review proceedings are not normally allowed where the claimant has a statutory right of appeal (as in the case of a variation, enforcement, suspension and revocation notices under the Environmental Permitting (England and Wales) Regulations 2010). In such cases the claimant would have to show that the regulator had acted beyond its powers or in a way that no properly informed regulator would have acted.[406]

3. Judicial procedure (if relevant-with a focus on criminal sanctions)

3.3 General information

Criminal offences relevant to the IPPC Directive are set out in regulation 38 of the EP Regulations and section 33 of the Environmental Protection Act 1990. As with administrative sanctions, the way in which these provisions are applied and the factors which regulators must take into account when deciding whether or not to prosecute is determined by various guidance documents including DEFRA guidance,[407] the Regulators' Compliance Code,[408] the Cabinet Office Enforcement Concordat[409] and

[400] The Environmental Permitting (England and Wales) Regulations 2010, Schedule 6, paragraph 3

[406] Regulatory Guidance Series number 11, point 3.6
[407] DEFRA: Core Environmental Permitting guidance (v 3.1) - updated March 2010. Contains guidance for those operating, regulating or interested in facilities that are covered by the Environmental Permitting (England and Wales) Regulations 2010 SI 2010 No.675 (as amended) ('the Regulations'). For local authority-regulated facilities, the General Guidance Manual on policy and procedure can be found at http://www.defra.gov.uk/environment/quality/pollution/ppc/localauth/pubs/guidance/manuals.htm

the Environment Agency's own guidance incorporating its outcome-based approach (outlined in section 2.1 above).[410] In addition to these documents, regulators are required to take account of the Code for Crown Prosecutors[411] and the Attorney General's Guidelines on the Acceptance of Pleas and the Prosecutor's Role in the Sentencing Exercise.[412]

3.1.1 Criminal offences

Regulation 38 of the EP Regulations specifies a range of criminal offences for non-compliance with the Regulations. The most relevant offences to the IPPC Directive are:

- Contravention of regulation 12(1) i.e. to operate a regulated facility or to knowingly cause or knowingly permit a water discharge activity or groundwater activity except under and to the extent authorised by an environmental permit (Regulation 38(1));
- Failure to comply with or to contravene an environmental permit condition (Regulation 38(2));
- Failure to comply with the requirements of an enforcement notice, a prohibition notice or a suspension notice (Regulation 38 (3));
- Failure to comply with a notice under regulation 60(1) requiring the provision of information, without reasonable excuse, or to intentionally or recklessly make a false or misleading statement (Regulation 38 (4));

3.1.2 Additional (miscellaneous) criminal offences and related measures

- To deposit, knowingly cause or knowingly permit the deposit of controlled waste (including extractive waste) unless the deposit is covered by and in accordance with an environmental permit or exemption (Section 33(1)(a) Environmental Protection Act 1990);
- To submit waste (not including extractive waste) to a disposal or recovery operation in or on land or by mobile plant or to knowingly cause or knowingly permit that activity unless that operation is carried out in accordance with an environmental permit (Section 33(1)(b) Environmental Protection Act 1990);
- To treat, keep or dispose of waste (including extractive waste) in a manner likely to cause pollution of the environment or harm to human health, whether or not the operation is carried out in accordance with an environmental permit (Section 33(1)(c) Environmental Protection Act 1990);
- Pursuant to Regulation 44 of the EP Regulations, where a person is convicted for an offence for operating without or other than in accordance with a permit, or for failing to comply with a notice under regulation 38(3),[413] the regulator can apply to the court for an order requiring the person to take steps to remedy the matter.
- Injunction (Regulation 42) – to restrain any criminal act, particularly where a rapid response is required; and
- Court Order (Regulation 42) to either stop an activity or to carry out a particular activity. If the regulator considers that proceedings for a breach of notice under regulation 38(3) would afford an ineffectual remedy, it may take proceedings in the High Court in order to secure compliance with a notice.[414]

3.1.3 Criminal sanctions

Pursuant to regulation 38(1) of the Regulations, criminal sanctions are not restricted to the operator, but may be brought against any person (natural or legal) who commits an offence. The regulator may consider two potential criminal sanctions for IPPC-related offences:

i) a caution

A caution is not a criminal conviction but it forms part of an offender's criminal record and may be cited in court if further offences are committed. Formal cautions are intended to be a deterrent and according to the Environment Agency are considered where, although a prosecution could be initiated, other factors mitigate against this. Where a formal caution is not accepted, the EA will normally prosecute for the original offence.[415] Where a formal caution is used, the 'Full Code test' as required under the Code for Crown Prosecutors (see next paragraph below) must be considered.

ii) a prosecution

The second sanction applicable for IPPC offences is a prosecution. When considering prosecution, regulators must have regard to the Code for Crown Prosecutors ('the Code'). The Code provides guidance on the general principles to be applied when considering prosecutions. Where the regulator decides that a criminal sanction is appropriate it must assess the case in accordance with the requirements of the Code before commencing a prosecution. The Full Code Test has two stages: (i) the evidential stage; followed by (ii) the public interest stage.

For the evidential stage, prosecutors must be satisfied that there is sufficient evidence to provide a realistic prospect of conviction against each suspect on each charge. This will include considering the reliability and admissibility of the evidence.[416] They must also consider what the defence case may be, and how it is likely to affect the prospects of conviction. A case which does not pass the evidential stage must not proceed, no matter how serious or sensitive it may be. Where there is sufficient evidence to justify a prosecution or to offer an out-of-court disposal, prosecutors must go on to consider the second stage, i.e. whether a prosecution is required in the public interest. A number of factors will make a prosecution more likely, for example where a conviction is likely to result in a significant sentence, and where the offence was committed in order to facilitate more serious offending.[417]

Based on these factors as well as its own public interest factors *(see section 2.1 above),*[418] the Environment Agency will make a decision as to whether a prosecution is an appropriate response or whether an alternative to prosecution may be more appropriate. This assessment will include a consideration of factors set out by DEFRA, including those which will tend to suggest that prosecution is the proportionate action (*see Annex II hereto*).

3.1.4 Criminal procedure

Criminal offences for IPPC-related breaches in the UK are divided into two types: those on 'summary conviction' " or on 'conviction on indictment' depending on the seriousness of the offence (summary offences being the less serious of the two). All criminal cases will begin in the Magistrates' courts. If a defendant pleads not guilty to the charges the case will proceed to trial and may transfer to the Crown

[415] Environment Agency Enforcement and Sanctions Guidance, page 7
[416] Code for Crown Prosecutors, pages 7-9
[417] Code for Crown Prosecutors, pages 10-12
[418] The Environment Agency's guidance also sets out the public interest factors which it will take into account Environment Agency's Enforcement and Sanctions Guidance, page 12;

Court. Over 95 per cent of all criminal cases are dealt with in the magistrates' court and the vast majority of those will be completed there.[419]

Upon conviction, the court may also make additional orders such as compensation or an order to disqualify directors, confiscate assets, forfeit relevant equipment, or require remediation of the damage. Under 11.4 of the Code for Crown Prosecutors, it is the duty of the prosecutor to apply for such orders and compensation.

3.4 Possibilities of appeal

i) Magistrates Court

If found guilty after a trial, the person convicted may appeal to the Crown Court against the conviction. If the person pleaded guilty and was sentenced in the magistrates' court, they are not able to appeal against the conviction, but they can still appeal against the length or nature of the sentence imposed. A notice to appeal against the conviction or sentence must be served within 21 days.

ii) Crown Court

Upon conviction in the Crown Court, a notice of appeal must be given to the criminal division of the Court of Appeal within 28 days of the decision. An appeal can be against conviction or sentence but, unlike appeals from the Magistrates' Court to the Crown Court, there is no automatic right to appeal save for in two limited circumstances:

- if the sole ground(s) for the appeal involve(s) a question of law only
- in exceptional cases, the trial judge in the Crown Court may certify that the case is fit for appeal.

4. Synergies between administrative and criminal procedures

4.1 Criminal sanctions v administrative measures

The UK legislation does not prevent regulatory authorities from applying administrative enforcement measures and criminal sanctions in conjunction. On the contrary, the legislation provides for the use of both measures, while regulatory guidance advises the use of either and/or both where it is considered proportionate under the circumstances. Indeed, in its approach to 'better regulation' the Environment Agency aims to apply the most proportionate response to instances of non-compliance. It also applies its own 'outcome-focused' procedure and guidance, which it uses to determine the sanctions it will apply with reference to the outcome to be achieved. This includes the use of administrative measures with the option to resort to criminal prosecution where operators have breached their permit conditions or where administrative procedures are not complied with. The primary difference between the two is that administrative measures may be applied regardless of whether a crime has been committed, while criminal prosecution requires the Full Code Test to be satisfied before proceeding.

4.2 Criminal v Civil Sanctions

In general, criminal proceedings may not be taken where a civil sanction has been served pursuant to The Environmental Civil Sanctions Order & Regulations 2010. Exceptions to this are where:

[419] Judiciary of England and Wales website: http://www.judiciary.gov.uk/you-and-the-judiciary/going-to-court/magistrates-court

- A restoration notice, compliance notice or enforcement undertaking is used without the addition of a VMP and the person fails to comply with the notice or undertaking. In this case regulators can prosecute for the original offence.

- A stop notice is served; as failure to comply with a stop notice is a criminal offence in itself.[420]

The following case illustrates the approach taken by the courts in relation to IPPC related offences and the factors taken into account when determining sentences:

Example of criminal sanction

R v Cemex Cement Limited [2007] [421]

R v Cemex was an appeal case brought under the previous Permitting Pollution and Control regime, Nevertheless, it illustrate the way in which cases involving pollution from industrial installations have been dealt by the courts. In this case the Court of Appeal significantly reduced the fine imposed by the Magistrates Court from £400,000 to £50,000. Both the prosecution and defence in the case were content for the matter to be dealt with by the magistrates. However the magistrates decided that their powers of sentence (limited in the case of a fine to £20,000) were inadequate and they committed the case to the Crown Court for sentence. The Crown Court imposed a fine of £400,000 and ordered Cemex to pay the prosecution costs £12,429.14. Cemex appealed.

Offence
A large amount of potentially hazardous dust was released from a kiln as a result of it not being properly maintained. The Appellant ('Cemex') pleaded guilty to an offence under regulation 32(1)(b) of the (then) Pollution Prevention Control Regulations 2000, for failing to comply with a condition in the permit which stated that "all plant equipment and technical means used in operating the permitted installation shall be maintained in good operating condition".

Facts
The offence came to light when a member of the public saw dust coming out of the external door intermittently. He reported the matter to the Environment Agency (EA). The EA informed Cemex about the complaint. Cemex inspected the door and noticed damage. They made a temporary repair but notified those responsible for carrying out maintenance work that the door required urgent repair. The repair was fully carried out by contractors the following day. As a result, dust was allowed to escape, which the prevailing winds dispersed over a wide area. When that dust settled it caused a sticky substance to be found on cars and structures.

The judge noted that despite the proximity of the cement works and a nearby housing estate (approximately 100 yards), noone appeared to have been physically harmed by the exposure to the dust released, and twelve months after the incident there was no report of adverse health consequences.

However, the judge observed that there was no or no adequate record keeping of inspections. He described this situation as 'simply not good enough' and referred to 'a sloppy attitude' . He called it sloppy in part because there had been previous warnings issued to Cemex, or to those from whom Cemex had acquired the works. These had not resulted in any criminal prosecutions, and the judge noted that Cemex had no convictions recorded against it. In this case the judge did accept that Cemex had taken steps to remedy the matter and had not 'sat on their hands'.
The judge was especially critical of the fact that the kiln had been stopped before the dust emissions had been reported and then later restarted. He regarded the following as aggravating features: i) that there was a delay in the repair for the period already noted, ii) that when the repair was first done it was imperfect and iii) that the kiln was restarted without the door having been properly repaired. The Recorder stated that in his view it was a recipe for disaster and would have the inevitable consequence that there would be an emission of dust, if the kiln was restarted at a time when the door was an imperfect fit as occurred.

[420] See Civil sanctions for environmental offences, The Environmental Civil Sanctions Order & Regulations 2010, Guidance to regulators in England on how the civil sanctions should be applied, and draft guidance for Wales, p 10
[421] R v Cemex Cement Limited [2007] EWCA Crim 1759

Appeal

The Grounds of Appeal were that the sentence handed down in the Crown Court was wrong in principle and manifestly excessive. The submission that the sentence was wrong in principle was advanced on the footing that it was based on a serious misinterpretation of the evidence. The errors alleged were as to the quantity of dust emitted from the defective door (as opposed to dust lawfully emitted from the chimney stack), the risk that the dust presented to health of the exposed population and the extent to which the dust was toxic or hazardous. The Appeal Court rejected the suggestion that the Crown Court judge's sentencing approach had any erroneous basis of fact, whether as to the source and quantity of the emissions, or as to the adverse risk or adverse consequences to the health of those who might come into contact with the dust.

The submission that the sentence was manifestly excessive was advanced on the basis that the judge had failed to apply the principles in *R v Howe.*[422]

The case of R v Howe

The case of Howe concerned sentencing under the Health and Safety at Work Act 1974 (the 1974 Act) which the Court of Appeal considered to be of assistance in cases of environmental pollution. In that case an accident had occurred and a man was electrocuted. The premises were those of a small business. The appellant had been fined £48,000 and ordered to pay £7,500 costs in respect of four offences under the 1974 Act and related regulations. The company had failed to keep its electrical systems in a safe condition. The Appeal Court in *R v Howe* held that the Judge had given inadequate weight to the financial position of the appellant. The Appeal Court reduced the fine by £15,000.

The judgment in R v Howe highlighted the following factors which should be taken into account when determining the sentence:

- *In assessing the gravity of the breach it is often helpful to look at how far short of the appropriate standard the defendant fell in failing to meet the reasonably practicable test.*
- *Next, it is often a matter of chance whether death or serious injury results from even a serious breach. Generally where death is the consequence of a criminal act it is regarded as an aggravating feature of the offence. The penalty should reflect public disquiet at the unnecessary loss of life.*
- *Financial profit can often be made at the expense of proper action to protect employees and the public. Cost cutting is a crucial tool in achieving a competitive edge. A deliberate breach of the health and safety legislation with a view to profit seriously aggravates the offence.*
- *Other matters that may be relevant to sentence are the degree of risk and extent of the danger created by the offence; the extent of the breach or breaches, for example whether it was an isolated incident or continued over a period and, importantly, the defendant's resources and the effect of the fine on its business.*
- ***Particular aggravating features** will include (1) a failure to heed warnings and (2) where the defendant has deliberately profited financially from a failure to take necessary health and safety steps or specifically run a risk to save money.*
- ***Particular mitigating features** will include (1) prompt admission of responsibility and a timely plea of guilty, (2) steps to remedy deficiencies after they are drawn to the defendant's attention and (3) a good safety record.*
- *Any fine should reflect not only the gravity of the offence but also the means of the offender, and this applies just as much to corporate defendants as to any other (see s 18(3) of the Criminal Justice Act 1991)*

Cemex Case – Significant features:

The Appeal Court in R v Cemex accepted that none of the aggravating features expressly mentioned in *Howe* were present, while all of the mitigating factors referred to in that case were present. While the Appeal Court accepted that the factors which the judge had identified as aggravating were present, they highlighted the significant features which the judge had failed to take into account:

There was no evidence that Cemex decided to put profit before ensuring appropriate environmental controls.

The failure was not in the absence of a proper system, but in properly carrying out the system that there was.

Cemex had completed the temporary repair by 2.45 pm on the day that the EA notified it, and the full repair by about a day later.

Much of the dust that escaped on the day the silo was inspected and the day it was repaired came lawfully

[422] *R v Howe* [1999] 2 All ER 249

from the chimney stack.
There were a limited number of complaints from the public, and no complaints of ill health or damage to property. The estimated quantity of additional exposure amount to 0.25% of the annual PM10 exposure.
Cemex cleaned up the dust deposits the following week and reviewed and tightened its systems.
Cemex co-operated with the EA, tendered a prompt plea and an apology to members of the community who had been affected. It had a good record.

Judgment
The Appeal Court stated that there was no question of the Crown Court judge giving insufficient weight to the financial position of the Appellant. However, in summing up the case, the Appeal Court stated that the point was whether, in the absence of any fatality, any actual damage to health, or any deliberate failure by Cemex, and given the mitigating factors referred to, this was a case requiring a fine of £400,000. In its judgment, a fine of £400,000 was considered disproportionate. Having regard to the considerations in the cases referred to, it was held that the fine did not need to exceed £50,000. The sentence imposed by the Crown Court judge was therefore quashed and a fine of £50,000 substituted.

5. Conclusions

5.2 Conclusions

Proportionality

UK legislation provides regulators with a range of administrative sanctioning tools to ensure compliance with the relevant provisions of the IPPC Directive. This is complemented by guidance which aims to ensure that the regulators' approach is proportionate to the risks posed. Criminal penalties for non-compliance are intended to reflect the nature and gravity of the offence, by providing for convictions either 'summarily' or 'on conviction on indictment', with maximum sentences and fines for both types of offences. Both administrative measures and criminal penalties may therefore be deemed as fulfilling the criterion of proportionality. Furthermore, the introduction of civil sanctions for IPPC-related breaches is likely to provide a more proportionate response to non-compliance by giving regulators the power to impose civil sanctions for a range of environmental offences.

Effectiveness

The administrative tools available to regulators include a range of different notices which may be served on the operator, depending on the nature of the breach or level of harm posed to the environment. In certain cases, the regulator may determine the steps to be taken and the time period within which the operator must comply with a notice. Such notices include the power to remediate damage, suspend activities and vary permit conditions. The effectiveness of such notices can vary according to the nature of the offence and the outcome to be achieved. The ability to bring successful criminal proceedings is dependent primarily on the ability to meet the evidential and public interest criteria required, which, in addition to the time it can take to secure a conviction, has been viewed as a barrier to effectiveness. The introduction of civil sanctions is expected to improve effectiveness by providing regulators with additional powers which (it is hoped) will resolve many cases more quickly and effectively.

Dissuasiveness

Administrative measures including the suspension or restriction of activities, variation of permit conditions or even revocation of the permit may be viewed as being relatively stringent. However, it is arguable as to how dissuasive such administrative measures actually are, since they do not include the ability to impose any financial penalty. Criminal sanctions may be viewed as being considerably more stringent, due to the sizable fines and sentences which may be imposed.

5.2 Summary of case study responses

In order to illustrate how the UK legislation is applied in practice, two case studies were selected for the purposes of this study. With the assistance of the Environment Agency (EA), two cases were identified in which proceedings were brought by the EA for breach of the relevant IPPC legislation. The case studies were supplemented by telephone interviews with the relevant regulatory officers involved, both of whom were asked about the investigation and prosecution procedures carried out. They were also asked to comment on the extent to which the sanctions imposed were deemed proportionate, effective and dissuasive. The details of these cases studies are set out in Annex I.

Proportionality

Proportionality in both cases was deemed to be difficult to measure, in part due to the fact that the courts were responsible for the level of fines imposed. However, the levels of fines were believed to be proportionate when compared with those imposed by the Magistrates Court for similar offences. In one case, it was suggested that environmental offences do not receive the same level of attention as, for example, drink-driving offences. Furthermore, the Magistrate's Court deal with the majority of prosecutions, while only those breaches which are deemed significant or serious enough are referred to the Crown Court.

Effectiveness

In both case studies, the sanctions imposed were deemed to be effective. 'Effectiveness' was not necessarily measured in terms of the time taken to achieve compliance, but rather the extent to which the sanctions had achieved the required improvements, bringing the operator back into compliance with the regulations. In one of the cases, while the sanctions were viewed as being extremely effective, it was suggested that additional powers could improve effectiveness, for example, by allowing the EA to serve notices where the integrity of plant machinery was brought into question. However, to a large extent, the effectiveness of the sanctions available was characterised by the proportionality and dissuasiveness of those sanctions.

Dissuasiveness

In terms of dissuasiveness, both cases highlighted the deterrent effect of sanctions available to the EA. Furthermore, in both cases, it was suggested that the negative publicity associated with such sanctions contributed to their dissuasiveness. This was particularly evident where the cases had received press attention and the EA had received enquiries from other operators about the nature and reasons for the sanctions imposed. Such attention suggests that the sanctions imposed had achieved a wider deterrent effect than merely on influencing the behaviour of the operator.

Case studies

The first case study concerns an abattoir, with a continuing history of compliance issues, arising primarily from poor management and non-compliance with permit obligations. The site also has a history of odour problems with complaints received from local residents. One particularly serious incident resulted in the suspension of the operator's activities. On another occasion, activities were suspended for the operator's failure to have a document management system in place. Both administrative measures and criminal prosecution have been employed as sanctioning measures. The EA tried where possible to use administrative measures, including warning letters, site visits and administrative (enforcement) notices. However, in the case of significant or blatant breaches, the EA have resorted to criminal prosecution.

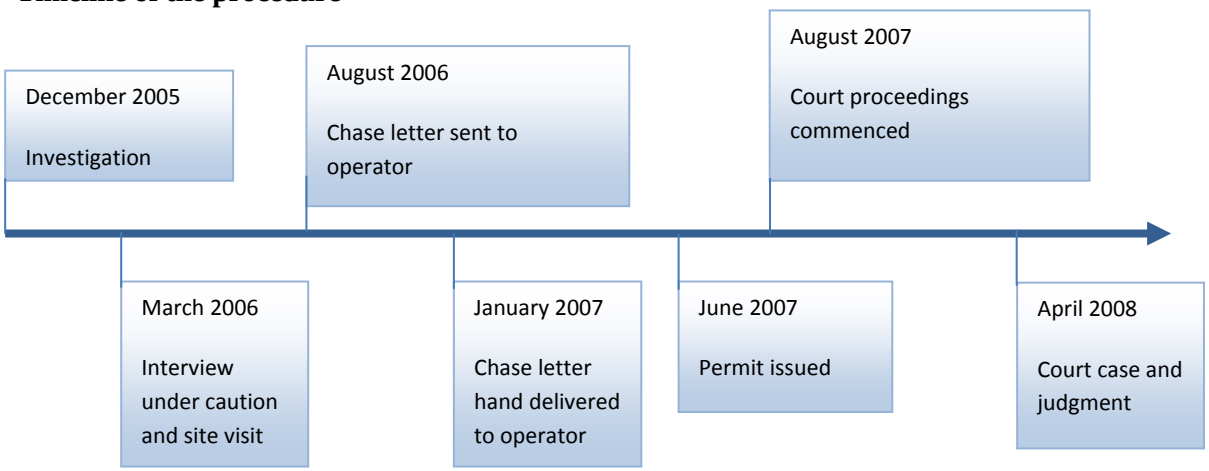
The second case study concerns a chemical manufacturing and processing facility prosecuted for breaching three of its environmental permit conditions. The three charges related to an emission of particulates from the facility in May 2009. The operator failed to notify the Environment Agency (EA) of the breach until a routine inspection by EA officers in October 2009. The case was brought to Leeds Magistrate's court in June 2010 and the operator pleaded guilty to three charges: exceeding its permitted limits, failing to notify the EA promptly of the incident and failing to maintain and implement its incident procedures. It was fined £15,000 plus costs of £2,567.88.

The sanctions imposed in both cases were believed by those interviewed to have been effective and dissuasive, on account of the fines imposed and their positive effects on operator compliance. Proportionality was considered more difficult to determine, partially due the fact that the Courts are responsible for setting the fines. However, in both cases, the fines were considered to be proportionate when compared with fines for similar types of offences.

Case study 1: West Scottish Lamb

Interviewee – Mr Jon Mellor
Organisation and position and: Environment Agency (EA), Regulatory Officer
Telephone number: + 00 44 1768 215738
Date of interview: 11/04/2011

Timeline of the procedure



Description of the background

The facility is an abattoir, covering approximately 2 acres on an industrial estate in Cumbria. It is designed for slaughtering of cows and sheep. This case study concerns 3 separate incidents.

Incident 1

From 31 August 2004, the legislation required abattoirs with a carcass production capacity of more than 50 tonnes per day to operate with a permit.[423] In March 2005, an EA officer visited the operator to enquire why they had not applied for a permit. The operator claimed that they were below the threshold of 50 tonnes and subsequently confirmed this in writing to the EA. In December 2005, the Local Authority received a planning application which appeared to raise doubt over the assertion that the site was below the threshold. The EA commenced investigations and with Meat Hygiene Service records established that the site had exceeded the thresholds under the permit.

Legislation applicable

Regulation 9(1) of the Pollution Prevention and Control (England & Wales) Regulations 2000 (now Regulation 12(1) the EP (England and Wales) Regulations 2010)). At the time of the offence, the maximum sanctions under the Regulations were (a) on summary conviction, a fine not exceeding £20,000 or to imprisonment for a term not exceeding six months or to both; (b) on conviction on indictment, to a fine or to imprisonment for a term not exceeding five years or to both.

The procedure

- *March 2006* - the EA interviewed representatives of the company under caution and advised them that they were operating illegally and needed a permit. Later that month EA officers visited the site to provide pre-application advice.
- *August 2006* - the EA wrote to the operator to express concerns about the apparent lack of progress.
- *September 2006* - the operator appointed a new consultant, and as a result it was necessary to restart 'pre-application' discussions.
- *January 2007* - the EA hand delivered a letter to the company director expressing concern about the lack of apparent progress with their permit application.
- *April 2007* - The EA received the operator's application but the incorrect fee was made
- *June 2007* - Outstanding fee received and permit issued. The permit contained an extensive 'improvement Programme' to address deficiencies on the site and to bring standards up to the Best Available Techniques (BAT).
- *August 2007* - Court proceedings were commenced. However, there were several delays in the proceedings, in part due to a request by the operator to seek a legal opinion, and due to holidays and lack of availability of the directors. The operator was prosecuted for failure to have an environmental permit in place between August 2004 and June 2007.
- *April 2008* - the case was heard before Carlisle Magistrates Court. The evidence presented against the operator included 'daily kill sheets' which were exhibited to a statement provided by MHS Principal Inspector who confirmed that they were an accurate record of the numbers of animals slaughtered. In addition, EA officers used statements and photographs to provide details of the installation and highlight the areas which were not at standard expected by a permitted installation. The Local Authority also provided statements detailing the history of odour complaints from the site and also the detailed site information which had been provided in support of the planning application. The defendant pleaded guilty and was fined £7,000 plus £2,358.15 in costs. The case received local media coverage.[424]

Incident 2

A separate incident occurred on 24 August 2009 when the operator failed to identify a blood tank had not been emptied and subsequently overfilled, destroying the charcoal filter which treated the displacement air from the tank. The tank over pressurised and when pressure was eventually released

[423] Schedule 1, Section 6.8 A1(b) of the Environmental Permitting (England and Wales) Regulations 2007
[424] http://www.newsandstar.co.uk/abattoir-fined-for-permit-breach-1.89504?referrerPath=home/2.1962

blood was sprayed across the yard and surrounding buildings. The spill was contained on the site but the odour was, according to the EA 'extremely objectionable' . The disruption to the neighbouring businesses and local residents was considerable and the Agency received a large number of complaints. The EA assessed the incident and gave it a Common Incident Compliance Scheme (CICS) rating of 2, on the basis that although the odour was noxious, no serious harm was caused to the environment. However, the EA considered that operation of the facility involved a risk of serious pollution, namely '*unabated emissions from the blood tank and associated pipe work causing annoyance outside the site*'.

Legislation applicable

The Environmental Permitting (England and Wales) Regulations 2007, Regulation 36 (Enforcement Notices), 38 (offences) and 39 (penalties). The maximum sanctions under the Regulations were: (a) on summary conviction, to a fine not exceeding £50,000 or imprisonment for a term not exceeding 12 months, or to both; or (b) on conviction on indictment, to a fine or imprisonment for a term not exceeding 5 years, or to both.

The procedure

As an immediate response to the incident, the EA issued an enforcement notice under Regulation 37 of the 2007 Regulations. The notice had the effect of suspending the permitted activity, i.e. the slaughtering of livestock in accordance with Schedule 1, Section 6.8 A1(b) of the Regulations. The notice also required detailed steps to be taken by the operator, specifying the deadlines by which these steps were to be completed. These included cleaning and inspecting the blood tank, demonstrating the integrity of the pipe work and agreeing timescales for an investigation into the incident. The impact of the notice was immediate. Works were duly completed by the operator before the suspension element of the notice came into effect, and the site was allowed to commence operations. EA officers attended the site on the day of the incident to verify satisfactory completion of the works.

Incident 3

In September 2009, (as part of the investigation into the incident on 24 August), the EA conducted an audit at the facility, indicating that the operator was not complying with a permit condition, namely to ensure that any emissions from activities were free from odour levels likely to cause annoyance outside the site, and to take appropriate measures to prevent or minimise that odour. In addition, the operator's paper work was found to be in extremely poor order. This was followed by a number of other substantiated odour incidents (though not as significant as the incident on 24 August). It eventually became apparent that the operator had disregarded the facility's Environmental Management System (EMS).

Legislation applicable

The Environmental Permitting (England and Wales) Regulations 2007, Regulation 36 (Enforcement Notices), Regulation 38 (offences) and Regulation 39 (penalties). The maximum sanctions under the Regulations were: (a) on summary conviction, to a fine not exceeding £50,000 or imprisonment for a term not exceeding 12 months, or to both; or (b) on conviction on indictment, to a fine or imprisonment for a term not exceeding 5 years, or to both.

The procedure

In October 2009 the EA issued an enforcement notice under Regulation 36 of the 2007 Regulations, on the basis that the operation of the facility involved a risk of serious pollution. Again, the notice specified the steps to be taken by the operator, which required, inter alia, removal of all animal by-products from the site, developing and implementing a management system, and defining the roles and

responsibilities of staff, as well as staff training. The operator employed consultants to oversee the running of the installation and re-establishment of the EMS. The EA ensured compliance with the notice by visiting the operator, during a follow up audit and agreement of a programme of staff training and ongoing supervision by the consultants. The incident was given a CICS rating of 2.

In July 2010 the case was brought before Carlisle Magistrates Court. Evidence collected by the Agency included photographs and statements from Agency Officers. Statements were also obtained from a number of staff who were directly involved with the clean-up and the events leading up to the incident. The Agency required the operator to identify all records and files / documented systems relating to the permit / environmental issues. This confirmed the documented management system was no longer in a functioning order. At court, the Magistrates were referred to the sentencing guidelines[425] and shown some recent press releases for similar offences. The operator was convicted of the following permit breaches by Carlisle Magistrates Court in respect of incidents 2 and 3:

1. 24.08.09 - Failure to comply with licence condition 3.1.1 (unauthorised point source emission), fined £2,500
2. 24.08.09 - Failure to comply with condition 3.4.1 (activities shall be free from odour levels likely to cause annoyance, and failure to take appropriate measures to minimise odour), fined £2,500
3. 30.09.09 - Failure to comply with condition 3.4.1 (as above), fined £2,500
4. 8.10.09 - Failure to comply with condition 3.4.1 (as above), fined £2,500
5. 14.10.09 – Failure to comply with condition 1.1 and 1.2 (activities not managed and operated in accordance with a management system, and no accident management plan maintained and implemented), fined £7,000

The case received media coverage from the local press.[426]

General comments on sanctions

Effectiveness of sanctions

The EA described the effect of sanctions in this case as '*enormous*'. The EA regulation officer stated that '*without question we would not have secured the improvements which have achieved without the use of the notices*'. However, they indicated that certain additional powers would have been useful, such as in a subsequent case where the operator had wanted to re-use a particular piece of plant machinery before carrying out integrity testing. The EA officer said ' *we did eventually persuade the operator to do the integrity testing and modify the tank before use but the issue went on for a number of weeks and took several days of regulatory effort. A notice would have helped the operator understand that the issue was not negotiable*'.

Proportionality

The EA officer stated that while it was difficult to judge proportionality, they believed that the fines imposed were generally similar to other environmental offences heard in Magistrates Courts in the area. The operator had been in court on a number of previous occasions, for prosecutions brought by other regulators, including the Meat Hygiene Service (MHS). In one case, the operator was fined £5,000 for animal cruelty offences,[427] and in another it was fined £7,000 for and in another for failing to operate within regulations relating to slaughtering of animals.[428] These incidents give an indication of the levels of fines achieved by other regulators at the site.

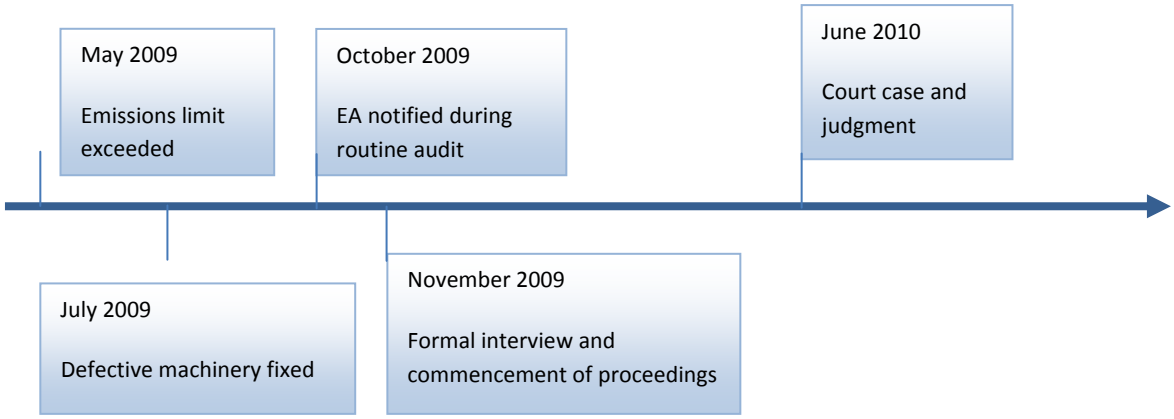
Dissuasiveness

While confirming that there were still some issues at the site, the officer believed that the sanctions imposed had achieved a deterrent effect on the operator, as evidenced by significant improvements in the operator's compliance. Furthermore, following the operator's conviction, the EA received enquiries from other operators about the nature and reasons for the sanctions imposed, suggesting that the sanctions had achieved a wider deterrent effect.

Case study 2: BRENNTAG

Interviewee – Ms Claire Wiles
Organisation and position: Environment Agency (EA), Regulatory Officer (Pollution Permission and Control)
Telephone number: + 00 44 1709 312762
Date of interview: 11/04/2011

Timeline of the procedure



Description of the background

The facility is a 3.5 acre industrial site in a mixed residential and commercial area on the outskirts of Leeds. Its activities include the manufacture, repackaging and distribution of organic chemicals, including alkalis, acids and inorganic chemicals. The permit for the facility was first issued in May 2005, and was subject to a minor variation in August 2006.

EA inspections are carried out at the site once or twice per year. In line with the site's environmental permit, external consultants are engaged by the operator to test their emissions from a wet scrubber on site. On 29 May 2009 the external consultants detected an elevated particulates release. This was reported to the operator on 5 June 2009 and traced to a defective item within the plant (a pump within a scrubber). The operator did not report this to the EA and continued to operate the plant from 5 June 2009 until the item of plant was repaired on 10 July 2009. During this period particulates (caused when zinc oxide is added to the manufacturing process) were released into the atmosphere when the plant was in use. It was brought to the attention of the EA during a routine part audit in October 2009. During that audit, the operator notified the EA that in May 2009 they had exceeded their permitted emissions of particulate matter under the permit.

Legislation applicable

This was a prosecution for a breach of environmental permit conditions, under Regulations 38 of the Environmental Permitting (England and Wales) Regulations 2007. The operator was charged with three separate offences under Regulation 38(1)(b) of the Environmental Permitting (England and Wales) Regulations 2007, namely:

i) exceeding the permitted limit of emissions to air of particulate matter from an emission point reference;

ii) failure to maintain and implement written procedures for investigating incidents and prompt implementation of appropriate actions in relation to the scrubber pump;

iii) Failure to notify the Environment Agency without delay of the detection of an emission of a substance which exceeds any limit in the permit.

The EA confirmed that at the time of the offence the maximum sanctions applicable under section 39 of the 2007 Regulations were (a) on summary conviction, to a fine not exceeding £50,000 or imprisonment for a term not exceeding 12 months, or to both; or (b) on conviction on indictment, to a fine or imprisonment for a term not exceeding 5 years, or to both. The operator was fined £15,000 (£5,000 for each offence) plus prosecution costs of £2,567.88.

The procedure

On discovering the breach, the case officer immediately ceased the audit and served on the operator a 'Notice of Powers and Rights - Police and Criminal Evidence Act 1984, Code B', formally notifying them that a suspected offence had been committed. The EA officer took copies of several reports including monitoring reports, a safety data sheet for Zinc Oxide, and an air monitoring summary Excel spreadsheet. A formal interview was conducted on the 23 November 2009 with the operator's UK Technical and Compliance Manager, authorised to speak on behalf of the company who admitted to the charges. The minimum criteria for prosecution is the '2 stage test', as outlined in the country detailed report. The evidence was deemed by the EA as sufficient to meet this test. Proceedings were dealt with in the Bradford Magistrates Court approximately 8 months after discovery of the breach by the EA.

In this case, prosecution was the first and only sanction considered. The operators had blatantly ignored the incident and had continued to operate the facility without notifying the EA. The impact of the increased concentration was deemed by the EA to be so low that no environmental harm was likely to have been caused, and therefore no specific tests were carried out. However, it was the EA's view that the operator's failure to comply with the permit conditions had posed a significant potential risk, due to the particulates generated which can be toxic to aquatic life. This was further aggravated by its failure to notify the EA.

Although no environmental damage was detected, the incident was assessed and given a score of 2 in accordance with the EA's Compliance Classification System (CCS), on the basis that the chemicals involved were potentially toxic. The factors taken into account in determining the seriousness of the offence included the quantity and type of discharge, the decision to continue operating when a fault was identified, an element of financial motivation, and the failure to report the incident to the Agency. The penalty was a matter for the Bradford Magistrates Court whose responsibility it is to set the level of the fine.

General comments on sanctions

Effectiveness

The fine imposed was viewed by the EA as efficient and effective for the following reasons:

- It was seen as a deterrent from future offending.
- The quantum (£15,000 in total) had an impact on the operator's finances.
- The EA produced a press release after conviction and the case attracted publicity in the area.

The press release was viewed by the EA as having a deterrent effect, primarily on the business itself rather than on other operators. Furthermore, the EA believed that the sanction had affected profitability. '*We don't consider the fine to be trivial and believe the operator would not want to pay out this sum of money again. We also expect that there has been damage to the company's reputation and brand image*'.

The effectiveness of the sanctions was further evidenced when the operator breached its ELVs on another two occasions. In both instances, the operator notified the EA of the breaches within 24 hours, ceasing processing operations immediately, until compliance was restored. The operator was given two weeks to comply and the EA officer visited to confirm compliance. A further breach occurred on 29/01/10, whereupon they restored compliance on 11/03/2010 and again on 21/10/2011 whereupon they restored compliance in February 2011.

£15,000 was viewed by the EA as a reasonable fine, considering the lack of any major impact on the environment. It was commented that one or more aggravating factors will tend to result in a higher fine, particularly where there is evidence of damage to the environment e.g. to fish and wildlife. Where a case is referred to the Crown Court, fine can be unlimited. However, it was suggested that such offences don't always get the attention they necessarily deserve, especially compared with other offences (e.g. drink-driving). Furthermore, breaches must be must be significant to be referred to the Crown Court. Generally, the range of sanctions is considered sufficient to deal with most offences.

Proportionality

The EA officer believed the sanction to be proportionate, adding that it compared well to other cases. She could not comment on whether the fine was proportionate to company turnover. It was the court to make that decision and the EA was not sure how they calculated the fine.

Dissuasiveness

The EA believed that in this case the offences were not committed deliberately therefore the sanction was not considered to be a deterrent from offending per se. However, they did believe that the sanctions imposed would act as a deterrent to future decisions motivated by financial rather than environmental considerations (as the decision to continue operating was here). They added that the damage to the operator's reputation and image may have had a negative effect, although it was not possible to measure this impact. The officer confirmed that the EA had seen a change in the behaviour of the operator since the prosecution in that they had been notified without delay of further permit breaches. Furthermore, they believed that the sanction would serve to dissuade others from further offences of that nature. The EA officer added '*There is evidence of the dissuasive effect as we have seen a behavioural change in the Operator since the prosecution. It took around 8 months to secure the prosecution but it was worth the effort*'.

[429] Enforcement and Sanctions Guidance, page 11

DEFRA Public interest factors in favour of prosecution[430]

Factors relating to	Factor tending to suggest that prosecution is appropriate
Offence	• long-term or continuing breach • significant deviation from legal requirement or permit conditions • operating without a licence or permit
Offender	• has committed an offence intentionally or with recklessness or negligence • has a history of non-compliance • has failed to comply with a previous civil sanction • is shown to be dishonest or deceiving • as failed to report non-compliance • has not cooperated with investigations • has failed to comply with restoration or other notice requirements • the offence involved obstruction • the incident was foreseeable • the offence has been committed with the consent, • connivance or neglect of senior officers of corporate body
Impact	• serious environmental impact or risk of impact, including impact on the local community • serious impact on compliant business, competitors undermined • the offence undermines the regulatory system
Possible wider consequences	• significant potential long-term effect • potential impact on the wider population

Costing the Earth: Guidelines for Magistrates
7.2 Acid effluent into river

Legislation
The Environmental Permitting Regulations 2007 No. 3538 (EPR 2007)[431] provide that:

12 No person may operate a regulated facility except under and to the extent authorised by an environmental permit.

36(1) If the regulator considers that an operator has contravened, is contravening, or is likely to contravene an environmental permit condition, the regulator may serve a notice on him under this regulation (in these Regulations, an 'enforcement notice').

38(1) It is an offence for a person- (a) to contravene, or knowingly cause or knowingly permit the contravention of, regulation 12

Maximum penalty
39(1) A person guilty of an offence under regulation 38(1)(a), (b) or (c) is liable- (a) on summary conviction to a fine not exceeding £50,000 or imprisonment for a term not exceeding 12 months, or to both; or (b) on conviction on indictment to a fine or imprisonment for a term not exceeding 5 years, or to both.

Facts
An engineering company, Tirnshap Engineering Ltd (TEL), is regulated by the Environment Agency (EA). It has an environmental permit which enables it to use certain chemicals. Its works are situated close to open marshland, which has been designated as a Site of Special Scientific Interest (SSSI). Effluent from the works after it has been treated is discharged lawfully to a nearby river.

The operations at the plant produce a strong acid effluent. That effluent flows via an underground drain into an interceptor pit. From there it is pumped to an effluent treatment plant for cleansing purposes before being released into the river. In February abnormally high acid levels were recorded in the drain which were at first attributed to leaks into the effluent system. Initial checks found nothing. However, later that month, TEL decided to institute a drain sampling exercise and consideration was given to possible leaks of acid from the process. Checks carried out on the outfall pipes revealed a problem. When the storm water drains were checked, liquid was observed entering through the brickwork. It was decided to flush the storm drain system with water to remove the acid contamination. The EA was informed of these moves. The following month, the EA was shown a video examination of the process drain, which indicated fractures in the pipe. TEL stated that acidic liquor from the effluent drain had leaked into the ground and from there into storm water drains and off the site. Consultants were then asked to determine the effects of this escape of acidic liquor from the system on the nearby marshland. Samples were taken. The results indicated that in the areas of open water in the marshland, which were affected by the acid spill, the invertebrate population had been either completely wiped out or very substantially reduced. The affected area would gradually regenerate but only after a lengthy period of several years. In the meantime, visiting bird life would be unlikely to return or roost at the site and the fish population similarly had been decimated.

TEL concluded that it was likely that a significant loss of acid had occurred since early February and it estimated a loss of about 17.5 tonnes of 100% proof hydrochloric acid. From a records inspection, the EA also calculated that there had been a significant loss of acidic scrubber liquor during the previous month. It was calculated that there was a total estimated loss of 39 tonnes of 100% proof hydrochloric acid.

[431] Repealed by the Environmental Permitting Regulations 2010 (EPR 2010) as amended.

The cause of the incident was the leaks in the process drain. The company accepted that acid had leaked from this drain via the surface drains into the marshland and that the leak was a breach of the conditions of its permit. On investigation, the EA also discovered that the drains had been examined in 2002 and had been found to be leaking at that time and to have structural damage. TEL, however, had decided that no remedial action was necessary. The company had failed to consider the implications of continued operation of the drains in their current state. It is highly likely that the acid had attacked the drains over a period of time owing to the fact that they were flooded. TEL was found guilty of three offences under Regulations 12 & 38 of the EPR 2007 in failing to abide by conditions in its permit in that:

• it failed to maintain in good operating condition all its plant equipment and technical means;
• it failed to operate the site in such a way as to prevent pollution of any surface or underground waters and so that there was no discharge of trade effluent to any underground strata; and
• it failed to use the best available techniques for rendering harmless any substance that might cause harm if released into any environmental medium.

Assessing seriousness
• TEL was aware of the problem several years ago but had taken no remedial action. If it had done so at that time it would have cost in the region of £20,000.

• The environmental impact has been considerable, with the marshland being gravely affected for a protracted period. TEL could be considered to have taken a risk in respect of its drainage systems so as to save costs.

• As soon as fully aware of the extent of the problem TEL spent £50,000 on rectifying its drainage system.

• The effluent had diffused and affected other water bodies. The discharge affected the nearby marshland, which is designated as a SSSI.

Questions
1. What is the most appropriate sentence for TEL?
2. Is the £50,000 spent on rectification a true mitigating feature, bearing in mind that the work should have been done several years before?

Judicial opinion
Acid effluent into river - The offences arise out of breach of permit conditions. The defects have been known to the company for many years. A total fine of £25,000 plus costs. Still not having done the works when the case came before the court would be an aggravating factor. The company should have done the works earlier. Completing them late in the day does not provide weighty mitigation.

CONVENTION ON ACCESS TO INFORMATION, PUBLIC PARTICIPATION IN DECISION-MAKING AND ACCESS TO JUSTICE IN ENVIRONMENTAL MATTERS

done at Aarhus, Denmark,
on 25 June 1998

The Parties to this Convention,

Recalling principle l of the Stockholm Declaration on the Human Environment,

Recalling also principle 10 of the Rio Declaration on Environment and Development,

Recalling further General Assembly resolutions 37/7 of 28 October 1982 on the World Charter for Nature and 45/94 of 14 December 1990 on the need to ensure a healthy environment for the well-being of individuals,

Recalling the European Charter on Environment and Health adopted at the First European Conference on Environment and Health of the World Health Organization in Frankfurt-am-Main, Germany, on 8 December 1989,

Affirming the need to protect, preserve and improve the state of the environment and to ensure sustainable and environmentally sound development,

Recognizing that adequate protection of the environment is essential to human well-being and the enjoyment of basic human rights, including the right to life itself,

Recognizing also that every person has the right to live in an environment adequate to his or her health and well-being, and the duty, both individually and in association with others, to protect and improve the environment for the benefit of present and future generations,

Considering that, to be able to assert this right and observe this duty, citizens must have access to information, be entitled to participate in decision-making and have access to justice in environmental matters, and acknowledging in this regard that citizens may need assistance in order to exercise their rights,

Recognizing that, in the field of the environment, improved access to information and public participation in decision-making enhance the quality and the implementation of decisions, contribute to public awareness of environmental issues, give the public the opportunity to express its concerns and enable public authorities to take due account of such concerns,

Aiming thereby to further the accountability of and transparency in decision-making and to strengthen public support for decisions on the environment,

Recognizing the desirability of transparency in all branches of government and inviting legislative bodies to implement the principles of this Convention in their proceedings,

Recognizing also that the public needs to be aware of the procedures for participation in environmental decision-making, have free access to them and know how to use them,

Recognizing further the importance of the respective roles that individual citizens, non-governmental organizations and the private sector can play in environmental protection,

Desiring to promote environmental education to further the understanding of the environment and sustainable development and to encourage widespread public awareness of, and participation in, decisions affecting the environment and sustainable development,

Noting, in this context, the importance of making use of the media and of electronic or other, future forms of communication,

Recognizing the importance of fully integrating environmental considerations in governmental decision-making and the consequent need for public authorities to be in possession of accurate, comprehensive and up-to-date environmental information,

Acknowledging that public authorities hold environmental information in the public interest,

Concerned that effective judicial mechanisms should be accessible to the public, including organizations, so that its legitimate interests are protected and the law is enforced,

Noting the importance of adequate product information being provided to consumers to enable them to make informed environmental choices,

Recognizing the concern of the public about the deliberate release of genetically modified organisms into the environment and the need for increased transparency and greater public participation in decision-making in this field,

Convinced that the implementation of this Convention will contribute to strengthening democracy in the region of the United Nations Economic Commission for Europe (ECE),

Conscious of the role played in this respect by ECE and recalling, inter alia, the ECE Guidelines on Access to Environmental Information and Public Participation in Environmental Decision-making endorsed in the Ministerial Declaration adopted at the Third Ministerial Conference "Environment for Europe" in Sofia, Bulgaria, on 25 October 1995,

Bearing in mind the relevant provisions in the Convention on Environmental Impact Assessment in a Transboundary Context, done at Espoo, Finland, on 25 February 1991, and the Convention on the Transboundary Effects of Industrial Accidents and the Convention on the Protection and Use of Transboundary Watercourses and International Lakes, both done at Helsinki on 17 March 1992, and other regional conventions,

Conscious that the adoption of this Convention will have contributed to the further strengthening of the "Environment for Europe" process and to the results of the Fourth Ministerial Conference in Aarhus, Denmark, in June 1998,

Have agreed as follows:

Article 1

OBJECTIVE

In order to contribute to the protection of the right of every person of present and future generations to live in an environment adequate to his or her health and well-being, each Party shall guarantee the rights of access to information, public participation in decision-making, and access to justice in environmental matters in accordance with the provisions of this Convention.

Article 2

DEFINITIONS

For the purposes of this Convention,

1. "Party" means, unless the text otherwise indicates, a Contracting Party to this Convention;

2. "Public authority" means:

(a) Government at national, regional and other level;

(b) Natural or legal persons performing public administrative functions under national law, including specific duties, activities or services in relation to the environment;

(c) Any other natural or legal persons having public responsibilities or functions, or providing public services, in relation to the environment, under the control of a body or person falling within subparagraphs (a) or (b) above;

(d) The institutions of any regional economic integration organization referred to in article 17 which is a Party to this Convention.

This definition does not include bodies or institutions acting in a judicial or legislative capacity;

3. "Environmental information" means any information in written, visual, aural, electronic or any other material form on:

(a) The state of elements of the environment, such as air and atmosphere, water, soil, land, landscape and natural sites, biological diversity and its components, including genetically modified organisms, and the interaction among these elements;

(b) Factors, such as substances, energy, noise and radiation, and activities or measures, including administrative measures, environmental agreements, policies, legislation, plans and programmes, affecting or likely to affect the elements of the environment within the scope of subparagraph (a) above, and cost-benefit and other economic analyses and assumptions used in environmental decision-making;

(c) The state of human health and safety, conditions of human life, cultural sites and built structures, inasmuch as they are or may be affected by the state of the elements of the environment or, through these elements, by the factors, activities or measures referred to in subparagraph (b) above;

4. "The public" means one or more natural or legal persons, and, in accordance with national legislation or practice, their associations, organizations or groups;

5. "The public concerned" means the public affected or likely to be affected by, or having an interest in, the environmental decision-making; for the purposes of this definition, non-governmental organizations promoting environmental protection and meeting any requirements under national law shall be deemed to have an interest.

Article 3

GENERAL PROVISIONS

1. Each Party shall take the necessary legislative, regulatory and other measures, including measures to achieve compatibility between the provisions implementing the information, public participation and access-to-justice provisions in this Convention, as well as proper enforcement measures, to establish and maintain a clear, transparent and consistent framework to implement the provisions of this Convention.

2. Each Party shall endeavour to ensure that officials and authorities assist and provide guidance to the public in seeking access to information, in facilitating participation in decision-making and in seeking access to justice in environmental matters.

3. Each Party shall promote environmental education and environmental awareness among the public, especially on how to obtain access to information, to participate in decision-making and to obtain access to justice in environmental matters.

4. Each Party shall provide for appropriate recognition of and support to associations, organizations or groups promoting environmental protection and ensure that its national legal system is consistent with this obligation.

5. The provisions of this Convention shall not affect the right of a Party to maintain or introduce measures providing for broader access to information, more extensive public participation in decision-making and wider access to justice in environmental matters than required by this Convention.

6. This Convention shall not require any derogation from existing rights of access to information, public participation in decision-making and access to justice in environmental matters.

7. Each Party shall promote the application of the principles of this Convention in international environmental decision-making processes and within the framework of international organizations in matters relating to the environment.

8. Each Party shall ensure that persons exercising their rights in conformity with the provisions of this Convention shall not be penalized, persecuted or harassed in any way for their involvement. This provision shall not affect the powers of national courts to award reasonable costs in judicial proceedings.

9. Within the scope of the relevant provisions of this Convention, the public shall have access to information, have the possibility to participate in decision-making and have access to justice in environmental matters without discrimination as to citizenship, nationality or domicile and, in the case of a legal person, without discrimination as to where it has its registered seat or an effective centre of its activities.

Article 4

ACCESS TO ENVIRONMENTAL INFORMATION

1. Each Party shall ensure that, subject to the following paragraphs of this article, public authorities, in response to a request for environmental information, make such information available to the public, within the framework of national legislation, including, where requested and subject to subparagraph (b) below, copies of the actual documentation containing or comprising such information:

(a) Without an interest having to be stated;

(b) In the form requested unless:

(i) It is reasonable for the public authority to make it available in another form, in which case reasons shall be given for making it available in that form; or

(ii) The information is already publicly available in another form.

2. The environmental information referred to in paragraph 1 above shall be made available as soon as possible and at the latest within one month after the request has been submitted, unless the volume and the complexity of the information justify an extension of this period up to two months after the request. The applicant shall be informed of any extension and of the reasons justifying it.

3. A request for environmental information may be refused if:

(a) The public authority to which the request is addressed does not hold the environmental information requested;

(b) The request is manifestly unreasonable or formulated in too general a manner; or

(c) The request concerns material in the course of completion or concerns internal communications of public authorities where such an exemption is provided for in national law or customary practice, taking into account the public interest served by disclosure.

4. A request for environmental information may be refused if the disclosure would adversely affect:

(a) The confidentiality of the proceedings of public authorities, where such confidentiality is provided for under national law;

(b) International relations, national defence or public security;

(c) The course of justice, the ability of a person to receive a fair trial or the ability of a public authority to conduct an enquiry of a criminal or disciplinary nature;

(d) The confidentiality of commercial and industrial information, where such confidentiality is protected by law in order to protect a legitimate economic interest. Within this framework, information on emissions which is relevant for the protection of the environment shall be disclosed;

(e) Intellectual property rights;

(f) The confidentiality of personal data and/or files relating to a natural person where that person has not consented to the disclosure of the information to the public, where such confidentiality is provided for in national law;

(g) The interests of a third party which has supplied the information

requested without that party being under or capable of being put under a legal obligation to do so, and where that party does not consent to the release of the material; or

(h) The environment to which the information relates, such as the breeding sites of rare species.

The aforementioned grounds for refusal shall be interpreted in a restrictive way, taking into account the public interest served by disclosure and taking into account whether the information requested relates to emissions into the environment.

5. Where a public authority does not hold the environmental information requested, this public authority shall, as promptly as possible, inform the applicant of the public authority to which it believes it is possible to apply for the information requested or transfer the request to that authority and inform the applicant accordingly.

6. Each Party shall ensure that, if information exempted from disclosure under paragraphs 3 (c) and 4 above can be separated out without prejudice to the confidentiality of the information exempted, public authorities make available the remainder of the environmental information that has been requested.

7. A refusal of a request shall be in writing if the request was in writing or the applicant so requests. A refusal shall state the reasons for the refusal and give information on access to the review procedure provided for in accordance with article 9. The refusal shall be made as soon as possible and at the latest within one month, unless the complexity of the information justifies an extension of this period up to two months after the request. The applicant shall be informed of any extension and of the reasons justifying it.

8. Each Party may allow its public authorities to make a charge for supplying information, but such charge shall not exceed a reasonable amount. Public authorities intending to make such a charge for supplying information shall make available to applicants a schedule of charges which may be levied, indicating the circumstances in which they may be levied or waived and when the supply of information is conditional on the advance payment of such a charge.

Article 5

COLLECTION AND DISSEMINATION OF ENVIRONMENTAL INFORMATION

1. Each Party shall ensure that:

(a) Public authorities possess and update environmental information which is relevant to their functions;

(b) Mandatory systems are established so that there is an adequate flow of information to public authorities about proposed and existing activities which may significantly affect the environment;

(c) In the event of any imminent threat to human health or the environment, whether caused by human activities or due to natural causes, all information which could enable the public to take measures to prevent or mitigate harm arising from the threat and is held by a public authority is disseminated immediately and without delay to members of the public who may be affected.

2. Each Party shall ensure that, within the framework of national legislation, the way in which public authorities make environmental information available to the public is transparent and that environmental information is effectively accessible, inter alia, by:

(a) Providing sufficient information to the public about the type and scope of environmental information held by the relevant public authorities, the basic terms and conditions under which such information is made available and accessible, and the process by which it can be obtained;

(b) Establishing and maintaining practical arrangements, such as:

(i) Publicly accessible lists, registers or files;

(ii) Requiring officials to support the public in seeking access to information under this Convention; and

(iii) The identification of points of contact; and

(c) Providing access to the environmental information contained in lists, registers or files as referred to in subparagraph (b) (i) above free of charge.

3. Each Party shall ensure that environmental information progressively becomes available in electronic databases which are easily accessible to the public through public telecommunications networks. Information accessible in this form should include:

(a) Reports on the state of the environment, as referred to in paragraph 4 below;

(b) Texts of legislation on or relating to the environment;

(c) As appropriate, policies, plans and programmes on or relating to the environment, and environmental agreements; and

(d) Other information, to the extent that the availability of such information in this form would facilitate the application of national law implementing this Convention,

provided that such information is already available in electronic form.

4. Each Party shall, at regular intervals not exceeding three or four years, publish and disseminate a national report on the state of the environment, including information on the quality of the environment and information on pressures on the environment.

5. Each Party shall take measures within the framework of its legislation for the purpose of disseminating, inter alia:

(a) Legislation and policy documents such as documents on strategies, policies, programmes and action plans relating to the environment, and progress reports on their implementation, prepared at various levels of government;

(b) International treaties, conventions and agreements on environmental issues; and

(c) Other significant international documents on environmental issues, as appropriate.

6. Each Party shall encourage operators whose activities have a significant impact on the environment to inform the public regularly of the environmental impact of their activities and products, where appropriate within the framework of voluntary eco-labelling or eco-auditing schemes or by other means.

7. Each Party shall:

(a) Publish the facts and analyses of facts which it considers relevant and important in framing major environmental policy proposals;

(b) Publish, or otherwise make accessible, available explanatory material on its dealings with the public in matters falling within the scope of this Convention; and

(c) Provide in an appropriate form information on the performance of public functions or the provision of public services relating to the environment by government at all levels.

8. Each Party shall develop mechanisms with a view to ensuring that sufficient product information is made available to the public in a manner which enables consumers to make informed environmental choices.

9. Each Party shall take steps to establish progressively, taking into account international processes where appropriate, a coherent, nationwide system of pollution inventories or registers on a structured, computerized and publicly accessible database compiled through standardized reporting. Such a system may include inputs, releases and transfers of a specified range of substances and products, including water, energy and resource use, from a specified range of activities to environmental media and to on-site and off-site treatment and disposal sites.

10. Nothing in this article may prejudice the right of Parties to refuse to disclose certain environmental information in accordance with article 4, paragraphs 3 and 4.

Article 6

PUBLIC PARTICIPATION IN DECISIONS ON SPECIFIC ACTIVITIES

1. Each Party:

(a) Shall apply the provisions of this article with respect to decisions on whether to permit proposed activities listed in annex I;

(b) Shall, in accordance with its national law, also apply the provisions of this article to decisions on proposed activities not listed in annex I which may have a significant effect on the environment. To this end, Parties shall determine whether such a proposed activity is subject to these provisions; and

(c) May decide, on a case-by-case basis if so provided under national law, not to apply the provisions of this article to proposed activities serving national defence purposes, if that Party deems that such application would have an adverse effect on these purposes.

2. The public concerned shall be informed, either by public notice or individually as appropriate, early in an environmental decision-making procedure, and in an adequate, timely and effective manner, inter alia, of:

(a) The proposed activity and the application on which a decision will be taken;

(b) The nature of possible decisions or the draft decision;

(c) The public authority responsible for making the decision;

(d) The envisaged procedure, including, as and when this information can be provided:

(i) The commencement of the procedure;

(ii) The opportunities for the public to participate;

(iii) The time and venue of any envisaged public hearing;

(iv) An indication of the public authority from which relevant information can be obtained and where the relevant information has been deposited for examination by the public;

(v) An indication of the relevant public authority or any other official body to which comments or questions can be submitted and of the time schedule for transmittal of comments or questions; and

(vi) An indication of what environmental information relevant to the proposed activity is available; and

(e) The fact that the activity is subject to a national or transboundary environmental impact assessment procedure.

3. The public participation procedures shall include reasonable time-frames for the different phases, allowing sufficient time for informing the public in accordance with paragraph 2 above and for the public to prepare and participate effectively during the environmental decision-making.

4. Each Party shall provide for early public participation, when all options are open and effective public participation can take place.

5. Each Party should, where appropriate, encourage prospective applicants to identify the public concerned, to enter into discussions, and to provide information regarding the objectives of their application before applying for a permit.

6. Each Party shall require the competent public authorities to give the public concerned access for examination, upon request where so required under national law, free of charge and as soon as it becomes available, to all information relevant to the decision-making referred to in this article that is available at the time of the public participation procedure, without prejudice to the right of Parties to refuse to disclose certain information in accordance with article 4, paragraphs 3 and 4. The relevant information shall include at least, and without prejudice to the provisions of article 4:

(a) A description of the site and the physical and technical characteristics of the proposed activity, including an estimate of the expected residues and emissions;

(b) A description of the significant effects of the proposed activity on the environment;

(c) A description of the measures envisaged to prevent and/or reduce the effects, including emissions;

(d) A non-technical summary of the above;

(e) An outline of the main alternatives studied by the applicant; and

(f) In accordance with national legislation, the main reports and advice issued to the public authority at the time when the public concerned shall be informed in accordance with paragraph 2 above.

7. Procedures for public participation shall allow the public to submit, in writing or, as appropriate, at a public hearing or inquiry with the applicant, any comments, information, analyses or opinions that it considers relevant to the proposed activity.

8. Each Party shall ensure that in the decision due account is taken of the outcome of the public participation.

9. Each Party shall ensure that, when the decision has been taken by the public authority, the public is promptly informed of the decision in accordance with the appropriate procedures. Each Party shall make accessible to the public the text of the decision along with the reasons and considerations on which the decision is based.

10. Each Party shall ensure that, when a public authority reconsiders or updates the operating conditions for an activity referred to in paragraph 1, the provisions of paragraphs 2 to 9 of this article are applied mutatis mutandis, and where appropriate.

11. Each Party shall, within the framework of its national law, apply, to the extent feasible and appropriate, provisions of this article to decisions on whether to permit the deliberate release of genetically modified organisms into the environment.

Article 7

PUBLIC PARTICIPATION CONCERNING PLANS, PROGRAMMES AND POLICIES RELATING TO THE ENVIRONMENT

Each Party shall make appropriate practical and/or other provisions for the public to participate during the preparation of plans and programmes relating to the environment, within a transparent and fair framework, having provided the necessary information to the public. Within this framework, article 6, paragraphs 3, 4 and 8, shall be applied. The public which may participate shall be identified by the relevant public authority, taking into account the objectives of this Convention. To the extent appropriate, each Party shall endeavour to provide opportunities for public participation in the preparation of policies relating to the environment.

Article 8

PUBLIC PARTICIPATION DURING THE PREPARATION OF EXECUTIVE REGULATIONS AND/OR GENERALLY APPLICABLE LEGALLY BINDING NORMATIVE INSTRUMENTS

Each Party shall strive to promote effective public participation at an appropriate stage, and while options are still open, during the preparation by public authorities of executive regulations and other generally applicable legally binding rules that may have a significant effect on the environment. To this end, the following steps should be taken:

(a) Time-frames sufficient for effective participation should be

fixed;

(b) Draft rules should be published or otherwise made publicly available; and

(c) The public should be given the opportunity to comment, directly or through representative consultative bodies.

The result of the public participation shall be taken into account as far as possible.

Article 9

ACCESS TO JUSTICE

1. Each Party shall, within the framework of its national legislation, ensure that any person who considers that his or her request for information under article 4 has been ignored, wrongfully refused, whether in part or in full, inadequately answered, or otherwise not dealt with in accordance with the provisions of that article, has access to a review procedure before a court of law or another independent and impartial body established by law.

In the circumstances where a Party provides for such a review by a court of law, it shall ensure that such a person also has access to an expeditious procedure established by law that is free of charge or inexpensive for reconsideration by a public authority or review by an independent and impartial body other than a court of law.

Final decisions under this paragraph 1 shall be binding on the public authority holding the information. Reasons shall be stated in writing, at least where access to information is refused under this paragraph.

2. Each Party shall, within the framework of its national legislation, ensure that members of the public concerned

(a) Having a sufficient interest

or, alternatively,

(b) Maintaining impairment of a right, where the administrative procedural law of a Party requires this as a precondition,

have access to a review procedure before a court of law and/or another independent and impartial body established by law, to challenge the substantive and procedural legality of any decision, act or omission subject to the provisions of article 6 and, where so provided for under national law and without prejudice to paragraph 3 below, of other relevant provisions of this Convention.

What constitutes a sufficient interest and impairment of a right shall be determined in accordance with the requirements of national law and consistently with the objective of giving the public concerned wide access to justice within the scope of this Convention. To this end, the interest of any non-governmental organization meeting the requirements referred to in article 2, paragraph 5, shall be deemed sufficient for the purpose of subparagraph (a) above. Such organizations shall also be deemed to have rights capable of being impaired for the purpose of subparagraph (b) above.

The provisions of this paragraph 2 shall not exclude the possibility of

a preliminary review procedure before an administrative authority and shall not affect the requirement of exhaustion of administrative review procedures prior to recourse to judicial review procedures, where such a requirement exists under national law.

3. In addition and without prejudice to the review procedures referred to in paragraphs 1 and 2 above, each Party shall ensure that, where they meet the criteria, if any, laid down in its national law, members of the public have access to administrative or judicial procedures to challenge acts and omissions by private persons and public authorities which contravene provisions of its national law relating to the environment.

4. In addition and without prejudice to paragraph 1 above, the procedures referred to in paragraphs 1, 2 and 3 above shall provide adequate and effective remedies, including injunctive relief as appropriate, and be fair,

equitable, timely and not prohibitively expensive. Decisions under this article shall be given or recorded in writing. Decisions of courts, and whenever possible of other bodies, shall be publicly accessible.

5. In order to further the effectiveness of the provisions of this article, each Party shall ensure that information is provided to the public on access to administrative and judicial review procedures and shall consider the establishment of appropriate assistance mechanisms to remove or reduce financial and other barriers to access to justice.

Article 10

MEETING OF THE PARTIES

1. The first meeting of the Parties shall be convened no later than one year after the date of the entry into force of this Convention. Thereafter, an ordinary meeting of the Parties shall be held at least once every two years, unless otherwise decided by the Parties, or at the written request of any Party, provided that, within six months of the request being communicated to all Parties by the Executive Secretary of the Economic Commission for Europe, the said request is supported by at least one third of the Parties.

2. At their meetings, the Parties shall keep under continuous review the implementation of this Convention on the basis of regular reporting by the Parties, and, with this purpose in mind, shall:

(a) Review the policies for and legal and methodological approaches to access to information, public participation in decision-making and access to justice in environmental matters, with a view to further improving them;

(b) Exchange information regarding experience gained in concluding and implementing bilateral and multilateral agreements or other arrangements having relevance to the purposes of this Convention and to which one or more of the Parties are a party;

(c) Seek, where appropriate, the services of relevant ECE bodies and other competent international bodies and specific committees in all aspects pertinent to the achievement of the purposes of this Convention;

(d) Establish any subsidiary bodies as they deem necessary;

(e) Prepare, where appropriate, protocols to this Convention;

(f) Consider and adopt proposals for amendments to this Convention in accordance with the provisions of article 14;

(g) Consider and undertake any additional action that may be required for the achievement of the purposes of this Convention;

(h) At their first meeting, consider and by consensus adopt rules of procedure for their meetings and the meetings of subsidiary bodies;

(i) At their first meeting, review their experience in implementing the provisions of article 5, paragraph 9, and consider what steps are necessary to develop further the system referred to in that paragraph, taking into account international processes and developments, including the elaboration of an appropriate instrument concerning pollution release and transfer registers or inventories which could be annexed to this Convention.

3. The Meeting of the Parties may, as necessary, consider establishing financial arrangements on a consensus basis.

4. The United Nations, its specialized agencies and the International Atomic Energy Agency, as well as any State or regional economic integration organization entitled under article 17 to sign this Convention but which is not a Party to this Convention, and any intergovernmental organization qualified in the fields to which this Convention relates, shall be entitled to participate as observers in the meetings of the Parties.

5. Any non-governmental organization, qualified in the fields to which this Convention relates, which has informed the Executive Secretary of the Economic Commission for Europe of its wish to be represented at a meeting of the Parties shall be entitled to participate as an observer unless at least one third of the Parties present in the meeting raise objections.

6. For the purposes of paragraphs 4 and 5 above, the rules of procedure referred to in paragraph 2 (h) above shall provide for practical arrangements for the admittance procedure and other relevant terms.

Article 11

RIGHT TO VOTE

1. Except as provided for in paragraph 2 below, each Party to this Convention shall have one vote.

2. Regional economic integration organizations, in matters within their competence, shall exercise their right to vote with a number of votes equal to the number of their member States which are Parties to this Convention. Such organizations shall not exercise their right to vote if their member States exercise theirs, and vice versa.

Article 12

SECRETARIAT

The Executive Secretary of the Economic Commission for Europe shall carry out the following secretariat functions:

(a) The convening and preparing of meetings of the Parties;

(b) The transmission to the Parties of reports and other information received in accordance with the provisions of this Convention; and

(c) Such other functions as may be determined by the Parties.

Article 13

ANNEXES

The annexes to this Convention shall constitute an integral part thereof.

Article 14

AMENDMENTS TO THE CONVENTION

1. Any Party may propose amendments to this Convention.

2. The text of any proposed amendment to this Convention shall be submitted in writing to the Executive Secretary of the Economic Commission for Europe, who shall communicate it to all Parties at least ninety days before the meeting of the Parties at which it is proposed for adoption.

3. The Parties shall make every effort to reach agreement on any proposed amendment to this Convention by consensus. If all efforts at consensus have been exhausted, and no agreement reached, the amendment shall as a last resort be adopted by a three-fourths majority vote of the Parties present and voting at the meeting.

4. Amendments to this Convention adopted in accordance with paragraph 3 above shall be communicated by the Depositary to all Parties for ratification, approval or acceptance. Amendments to this Convention other than those to an annex shall enter into force for Parties having ratified, approved or accepted them on the ninetieth day after the receipt by the Depositary of notification of their ratification, approval or acceptance by at least three fourths of these Parties. Thereafter they shall enter into force for any other Party on the ninetieth day after that Party deposits its instrument of ratification, approval or acceptance of the amendments.

5. Any Party that is unable to approve an amendment to an annex to this Convention shall so notify the Depositary in writing within twelve months from the date of the communication of the adoption. The Depositary shall without delay notify all Parties of any such notification received. A Party may at any time substitute an acceptance for its previous notification and, upon deposit of an instrument of acceptance with the Depositary, the amendments to such an annex shall become effective for that Party.

6. On the expiry of twelve months from the date of its communication by the Depositary as provided for in paragraph 4 above an amendment to an annex shall become effective for those Parties which have not submitted a notification to the Depositary in accordance with the provisions of paragraph 5 above, provided that not more than one third of the Parties have submitted such a notification.

7. For the purposes of this article, "Parties present and voting" means Parties present and casting an affirmative or negative vote.

Article 15

REVIEW OF COMPLIANCE

The Meeting of the Parties shall establish, on a consensus basis, optional arrangements of a non-confrontational, non-judicial and consultative nature for reviewing compliance with the provisions of this Convention. These arrangements shall allow for appropriate public involvement and may include the option of considering communications from members of the public on matters related to this Convention.

Article 16

SETTLEMENT OF DISPUTES

1. If a dispute arises between two or more Parties about the interpretation or application of this Convention, they shall seek a solution by negotiation or by any other means of dispute settlement acceptable to the parties to the dispute.

2. When signing, ratifying, accepting, approving or acceding to this Convention, or at any time thereafter, a Party may declare in writing to the Depositary that, for a dispute not resolved in accordance with paragraph 1 above, it accepts one or both of the following means of dispute settlement as compulsory in relation to any Party accepting the same obligation:

(a) Submission of the dispute to the International Court of Justice;

(b) Arbitration in accordance with the procedure set out in annex II.

3. If the parties to the dispute have accepted both means of dispute settlement referred to in paragraph 2 above, the dispute may be submitted only to the International Court of Justice, unless the parties agree otherwise.

Article 17

SIGNATURE

This Convention shall be open for signature at Aarhus (Denmark) on 25 June 1998, and thereafter at United Nations Headquarters in New York until 21 December 1998, by States members of the Economic Commission for Europe as well as States having consultative status with the Economic Commission for Europe pursuant to paragraphs 8 and 11 of Economic and Social Council resolution 36 (IV) of 28 March 1947, and by regional economic integration organizations constituted by sovereign States members of the Economic Commission for Europe to which their member States have transferred competence over matters governed by this Convention, including the competence to enter into treaties in respect of these matters.

Article 18

DEPOSITARY

The Secretary-General of the United Nations shall act as the Depositary of this Convention.

Article 19

RATIFICATION, ACCEPTANCE, APPROVAL AND ACCESSION

1. This Convention shall be subject to ratification, acceptance or approval by signatory States and regional economic integration organizations.

2. This Convention shall be open for accession as from 22 December 1998 by the States and regional economic integration organizations referred to in article 17.

3. Any other State, not referred to in paragraph 2 above, that is a Member of the United Nations may accede to the Convention upon approval by the Meeting of the Parties.

4. Any organization referred to in article 17 which becomes a Party to this Convention without any of its member States being a Party shall be bound by all the obligations under this Convention. If one or more of such an organization's member States is a Party to this Convention, the organization and its member States shall decide on their respective responsibilities for the performance of their obligations under this Convention. In such cases, the organization and the member States shall not be entitled to exercise rights under this Convention concurrently.

5. In their instruments of ratification, acceptance, approval or accession, the regional economic integration organizations referred to in article 17 shall declare the extent of their competence with respect to the matters

governed by this Convention. These organizations shall also inform the Depositary of any substantial modification to the extent of their competence.

Article 20

ENTRY INTO FORCE

1. This Convention shall enter into force on the ninetieth day after the date of deposit of the sixteenth instrument of ratification, acceptance, approval or accession.

2. For the purposes of paragraph 1 above, any instrument deposited by a regional economic integration organization shall not be counted as additional to those deposited by States members of such an organization.

3. For each State or organization referred to in article 17 which ratifies, accepts or approves this Convention or accedes thereto after the deposit of the sixteenth instrument of ratification, acceptance, approval or accession, the Convention shall enter into force on the ninetieth day after the date of deposit by such State or organization of its instrument of ratification, acceptance, approval or accession.

Article 21

WITHDRAWAL

At any time after three years from the date on which this Convention has come into force with respect to a Party, that Party may withdraw from the Convention by giving written notification to the Depositary. Any such withdrawal shall take effect on the ninetieth day after the date of its receipt by the Depositary.

Article 22

AUTHENTIC TEXTS

The original of this Convention, of which the English, French and Russian texts are equally authentic, shall be deposited with the Secretary-General of the United Nations.

IN WITNESS WHEREOF the undersigned, being duly authorized thereto, have signed this Convention.

DONE at Aarhus (Denmark), this twenty-fifth day of June, one thousand nine hundred and ninety-eight.

Annex I

LIST OF ACTIVITIES REFERRED TO IN ARTICLE 6, PARAGRAPH 1 (a)

1. Energy sector:

- Mineral oil and gas refineries;
- Installations for gasification and liquefaction;
- Thermal power stations and other combustion installations with a heat input of 50 megawatts (MW)or more;
- Coke ovens;
- Nuclear power stations and other nuclear reactors including the dismantling or decommissioning of such power stations or reactors 1/ (except research installations for the production and conversion of fissionable and fertile materials whose maximum power does not exceed 1 kW continuous thermal load);
- Installations for the reprocessing of irradiated nuclear fuel;
- Installations designed:
  - For the production or enrichment of nuclear fuel;
  - For the processing of irradiated nuclear fuel or high-level radioactive waste;
  - For the final disposal of irradiated nuclear fuel;
  - Solely for the final disposal of radioactive waste;
  - Solely for the storage (planned for more than 10 years) of irradiated nuclear fuels or radioactive waste in a different site than the production site.

2. Production and processing of metals:

- Metal ore (including sulphide ore) roasting or sintering installations;
- Installations for the production of pig-iron or steel (primary or secondary fusion) including continuous casting, with a capacity exceeding 2.5 tons per hour;
- Installations for the processing of ferrous metals:
  (i) Hot-rolling mills with a capacity exceeding 20 tons of crude steel per hour;
  (ii) Smitheries with hammers the energy of which exceeds 50 kilojoules per hammer, where the calorific power used exceeds 20 MW;
  (iii) Application of protective fused metal coats with an input exceeding 2 tons of crude steel per hour;
- Ferrous metal foundries with a production capacity exceeding 20 tons per day;
- Installations:
  (i) For the production of non-ferrous crude metals from ore, concentrates or secondary raw materials by metallurgical, chemical or electrolytic processes;
  (ii) For the smelting, including the alloying, of non-ferrous metals, including recovered products (refining, foundry casting, etc.), with a melting capacity exceeding 4 tons per day for lead and cadmium or 20 tons per day for all other metals;
- Installations for surface treatment of metals and plastic materials using an electrolytic or chemical process where the volume of the treatment vats exceeds 30 m^3.

3. Mineral industry:

- Installations for the production of cement clinker in rotary kilns with a production capacity exceeding 500 tons per day or lime in rotary kilns with a production capacity exceeding 50 tons per day or in other furnaces with a production capacity exceeding 50 tons per day;
- Installations for the production of asbestos and the manufacture of asbestos-based products;
- Installations for the manufacture of glass including glass fibre with a melting capacity exceeding 20 tons per day;
- Installations for melting mineral substances including the production of mineral fibres with a melting capacity exceeding 20 tons per day;
- Installations for the manufacture of ceramic products by firing, in particular roofing tiles, bricks, refractory bricks, tiles, stoneware or porcelain, with a production capacity exceeding 75 tons per day, and/or with a kiln capacity exceeding 4 m^3 and with a setting density per kiln exceeding 300 kg/m^3.

4. Chemical industry: Production within the meaning of the categories of activities contained in this paragraph means the production on an industrial scale by chemical processing of substances or groups of substances listed in subparagraphs (a) to (g):

(a) Chemical installations for the production of basic organic chemicals, such as:

(i) Simple hydrocarbons (linear or cyclic, saturated or unsaturated, aliphatic or aromatic);
(ii) Oxygen-containing hydrocarbons such as alcohols, aldehydes, ketones, carboxylic acids, esters, acetates, ethers, peroxides, epoxy resins;
(iii) Sulphurous hydrocarbons;
(iv) Nitrogenous hydrocarbons such as amines, amides, nitrous compounds, nitro compounds or nitrate compounds, nitriles, cyanates, isocyanates;
(v) Phosphorus-containing hydrocarbons;
(vi) Halogenic hydrocarbons;
(vii) Organometallic compounds;
(viii) Basic plastic materials (polymers, synthetic fibres and cellulose-based fibres);
(ix) Synthetic rubbers;
(x) Dyes and pigments;
(xi) Surface-active agents and surfactants;

(b) Chemical installations for the production of basic inorganic chemicals, such as:

(i) Gases, such as ammonia, chlorine or hydrogen chloride, fluorine or hydrogen fluoride, carbon oxides, sulphur compounds, nitrogen oxides, hydrogen, sulphur dioxide, carbonyl chloride;
(ii) Acids, such as chromic acid, hydrofluoric acid, phosphoric acid, nitric acid, hydrochloric acid, sulphuric acid, oleum, sulphurous acids;
(iii) Bases, such as ammonium hydroxide, potassium hydroxide, sodium hydroxide;
(iv) Salts, such as ammonium chloride, potassium chlorate, potassium carbonate, sodium carbonate, perborate, silver nitrate;

(v) Non-metals, metal oxides or other inorganic compounds such as calcium carbide, silicon, silicon carbide;

(c) Chemical installations for the production of phosphorous-, nitrogen- or potassium-based fertilizers (simple or compound fertilizers);

(d) Chemical installations for the production of basic plant health products and of biocides;

(e) Installations using a chemical or biological process for the production of basic pharmaceutical products;

(f) Chemical installations for the production of explosives;

(g) Chemical installations in which chemical or biological processing is used for the production of protein feed additives, ferments and other protein substances.

5. Waste management:

- Installations for the incineration, recovery, chemical treatment or landfill of hazardous waste;
- Installations for the incineration of municipal waste with a capacity exceeding 3 tons per hour;
- Installations for the disposal of non-hazardous waste with a capacity exceeding 50 tons per day;
- Landfills receiving more than 10 tons per day or with a total capacity exceeding 25 000 tons, excluding landfills of inert waste.

6. Waste-water treatment plants with a capacity exceeding 150 000 population equivalent.

7. Industrial plants for the:

(a) Production of pulp from timber or similar fibrous materials;

(b) Production of paper and board with a production capacity exceeding 20 tons per day.

8. (a) Construction of lines for long-distance railway traffic and of airports 2/ with a basic runway length of 2 100 m or more;

(b) Construction of motorways and express roads; 3/

(c) Construction of a new road of four or more lanes, or realignment and/or widening of an existing road of two lanes or less so as to provide four or more lanes, where such new road, or realigned and/or widened section of road, would be 10 km or more in a continuous length.

9. (a) Inland waterways and ports for inland-waterway traffic which permit the passage of vessels of over 1 350 tons;

(b) Trading ports, piers for loading and unloading connected to land and outside ports (excluding ferry piers) which can take vessels of over 1 350 tons.

10. Groundwater abstraction or artificial groundwater recharge schemes where the annual volume of water abstracted or recharged is equivalent to or exceeds 10 million cubic metres.

11. (a) Works for the transfer of water resources between river basins where this transfer aims at preventing possible shortages of water and where the amount of water transferred exceeds 100 million cubic metres/year;

(b) In all other cases, works for the transfer of water resources between river basins where the multiannual average flow of the basin of abstraction exceeds 2 000 million cubic metres/year and where the amount of water transferred exceeds 5% of this flow.

In both cases transfers of piped drinking water are excluded.

12. Extraction of petroleum and natural gas for commercial purposes where the amount extracted exceeds 500 tons/day in the case of petroleum and 500 000 cubic metres/day in the case of gas.

13. Dams and other installations designed for the holding back or permanent storage of water, where a new or additional amount of water held back or stored exceeds 10 million cubic metres.

14. Pipelines for the transport of gas, oil or chemicals with a diameter of more than 800 mm and a length of more than 40 km.

15. Installations for the intensive rearing of poultry or pigs with more than:

(a) 40 000 places for poultry;

(b) 2 000 places for production pigs (over 30 kg); or

(c) 750 places for sows.

16. Quarries and opencast mining where the surface of the site exceeds 25 hectares, or peat extraction, where the surface of the site exceeds 150 hectares.

17. Construction of overhead electrical power lines with a voltage of 220 kV or more and a length of more than 15 km.

18. Installations for the storage of petroleum, petrochemical, or chemical products with a capacity of 200 000 tons or more.

19. Other activities:

- Plants for the pretreatment (operations such as washing, bleaching, mercerization) or dyeing of fibres or textiles where the treatment capacity exceeds 10 tons per day;
- Plants for the tanning of hides and skins where the treatment capacity exceeds 12 tons of finished products per day;
- (a) Slaughterhouses with a carcass production capacity greater than 50 tons per day;

  (b) Treatment and processing intended for the production of food products from:

    (i) Animal raw materials (other than milk) with a finished product production capacity greater than 75 tons per day;

    (ii) Vegetable raw materials with a finished product production capacity greater than 300 tons per day (average value on a quarterly basis);

(c) Treatment and processing of milk, the quantity of milk received being greater than 200 tons per day (average value on an annual basis);

- Installations for the disposal or recycling of animal carcasses and animal waste with a treatment capacity exceeding 10 tons per day;
- Installations for the surface treatment of substances, objects or products using organic solvents, in particular for dressing, printing, coating, degreasing, waterproofing, sizing, painting, cleaning or impregnating, with a consumption capacity of more than 150 kg per hour or more than 200 tons per year;
- Installations for the production of carbon (hard-burnt coal) or electrographite by means of incineration or graphitization.

20. Any activity not covered by paragraphs 1-19 above where public participation is provided for under an environmental impact assessment procedure in accordance with national legislation.

21. The provision of article 6, paragraph 1 (a) of this Convention, does not apply to any of the above projects undertaken exclusively or mainly for research, development and testing of new methods or products for less than two years unless they would be likely to cause a significant adverse effect on environment or health.

22. Any change to or extension of activities, where such a change or extension in itself meets the criteria/thresholds set out in this annex, shall be subject to article 6, paragraph 1 (a) of this Convention. Any other change or extension of activities shall be subject to article 6, paragraph 1 (b) of this Convention.

Notes

1/ Nuclear power stations and other nuclear reactors cease to be such an installation when all nuclear fuel and other radioactively contaminated elements have been removed permanently from the installation site.

2/ For the purposes of this Convention, "airport" means an airport which complies with the definition in the 1944 Chicago Convention setting up the International Civil Aviation Organization (Annex 14).

3/ For the purposes of this Convention, "express road" means a road which complies with the definition in the European Agreement on Main International Traffic Arteries of 15 November 1975.

Annex II

ARBITRATION

1. In the event of a dispute being submitted for arbitration pursuant to article 16, paragraph 2, of this Convention, a party or parties shall notify the secretariat of the subject matter of arbitration and indicate, in particular, the articles of this Convention whose interpretation or application is at issue. The secretariat shall forward the information received to all Parties to this Convention.

2. The arbitral tribunal shall consist of three members. Both the claimant party or parties and the other party or parties to the dispute shall appoint an arbitrator, and the two arbitrators so appointed shall designate by common agreement the third arbitrator, who shall be the president of the arbitral tribunal. The latter shall not be a national of one of the parties to the dispute, nor have his or her usual place of residence in the territory of one of these parties, nor be employed by any of them, nor have dealt with the case in any other capacity.

3. If the president of the arbitral tribunal has not been designated within two months of the appointment of the second arbitrator, the Executive Secretary of the Economic Commission for Europe shall, at the request of either party to the dispute, designate the president within a further two-month period.

4. If one of the parties to the dispute does not appoint an arbitrator within two months of the receipt of the request, the other party may so inform the Executive Secretary of the Economic Commission for Europe, who shall designate the president of the arbitral tribunal within a further two-month period. Upon designation, the president of the arbitral tribunal shall request the party which has not appointed an arbitrator to do so within two months. If it fails to do so within that period, the president shall so inform the Executive Secretary of the Economic Commission for Europe, who shall make this appointment within a further two-month period.

5. The arbitral tribunal shall render its decision in accordance with international law and the provisions of this Convention.

6. Any arbitral tribunal constituted under the provisions set out in this annex shall draw up its own rules of procedure.

7. The decisions of the arbitral tribunal, both on procedure and on substance, shall be taken by majority vote of its members.

8. The tribunal may take all appropriate measures to establish the facts.

9. The parties to the dispute shall facilitate the work of the arbitral tribunal and, in particular, using all means at their disposal, shall:

(a) Provide it with all relevant documents, facilities and information;

(b) Enable it, where necessary, to call witnesses or experts and receive their evidence.

10. The parties and the arbitrators shall protect the confidentiality of any information that they receive in confidence during the proceedings of the arbitral tribunal.

11. The arbitral tribunal may, at the request of one of the parties, recommend interim measures of protection.

12. If one of the parties to the dispute does not appear before the arbitral tribunal or fails to defend its case, the other party may request the tribunal to continue the proceedings and to render its final decision. Absence of a party or failure of a party to defend its case shall not constitute a bar to the proceedings.

13. The arbitral tribunal may hear and determine counter-claims arising directly out of the subject matter of the dispute.

14. Unless the arbitral tribunal determines otherwise because of the particular circumstances of the case, the expenses of the tribunal, including the remuneration of its members, shall be borne by the parties to the dispute in equal shares. The tribunal shall keep a record of all its expenses, and shall furnish a final statement thereof to the parties.

15. Any Party to this Convention which has an interest of a legal nature in the subject matter of the dispute, and which may be affected by a decision in the case, may intervene in the proceedings with the consent of the tribunal.

16. The arbitral tribunal shall render its award within five months of the date on which it is established, unless it finds it necessary to extend the time limit for a period which should not exceed five months.

17. The award of the arbitral tribunal shall be accompanied by a statement of reasons. It shall be final and binding upon all parties to the dispute. The award will be transmitted by the arbitral tribunal to the parties to the dispute and to the secretariat. The secretariat will forward the information received to all Parties to this Convention.

18. Any dispute which may arise between the parties concerning the interpretation or execution of the award may be submitted by either party to the arbitral tribunal which made the award or, if the latter cannot be seized thereof, to another tribunal constituted for this purpose in the same manner as the first.

►B DIRECTIVE 2003/35/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 26 May 2003

providing for public participation in respect of the drawing up of certain plans and programmes relating to the environment and amending with regard to public participation and access to justice Council Directives 85/337/EEC and 96/61/EC

(OJ L 156, 25.6.2003, p. 17)

DIRECTIVE 2003/35/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 26 May 2003

providing for public participation in respect of the drawing up of certain plans and programmes relating to the environment and amending with regard to public participation and access to justice Council Directives 85/337/EEC and 96/61/EC

THE EUROPEAN PARLIAMENT AND THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty establishing the European Community, and in particular Article 175 thereof,

Having regard to the proposal from the Commission ([1]),

Having regard to the opinion of the European Economic and Social Committee ([2]),

Having regard to the opinion of the Committee of the Regions ([3]),

Acting in accordance with the procedure laid down in Article 251 of the Treaty ([4]), in the light of the joint text approved by the Conciliation Committee on 15 January 2003,

Whereas:

(1) Community legislation in the field of the environment aims to contribute to preserving, protecting and improving the quality of the environment and protecting human health.

(2) Community environmental legislation includes provisions for public authorities and other bodies to take decisions which may have a significant effect on the environment as well as on personal health and well-being.

(3) Effective public participation in the taking of decisions enables the public to express, and the decision-maker to take account of, opinions and concerns which may be relevant to those decisions, thereby increasing the accountability and transparency of the decision-making process and contributing to public awareness of environmental issues and support for the decisions taken.

([1]) OJ C 154 E, 29.5.2001, p. 123.
([2]) OJ C 221, 7.8.2001, p. 65.
([3]) OJ C 357, 14.12.2001, p. 58.
([4]) Opinion of the European Parliament of 23 October 2001 (OJ C 112, 9.5.2002, p. 125 (E)), Council Common Position of 25 April 2002 (OJ C 170 E, 16.7.2002, p. 22) and Decision of the European Parliament of 5 September 2002 (not yet published in the Official Journal). Decision of the European Parliament of 30 January 2003 and Decision of the Council of 4 March 2003.

▼B

(4) Participation, including participation by associations, organisations and groups, in particular non-governmental organisations promoting environmental protection, should accordingly be fostered, including *inter alia* by promoting environmental education of the public.

(5) On 25 June 1998 the Community signed the UN/ECE Convention on Access to Information, Public Participation in Decision-Making and Access to Justice in Environmental Matters (the Århus Convention). Community law should be properly aligned with that Convention with a view to its ratification by the Community.

(6) Among the objectives of the Århus Convention is the desire to guarantee rights of public participation in decision-making in environmental matters in order to contribute to the protection of the right to live in an environment which is adequate for personal health and well-being.

(7) Article 6 of the Århus Convention provides for public participation in decisions on the specific activities listed in Annex I thereto and on activities not so listed which may have a significant effect on the environment.

(8) Article 7 of the Århus Convention provides for public participation concerning plans and programmes relating to the environment.

(9) Article 9(2) and (4) of the Århus Convention provides for access to judicial or other procedures for challenging the substantive or procedural legality of decisions, acts or omissions subject to the public participation provisions of Article 6 of the Convention.

(10) Provision should be made in respect of certain Directives in the environmental area which require Member States to produce plans and programmes relating to the environment but which do not contain sufficient provisions on public participation, so as to ensure public participation consistent with the provisions of the Århus Convention, in particular Article 7 thereof. Other relevant Community legislation already provides for public participation in the preparation of plans and programmes and, for the future, public participation requirements in line with the Århus Convention will be incorporated into the relevant legislation from the outset.

(11) Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment [1], and Council Directive 96/61/EC of 24 September 1996 concerning integrated pollution prevention and control [2] should be amended to ensure that they are fully compatible with the provisions of the Århus Convention, in particular Article 6 and Article 9(2) and (4) thereof.

---

[1] OJ L 175, 5.7.1985, p. 40. Directive as amended by Directive 97/11/EC (OJ L 73, 14.3.1997, p. 5).

[2] OJ L 257, 10.10.1996, p. 26.

▼B

(12) Since the objective of the proposed action, namely to contribute to the implementation of the obligations arising under the Århus Convention, cannot be sufficiently achieved by the Member States and can therefore, by reason of the scale and effects of the action, be better achieved at Community level, the Community may adopt measures in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty. In accordance with the principle of proportionality, as set out in that Article, this Directive does not go beyond what is necessary in order to achieve that objective,

HAVE ADOPTED THIS DIRECTIVE:

Article 1

Objective

The objective of this Directive is to contribute to the implementation of the obligations arising under the Århus Convention, in particular by:

(a) providing for public participation in respect of the drawing up of certain plans and programmes relating to the environment;

(b) improving the public participation and providing for provisions on access to justice within Council Directives 85/337/EEC and 96/61/EC.

Article 2

Public participation concerning plans and programmes

1. For the purposes of this Article, 'the public' shall mean one or more natural or legal persons and, in accordance with national legislation or practice, their associations, organisations or groups.

2. Member States shall ensure that the public is given early and effective opportunities to participate in the preparation and modification or review of the plans or programmes required to be drawn up under the provisions listed in Annex I.

To that end, Member States shall ensure that:

(a) the public is informed, whether by public notices or other appropriate means such as electronic media where available, about any proposals for such plans or programmes or for their modification or review and that relevant information about such proposals is made available to the public including *inter alia* information about the right to participate in decision-making and about the competent authority to which comments or questions may be submitted;

(b) the public is entitled to express comments and opinions when all options are open before decisions on the plans and programmes are made;

(c) in making those decisions, due account shall be taken of the results of the public participation;

▼B

(d) having examined the comments and opinions expressed by the public, the competent authority makes reasonable efforts to inform the public about the decisions taken and the reasons and considerations upon which those decisions are based, including information about the public participation process.

3. Member States shall identify the public entitled to participate for the purposes of paragraph 2, including relevant non-governmental organisations meeting any requirements imposed under national law, such as those promoting environmental protection.

The detailed arrangements for public participation under this Article shall be determined by the Member States so as to enable the public to prepare and participate effectively.

Reasonable time-frames shall be provided allowing sufficient time for each of the different stages of public participation required by this Article.

4. This Article shall not apply to plans and programmes designed for the sole purpose of serving national defence or taken in case of civil emergencies.

5. This Article shall not apply to plans and programmes set out in Annex I for which a public participation procedure is carried out under Directive 2001/42/EC of the European Parliament and of the Council of 27 June 2001 on the assessment of the effects of certain plans and programmes on the environment ([1]) or under Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy ([2]).

▼M1

———————

▼B

Article 4

Amendment of Directive 96/61/EC

Directive 96/61/EC is hereby amended as follows:

1. Article 2 shall be amended as follows:

(a) the following sentence shall be added to point 10(b):

‘For the purposes of this definition, any change to or extension of an operation shall be deemed to be substantial if the change or extension in itself meets the thresholds, if any, set out in Annex I.’;

(b) the following points shall be added:

‘13. “the public” shall mean one or more natural or legal persons and, in accordance with national legislation or practice, their associations, organisations or groups;

([1]) OJ L 197, 21.7.2001, p. 30.
([2]) OJ L 327, 22.12.2000, p. 1. Directive as amended by Decision No 2455/2001/EC (OJ L 331, 15.12.2001, p. 1).

▼B

14. “the public concerned” shall mean the public affected or likely to be affected by, or having an interest in, the taking of a decision on the issuing or the updating of a permit or of permit conditions; for the purposes of this definition, non-governmental organisations promoting environmental protection and meeting any requirements under national law shall be deemed to have an interest;’

2. in Article 6(1), first subparagraph, the following indent shall be added:

‘— the main alternatives, if any, studied by the applicant in outline.’

3. Article 15 shall be amended as follows:

(a) paragraph 1 shall be replaced by the following:

‘1. Member States shall ensure that the public concerned are given early and effective opportunities to participate in the procedure for:

— issuing a permit for new installations,

— issuing a permit for any substantial change in the operation of an installation,

— updating of a permit or permit conditions for an installation in accordance with Article 13, paragraph 2, first indent.

The procedure set out in Annex V shall apply for the purposes of such participation.’;

(b) the following paragraph shall be added:

‘5. When a decision has been taken, the competent authority shall inform the public in accordance with the appropriate procedures and shall make available to the public the following information:

(a) the content of the decision, including a copy of the permit and of any conditions and any subsequent updates; and

(b) having examined the concerns and opinions expressed by the public concerned, the reasons and considerations on which the decision is based, including information on the public participation process.’;

4. the following Article shall be inserted:

‘Article 15a

Access to justice

Member States shall ensure that, in accordance with the relevant national legal system, members of the public concerned:

(a) having a sufficient interest, or alternatively,

(b) maintaining the impairment of a right, where administrative procedural law of a Member State requires this as a precondition;

▼B

have access to a review procedure before a court of law or another independent and impartial body established by law to challenge the substantive or procedural legality of decisions, acts or omissions subject to the public participation provisions of this Directive.

Member States shall determine at what stage the decisions, acts or omissions may be challenged.

What constitutes a sufficient interest and impairment of a right shall be determined by the Member States, consistently with the objective of giving the public concerned wide access to justice. To this end, the interest of any non-governmental organisation meeting the requirements referred to in Article 2(14) shall be deemed sufficient for the purpose of subparagraph (a) of this Article. Such organisations shall also be deemed to have rights capable of being impaired for the purpose of subparagraph (b) of this Article.

The provisions of this Article shall not exclude the possibility of a preliminary review procedure before an administrative authority and shall not affect the requirement of exhaustion of administrative review procedures prior to recourse to judicial review procedures, where such a requirement exists under national law.

Any such procedure shall be fair, equitable, timely and not prohibitively expensive.

In order to further the effectiveness of the provisions of this Article, Member States shall ensure that practical information is made available to the public on access to administrative and judicial review procedures.';

5. Article 17 shall be amended as follows:

(a) paragraph 1 shall be replaced by the following:

'1. Where a Member State is aware that the operation of an installation is likely to have significant negative effects on the environment of another Member State, or where a Member State likely to be significantly affected so requests, the Member State in whose territory the application for a permit pursuant to Article 4 or Article 12(2) was submitted shall forward to the other Member State any information required to be given or made available pursuant to Annex V at the same time as it makes it available to its own nationals. Such information shall serve as a basis for any consultations necessary in the framework of the bilateral relations between the two Member States on a reciprocal and equivalent basis.';

(b) the following paragraphs shall be added:

'3. The results of any consultations pursuant to paragraphs 1 and 2 must be taken into consideration when the competent authority reaches a decision on the application.

4. The competent authority shall inform any Member State, which has been consulted pursuant to paragraph 1, of the decision reached on the application and shall forward to it the information referred to in Article 15(5). That Member State shall take the measures necessary to ensure that that information is made available in an appropriate manner to the public concerned in its own territory.';

▼B

6. an Annex V shall be added, as set out in Annex II to this Directive.

Article 5

Reporting and review

By 25 June 2009, the Commission shall send a report on the application and effectiveness of this Directive to the European Parliament and to the Council. With a view to further integrating environmental protection requirements, in accordance with Article 6 of the Treaty, and taking into account the experience acquired in the application of this Directive in the Member States, such a report will be accompanied by proposals for amendment of this Directive, if appropriate. In particular, the Commission will consider the possibility of extending the scope of this Directive to other plans and programmes relating to the environment.

Article 6

Implementation

Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with this Directive by 25 June 2005 at the latest. They shall forthwith inform the Commission thereof.

When Member States adopt these measures, they shall contain a reference to this Directive or shall be accompanied by such a reference on the occasion of their official publication. The methods of making such reference shall be laid down by Member States.

Article 7

Entry into force

This Directive shall enter into force on the day of its publication in the *Official Journal of the European Union*.

Article 8

Addressees

This Directive is addressed to the Member States.

▼B

ANNEX II

In Directive 96/61/EC, the following Annex shall be added:

'ANNEX V

Public participation in decision-making

1. The public shall be informed (by public notices or other appropriate means such as electronic media where available) of the following matters early in the procedure for the taking of a decision or, at the latest, as soon as the information can reasonably be provided:

   (a) the application for a permit or, as the case may be, the proposal for the updating of a permit or of permit conditions in accordance with Article 15(1), including the description of the elements listed in Article 6(1);

   (b) where applicable, the fact that a decision is subject to a national or transboundary environmental impact assessment or to consultations between Member States in accordance with Article 17;

   (c) details of the competent authorities responsible for taking the decision, those from which relevant information can be obtained, those to which comments or questions can be submitted, and details of the time schedule for transmitting comments or questions;

   (d) the nature of possible decisions or, where there is one, the draft decision;

   (e) where applicable, the details relating to a proposal for the updating of a permit or of permit conditions;

   (f) an indication of the times and places where, or means by which, the relevant information will be made available;

   (g) details of the arrangements for public participation and consultation made pursuant to point 5.

2. Member States shall ensure that, within appropriate time-frames, the following is made available to the public concerned:

   (a) in accordance with national legislation, the main reports and advice issued to the competent authority or authorities at the time when the public concerned were informed in accordance with point 1;

   (b) in accordance with the provisions of Directive 2003/4/EC of the European Parliament and of the Council of 28 January 2003 on public access to environmental information (*), information other than that referred to in point 1 which is relevant for the decision in accordance with Article 8 and which only becomes available after the time the public concerned was informed in accordance with point 1.

3. The public concerned shall be entitled to express comments and opinions to the competent authority before a decision is taken.

4. The results of the consultations held pursuant to this Annex must be taken into due account in the taking of a decision.

5. The detailed arrangements for informing the public (for example by bill posting within a certain radius or publication in local newspapers) and consulting the public concerned (for example by written submissions or by way of a public inquiry) shall be determined by the Member States. Reasonable time-frames for the different phases shall be provided, allowing sufficient time for informing the public and for the public concerned to prepare and participate effectively in environmental decision-making subject to the provisions of this Annex.

(*) OJ L 41, 14.2.2003, p. 26.'

DIRECTIVE 2003/4/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL
of 28 January 2003
on public access to environmental information and repealing Council Directive 90/313/EEC

THE EUROPEAN PARLIAMENT AND THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty establishing the European Community, and in particular Article 175(1) thereof,

Having regard to the proposal from the Commission [1],

Having regard to the opinion of the European Economic and Social Committee [2],

Having regard to the opinion of the Committee of the Regions [3],

Acting in accordance with the procedure laid down in Article 251 of the Treaty [4] in the light of the joint text approved by the Conciliation Committee on 8 November 2002,

Whereas:

(1) Increased public access to environmental information and the dissemination of such information contribute to a greater awareness of environmental matters, a free exchange of views, more effective participation by the public in environmental decision-making and, eventually, to a better environment.

(2) Council Directive 90/313/EEC of 7 June 1990 on the freedom of access to information on the environment [5] initiated a process of change in the manner in which public authorities approach the issue of openness and transparency, establishing measures for the exercise of the right of public access to environmental information which should be developed and continued. This Directive expands the existing access granted under Directive 90/313/EEC.

(3) Article 8 of that Directive requires Member States to report to the Commission on the experience gained, in the light of which the Commission is required to make a report to the European Parliament and to the Council together with any proposal for revision of the Directive which it may consider appropriate.

(4) The report produced under Article 8 of that Directive identifies concrete problems encountered in the practical application of the Directive.

(5) On 25 June 1998 the European Community signed the UN/ECE Convention on Access to Information, Public Participation in Decision-Making and Access to Justice in Environmental Matters ('the Aarhus Convention'). Provisions of Community law must be consistent with that Convention with a view to its conclusion by the European Community.

(6) It is appropriate in the interest of increased transparency to replace Directive 90/313/EEC rather than to amend it, so as to provide interested parties with a single, clear and coherent legislative text.

(7) Disparities between the laws in force in the Member States concerning access to environmental information held by public authorities can create inequality within the Community as regards access to such information or as regards conditions of competition.

(8) It is necessary to ensure that any natural and legal person has a right of access to environmental information held by or for public authorities without his having to state an interest.

(9) It is also necessary that public authorities make available and disseminate environmental information to the general public to the widest extent possible, in particular by using information and communication technologies. The future development of these technologies should be taken into account in the reporting on, and reviewing of, this Directive.

(10) The definition of environmental information should be clarified so as to encompass information in any form on the state of the environment, on factors, measures or activities affecting or likely to affect the environment or designed to protect it, on cost-benefit and economic analyses used within the framework of such measures or activities and also information on the state of human health and safety, including the contamination of the food chain, conditions of human life, cultural sites and built structures in as much as they are, or may be, affected by any of those matters.

(11) To take account of the principle in Article 6 of the Treaty, that environmental protection requirements should be integrated into the definition and implementation of Community policies and activities, the definition of public authorities should be expanded so as to encompass government or other public administration at national, regional or local level whether or not they have specific responsibilities for the environment. The definition should likewise be expanded to include other persons or bodies performing public administrative functions in relation to the environment under national law, as well as other persons or bodies acting under their control and having public responsibilities or functions in relation to the environment.

Decision of the Council of 16 December 2002 and decision the European Parliament of 18 December 2002.
[5] OJ L 158, 23.6.1990, p. 56.

(12) Environmental information which is physically held by other bodies on behalf of public authorities should also fall within the scope of this Directive.

(13) Environmental information should be made available to applicants as soon as possible and within a reasonable time and having regard to any timescale specified by the applicant.

(14) Public authorities should make environmental information available in the form or format requested by an applicant unless it is already publicly available in another form or format or it is reasonable to make it available in another form or format. In addition, public authorities should be required to make all reasonable efforts to maintain the environmental information held by or for them in forms or formats that are readily reproducible and accessible by electronic means.

(15) Member States should determine the practical arrangements under which such information is effectively made available. These arrangements shall guarantee that the information is effectively and easily accessible and progressively becomes available to the public through public telecommunications networks, including publicly accessible lists of public authorities and registers or lists of environmental information held by or for public authorities.

(16) The right to information means that the disclosure of information should be the general rule and that public authorities should be permitted to refuse a request for environmental information in specific and clearly defined cases. Grounds for refusal should be interpreted in a restrictive way, whereby the public interest served by disclosure should be weighed against the interest served by the refusal. The reasons for a refusal should be provided to the applicant within the time limit laid down in this Directive.

(17) Public authorities should make environmental information available in part where it is possible to separate out any information falling within the scope of the exceptions from the rest of the information requested.

(18) Public authorities should be able to make a charge for supplying environmental information but such a charge should be reasonable. This implies that, as a general rule, charges may not exceed actual costs of producing the material in question. Instances where advance payment will be required should be limited. In particular cases, where public authorities make available environmental information on a commercial basis, and where this is necessary in order to guarantee the continuation of collecting and publishing such information, a market-based charge is considered to be reasonable; an advance payment may be required. A schedule of charges should be published and made available to applicants together with information on the circumstances in which a charge may be levied or waived.

(19) Applicants should be able to seek an administrative or judicial review of the acts or omissions of a public authority in relation to a request.

(20) Public authorities should seek to guarantee that when environmental information is compiled by them or on their behalf, the information is comprehensible, accurate and comparable. As this is an important factor in assessing the quality of the information supplied the method used in compiling the information should also be disclosed upon request.

(21) In order to increase public awareness in environmental matters and to improve environmental protection, public authorities should, as appropriate, make available and disseminate information on the environment which is relevant to their functions, in particular by means of computer telecommunication and/or electronic technology, where available.

(22) This Directive should be evaluated every four years, after its entry into force, in the light of experience and after submission of the relevant reports by the Member States, and be subject to revision on that basis. The Commission should submit an evaluation report to the European Parliament and the Council.

(23) Since the objectives of the proposed Directive cannot be sufficiently achieved by the Member States and can therefore be better achieved at Community level, the Community may adopt measures, in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty. In accordance with the principle of proportionality, as set out in that Article, this Directive does not go beyond what is necessary in order to achieve those objectives.

(24) The provisions of this Directive shall not affect the right of a Member State to maintain or introduce measures providing for broader access to information than required by this Directive,

HAVE ADOPTED THIS DIRECTIVE:

Article 1

Objectives

The objectives of this Directive are:

(a) to guarantee the right of access to environmental information held by or for public authorities and to set out the basic terms and conditions of, and practical arrangements for, its exercise; and

(b) to ensure that, as a matter of course, environmental information is progressively made available and disseminated to the public in order to achieve the widest possible systematic availability and dissemination to the public of environmental information. To this end the use, in particular, of computer telecommunication and/or electronic technology, where available, shall be promoted.

Article 2

Definitions

For the purposes of this Directive:

1. 'Environmental information' shall mean any information in written, visual, aural, electronic or any other material form on:
   (a) the state of the elements of the environment, such as air and atmosphere, water, soil, land, landscape and natural sites including wetlands, coastal and marine areas, biological diversity and its components, including genetically modified organisms, and the interaction among these elements;
   (b) factors, such as substances, energy, noise, radiation or waste, including radioactive waste, emissions, discharges and other releases into the environment, affecting or likely to affect the elements of the environment referred to in (a);
   (c) measures (including administrative measures), such as policies, legislation, plans, programmes, environmental agreements, and activities affecting or likely to affect the elements and factors referred to in (a) and (b) as well as measures or activities designed to protect those elements;
   (d) reports on the implementation of environmental legislation;
   (e) cost-benefit and other economic analyses and assumptions used within the framework of the measures and activities referred to in (c); and
   (f) the state of human health and safety, including the contamination of the food chain, where relevant, conditions of human life, cultural sites and built structures inasmuch as they are or may be affected by the state of the elements of the environment referred to in (a) or, through those elements, by any of the matters referred to in (b) and (c).
2. 'Public authority' shall mean:
   (a) government or other public administration, including public advisory bodies, at national, regional or local level;
   (b) any natural or legal person performing public administrative functions under national law, including specific duties, activities or services in relation to the environment; and
   (c) any natural or legal person having public responsibilities or functions, or providing public services, relating to the environment under the control of a body or person falling within (a) or (b).

   Member States may provide that this definition shall not include bodies or institutions when acting in a judicial or legislative capacity. If their constitutional provisions at the date of adoption of this Directive make no provision for a review procedure within the meaning of Article 6, Member States may exclude those bodies or institutions from that definition.
3. 'Information held by a public authority' shall mean environmental information in its possession which has been produced or received by that authority.
4. 'Information held for a public authority' shall mean environmental information which is physically held by a natural or legal person on behalf of a public authority.
5. 'Applicant' shall mean any natural or legal person requesting environmental information.
6. 'Public' shall mean one or more natural or legal persons, and, in accordance with national legislation or practice, their associations, organisations or groups.

Article 3

Access to environmental information upon request

1. Member States shall ensure that public authorities are required, in accordance with the provisions of this Directive, to make available environmental information held by or for them to any applicant at his request and without his having to state an interest.

2. Subject to Article 4 and having regard to any timescale specified by the applicant, environmental information shall be made available to an applicant:
   (a) as soon as possible or, at the latest, within one month after the receipt by the public authority referred to in paragraph 1 of the applicant's request; or
   (b) within two months after the receipt of the request by the public authority if the volume and the complexity of the information is such that the one-month period referred to in (a) cannot be complied with. In such cases, the applicant shall be informed as soon as possible, and in any case before the end of that one-month period, of any such extension and of the reasons for it.

3. If a request is formulated in too general a manner, the public authority shall as soon as possible, and at the latest within the timeframe laid down in paragraph 2(a), ask the applicant to specify the request and shall assist the applicant in doing so, e.g. by providing information on the use of the public registers referred to in paragraph 5(c). The public authorities may, where they deem it appropriate, refuse the request under Article 4(1)(c).

4. Where an applicant requests a public authority to make environmental information available in a specific form or format (including in the form of copies), the public authority shall make it so available unless:
   (a) it is already publicly available in another form or format, in particular under Article 7, which is easily accessible by applicants; or
   (b) it is reasonable for the public authority to make it available in another form or format, in which case reasons shall be given for making it available in that form or format.

For the purposes of this paragraph, public authorities shall make all reasonable efforts to maintain environmental information held by or for them in forms or formats that are readily reproducible and accessible by computer telecommunications or by other electronic means.

The reasons for a refusal to make information available, in full or in part, in the form or format requested shall be provided to the applicant within the time limit referred to in paragraph 2(a).

5. For the purposes of this Article, Member States shall ensure that:

(a) officials are required to support the public in seeking access to information;

(b) lists of public authorities are publicly accessible; and

(c) the practical arrangements are defined for ensuring that the right of access to environmental information can be effectively exercised, such as:

— the designation of information officers;

— the establishment and maintenance of facilities for the examination of the information required,

— registers or lists of the environmental information held by public authorities or information points, with clear indications of where such information can be found.

Member States shall ensure that public authorities inform the public adequately of the rights they enjoy as a result of this Directive and to an appropriate extent provide information, guidance and advice to this end.

Article 4

Exceptions

1. Member States may provide for a request for environmental information to be refused if:

(a) the information requested is not held by or for the public authority to which the request is addressed. In such a case, where that public authority is aware that the information is held by or for another public authority, it shall, as soon as possible, transfer the request to that other authority and inform the applicant accordingly or inform the applicant of the public authority to which it believes it is possible to apply for the information requested;

(b) the request is manifestly unreasonable;

(c) the request is formulated in too general a manner, taking into account Article 3(3);

(d) the request concerns material in the course of completion or unfinished documents or data;

(e) the request concerns internal communications, taking into account the public interest served by disclosure.

Where a request is refused on the basis that it concerns material in the course of completion, the public authority shall state the name of the authority preparing the material and the estimated time needed for completion.

2. Member States may provide for a request for environmental information to be refused if disclosure of the information would adversely affect:

(a) the confidentiality of the proceedings of public authorities, where such confidentiality is provided for by law;

(b) international relations, public security or national defence;

(c) the course of justice, the ability of any person to receive a fair trial or the ability of a public authority to conduct an enquiry of a criminal or disciplinary nature;

(d) the confidentiality of commercial or industrial information where such confidentiality is provided for by national or Community law to protect a legitimate economic interest, including the public interest in maintaining statistical confidentiality and tax secrecy;

(e) intellectual property rights;

(f) the confidentiality of personal data and/or files relating to a natural person where that person has not consented to the disclosure of the information to the public, where such confidentiality is provided for by national or Community law;

(g) the interests or protection of any person who supplied the information requested on a voluntary basis without being under, or capable of being put under, a legal obligation to do so, unless that person has consented to the release of the information concerned;

(h) the protection of the environment to which such information relates, such as the location of rare species.

The grounds for refusal mentioned in paragraphs 1 and 2 shall be interpreted in a restrictive way, taking into account for the particular case the public interest served by disclosure. In every particular case, the public interest served by disclosure shall be weighed against the interest served by the refusal. Member States may not, by virtue of paragraph 2(a), (d), (f), (g) and (h), provide for a request to be refused where the request relates to information on emissions into the environment.

Within this framework, and for the purposes of the application of subparagraph (f), Member States shall ensure that the requirements of Directive 95/46/EC of the European Parliament and of the Council of 24 October 1995 on the protection of individuals with regard to the processing of personal data and on the free movement of such data are complied with [1].

3. Where a Member State provides for exceptions, it may draw up a publicly accessible list of criteria on the basis of which the authority concerned may decide how to handle requests.

[1] OJ L 281, 23.11.1995, p. 31.

4. Environmental information held by or for public authorities which has been requested by an applicant shall be made available in part where it is possible to separate out any information falling within the scope of paragraphs 1(d) and (e) or 2 from the rest of the information requested.

5. A refusal to make available all or part of the information requested shall be notified to the applicant in writing or electronically, if the request was in writing or if the applicant so requests, within the time limits referred to in Article 3(2)(a) or, as the case may be, (b). The notification shall state the reasons for the refusal and include information on the review procedure provided for in accordance with Article 6.

Article 5

Charges

1. Access to any public registers or lists established and maintained as mentioned in Article 3(5) and examination *in situ* of the information requested shall be free of charge.

2. Public authorities may make a charge for supplying any environmental information but such charge shall not exceed a reasonable amount.

3. Where charges are made, public authorities shall publish and make available to applicants a schedule of such charges as well as information on the circumstances in which a charge may be levied or waived.

Article 6

Access to justice

1. Member States shall ensure that any applicant who considers that his request for information has been ignored, wrongfully refused (whether in full or in part), inadequately answered or otherwise not dealt with in accordance with the provisions of Articles 3, 4 or 5, has access to a procedure in which the acts or omissions of the public authority concerned can be reconsidered by that or another public authority or reviewed administratively by an independent and impartial body established by law. Any such procedure shall be expeditious and either free of charge or inexpensive.

2. In addition to the review procedure referred to in paragraph 1, Member States shall ensure that an applicant has access to a review procedure before a court of law or another independent and impartial body established by law, in which the acts or omissions of the public authority concerned can be reviewed and whose decisions may become final. Member States may furthermore provide that third parties incriminated by the disclosure of information may also have access to legal recourse.

3. Final decisions under paragraph 2 shall be binding on the public authority holding the information. Reasons shall be stated in writing, at least where access to information is refused under this Article.

Article 7

Dissemination of environmental information

1. Member States shall take the necessary measures to ensure that public authorities organise the environmental information which is relevant to their functions and which is held by or for them, with a view to its active and systematic dissemination to the public, in particular by means of computer telecommunication and/or electronic technology, where available.

The information made available by means of computer telecommunication and/or electronic technology need not include information collected before the entry into force of this Directive unless it is already available in electronic form.

Member States shall ensure that environmental information progressively becomes available in electronic databases which are easily accessible to the public through public telecommunication networks.

2. The information to be made available and disseminated shall be updated as appropriate and shall include at least:

(a) texts of international treaties, conventions or agreements, and of Community, national, regional or local legislation, on the environment or relating to it;

(b) policies, plans and programmes relating to the environment;

(c) progress reports on the implementation of the items referred to in (a) and (b) when prepared or held in electronic form by public authorities;

(d) the reports on the state of the environment referred to in paragraph 3;

(e) data or summaries of data derived from the monitoring of activities affecting, or likely to affect, the environment;

(f) authorisations with a significant impact on the environment and environmental agreements or a reference to the place where such information can be requested or found in the framework of Article 3;

(g) environmental impact studies and risk assessments concerning the environmental elements referred to in Article 2(1)(a) or a reference to the place where the information can be requested or found in the framework of Article 3.

3. Without prejudice to any specific reporting obligations laid down by Community legislation, Member States shall take the necessary measures to ensure that national, and, where appropriate, regional or local reports on the state of the environment are published at regular intervals not exceeding four years; such reports shall include information on the quality of, and pressures on, the environment.

4. Without prejudice to any specific obligation laid down by Community legislation, Member States shall take the necessary measures to ensure that, in the event of an imminent threat to human health or the environment, whether caused by human activities or due to natural causes, all information held by or for public authorities which could enable the public likely to be affected to take measures to prevent or mitigate harm arising from the threat is disseminated, immediately and without delay.

5. The exceptions in Article 4(1) and (2) may apply in relation to the duties imposed by this Article.

6. Member States may satisfy the requirements of this Article by creating links to Internet sites where the information can be found.

Article 8

Quality of environmental information

1. Member States shall, so far as is within their power, ensure that any information that is compiled by them or on their behalf is up to date, accurate and comparable.

2. Upon request, public authorities shall reply to requests for information pursuant to Article 2(1)b, reporting to the applicant on the place where information, if available, can be found on the measurement procedures, including methods of analysis, sampling, and pre-treatment of samples, used in compiling the information, or referring to a standardised procedure used.

Article 9

Review procedure

1. Not later than 14 February 2009, Member States shall report on the experience gained in the application of this Directive.

They shall communicate the report to the Commission not later than 14 August 2009.

No later than 14 February 2004, the Commission shall forward to the Member States a guidance document setting out clearly the manner in which it wishes the Member States to report.

2. In the light of experience and taking into account developments in computer telecommunication and/or electronic technology, the Commission shall make a report to the European Parliament and to the Council together with any proposal for revision, which it may consider appropriate.

Article 10

Implementation

Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with this Directive by 14 February 2005. They shall forthwith inform the Commission thereof.

When Member States adopt these measures, they shall contain a reference to this Directive or shall be accompanied by such reference on the occasion of their official publication. The methods of making such reference shall be laid down by Member States.

Article 11

Repeal

Directive 90/313/EEC is hereby repealed with effect from 14 February 2005.

References to the repealed Directive shall be construed as referring to this Directive and shall be read in accordance with the correlation table in the Annex.

Article 12

Entry into force

This Directive shall enter into force on the day of its publication in the *Official Journal of the European Union*.

Sludge on the wall – the rushing flood reached the window tops

Foreword

It was 6th October, early in the afternoon. Wearing rubber boots covered knee deep in red mud, we were standing in the main street of Kolontár with Simon Gergely, an expert working for Clean Air Action Group. We had just finished an interview given to Al Jazeera Television on the red mud disaster, and we were waiting for the broadcasting van to make contact with the studio of ABC News. Everywhere around us, tree trunks, house walls and garden fences were all stained waist high by the permanent trace of the flood which took place two days before. Next to the railway, bulldozers were pulling apart the remains of what used to be the bridge of the Torna creek, swept away by the flood. In the gardens, the professionals from Disaster Management were trying to collect and remove red mud. It all looked hopeless for no matter where you looked, the valley of Torna creek was covered with red mud. On Arany János street, vans of TV channels formed a line reaching as far as the cultural centre. They were all there: the great press syndicates along with Austrian, German, French, Canadian, American and Arabic television crews. The world was watching Kolontár.

By now, the first shock is gone. So are the crews. News programmes stopped broadcasting images of Kolontár and Devecser, but the attention that was focused on Hungary last

October has not disappeared. The answers to all the questions raised then are still expected by many. What caused the dam break? Could the disaster have been avoided? Had MAL Co. Ltd. acted with due and proper care? Was monitoring on the part of authorities satisfactory? Are the regulations governing activities with similar levels of risk suitable, are European regulations sufficient? Who will pay for the compensation of damages and from what funds? Neither domestic or international public opinion has received satisfying answers to a large share of these questions so far. Information reported in the media was often contradictory. Official bodies, NGOs, parties including LMP tried to answer a number of particular questions. An exhaustive study, however, has not yet been not provided to the public, and a proper assessment of events calls for a thorough analysis of facts, causes and correlations. This was encouraged by the delegation of the European Green Party visiting the disaster site one week after the spill took place. The very idea of the present report was formed back then, and now the report is offered to the reader as a result of the cooperation of the European Green Party, LMP, NGOs and expert groups.

***

The Kolontár disaster was, without a doubt, one of the most severe environmental disasters ever experienced in this country. Not only was it shocking because it left ten people dead, and injured one and a half hundred directly, leaving behind long term environmental and health impacts which are currently impossible to assess. But it is especially depressing to face the events when one realizes that the disaster could have been avoided. What we're dealing with is not a natural disaster, an earthquake, an inundation or a raging storm which cannot directly be prevented or avoided (even if the paramount responsibility of the consumer society as the engine of global climate change might well be recalled when speaking of the latter two). The Kolontár disaster, on the other hand, can be directly linked to human negligence, to ignoring signs, severe omissions and issues of liability. It wouldn't have happened if... if the company had switched to the dry disposal technology previously, just as it had done in the case of the Mosonmagyaróvár plant. If anyone, whether on the part of the corporation or of the competent authorities had taken the trouble to monitor the structural engineering condition of the dam and its dislocation, now proven to have been happening for years. Or if the authorities had not given permission, in 2006, for depositing ordinary waste which in fact had a pH value of 13. If the competences regarding construction authorization and inspection had been clarified. One could go on and on. The fact however is that none of these measures were taken, and as a result of these omissions, Kolontár, Devecser, Somlóvásárhely, the Torna creek and the Marcal river were flooded by red mud. Nevertheless, the issue of what could and should have been done for prevention is still of some interest. We can learn, and we must learn from the Kolontár disaster. The conclusions need to be drawn and the systematic errors leading to the disaster need to be elucidated. Naturally, there is need to identify who committed what errors and who bears moral or legal responsibility for the omissions and bad decisions. It would, perhaps, be even more important to ensure that in the future, the same mistakes and the same deficient systems do not lead to similar events in different circumstances. In Hungary there are three further red mud reservoirs beside the one in Ajka, and several dozens

of hazardous industrial sites or deposits. It is the task of the judicial bodies to allocate liability for the events. The issue of weather we learn from the disaster at Kolontár and whether we rectify the errors that had lead to it is our shared responsibility, including political decision makers, state authorities, NGOs and professional organizations.

With this report, we volunteered to sketch, based on the information available, the reasons behind the red mud disaster, and to identify the steps to be taken, if we are willing to learn from the lesson, in Hungarian and EU legislation concerning state monitoring and authorization as well as the functioning of institutions in order to minimize the risk of the occurrence of a similar disaster. Our findings indicate that there is a lot to be done. One has to face the fact that all parties concerned had committed severe omissions, including the governments and Parliaments of the past one and a half decades, Mal Co. Ltd., as well as the environmental, construction and mining authorities. The measures to be taken involve a similarly large group of stakeholders. EU regulations need to be revised, and the same holds for the Hungarian regulatory framework and legal practice.

We do not think that our report answers all the questions. We are confident that further similar reports will be made by other expert groups and governmental circles, and that these will shed light on issues which escaped our attention. The conclusions of the Report, however, call for serious action to be taken immediately. Legislators have only carried out a tiny fraction of these tasks so far. (Basically, certain provisions of Act 2010/CLXXXI can be regarded as such.) We hope this Report may contribute to rectifying omissions as soon as possible so that the risk of further disasters of a similar nature can be significantly reduced both in Hungary and in the EU.

LMP – Politics Can Be Different

Chairman of the Sustainable Development Committee
of the Hungarian Parliament

The villages may become uninhabitable unless the soil in the gardens is recovered

Executive Summary

Regarding the spatial extent, duration and severity of impact, the dam break at 12:25 pm on 04. 10. 2010 and the red mud disaster in its wake turned out to be the greatest environmental crisis ever of Hungary and of the whole region. The spilt slurry reached the municipalities of Devecser, Kolontár, Somlóvásárhely, Somlójenő, Tüskevár, Apácatorna and Kisberzseny. The red mud contaminated the valleys of the Torna creek and the Marcal river, almost reaching the river Rába. Through the Torna, Marcal, Rába and the Moson branch of the Danube, the alkaline slurry entered the Danube, causing destruction in all the affected waters. Along the Torna and the impacted section of Marcal, practically all aquatic life was destroyed.

The disaster left 10 people dead and almost 150 injured, including local residents and the participants in the rescue operations.

The spilt mud and alkaline slurry polluted about 1,000 acres of land. The amount of the emitted pollutants was about 0.9–1 million cubic meters.

The fact that the devastation wrought by the dam break significantly exceeded the expected impact as specified in the disaster management plan can be accounted for in physical terms by the exceedingly large water content of the slurry stored in Basin X, and

from a chemical perspective by the alkalinity of the spilt liquid, which approached pH 13. The relatively high concentration of metals (arsenic, mercury, etc.) in the pollutant mix has also presented further health and environmental problems.

The Bayer process is globally the most widespread method of producing aluminium, and leads to the formation of red mud practically everywhere it is used. Currently, no economically viable and efficient solutions are available for the recovery of this slurry or tailings-like material. It is most often deposited (dumping it in the sea or in reservoirs surrounded by dams). Attempts have been made to find ways of recovering the material: red mud is used both as a raw material or an additive e.g. in manufacturing bricks, road construction and soil improvement. Furthermore, the technology for extracting metals is practically available but it is too costly. In an international context, the trend is shifting away from wet disposal technologies towards dry disposal, which poses lower risk. (Dry disposal was used in Mosonmagyaróvár until production was discontinued there.) The alkalinity of the deposited slurry is typically lower internationally than it is in Hungary. On the other hand, the dry technology about to be temporarily introduced in Ajka, a technology which involves blending in power plant gypsum, has not yet been implemented at an industrial level anywhere.

Following this unprecedented accident the authorities responded with the expected rapidity and decisiveness, but not always efficiently in the defence of human health, the environment and material assets impacted by the disaster or at risk. **One reason for the fact that intervention was not efficient enough was lack of information** (local residents and participants in the rescue operations were not informed as to the composition and pH value of the red mud, the biological effect of the slurry, the list of materials to be used in restoration and whether they were available). **The defective communication structure was a further reason** (crucial information on environmental health issues was published with a delay of several days, with significant initial inaccuracies). As a result, for several days the people impacted were on several occasions forced to make decisions potentially influencing the rest of their lives based on conflicting information (e.g. "the red mud is not harmful" vs. "the red mud is toxic and/or radioactive"). The deficiencies of governmental information characterising the first days after the accident were primarily mitigated by non-governmental organisations (Greenpeace, Clean Air Working Group, etc.), as they were the sources of communication regarding measurement data and useful health advice.

The red mud contained chromium, mercury, lead and nickel contaminants several times the limit values for ground water and drinking water, also exceeding intervention levels no longer in force. The majority of tests indicated arsenic concentration levels beyond the limits values defined for soil and sewage sludge.

In the first few days, public authorities and institutions stated, citing test results obtained decades earlier, that the composition of the red mud poses no significant health risk or environmental hazard. In the first week of damage control, the population received no factual information about either the potential radioactive impact of the pollutants or the health consequences of airborne dust pollution. The long-term effects of soil pollution on the environment and agricultural production were not communicated to residents until February 2011. Official communications involving conflicting and often unsubstantiated information was a constant feature of the remediation process.

At the same time, the first measurements made by the Hungarian Academy of Sciences clarified what environmental authorities had managed to ignore for years: "based on analysing samples taken at different locations, the reservoir spillage takes pH values in the range 11 to 14. Consequently, the red mud should be considered as an environmentally hazardous substance."

***

Possibly the most important statement of the Kolontár Report is that all Hungarian authorities with a role in licensing and monitoring the accident-stricken red mud reservoir had committed errors.

- **The Central Transdanubian Environmental, Nature Protection and Water Management Inspectorate** had endorsed the classification of the deposited material as non-hazardous waste, thus significantly relaxing requirements on disposal and subsequent monitoring.

- **The authorities** endorsed the uncorroborated disaster management plan handed in by MAL Co. Ltd.

- **The Inspectorate failed to engage the competent District Mining Inspectorate** in the licensing process.

- **The notary of Ajka** had prohibited the depositing of hazardous waste in the reservoir, but **failed to take steps when hazardous waste was in fact deposited in the area.**

- Although the licensing of mining waste deposits has been the competence of the Mine Supervision since 2008, **the competent District Mining Inspectorate did not check the structure of the disposal site for technological compliance, and failed to enforce use of the best available technology with regard to disposal** (conversion to dry technology).

- **None of the authorities substantially considered the risk of a dam break.**

- When the privatisation contract was concluded, IPPC and BAT requirements were not taken into consideration. Neither was compliance with these requirements subsequently enforced in an exhaustive manner by either the environmental or the construction authorities.

Regarding the occurrence and the severity of accident, a decisive factor was the Hungarian authorities' failure to treat the red mud deposited together with the slurry as hazardous waste in the course of the licensing and inspection process, even though the alkalinity of the material in the reservoir that was later damaged would have justified this. Licensing hazardous waste disposal entails imposing stricter standards and the participation of more au-

thorities than is required for treating non-hazardous waste. A more thorough procedure might have shed light the technological risks of the landfill and the deficiencies of the emergency plan.

The company acting as the landfill operator bears liability for classifying the deposited material as non-hazardous at the time of applying for the integrated environmental permit, even though the alkalinity levels clearly met the criteria for hazardous waste. The company also bears partial liability in failing to meet the environmental requirements specified in the privatisation contract fully and on time. Similarly, the company bears partial liability for failing to ensure the transition (or the preparation for the transition) to a dry depositing technology, at the latest, by the time of requesting the integrated environmental permit. Though it is at present an open question, local reports suggest that the company might have become aware of the stability problems of the reservoir (local residents reported works carried out in August and September to reinforce the wall of Basin X), but failed to notify any of the official bodies.

***

Furthermore, the occurrence of the accident can be linked to regulatory anomalies owing to the fact there had been deficiencies in adopting and properly implementing EU legislation.

The relevant Hungarian legislation only partially matches "Directive 2008/98/EC on waste requirements". Though it should have entered into force by 12.12.2010, the Directive was not fully implemented in Hungary. **An important fact concerning the issue of the responsibility of authorities is that the waste treatment plant belongs to the competence of the Mine Supervision under Hungarian legislation. The directive cited imposes an obligation of regular monitoring on the operator, to be carried out at least annually with regard to both the condition of the built structure and of the waste, but this obligation was not fulfilled in practice.**

According to the Act on the Environment, the permit-holder (along with the owners and managers of legal entities which cause harm) has increased responsibility for damages incurred through use of the environment, a responsibility which may only be limited, or transferred under very strict conditions. However, these general rules apparently come short of providing for adequate and available financial means needed to cover for the damage incurred. **According to the Act adopted in 1995, the rules governing the obligation to provide a security deposit and to establish dedicated reserve funds in the course of the environmental licensing process and the rules on liability insurance policies shall be laid down in a government decree. This objective has only been formally met so far.**

On the whole, the EU legislation examined in the present analysis, provided it is adopted and implemented in line with the intent of the legislator, seems suitable for the prevention of similar accidents and for managing the consequences thereof. At the same time, there is a need to adopt uniform classification criteria for hazardous waste, unified EU-wide regulation governing security deposits and liability insurance (at least for reasons concerning competition law), and a common EU environmental emergency fund set up to cover environmental damage that can not be remedied otherwise.

***

It is not possible to account for the Kolontár red mud disaster by means of a single cause. Among the potential causes and preceding events, the following should by all means be noted:

- **The conditions of privatization:** it was with reference to the obligations of environmental protection that the buyer was able to acquire the Ajka Aluminium plant at a very low price. However, these obligations were not properly regulated within the contract, and there were also gaps in monitoring implementation. Moreover, the authorities allowed on more than one occasion for the owner to postpone meeting these obligations.

- **Deficiencies in monitoring environmental damage-limitation:** the privatisation contracts contained an obligation to provide for environmental damage-limitation, but the monitoring of how this was implemented was deficient. No detailed documentation is available, except for written records to the effect that invoices were presented as evidence for compliance without technical inspection having taken place;

- **Outdated disposal technology:** when the first red mud reservoirs were established, the technology of wet disposal for red mud was still widespread, but much safer dry processes were already available by the time the permit for Basin X was granted, and the integrated environmental permit for the reservoir was granted;

- **Incorrect classification of red mud waste:** when the integrated environmental permit was granted, red mud was not classified as hazardous waste, even though it clearly counted as such on the basis of its pH value under the Hungarian and EU legislation then in force;

- **licensing and monitoring malpractice on the part of administrations:** following the disaster, a court ruling was required to clarify which authority should have granted a permit for the dam building at the reservoir and carried out static stability inspection of the built structure;

- **the sinking of the dam (which could also be related to posterior slurry walling):** satellite images clearly show that the barrier sank in certain places at a rate of 1 cm / year, creating maximum shear stress precisely at the section where the dam finally broke, while the sinking itself might have occurred because of the slurry walling, or because of the dam base and subsoil becoming soaked due to the slurry walling. However, no use was made of the satellite imagery in the structural engineering inspection of the dam, even though they were continuously available;

- **Negligence on the part of company management, the authorities and government officials:** several NGOs had previously protested about the lack of environmental protection developments and the failure to carry out inspections. Their comments had no practical consequences at all.

***

The Ajka red mud disaster was unique due both to its nature and its dimensions. At least part of the lessons learned from similar industrial accidents remain valid:

- The costs of remediation are eventually borne by the state, with the companies responsible for incidents almost always backing out of the process to a greater or smaller extent,

- Compensation for damages only takes place in the long run, with both the range of individuals eventually receiving compensation and its extent far more limited than that originally promised,

- Personal and institutional responsibility is identified in the rarest of cases,

- The impact of environmental damage typically lasts longer than was originally estimated.

The trace of pollution ont he wall —with the ruptured dam in the background. The residents were forced to escape through the roof

1. Antecedents

1.1. Aluminium industry and Alumina production in Hungary

On the territory of historical Hungary, intensive research for ores started in the beginning of the 1900s. The mining of bauxite, first reported in Bihar county, reached an industrial scale as early as the first World War. Around 1920, large quantities of bauxite were found in the Vértes and Bakony mountains. Mining at an industrial scale started in 1926 at the bauxite quarry at Gánt.

The first Hungarian alumina plant, constructed in Mosonmagyaróvár, started operations in 1934. Before this time, Alumina was manufactured with Hungarian bauxite as raw material in Germany. Within a few years, aluminium was also manufactured in Csepel. Partly as an answer to heightened demand for Alumina and aluminium as a consequence of the German war effort, construction of the Alumina plant and aluminium furnace at Ajka was started in 1941. The planned capacity of the Alumina plant was 20 kt/year, that of the aluminium furnace was 10 kt/year. The Ajka thermal power plant was constructed next to the aluminium company, providing water vapour for the aluminium furnace and electric energy for the Alumina plant.

The plant and the furnace started to operate in 1943, though neither reached the planned capacity levels before the reconstruction following the second World War.

At the time of forced industrialization and the war economy, aluminium was a metal of strategic importance: one of the most important raw materials for (partly, military) airplane construction. The whole of this priority industry was covered by MASZOBAL Ltd. (Hungarian-Soviet Bauxite Aluminium Ltd.), established on January 1, comprising by the bauxite mines at Gánt, Iszkaszentgyörgy, Halimba and Nyirád, the Alumina plant and aluminium furnace at Ajka, the light alloy rolling mill at Székesfehérvár, the Almásfüzitő Alumina plant, the Bauxite Research Lab at Balatonalmád, the Viktoria Chemical Plant,to which were added, from 1952 on, the Aluminium rolling mill at Kőbánya, the Aluminium furnaces at Tatabánya and Inota, as well as the Alumina and Alundum (Borolon) Plant at Magyaróvár. MASZOBAL was dismantled at the end of 1954, as the Hungarian State redeemed the totality of the property of the Soviet state, and went on to establish the Aluminium Trading Company, controlled by the Ministry. Its supervision was exerted by the Ministry for Heavy Industry (NIM), then by the Chief Department for Non Ferrous Metals in the NIM until June 1963. The main tenet of the Hungarian-Soviet Treaty on Alumina and Aluminium was that "further exploitation of the Hungarian Bauxite riches, needs to be secured by joining one of the most favourable alumina production opportunities in the socialist camp with the cheapest and most efficiently available electric energy base, in a way that it is an optimal solution for both the countries participating in the co-operation and the whole of the socialist camp". According to the treaty, Hungary accepted to ship a continuously growing amount of Alumina between 1967 and 1980, gradually reaching 330,000 tons to the Soviet Union. According to the plans, the alumina is processed there, and the aluminium produced is shipped back to Hungary. Soviet metal shipments – equally growing gradually – reached 165 thousand tons by 1980. In the framework of the Soviet-Hungarian Treaty on Alumina and Aluminium, it was not the electricity required for processing, as it could have been more rational, but the alumina was shipped to the Soviet Union. Simplifying somewhat, the construction can be described as outsourced smelting. The price of alumina and aluminium was accounted for the Hungarian-Soviet border, the Soviet party financing the transportation within the Soviet Union. Most of the costs of smelting were paid for with Hungarian industrial products, creating a market for Hungarian industry goods.

The heavy industry minister in 1963 founded a single organization for Hungarian Aluminium Industry, the Hungarian Aluminium Industry Trust (MAT), which integrated the constantly growing firms in the sector until the regime change. In September 1988 an agreement was reached that abolished the Soviet-Hungarian Treaty on Alumina and Aluminium in 1990, and cooperation in the MAT in the period 1991-1995 was carried out as a business venture. ON 31 March 1991, trust were transformed into corporations, and the MAT was transformed into 100% state owned joint-stock HUNGALU on 31 December 1991. On June 30 1991, State Property Agency (AV Rt) became the owner of MAT. In 1990, the Nyirád Bauxite mine closed, while the aluminium furnaces at Tatabánya and Ajka stopped production in 1991. Similarly, production was stopped at the Ajka furnace in 1992, and capacities were decreased in other alumina plants in the country during 1993, with the Almásfüzitő Alumina Plant closing down in 1994. Privatization seemed to be the only option to prevent the total collapse.

1.2. Privatization in the aluminium industry

1.2.1. Selling the productive companies of the sector

At the time of the government decree in 1995 deciding about privatization, maintaining operability and financing loss-making management in the sector would have needed billion-scale financial commitment from the state, let alone the environmental problems caused by the red mud accumulated during the decades. In the beginning of the nineties (between 1991 and 1993) demand for aluminium fell sharply, its price on the global market reached a historic nadir, the Russian market collapsed for bankruptcy, in addition it was apparent at the time that the operational costs of energy-consuming aluminium smelters (partly due to the privatization of the energy sector in progress at the time) would jump. In the meantime, the report about the privatization concept, compiled for the general assembly of HUNGALU Rt. on May 15, 1995 claims that "from the middle of 1994, aluminium prices on the global market increased significantly, and from the beginning of 1995 the price of alumina products has also moved favourably. After a five-year decrease price revenues will start to increase in 1995, even on a real value." Therefore the unfavourable present situation had to be considered against good prospects. Finally the government's short-sightedness and tight-fisted attitude won: as there was no intention to spend money from budgetary resources on the aluminium industry, the government decided to sell the sector. However, as we look back now it seems in this case this was a "guided privatisation", pertaining the pretence of competition, the government selected the owners they found favourable, and ensured advantageous conditions for the favoured owner groups so that they can obtain the complete aluminium industry, from mining through processing to production and trade.

Before the privatisation of HUNGALU, in May 1995 the Minister of the Industry dismissed board director Ervin Ernst and C.E.O. Péter Keresztes, and appointed Árpád Bakonyi as board director, who was often mentioned in the news concerning the Kolontár disaster and Pál Szabó as C.E.O. (who later became known by the public as the head of the Hungarian Post and the Hungarian Railways, and then the minister responsible for infrastructure). Thus persons were appointed to lead HUNGALU, who later appeared in the privatised companies as owners, managers, board members and supervisory board members. Árpád Bakonyi, together with Lajos Tolnay and Béla Petrusz has been an owner of great influence at MAL Zrt. However, there is another group in the most important companies of the Hungarian aluminium industry, which obtained ownership during the Horn government, and relates to later Prime Minister Ferenc Gyurcsány and Altus Rt.

The idea of an apparent guided privatisation is also confirmed by the fact that although foreign companies were also interested in the offer (e.g. a consortium established by Norwegian Hydro-Aluminium and Slovakian ZSNP entered the privatisation tender of Ajka Aluminium Industry Ltd. (Ajkai Alumíniumipari Kft.)), only one element of the HUNGALU property was sold to a foreign buyer on its actual market price. Alcoa took over the Light Metal Works in Székesfehérvár (Székesfehérvári Könnyűfémmű Vállalat) for 6.5 bn HUF, while another outstanding element of the stake, Mosonmagyaróvári Timföld és Műkorund (Motim) Rt. was taken over by Altus, owned by Gyurcsány, (together with the management) for 705 million HUF.

The present ownership structure in the Hungarian aluminium industry was established in a relatively complicated process. According to the first privatisation contract, in 1995 HUNGALU Magyar Alumíniumipari Rt. (HUNGALU) sold its stake in Balassagyarmati Fémipari Kft. (Balassagyarmat Metal Industry Ltd.) to Altus Befektetési és Vagyonkezelő Rt. (Altus Investment and Property Management Plc.) (Altus) and Tíz-M Szervezési, Vagyonkezelési és Szolgáltató Kft. (Organisation, Property Management and Service Ltd.) The second contract was concluded on December 21, 1995, in which HUNGALU sold 90 per cent stake of Magyaróvári Timföld és Műkorund Kft. (Motim) to Altus and GPS Vagyonkezelő és Gazdasági Tanácsadó Kft. (GPS Property Management and Business Counselling Ltd.), established by the heads of MOTIM at the time, in fifty-fifty per cent. The third contract was concluded in spring, 1996, in which HUNGALU sold Metalucon Fémszerkezeteket Gyártó és Forgalmazó Kft. (Metalucon Metal Structure Manufacturing and Trading Ltd.) to MMB Finance Befektető és Kereskedelmi Kft. (MMB Finance Investment and Trade Ltd.). The fourth contract was concluded on May 8, 1996, in which HUNGALU sold 90 per cent of Inotai Alumínium Kft. (Inota Aluminium Ltd.) to Magyar Aluminium Kft. (Hungarian Aluminium Ltd.) (MAL). The fifth contract was concluded on August 16, 1996, in which HUNGALU sold a 72 per cent stake of Bakonyi Bauxitbánya Kft. (Bakony Bauxite Mining Ltd.) to Fak-Top Kft.- MAL, MOTIM (actually Altus) and Metalservice Rt. According to the sixth contract, also on August 16, 1996 HUNGALU sold 90 per cent of Köbal Kőbányai Könnyűfémmű Kft. (Köbal Kőbányai Light Metal Works) to MAL. With the seventh contract signed on December 19, 1996 HUNGALU sold a 90 per cent stake of Almásfüzitői Timföld Kft. (Almásfüzítő Alumina Ltd.) to HUNGALUmina Vagyonhasznosító és Kereskedelmi Kft. (HUNGALUmina Property Exploitation and Trade Ltd.), which had been renting the plant stopped in 1994 since 1995, and later the complete machinery of the company. In July 1997, an eighth contract was concluded by which HUNGALU sold a 90 per cent stake of the Ajkai Alumíniumipari Kft. (Ajka Aluminium Industry Ltd.) to Inotai Alumínium Kft. (Inota Aluminium Industry Ltd.) (or actually, to MAL. The last contract, the ninth, signed on November 17, 1997 HUNGALU sold HUNGALU Kereskedelmi Kft. (HUNGALU Trade Ltd.) to MAL and Motim (Altus). Each contract contained business (employment, capital increase, development) and environmental commitments.

In the times of the Orbán government, the supervisory committee of the State Privatisation and Property Management Plc. compiled a report about the privatisation of the aluminium industry, which claimed "the Hungarian state suffered a significant loss in the course of the sale of the company [a HUNGALU]", worth approximately 25 billion HUF. The damage was mostly attributed to the sale of the companies below their actual price.

The privatisation contracts were classified during the Horn government, and they have just been disclosed, after the accident, on the urge of Politics Can Be Different, following several addresses in Parliament[1] and press releases.[2] For the experts the contracts themselves and the conditions of the conclusion of the contracts are controversial.

[2] Let's start the revision of privatization contracts with MAL Co. Ltd.
http://lehetmas.hu/sajtokozlemenyek/8293/privatizacios-szerzodesek-felulvizsgalata-kezdjuk-a-mal-zrt-vel/
On whose behalf keeps Government the MAL contract a secret?
http://vorosiszap.lehetmas.hu/hirek/108/kiert-titkolja-a-kormany-a-mal-szerzodest/

a) The contracts were compiled by the law firm Eörsi and partner (the firm of former SZDSZ MP Eörsi Mátyás). The texts are quite similar, they often overlap, contain repeating turns, when the texts were compiled, the peculiarities of the companies were not taken into consideration (especially with respect to environmental commitments, where almost all the contracts contain the same paragraphs).

b) The contracts published have not been signed. It seems for the Orbán government the protection of personal rights is more important than the public interest to know who and why decided about the wording of these contracts.

c) A returning element in all the contracts is that a report has to be compiled each year until March 31 about the progress of the environmental damage management (and in case the rate of the progress is behind the rate set forth by the environmental authority, a penalty shall be paid). In the meantime, based on the documents available it cannot be found whether anybody obeyed this requirement (only the fact at the environmental authority in charge for the region the companies concerned presented invoices proving they had worked on damage repairs, which was approved by the authority as a performance certificate).

d) From all the contracts, the third (about the sale of Ajkai Alumíniumipari Kft.) contains the most controversial elements. On one hand, HUNGALU remitted a 2.7 billion loan. On the other hand the price was actually only 10 million HUF (namely 90 per cent of the equity, a stake with a nominal value of 1591.040 million HUF was given to the buyer for 10 million forints). Based on point 6.2 of the contract, "the Company (Ajka), based on the agreement with the Buyer shall act as bailer. The Seller (HUNGALU) shall decide, whether it will validate its claim towards the Company and/or Buyer." In the meantime, the debt of Ajkai Alumíniumipari Kft., which was bigger than the equity was released, and took over the debts towards third parties as a commitment, and also took up that in case of the dissent of outsider parties, and in order to able to pay its overdue loans, almost on stock market level. In other words, the buyer took over a 90 per cent stake of a de facto sound company, for 10 million forints.

The contract estimates the costs of the damage remedy in the given circle at 3.3 billion HUF, in the meantime claims that this includes a 2,200,000 ECU (approximately 400 million forints on the exchange rate of 1997) PHARE project, and the biggest project, the recultivation of the abandoned depositories (together with the depositories), stayed at HUNGALU, therefore MAL should not spend much on environmental protection HUNGALU. From the contract it does not turn out why the price was decreased to such an extent eventually.

1.2.2. Transferring environmental responsibilities

The privatisation of the aluminium industry was called a success story in a report prepared for the Horn government by Judit Csiha. Its success is far from being obvious. The income from the sales amounting to HUF 9 to 10 billion was continuously spent on maintaining the emp-

loyment levels of the companies and keeping them functioning as well as on environmental damage control. So finally the state made no profit from privatisation while it was stuck with a range of environmental obligations and risks for decades. On 1996 price levels the privatised companies took an obligation to invest 11 million HUF n the form of the environmental investment, which would add up to HUF 30 million on 2009 price levels. The impacted companies on the other hand didn't even approach this amount in their actual environmental investment. The environmental obligations related to Ajka were specified in the Privatisation Contract, but in a vague form that would not faster accountability, without any specific details. The main environmental items of the privatization contract of Ajka Aluminium Industry ltd. could be found in section 4.2 of the contract. All environmental damage in fact identified so far or in the future, shall be eliminated following consultation with the environmental authority (to the extent and pace agreed upon) …on its expense or at the expense of the Association… the buyer agrees to accept the sanctions as well as the provisions of point 3 of Government decree 2263/1995. (IX.08.) with respect to the purchaser. (This government decree went out of force from 01 July 2001. {Government decree 2166/2001. (VI. 29.) on annulling decrees from the series 2000. 1. "The government terminates regulations made by the Council Of Ministers and government decrees specified in the appendix to this decree."}

In the privatisation contract of the Ajka plant, among others, references are often made to point 3 of government decree2263/1995. (IX.08.), as a text where the environmental obligations are defined, but in fact this point failed to include specific details.

2263/1995. (IX. 8) Government Decree
...

3. The Government considers it necessary to settle environmental problems in the aluminium industry. To this end,

a) HUNGALU shall create an environmental damage assessment and damage control plan for its societies. The environmental condition of the settlement shall be presented in the plan, proposals for damage control and the anticipated costs should be included;

b) HUNGALU shall fulfil the tasks set out in the plan approved by the regionally competent Environmental Inspectorate tasks performed by an. In case of a delay of more than a year, it shall transfer the coverage of the costs required to the Central Environmental Protection Fund.

The privatisation contract and the government decree formulated the following major environmental obligations:

- *Consulting with the regional competent environmental authority, the company shall develop an environmental damage control program and a road map for it.*

- *The environmental audit identified environmental damage amounting to HUF 3.3 Billion, over and beyond the PHARE project (a reference to the construction of a slurry wall to avoid further damage), added as the appendix of the contract. Failing to adhere to the programme endorsed by the environmental inspectorate, the company shall pay a penalty amounting to 10 percent of the value of the damage.*

- *Yearly damage control reports shall be sent to the privatisation authority or it legal successor.*

- *The PHARE project amounting to ECU 2.2 million shall be implemented by the seller.*

1.2.3. Omitting recultivation of the red mud reservoirs

On site inspection of the realisation of environmental investment on the part of the environmental authority took the form of checking that the invoices representing work carried out were handed over (cf. the Minutes page of the contract SZT 25561 with subject MOTIM). Thus in fact it had been unilateral acceptance of invoices without inspection.

The most costly of the environmental tasks would have been the creation of a safe disposal technology and the recultivation of existing reservoirs. The Kolontár accident could occur because neither of these large scale measures was fully implemented.

The National Development Agency carried out fieldwork in the region of AJKA. On 27 September and from 26 to 28 October, 2005. Based on this field work, a report was prepared, entitled the role of the national development plan in the development in the Ajka small region. The document has the following to say: „A large amount of tailings, especially in the form of red mud were accumulated in the region of Ajka. With the progress of technology this substance can become the raw material for new industrial activities. Until that point however it reduces environmental potential."

The report carried out nine years after the privatisation in 2005 mentions the following points among the recommended improvements and the expected costs: "Recultivation of redbud reservoirs in Ajka, Ajka, HUF 600.000.000". As a further item amount in HUF 50 million, appears protection of the water base of the Marcal river, primarily threatened by the red mud reservoirs.

14.5 billion m^3 of red mud was stored in the slurry basins of the Ajka aluminium plant before flood ending in environmental disaster. It is a fact that recultivation of the slurry reservoirs have only partially been implemented so far even thought the state declared being satisfied with the environmental performance of MAL Co. Ltd. on several accounts and never claimed the penalty that was provided for in the privatisation contract. At the same time, the political elite of all times proved friendly to the owners of the company. For example, Lajos Tolnay was invited to take part in the consultation referred to us "national consultation" as a member of a restricted consultation body let by George Matolcsy. The national consultation was a program of Viktor Orbán than in opposition. Even more strikingly, based on a decision by Minister of the Economy, George Matolcsy, the government decided to give the company

a national quality award in 2000. In a message the prime minister sent for the celebration at the award ceremony, he used the following words: the owners and employees of the company can be proud to be the stakeholders of an enterprise that represents the state of the art of Hungarian economy. Through their quality performance, they show the path for others. In the case of MAL this "quality performance" was made possible by only partially carrying out the remediation of hazardous waste produced in the past or during every day production, and due to the fact that not having to cover this significant part of the expenses, it was provided a competitive advantage compared to other companies taking their environmental obligations more seriously.

This naturally required cooperation on the part of the company and the environmental authority and, in addition, very liberal inspection and licensing behaviour on the part of the latter. It is a characteristic example that the Central Transdanubian Environmental Inspectorate gave permission in 2009, i.e. one year preceding the accident to raise the height of the dams of basin 8 which had already been closed and recultivated, and basin 9, closed but still kept under water and furthermore gave permission to reopen them as active reservoir basins.

1.3. Hazardous waste disposal

1.3.1. Hazardous waste in Hungary

According to data from the National Waste Management Plan, about 70 million tons of waste is produced in Hungary in a year. This quantity includes all waste created in the course of production, distribution and consumption, as well as processed plant leftovers and biomass used, for the most part, in agriculture. About 5% of the amount indicated is hazardous, while the remaining 95% consists of 10% of inert waste (construction and demolition waste, as well as waste products form the manufacturing of materials used in construction). 90% of industrial waste represents slag from power plants and the metal industry, mine slurry as well as industrial waste water sludge and sludge from water treatment. The rest of the remaining quantity includes waste similar to industrial waste generated through distribution (commerce, services).

About one fifth of 3.4 million tons of the hazardous waste produced is red mud resulting from alumina production. About 1.5 million tons of hazardous waste from the processing industry, the largest share of which is represented by tailings and slurry from metal smelting and processing as well as the processing and utilization of crude oil. A further one million ton is made up from combustion residues from power plants and waste incinerators. Naturally, hazardous waste is equally generated by agriculture and the food industry, as well as by the population and services. 10% of hazardous waste is generated by plants and animal. About 0.7 to 1 % of solid municipal waste is hazardous.

Under Hungarian regulations, it is primarily the producer or the owner at all times who bear responsibility for waste management, including the collection for later management, utilization and neutralization of the waste. This responsibility can be fulfilled by meeting the requirements specified by regulations, and in line with the polluter pays principle, either through waste management (an activity subject to licensing) or through paying for the services

of a licensed operator. In cases governed by separate regulations, the responsibility of waste management and the costs is borne by the producer generating the waste. As a consequence, prevention is equally the responsibility of the producer of the waste; the legal environment, however, provides only minimally efficient indirect incentives. The quantity of the waste produced is (slowly) decreasing, but this is explained by a decline of the economy and in production levels rather then premeditated prevention levels , especially in the first part of the 1990s. Today, the ongoing structural modification of industry and accompanying product and technology development entail the generation of lower amounts of waste, with decreased hazard levels, in part owing to stricter environmental regulations.

The rate of waste utilisation is significantly low in an international comparison, especially for hazardous waste, the utilization of which does not even reach 20%. Management of the waste produced is typically neutralized, mostly in the form of dumping. The proportion of the latter exceeds 50%, not including waste generated in agriculture. Added together, physical, chemical, biological and thermal neutralisation of the waste, barely represents 20% even including incineration, and almost half of this amount is liquid municipal waste processed in waste water treatment plants or poured in the sewage system. Thermal neutralization amounts to 6%, while physical-chemical neutralization, mostly consisting of the treatment of chemical waste, represents 4 %. About 75% of hazardous waste and about 60% of industrial waste, more than four fifths of solid municipal waste and about half the sewage sludge is deposited in landfills or subjected to long term storage in the area of production. Regarding industrial waste, it is mostly waste products from power plants, metallic industry and mining, produced at a large scale, that is deposited in landfills in the neighbourhood. Thermal neutralization of hazardous waste has a capacity of 85 thousand tons yearly, one third of which provided by small capacity hospital incinerators and waste oil incinerators.

Careless economic and waste management practice in past decades, and much more lax regulations than today, with illegal dumping on several occasions resulted in contaminated areas created over many places. About 500 million tons of industrial waste has been accumulated, deposited, for the most part closed and recultivated reservoirs. 99% of this material comes from the mining industry, iron production, electricity generation and the construction industry.

The total amount of bauxite residues produced and deposited in the course of Hungarian alumina production equals 35 million tons. Only 0.3% is deposited is reused in a year though the capacity for utilization is available for many times this quantity. About 7% of the waste accumulated in landfills is today classified as hazardous, about 90% of which is red mud and the rest consisting of drilling sludge. The quantity of hazardous waste entailing direct hazards deposited in ways which fail to meet contemporary depositing regulations represents about 270 thousand tons (several million tons including red mud).

The producers and managers of waste have to maintain accurate documentation of the waste managed on the basis of measurements, regarding the transport, treatment of the waste as well as the functioning of the operating facilities. Based on this documentation, they have to publish statistical and administrative reports to the authorities with data content specified by regulations. The documentation and the data reported provide the basis for monitoring what happens to the waste. On the other hand, the appropriate plans and forecasts can only be made on the basis of the assessment and analysis of the data thus produced.

There are different systems for the administration and processing of the data that are only partially harmonized, and are at times incomplete. The most complete information system on hazardous waste is operated by the ministry for rural development, based on mandatory comprehensive reporting on the part of producers and managers of hazardous waste. In the case of non hazardous waste that can be stored together with hazardous and municipal waste, the polluter plays principle is realized in theory: the costs are paid for by the producers of the waste. The Kolontár disaster has shown, however, that it is not fully realized in practice: the producer of the waste in Ajka has not paid for secure depositing and storage (using a cheaper and less secure technology) and it fell on the state (i.e. the community of taxpayers) to pay for the disaster, the impact of which was more serious than expected. The same was proven by chemical residues in Garé, waste with heavy metal content in Nagytétény, gas mass in Budafok and Üröm, dye production residues in Újpest and galvanic sludge in Csepel. The number and volume of cases indicates that the present regulatory environment concerning the licensing and inspection practice of authorities is not suitable for the prevention of hazardous waste related disaster with serious health and environmental impacts, while damage control calls for billions of Forints of expenses on the part of the state.

For the sake of prevention, the issues of mandatory liability insurance and the introduction of the institution of the provision of a security deposit have been regularly raised since the 1990s (last when the Ministry of Environmental was under the direction of Miklós Persányi). The governments of all times, however, always refused the proposals, invariably on the grounds that Hungarian economic actors would not be able to bear such an extra burden. Not only does this attitude raise concerns owing to creating a similar burden for the state without undemocratically, but it is also problematic from the point of view of EU competition policy, since these environmental costs are quite common in the European economy.

1.3.2. Red mud disposal sites in Hungary

In the territory of the country, as a heritage of the aluminium industry aluminium industry with much higher capacities of former times, large amounts of red mud are stored which fall into the category of hazardous waste as in the case of Ajka.

The reservoirs near the Ajka alumina plant contain 14.5 cubic meters of red mud (with 70% solid content, thus it would be more accurate to use the expressions bauxite residue and solid phase).

The slurry reservoirs covering 200 hectares in territory of the former Almásfüzitő alumina plant are located directly next to the Danube, containing 12 million tons of waste in 7 basins.

Reservoirs next to the Ajka plant store 14.5 cubic meters of red mud. (With 70% dry matter matter, making it mors accurete to talk of bauxite resudue or solid phase).

5 million tons of red mud were accumulated in the reservoir behind the dam constructed in the valley of Kántorkerti stream near Neszmély, equally deposited by the Almásfüzitő alumina plant. The quantity of the total amount of bauxite residues closely approximates 12 million tons. Calculating with 70% solid content, this equals to 17 million tons of wet slurry.

The landfills of the Mosonmagyaróvár alumina plant, owned by MOTIM ltd, are located at a few hundred kilometres from the city. The material stored there (bauxite residues equal-

ling 3.7 tons in terms of solid content) is much more dense than the substance deposited in Ajka. After filtering, the filter cakes with 55-60% solid content were deposited in a red mud refuse by means of a special pump system. This method of storing red mud was introduced in the first half of the 1980s. The closed reservoirs were covered by 20 cm of clay and 50 cm of soil, on top of which special acacia shrubs were planted. The company spent about HUF 2 Billion on recultivation so far.

According to information published after the Kolontár disaster, the greatest environmental risk is posed by the Almásfüzitő deposits in the direct vicinity of the Danube flooding area. Out of seven slurry basins located in the area, Basin 7 remains still partially uncovered, while the others are covered and recultivated. Several tons of other hazardous wastes were also deposited (Tatai Környezetvédelmi Ltd. executed various experiments in waste neutralization.) Basin 7 was partly covered with the flying ash from the Dorog hazardous waste incinerator.

Tatai Környezetvédelmi ltd. developed new technology for the recultivation of red mud reservoirs by other hazardous waste "which solves the isolation of hazardous materials in the reservoir from the environment, along with biological treatment and neutralization of organic material and waste with metal content, taken over from various waste producers.") The compost material generated through the process is similar to natural soil with regard to its structure and composition, while being resistant to highly alkaline sludge with an elevated metal content, and thus, it is perfectly suited for covering reservoirs and planting recultivation vegetation. This technology fulfils the following objectives:

- *The elimination of the production of surface dust on top of the reservoirs.*
- *Making reservoirs fit the landscape, that is, creating conditions as close to the original as possible form the biological and visual points of view. The growth of vegetation results in living organisms gradually returning into the covered areas.*
- *The production of large quantities of a recultivation mixture suited for covering the red mud reservoirs and planting vegetation, requiring minimal long term intervention.*
- *Reducing the proportion of water filtering through, thus preventing the ablution of heavy metals chemically fixed in the red mud.*
- *The processing and utilization of organic waste through placing it in an environment where its hazardous content is significantly or completely reduced through biological decomposition.*

The North Transdanubian Environmental Inspectorate, as the environmental authority of first instance issued an integrated environmental permit along with an environmental operation permit to the Tatai Környezetvédelmi Ltd. for the application of this technology. The permits cover the red mud reservoirs of Almásfüzitő and allow for the biological neutralization of 132,000 tons of hazardous and 280,000 tons of non hazardous waste a year through composting.

The real environmental risk of the Almásfüzitő red mud reservoirs is however inherent in their location. The environment of the present slurry reservoirs had been a swampy area before the river management works. This area is now separated by a 10 km long flood protection embankment along the Danube that is identical to the red mud reservoir dam over several sections. At times of flood, the slurry reservoirs stand out of the water the way islands do. The residential areas of the villages of Kiskolónia and Nagykolónia are located near the slurry reservoirs.

At the time of establishing the red mud reservoirs, no clay layer was spread, thus the reservoirs constructed without proper protection could contaminate ground waters. When the level of the Danube is low or moderate, this contaminated water could get into the Danube due to the direction of flow of the ground water. The Territory of the present slurry reservoirs had previously been river and stream beds that still define the direction of groundwater flow. These same causes significantly reduce the stability of the dams. In the groundwater monitoring wells, situated around the slurry reservoirs, concentrations in toxic metals and fluorides have been measured several times surpassing limit value.[3]

Furthermore, the area is exposed to the threat of earthquakes. At the nearby municipalities of Komárom and Dunaalmás, several earthquakes took place resulting in entire buildings collapsing. Potential major earthquakes happening in the area could cause an environmental disaster due to the red mud getting into the Danube which could threaten the provision of drinking water to the municipalities located along the river.

1.4. Technological deficiencies

1.4.1. The condition of the dam before the accident

The processing of satellite images reconstructed the past of the dam which broke on 4 October, presently, going back 7 and half years. The investigation started at an individual researcher's initiative, was carried out with the cooperation of Dr. Gyula Grenerczy (Satellite Geodetic Observatory of the Institute of Geodesy), Dr. Urs Wegmüller (Gamma Remote Sensing, Switzerland), The European Space Agency (ESA) and of Kepler Space.

Of one of the most novel and most advanced, highly complex space geodetic method, i.e. differential and constant Synthetic Aperture Radar Interferometry (PSI) was applied in the research. The method is based on satellite radar signals sweeping the globe, with the reflected signals detected and data is stowed. Each time it passes above the ground, the satellite creates an image of the perceived radar signals reflected by the landscape, and thus on the basis of comparing the satellite measurements carried out at different times, the movement of Individual objects can be determine with high accuracy using appropriate scientific methods.

This method of investigation is special on several accounts. It is the only method for the investigation of movement that can explore the past and can thus show movement from the past, even in cases where nobody carried out measurements in the field. In the case of all other technologies, points of measurements need to be established, measurements need to be

[3] http://www.ekoku.hu/vorosiszap_sajt.pdf

carried out on site, and one needs to wait for a given period of time unto the dislocations are significant enough to be indicated. In this case however, instead of establishing local points on site and carrying out measurements, the satellites themselves have carried out all the necessary measurements years or even almost two decades ago. Thus the history of dislocation can be examined post facto, without on site work or measurement. A further advantage is that there is no need to request permissions for entering the grounds. What the satellite sees from space can be investigated regarding its movements. With this method, one can learn of the dislocation history or the stability going back eighteen years until 1992.

Regarding the red mud reservoir, the researchers first investigated the radar images made by the ASAR sensor of the ENVISAT satellite of the European Space Agency from 2001. All the images made of the impacted area were drawn into the analyses. The first image was made in March 2003, while the last one was made one and a half months before the disaster. The interferometric technology makes it possible to analyse the dislocations occurring between individual images, and thus the movement of the reflecting surfaces can be condensed in a time series. Such reflecting surfaces are for example, human structures and buildings. On the other hand, the surface of agricultural land, forests and fields, as well as water surfaces are not suitable for the examination of dislocation with the above mentioned sensors. Geometry is equally an important factor for detection, since it is necessary for reflected signal to arrive back to the antenna of the satellite. The satellite can measure the movement in the direction of observation between different moments of taking the pictures.

The satellite follows an orbit approximately North-South in direction. It has a sensor looking to the right. It sends signals at 23 degrees approximately, and detects reflected waves. If the configuration is not appropriate, the radar signal will move in a different direction, and thus will not be detected by the satellite's antenna. First images from north to south were drawn in the investigation. At a later stage of the research, the other direction will also be investigated. Since reflections can arise from other places in the case of images made from a different direction. Thus the movement will be analysed regarding more points with more details, enabling researchers to isolate horizontal from vertical movements.

Within the surface investigated, the researchers managed to identify speed and dislocation history at more than 15000 points based on the data. **The analysis showed that the system of the red mud reservoir dam has been moving significantly for years. These dislocations are not only intensive, with their extent reaching and exceeding one centimetre yearly, but also they are uneven along the dam. Some parts of the dam moved more, others moved less, and this lead to the building up constant mechanical pressures in the system of the dam. Large differences of movement concentrated in a small area could equally have resulted in the fatal rupture and burst of the dam. The dam broke at the point of both the largest demonstrated movement and the largest differentiated movement.** At a distance of 120 metres from the point of rupture, the western dam was almost stable, while its southern part showed significant dislocations as well. The results of the investigations have demonstrated that through monitoring the stability of the dam, these movements could have been demonstrated years ago. Large scale, spatially differentiated dislocations clearly indicated that it was only a matter of time until this structure bursts and breaks. Thus its stabilisation could have been provided for. The first data demonstrate that these movements went back as early as 2003. On

all the points measured, the history of movements can be reconstructed, going back 7.5 years, recorded in total in 32 different moments in time.

An investigation going back even further in time could potentially indicate whether technological interventions in the past similar to the slurry walling mentioned above could have contributed to the deterioration of the dam and to the formation of sinking leading to the exertion of shearing stress.

This series of observations provides no information on the dislocations of the northern dam which was subject to a critical worsening of conditions due to the dam break, since that structure is not located in a direction suitable for use of the satellite signalling technology. And thus no meaningful enough reflection arrives back to the satellite antenna. This however can be helped by another geometry of observation. In the next phases of the investigation, the distant past will be examined based on radar data going from 1992 to 2000, obtained by satellites ESR1 and ESR3 of the ESA. The use of a different direction of satellite orbit, and the examination of satellite images from other frequencies is also planned for. However, the highest number of observations, with the highest reliability as well as the most detailed time series are provided by the Envisat satellite presented here.

Conclusions:

- The data obtained by the Envisat satellite radars prove that the surroundings of Ajka, Devecser, and Kolontár, as well as the red mud reservoir is generally very stable The points have a speed of less than ±2 mm yearly.
- On the sections of the dam system of red mud reservoir 10, mapped by a series of satellite radar detection images, the data show significant and large-scale movement with a speed over -1 cm / year, in the 2003 to 2010 period. The ENVISAT satellite radar detection direction differs from the vertical by 25 degrees and from the western direction to the north by 12 degrees

- Data show spatially unevenly distributed movement along the dam, which indicates the continuous build-up of shearing stress within its structure. The series of observations by satellite radar show that the dam parts of which images were made moved to the largest extent in the past in the north western corner of the reservoir (-12.2 mm yearly, in the direction of the satellites, - 13.5 mm/year for sheer sinking, and -28 mm yearly for the dam moving horizontally outwards, i.e. westwards.)

- In the dam system of the red mud reservoir Basin 10 showed significant movement observed over the past years, exceeding -12 mm yearly, which equal more than -9 cm dislocation in the direction of the satellite, if the sinking itself is 10 cm, and the horizontal movement itself is 10 cm during the 7 and half years observed. These values are much higher than the margin of error of 0.3 m yearly. The speed and extent of the dislocation are significant enough to ensure that they could have been detected years ago either through on-site measurements or by space geodetic means.

- Monitoring the movements of the embankment could have drawn attention to the danger of a potential rupture in the structure, thus creating an opportunity for prevention.

- Once the researchers demonstrated the PSI satellite technology allows remote monitoring of the deformation, without any field work, not only in the present, but - going back in time, based on historical data - in the past. This technique makes it unique, and the only one that can be applied even if the threat is undervalued, the lack of control, or other reasons, measurements have been performed previously.

- The results highlight the importance of monitoring and the need for its statutory requirement.

Outlook:

These results were established based on the measurements of ENVISAT satellites. In our case, they provide the most trustworthy, and the highest number of observations, with the most detailed time series. Further investigations will shed light on the distant past based on the data as observed by previous ERS satellites, going back from 2000 until 1992. The data observed by Envisat satellite, in the other direction of flight, represents an opportunity and better resolution. And provide more precise knowledge of the spatial direction of movement of the dam, while also separating the movement components, vertically (sinking) and horizontally. This entails that the primary focus was on horizontal movement pushing the dam outwards, and creating pressure at the corners. This horizontal movement was due to the layers of sludge and water on top of one another. The investigation of the distant past is especially important, since the communication of MAL Co. Ltd. indicates that the state obliged the company in 1997 to construct a watertight wall around the reservoir. This wall reaches 10 to 18 meters in depth below the ground, reaching the first impermeable layer, and creates an obstacle to the natural flow of (ground) waters, thus changing the stability of the soil. The movement of the dam, which varies in time, could have led to water soaking into the separating layers of the basin below the ground, making the subsoil watery and loose. The analysis of ERS data can answer whether the stability and the history of movement of the dam has in fact changed since the events of 1997.

1.4.2. Outdated technology at MAL Co. Ltd.

Outdated technology at MAL C. Ltd. The burst of a dam is not necessarily catastrophic in its impact. However, in the Kolontár-Devecser region, the significance of the impact was significant in a global comparison. Clearly, it was the quantity of the escaping material that lead to a floodlike spill. the height of the flood was defined by the quantity of the water. It was also related to the destructive impact, given the fact, that the forces at work are proportionate to the mass of the spill. The dimensions of the flood were much greater than previously expected in the disaster management plans endorsed by the authorities. The first estimations referred to spilt material to the extent of 600.000 to 700.000 m^3, whereas the data published since estimate

900.000 to 1M m^3 of spilled material. To the contrary, the disaster management plan only calculated with 300-400.000 m^3, (consisting of 200.000 to 3 of water and 50.000-100.000 of red mud. Working with a minor margin of error, this only equals half or less of the material that in fact escaped. This entails that if the scenario sketched in the disaster management plan had been realised, the height of the flooding liquid would have only been half of what was in fact observed.)

Instead of a flood reaching 2 metres in height some places, the experts only calculated with a height of one metre, which would have been less dangerous to people. It is also likely that the extent of the damage wrought would not have been reduced in a linear fashion. But to a much higher extent, because the water would not have been able to enter so many houses, and would have flooded a smaller area etc. The larger quantity of water meant that the spilt liquid and the flood it generated was more diluted and flowed much more easily, which also contributed to the destructive impact and the size of the forces involved.

It is an equally important question why there was more liquid material in the reservoir. The construction of slurry walls, built to prevent the contamination of ground waters created in practical terms a closed pool around the reservoir. Given the fact that the water seeping away from the reservoir basins as well as the precipitation falling between the banks and the slurry walls would in the end return to the active basin, due to its alkalinity, entailing, that if the active plant does not exclude this quantity of water, the whole basin will include more and more liquid water or solution in the active basin. This extra quantity of water should have been extracted by the company from the system, and neutralised and channelled into either a natural river bed or the technological system itself. This measure would have reduced the extent of the destruction by an order of magnitude at least as far as the loss of human lives is concerned.

Two further facts support the special role of the liquid phase. First of all, at the time of the second dam break, experts indicated that instead of an escaping flood, what should be expected will be sludge slowly flowing out, which will not be able to reach the villages. On the other hand, the government intends, an is fully justified to do so, to force the alumina plant to switch to a dry disposal technology, which is an admission of sorts that the disposal technology used increased the risk and the severity of the accident.

It seems that MAL Co. Ltd. did not seriously consider a potential dam break at all, nor its consequences, since the disaster management plan, as far as we know, deals with this most important of issues in a rather vague manner. The potential effects, as enumerated, are on the one hand imprecise, lacking the important depth. Firstly, experts should have calculated with a potential dam break in any direction. Secondly, they estimated that the sludge would only be able to reach the village as far as the railway embankment. But even in this case there does not seem to be a reason for not relocating the residents living between the stream and the reservoir. And a further point, which contributes to this is as follows. The fact that local residents received no information and no preparation on what should be done regarding red mud in case of a potential disaster also makes it likely that the disaster management plan was in fact unsubstantiated.

If we consider the damage wrought and the other factors which require further investigation then it becomes clear that the reason of such a severe disaster was not the dam break itself, but the excessive water content of the liquid escaping with the red mud flood. Its sheer

volume was about the double or triple of what had been estimated in the disaster management plan. To this contributed a very strong alkalinity, with a pH value of 12.87. A significantly smaller quantity of water would have meant an impact lower y at least an order of magnitude concerning human lives, the damage, and spoiled human livelihoods.

1.5. Civilian concerns and recommendations

NGOs were the first to call the attention of the authorities and the public to the technological and environmental problems of red mud disposal – up to the Kolontár accident, not very successfully.

The Hungarian Aluminium Oxide and Synthetic Corundum Corporation (MOTIM) was permitted by the North Transdanubian environmental authority to postpone the recultivation of the red mud basins multiple times, a fact that resulted in finishing it only in 2005, as opposed to the original deadlines of 1996 and 1997. In 2001 however—one year before the termination of aluminium oxide manufacturing—, MOTIM inaugurated the highly secure reservoir basin V., that meets even the most modern requirements. Therefore the company chose to invest in increasing the retention capacity instead of recultivating the old reservoirs it had purchased along with the factory facilities and did so right before terminating aluminium oxide—and, by extension, its own red mud—production.

Three years later, it was with reference to its free capacities that MOTIM applied for the right to deposit the acidic gas purification mass previously stored in the Budafok cave dwellings, a project for which the state allotted 1.8 billion Forints. Thus, instead of mitigating the environmental risks, the Mosonmagyaróvár aluminium industry company exposed the inhabitants of the area to an even newer threat when—besides the manufacturing of synthetic corundum and fused cast refractories—it switched over to hazardous waste storing and it did so with the approval of the North Transdanubian Environmental Inspectorate. The environmental protection authority gave MOTIM the aforementioned permit for mitigating the gas purification mass under strange circumstances. In 2004 the North Transdanubian Environmental Inspectorate issued the roughly three page permit in a matter of only a few days, whereas the issuance of an average permit typically takes one month long, its contents amounting to twenty-fifty pages. In the justification part it only features that the acidic and alkaline wastes neutralize each other. The **Mosonmagyaróvár Environmental Protection Association** contested the resolution however, as a result of which—preventing the outbreak of a scandal—MOTIM withdrew its request.

On the premises of the previously founded bauxite processing plant MOTIM has used its red mud basins for storing hazardous wastes ever since, although the governance of Mosonmagyaróvár has not been able to get a permit to implement a communal waste landfill in the same location (because the area lays above an endangered aquifer). Lázár Pavics, the expert from **Clean Air Action Group** filed a report with the prosecutor's office in this regard in 2006, according to the position of the Győr-Moson-Sopron County Attorney General's Office, however the case did not necessitate prosecution. In its answer the prosecutor's office touched on the fact that following the audit of the Transdanubian Environmental Protection, Nature Conservancy

and Water Inspectorate files, it concluded that all of the proceedings and adjudications having to do with the operation of either MOTIM or its predecessors, were founded and conform with the judicial rulings valid at those times. Concomitantly, none of the adjudications listed in the answer letter of the prosecutor's office deals with the placement of MOTIM's hazardous waste storing basins, neither do they discuss in what extent those meet legislations warranting the safety of aquifers. According to the Clean Air Action Group's position, the prosecutor's office was misinformed by the environmental protection authority, presumably following governmental expectations (in 49 percent the ownership of MOTIM belongs to the Altus Corporation, the company of the prime minister of the time, Ferenc Gyurcsány).

Otherwise the Clean Air Action Group notified the government as early as 2003, that the environmental remediation of the reservoirs containing about 30 million tonnes of red mud was a pressing matter. The organization recommended making a modification to the Criminal Code according to which the legal person who yields unlawful advantage to the operation of another, commits crime regardless whether the fact of bribery or other unlawful influencing could be proven. This would be a major step forward in order to put a stop to the present practice where decision makers—state agencies, civil servants, representative boards—make unlawful decisions with no personal consequences. It is that much more urgent, because the anti common interest adjudications that serve the self interest of a few, often have the argument of the decision, withdrawal only being possible accompanied by compensation, which there is no available budgetary source for.

In regard to the environmental hazards of the Almásfüzitő waste disposal site the **Esztergom Association of Environmental Culture** and **Válaszúton Foundation** strove to step up to the authorities (see the summary of their concerns in chapter 1.3.2.). Following the Kolontár accident, the organizations involved asked the environmental protection and disaster relief authorities to perform a special inspection at the Almásfüzitő tailings reservoir as well as to inform the public of the potential environmental hazards. They also proposed that tailings reservoirs and their remediation be controlled by a civilian supervisory committee formed of local citizens and experts.

1.6. Expert proposals

Professional-expert comments on the accident mainly have to do with licensing of the dam construction, the sturdiness of the dam and its structural engineering problems. Former employees of the Hungarian Geological Service now being dismantled, proposed for example that at the time when the now-damaged dam was built, there still existed a geological authority in Hungary (the Central Office of Geology). Back then, a dam of this size could only be constructed with the possession of the authority's licence, therefore the Ajka reservoir would surely have a geological authority licence as well. The authority's licence does contain a size reference (height, capacity, etc.). In 1993 the geological authority ceased existing and in accordance with the mining law, the Hungarian Geological Service became its official successor, holding an administrative licence. In 2006 it ceased existing, too, its official successor being the Hungarian Office of Mining and

Geology. Thus, at present, the original file is to be found in the archives of this last office. This file would be important, because based on this it would be clear who violated the licensing order, when and in what way that person did it. It can be speculated that the environmental protection authority was not aware of the fact, that for certain cases of dam remodelling (e.g. for elevating the dams of the reservoir already in use) it would be necessary to have a geological administrative licence.

According to Member of the Hungarian Academy of Sciences, József Ádám, chair of the Faculty of Geodesy and Surveying at the Department of Civil Engineering, Budapest University of Technology and Economics (BME), looking for the technical causes of the Kolontár dam rupture belongs primarily to the sciences of the field of civil engineering, secondarily to the topic of geological sciences. The professor's main propositions are the following:

a) The safe operation of such large scale engineering establishments entails the continuous monitoring of the condition of the establishment. Naturally, this encompasses the continuous examination of the sturdiness and motion testing of the reservoir dams.

b) Geodesic motion testing is indispensable for preventing similar accidents:

- For the safe operation of the reservoir (reservoirs) a continuous /repeated/ motion testing is needed.

- The frequency of motion testing and the accuracy of measurements (the necessity and method of operational or strengthening interventions can be decided upon depending on this, as a result of potential changes in measurements) are to be designed on the basis of geotechnical experts opinions.

c) As examples to the safe operation of large mechanical establishments, the repeated motion testing of the Paks Nuclear Power Plant, the Danube river bank at Budapest or the valley dams of water reservoirs in the Mátra Mountains could be mentioned.

d) Today's modern geodesic motion testing methods of measurement (employing conventional geodesic measuring procedures and the modern satellite techniques, with GPS-method and satellite radar interferometry) assure detection of changes both in a horizontal and vertical sense, if necessary, even in the millimetric range of accuracy.

e) For conducting such studies, in Hungary there is an adequate scientific capacity available. At the Budapest University of Technology and Economics most similar expert tasks are performed by the faculties of the Department of Civil Engineering. The staff of the Department can give expert answers to questions that concern the planning, calculus, error detection and motion testing related to the disaster of the dam rupturing.

1.7. The role of the authorities

1.7.1. Dismantling the authorities

In 2003 the Clean Air Action Group communicated its position to the government, drawing attention to the fact that dismantling of authorities as planned at the time would cause a lot more damage to the state then the benefits it may bring. The Group did not manage to prevent the process, what is more, it continued. The inspection services were especially severely hit as an outcome of the austerity measures of the years 2006-2007. Twenty-six environmental protection organizations protested this step in a joint statement, that—among other things—contained the followings: "Right now, at the environmental protection and nature conservancy inspectorates there is an average of less than half an hour allotted to a case. Site visits usually cannot be fit in this amount of time, office workers mostly make their decisions based on the paperwork turned in. One can imagine how objective the documents may be that are handed in by those, who have vested interest in the quickest possible realisation of the project or the avoidance of the environmental protection fines." The Kolontár red mud disaster also proves just how right they were.

In 2006 the Clean Air Action Group made a study and provided prime minister Ferenc Gyurcsány with it, describing the situation of the authorities, wherein it concluded the followings: "The government tries to justify the dismantling with budgetary thriftiness. At the same time it hasn't even estimated the severity of the damage inflicted upon society by the dismantling or the magnitude of cost assumed by the state, for example due to the increase in disease cases caused by the complete destruction of natural and cultural assets, the commonwealth and by environmental pollution. Namely the measures were not preceded by any kind of impact assessment, professional or public debate. (...) Weakness of organs responsible for safety, the enforcement of laws, is a characteristic of less developed countries. On the other hand, in the most competitive countries of the world regulations serving safety (environmental and health protection, etc.) are the most stringent and the conditions of inspection are such, that these regulations can be enforced. Hungary should not choose Ethiopia, not even Greece as an example to follow, but rather Scandinavia that is able to sustain a stable economy and society, and that is safe." The turned-in document did not receive a meaningful answer. The fate was similar of the Protect The Future Association's study titled "Smaller State, Greater Problem", based on its 2007 survey and that called for attention to the severe dangers lying in the undue situation of the environmental protection inspectorates. The research done by Protect The Future gave an objective proof to the flaws of inspections and the softening-up licensing practice as a result of the cut-backs at the environmental protection authorities.[4]

An even greater blow than the one of the environmental protection inspectorate was suffered by the National Public Health and Medical Officer Service (ÁNTSZ) that was halved, with the most experienced experts being removed from (their wages were the highest, thus the biggest "savings" could be achieved by firing them). The under-secretary of the time at the Ministry of Health gave the explanation to these steps by saying that "the bureaucratic procedures of the ÁNTSZ impeded the functioning of businesses." If the laws were indeed bureaucratic, then

[4] http://www.vedegylet.hu/index.php?page=news&news_id=651

the these laws should have been changed. However such changes did not happen – obviously for the reason that the laws assign those duties to the ÁNTSZ, that in the favour of citizens' health and safety it needs to fulfil. The government stepped in against "the bureaucracy afflicting businesses", by not reducing the assigned duties, just the money and the staff! By doing so the ÁNTSZ became incapable of taking care of its duties provided by the law. This is what became apparent during the red mud disaster, when the ÁNTSZ "concluded" that the Ajka red mud was non-toxic based on 1987 (!) measurements data. According to this data the sludge has a pH of 11.8, which is one order of magnitude less than the value of 12.9 pH measured in reality (the pH shows acidity/alkalinity based on a logarithmic scale, thus the 12.9 pH means an over ten times stronger lye concentration, than the pH of 11.8). This is how it could happen that the first up-to-date data following the disaster was not let known to the public by a state institution or authority, but chiefly from the measurements of an international environmental organization's, the Greenpeace's office in Hungary.

A modern state cannot do without the state-run inspection organs that function effectively and that are well prepared. As a result of the accelerated scientific-technical and economic development we have to face an increasing amount of risks. The large number of new chemical substances, the nuclear products spreading wide, the increasing transportation capacities, surfacing of the genetically modified products, the operation of the many hazardous industrial facilities constitute such risks, that require severe regulations and authorities performing their activity on a professionally high level of competence. In Hungary, in recent times the inspection organs—the environmental protection and nature conservancy authorities, the ÁNTSZ, the hydrological organs, the plant protection service, the traffic monitoring authorities, the Consumer Protection Main Inspectorate and others—have been dismantled in an ill-considered way, continuously and at a large scale.

Financial austerities at the state inspection organs cause much larger damages, than the benefits they bring forth, amounting to: crime increases, societal injustices and tensions grow stronger, the health status of the citizens and the quality of the environment worsen, the country's assessment changes unfavourably, moreover, the state revenue decreases. Dismantling of the inspection organs only favours those, who are striving to bypass legislature. Such complaints are continuously registered coming not only from the citizens, but those multinational and smaller domestic companies that take regulations seriously, as well.

Undeservingly little attention was given to the fact that authority dismantlings lead to prolonged case processing, a decrease in service quality and to juridical uncertainty. Procedures are slow, non-transparent, deflecting responsibilities right and left, symptoms which mostly stem from the overloadedness of the clerks, unpredictability, the constant reorganizing, "rationalizing".

The European Union stated even before our accession, that at the environmental protection and nature conservancy local organs there would be a need for more than one thousand additional employees in order for us to comply with the community's requirements, whereas GDP-proportional financing of the domestic environmental protection sector brings up the rear in the OECD, being approximately at the level of Turkey – as it was also shown by a Protect The Future-study.[5] On the contrary, since then, staff of these organs has been decrea-

[5] http://www.poltudszemle.hu/szamok/2008_3szam/2008_3_javor.pdf

sed continuously and the process only stopped in the last one or two years. Presently, at the environmental protection inspectorates a case is often allotted only a few minutes to be taken care of. Apart from few exceptions, the individual cases are approved without considerate review. Year after year, citizens' complaints arriving to the civil organizations are more and more numerous. Illegal waste disposal, the different activities that pollute the air and emit substantial noise, green area destructions are often due to the lack of authority inspections and measurements, as well as the fact that on-site inspections have become extremely rare and the quality of those is not always adequate because of the overloadedness of the employees. Delay of cases also happens frequently, which may discourage honest investors. Even certain leaders of the previous environmental protection ministry stressed it occasionally as an important consideration, that authorities "shall not be in the way of them, but rather help business activities as smoothly as possible", referring to the fact that they do not need to fully comply with environmental laws.

The situation is especially worrisome in the activity of the building authorities. According to the Green Economic Stimulus, the study put together by the **Lélegzet Foundation** in 2010, "right now—as a caricature of the statev—21 people are inspecting constructions in Hungary, out of which ten percent are inspected (the European average is sixty percent). Giving building permits out is the competence of the clerk and the departments of building authorities. The latter ones however cannot be regarded independent of the local governance, the mayor. This practice takes an expensive apparatus and at the same time—especially in the jurisdiction of the smaller governances—the adequate expertise is not assured. It is very common, that they administer building processes where regulations are infringed upon and they fail to represent the interest of the public versus the infringing builders. From societal and national economy standpoint the danger runs at least this high, that the infringing constructions too often are not stalled and they are not inspected adequately. Edifices built unlawfully, are practically never brought down." The reason behind failing to deconstruct is often simply financial – governances do not have the money to prepay for the official deconstructions, the costs of which are only redeemable later – as it was stated by the 2nd report of Protect The Future's Representation of Future Generations program in 2001.[6]

Local governances get numerous tasks as environmental protection authority of first instance (permitting related to woody plants, air protection authority, building authority, etc.), that legislation deploys to the clerk, who typically delegates related duties to the environmental protection department or the executive. It is especially true about these organs that in many places the needed expertise is not available and on top of all, due to the local connections and system of influences, the chance for biasedness, in more severe cases corruption, is quite significant. In many instances governances themselves are interested (e.g. via the local taxes) in carrying out certain environmentally burdensome projects, that also elevates the risks of corruption.

[6] http://www.vedegylet.hu/doc/jonek_2.pdf

The study of the Breath Foundation spelled out some recommendations as for how to strengthen the activity of authorities, too:

- The practice of environmental protection licensing has to be made more strict. In cases of projects that take up huge masses of land, attract heavy loads of traffic, not to be possible for the environmental protection authority to come to such absurd conclusions as the one saying that the project "does not have significant environmental impacts".

- In the cases of projects, the practice of impact zone delineation should be changed, broadened. So that thereafter it could not happen for example, that the impacts of a linear construction project generating significant traffic across a huge area are only assessed right alongside the new trace.

- The correctness of the key elements, measurements of the case study and impact assessment documentations handed in by the investor, should be assessed by the authority with the revision of the inspectorate in every instance.

- Both the available financial and human resources have to be expanded at the environmental protection, nature conservancy and hydrological inspectorates, the hydrological boards and the nature conservancy watch. Furthermore, a transparent organizational framework should be created that assures the most effective use of resources possible. For operating the environmental protection authorities, the best practical experiences should be implemented from the extremely rich international specialized literature. First, for instance, the recommendations made by Impel (European Network for the Implementation and Enforcement of Environmental Law) should be naturalized in the domestic practice.

- It needs to be specified in law, that the environmental protection, nature conservancy and hydrological authorities cannot hire an independent expert in a specialty issue that belongs to their area of competence. Expert opinions requested from partner authorities, the specialized authority's position and the own experts have to provide sufficient professional background for the decision making.

- The process in which authorities regard civil organizations expressing an opinion about their procedures as obstacles, instead of seeing the participants in improving effectiveness, the quality level of professional decisions and the social acceptance of those, needs to be reversed.

- Public hearings related to environmental protection licensing procedures always need to be held after work hours, at the closest possible location to the planned project, in order to allow as many people as possible to participate (at the moment in many cases efforts are reversed).

1.7.2. Lax authorities, lack of inspections

Based on the waste management law in effect, it is the MAL Co. Ltd. that had to have its waste management (including the storing technology) revised, which took place in 2003. **The company contested the environmental protection operation licence received during the licensing procedure, because the environmental protection authority of first instance ordered treating of the red mud as hazardous waste**.

The environmental protection inspectorate of territorial jurisdiction, on July 22nd 2003 transferred the documentations to the Main Inspectorate in order for the Main Inspectorate to confirm the fact of hazardousness or the opposite—according to the rules of the time. The answer sent to the Inspectorate by the Main Inspectorate (OKVF) on January 16th 2004, said that the pertaining legislation—Government decree; 98/2001. (VI.15.) about the conditions of activities related to hazardous wastes—was modified in its § 4. According to this, the producer of the waste is responsible for classifying its waste. That being said, the OKVF redirected the case to the inspectorate. (Üi. [Case identification number] 30 010-61/2004 p.10). By this time, based on the information about the technology and the test results, the Inspectorate did not oppose the classification of the waste as non-hazardous any more, thus the environmental protection operation licence was born.

The licensing procedure had some arguable points, however. The Main Inspectorate had not made a decision in this case for over 5 months. (Based on the Administrative proceedings law (Áe.1957/IV.tv.) in effect in 2003, the deadline would be 30 days in the second instance, too, but neither does the § 43 (1) of the Waste management law (Hgt.2000/43.tv) allow for longer deadline than 90 days). It was during this period that the extremely important change in the government decree took place, aforementioned above. The 98/2001. (VI.15.) Government decree stipulates the conditions of activities involving hazardous waste as follows: "Classification of wastes not featured in the waste catalogue, those ones not possible to be featured there or wastes the consistence of which is unknown, therefore hazardous wastes needs to be requested through the Main Inspectorate." This changed as of December 4th 2003: according to the 16/2001. (VII.18.) Ministry of the Environment (KöM) decree, the company classifies itself. It was then, that based on the decree the red mud was moved to code 01 03 09 EWC from 01 03 07 (07 is the group of hazardous wastes associated with metal ore mining and with treatment of such mining materials). **Based on the documentation sent in by MAL Co. Ltd., the Inspectorate accepted the reclassification, this way the red mud of MAL Co. Ltd. became non-hazardous waste.**

The change happened following the recognition of the fact that the environmental protection authority ever shrinking in its staff and financial instruments, did not have sufficient capacity for the inspection activity. Thus the inspection of the red mud reservoir basins was not of proper scale either, since the authority (would have) had to perform random re-inspection of countless other, air pollution, air burdening, water quality data provision.

Based on the environmental protection licence, MAL Co. Ltd. also had to provide the Inspectorate with the data and documents listed below:

a) annual summary report of the operation of the waste disposal site by April 30th following the current year, including the status description of the waste disposal site, data about sinking of the waste disposal site level, the results of underground water testing.

b) water quality studies as part of the monitoring system, on quarter, half year basis at the specified wells, as well as water level observations, also by April 30th.

The licence prescribed MAL further reporting, revision, operational, managerial obligations from the monitoring wells to sound protection, data that is also the responsibility of the authority to inspect. The company had the obligation to report to the environmental protection inspectorate all changes listed in the licence, the day following the observation. (Meeting this obligation, was also the authority's duty to inspect.)

On February 17th 2006, the aluminium oxide sector of MAL received an integrated environmental permit (MAL-EKE) from the inspectorate (valid through February 28th 2011). This licence included (Üsz. 10897/05) the dilution method using reclaimed water and lifting the water into basin X. Points 9.xx and 11.xx deal with the issues of waste management, and also cover the report of change obligation. The issue of the reservoir the licence does not touch upon any more, delegating that into the competence of local building affairs.

Ensuing the Kolontár accident, the **Society of Conservationists of Eastern Hungary** initiated a criminal complaint at the Supreme Court against an unknown perpetrator or perpetrators in suspicion of reckless endangerment due to professional negligence resulting in manslaughter. According to the legal position of the civilian organization, the environmental protection authority concerned, according to the ruling of the § 22 (3) of Government decree 314/2005. (XII.25.) about the environmental impact assessment and the integrated environmental usage licensing, during its on-site inspection performed on September 23rd 2010, did not do justice to the 219/2004. (VII.21.) Government decree about the protection of underground water tables and to the pertaining instructions of the 2001/331/EK (2001. IV.4.) proposal about determining the minimum requirements of environmental protection inspections conducted in the member states (in other words it did not perform a veritable inspection, resorting to the data provision of the operator).

Following the accident, Politics Can Be Different (LMP) immediately brought up the issue of authorities' responsibility as well. According to the position of the ecological party, both the flaws in the Hungarian and the Union regulations played role in what made the disaster possible. In the European Union the bauxite residues (red mud)—the solid phase—is not considered hazardous waste, in Hungary however, based on their alkalinity resulting from the employed technology, they are clearly to be listed among hazardous wastes. (It is worth mentioning here, that the solution phase accompanying the bauxite residues that leave the aluminium oxide factory have a pH exceeding 11.5, not only in Hungary, but in other parts within the EU as well.) In practice, however, authorities adapt the softer regulatory threshold in our country, too, treating red mud as non-hazardous waste.

LMP also pointed out that alongside the potential technical causes, the accident clearly raises the inadequacy of the administrative inspection, too: the environmental protection inspectorate does not have the competence of performing structural engineering examinations and not even weeks after the dam rupturing was it obvious which authority would have the duty to examine the technical status of the similar dams. "Based on the final decision of the Capital High Court in December 2010, the waste can be rendered harmless by depositing the red mud and the creation of the waste disposal site requires integrated environmental permit." The ruling closed up the competency dispute of the Central Transdanubian Environmental Protection, Nature Conservancy and Water Inspectorate versus the clerk of Devecser. The court did not challenge the fact that the regulation is ambiguous, but stated: based on the ruling currently in effect, the red mud reservoirs undoubtedly belong under the effect of the waste management law. Such a structure can be built "only by complying with the rulings of the specialized legislation and with the licence of the environmental protection authority". One of the conditions is to undergo the procedure necessary to be given the integrated environmental permit, that clearly belongs to the competence of the environmental protection inspectorate, according to the high court. From the order it becomes apparent, that the clerk exercising the power of general building affairs authority, does not have any duty in relation to such establishments whatsoever. Nonetheless, following the disaster, the inspectorate still conjured the clerk to conduct the administrative procedure, who refused to act, however, arguing that he did not have the competence.

In LMP's opinion, the inspection permits of the green authority that has been systematically weakened throughout the past years need to be strengthened, which requires both legal measures and staff expansion. The case warrants a Union level revision of the environmental protection regulation system of the state of Hungary (and presumably of the other states in the region). In the case of high environmental risk industrial operations, a system of mandatory financial collaterals and liability insurances has to be implemented that conform with the EU-guidelines that pertain to environmental responsibility. The system of environmental protection licensing and revision also has to be transformed. Finally, at the level of the European Union there is a need to create a guideline governing the mandatory liability insurances of hazardous industrial plants, as well as the establishing of shared funds filled by the deposits of the hazardous industrial plants and aimed for covering those damages that otherwise (based on the insurances and the damaging companies assets) could not be paid for.

The same opinion was shared by the European Commission in its stand at the beginning of December, according to which the red mud that flooded Devecser and Kolontár should have been classified hazardous waste (that is, Hungarian authorities let the MAL Corporation operate based on erroneous licences).

Following cautioning of the Union, the ecological party demanded a thorough and unbiased investigation to find out what professional errors were committed in the licensing procedure. Earlier, LMP had already drawn the attention to the fact that for the event of the red mud disaster not only the MAL Corporation is to be held responsible, but all of the authorities concerned, furthermore the legislation in effect and the governments that had failed to create the adequate legislation since 1995. In the instance of the authorities, it is incomprehensible, how they could give out licence in 2006 for regular waste disposal in the case of a material

having a pH of 13. The Basel Convention is clearly classifying bauxite residues (the red mud) hazardous waste, as long as their pH is higher than 11.5. This criteria features exclusively in relation to the red mud—not surprisingly, based on this, the European Commission also came to the conclusion that **the red mud causing the disaster is considered hazardous by the European Waste Catalogue (EWC), therefore the Hungarian authorities committed an error when they did not classify it as hazardous waste.**

LMP believes that it is the responsibility of governments of the past fifteen years, that as a result of the continuous changes dotted with cut-backs and dismantlings inflicted upon the administrative system, such an administrative system has been created that is insecure even in its own competencies, that is weak, susceptible to political influencing and that practically does not have on-site presence. In relation to this case, the ecological party called upon the government once again, to strengthen the administrative system, to bring to a halt the political influence and to lead a thorough and unbiased investigation of the red mud disaster, naming those found responsible.

Summary

It is not possible to account for the Kolontár red mud disaster by means of a single cause. Among the potential causes and preceding events, the following should by all means be noted:

- **The conditions of privatisation:** it was with reference to the obligations of environmental protection that the buyer was able to acquire the Ajka Aluminium plant at a very low price. However, these obligations were not properly regulated within the contract, and there were also gaps in monitoring implementation. Moreover, the authorities allowed on more than one occasion for the owner to postpone meeting these obligations.

- **Deficiencies in monitoring environmental damage control:** the privatisation contracts contained an obligation to provide for environmental damage-limitation, but the monitoring of how this was implemented was deficient. No detailed documentation is available, except for written records to the effect that invoices were presented as evidence for compliance without technical inspection having taken place;

- **Outdated disposal technology:** when the first red mud reservoirs were established, the technology of wet disposal for red mud was still widespread, but much safer dry processes were already available by the time the permit for Basin X was granted, and the integrated environmental permit for the reservoir was granted;

- **Inappropriate classification of red mud waste:** when the integrated environmental permit was granted, red mud was not classified as hazardous waste, even though it clearly counted as such on the basis of its pH value under the Hungarian and EU legislation then in force;

- **Licensing and monitoring malpractice on the part of administrations:** following the disaster, a court ruling was required to clarify which authority should have granted a permit for the dam building at the reservoir and carried out structural engineering inspection of the built structure;

- **The sinking of the dam (which could also be related to posterior slurry walling):** satellite images clearly show that the barrier sank in certain places at a rate of 1 cm / year, creating maximum shear stress precisely at the section where the dam finally broke, while the sinking itself might have occurred because of the slurry walling, or because of the dam base and subsoil becoming soaked due to the slurry walling. However, no use was made of the satellite imagery in the structural engineering inspection of the dam, even though they were continuously available; neither was the stability of the structure monitored in any other way.

- **Negligence on the part of the authorities and government officials:** several NGOs had previously protested about the lack of environmental protection developments and the failure to carry out inspections. Their comments had no practical consequences at all.

Recommendations

- Privatization documents of the industrial plants with great environmental risks, the environmental protection compliances and the inspection thereof all have to be revised. In the event that a clear connection is shown between the improper privatization practice and the large increase of the environmental risks, then the personal responsibility also has to be investigated among the participants of the privatization process.

- The licensing practice of the environmental protection authorities has to be revised, with special attention to industrial processes resulting in large amounts of hazardous waste, to the disposal of hazardous wastes, to the integrated environmental permits relating to these and within the IPPC guidelines to the enforcement of the BAT instructions.

- In the case of authorities taking part in (and those avoiding taking part in) the inspection and licensing, the exact institutional and personal responsibilities need to be investigated.

- It needs to be assessed whether the administrative capacity presently at hand is proportionate to the truly existing industrial hazards and the inspection demands relating to them, as well as the institution system needs to be reinforced where justified.

- There is need for regulation to be passed specifying the frequency of structural engineering and environmental safety inspections of similar structures and the distribution system of responsibilities (see the pertaining LMP bill).

- In order to prevent similar disasters, client rights of the civil organizations have to be strengthened, not taken away.

Smaller buildings were crushed by force of the current

2. An account of the accident

2.1. Chronology of the accident

4 October 2010

- At 12 25 pm, the barrier of the caustic waste reservoir breaks in the vicinity of Ajka, a town located in Veszprém county, at a distance of about 160 km from Budapest. The red mud reaches the municipalities of Devecser, Kolontár, Somlóvásárhely, Somlójenő, Tüskevár, Apácatorna and Kisberzseny. Devecser and Kolontár experience the greatest devastation. (In the following days, the red mud contaminates the Torna creek and the valley of river Marcal, almost reaching the river Rába. The red mud contaminates the valleys of the Torna creek and the Marcal river, almost reaching the river Rába. Through the Torna, Marcal, Rába and the Moson branch of the Danube, the alkaline slurry enters the Danube, causing some extent of destruction in all the affected waters. Along the Torna and the impacted section of Marcal, practically all aquatic life is destroyed. The disaster leaves 10 people dead and almost 150 slightly or severely injured, including local residents and the participants in the rescue operations. The spilt mud

and alkaline slurry pollutes about 1.000 acres of land. The amount of the emitted is was about 0.9–1 million cubic meters.)

- Fire-fighters reach the scene in about 8 minutes and start rescuing the inhabitants trapped or injured, amounting to about 60 victims in Kolontár and nearly 720 people in Devecser.

- Minister of the Interior Sándor Pintér and György Bakondi, the director of the National Directorate General for Disaster Management immediately travel to the scene.

- The commanding unit of the Directorate for Disaster Management is set up by 2 pm. The Local Defence Committee starts to operate.

- Action is taken immediately to accommodate the inhabitants whose homes have been flooded. Accommodation is organised for 40 people in Kolontár, while temporary night shelters are put up for 500 people in Devecser. Only 31 of the night shelters are used since the vast majority of afflicted chose to lodge with relatives and friends in neighbouring villages.

- The Directorate for Disaster Management (OKF) sends four members of the Crisis Intervention Team to the scene to provide mental health care and manage the rescue operations.

- At 4 pm on 4 October 2010, the regional offices of the Central Agricultural Office declare a ban on fishing and hunting. Sales and use of contaminated fodder and food is prohibited through an official intervention by the Chief Veterinary Officer.

5 October 2010

- In order to protect the water quality of the Marcal River and to prevent pollution of the Danube, the calcium nitrate and magnesium nitrate delivered on the scene is deployed in the river by fire fighters and military forces under the supervision of water management professionals from early dawn.

- 340 people are mobilised and deployed on the scene by the Police. Acting on oral instruction, the Army arrives on the scene as well.

- Shipping the collected pollutants starts back to the premises of the company having caused the incident, into an intact basin.

- Secretary of State for the Environment Zoltán Illés suspends production at MAL Co. Ltd. with immediate notice, simultaneously ordering the company to start restoring the reservoir damaged in the area of Ajka. The Ministry of the Interior calls upon the company to allocate HUF 100.000 as emergency aid to the each owner whose homes have been damaged.

- The Prime Minister requests the Minister of the Interior to investigate the issue of personal and material liability. The Government calls on the Minister for Rural Development to assess the damage to producers to and its consequences. The Ministry for Rural Development initiates a revision of other similar red mud reservoirs until 15 October.

- The Army and the National Public Health and Medical Officer Service (ÁNTSZ) assess radiological threats. Both laboratories conclude that there is no hazardous radiation exposure in the area.

- With the cooperation of the Central Agricultural Office, the collection and disposal of animal carcasses starts.

- The Veszprém County Defence Commission decides to ban the consumption of contaminated food products and animal feeds, as well as on involving public workers and municipal forces in the works in the municipalities.

6 October 2010

- The disaster is discussed as the first item on the agenda of the Government meeting. The comprehensive report of the Minister of the Interior is heard. The government declares a state of emergency.

- The Minister of the Interior announces that the Police will give first priority to investigating the issue of liability. The investigation is to be taken over by the National Bureau of Investigation.

- Professionals address the problem of alkaline red mud escaped from the reservoir at Kolontár flowing into the Marcal river. The Minister of the Interior states that round the clock, 24 hour long guards or monitoring shall be started on the dam of the reservoir.

- The government announces that staying in Hungary is completely safe, the collapse of the dam in no way threatens people and tourists. The disaster of the sludge reservoir is local, without the risk of adverse health effects outside the impacted areas.

- As a consequence of the disaster, the Government Accountability Commissioner speeds up the investigation regarding MAL Co. Ltd., the owner of the alumina plant. For the time being, information is gathered on the contracts concluded between the group and the state in recent years.

- The Army constructs a temporary bridge to replace the bridge destroyed at Kolontár. The maintenance of the replacement bridge will be continually secured.

- At a press conference by the Government Spokesperson, the Minister of the Interior states that the professionals are able to treat the alkalinity of the red mud released from the reservoir in the Marcal River.

- Benedek Jávor, the President of the Sustainable Development Committee of the Parliament, delegated by LMP, investigates conditions at Kolontár and Devecser. At a local press conference he urges the Minister for National Development to disclose the privatization contracts of the Ajka plant.

7 October 2010

- Early in the morning, the Prime Minister conducts inquiries about the situation on the ground. He walks along the streets among the destroyed houses of Kolontár, personally assessing the damage wrought by the red mud flooding the village on Monday afternoon. He ensures the injured that they will not be left alone. The elimination of damage in the surrounding damaged or partially destroyed homes is carried out depending on whether their owners declare they are willing later to remain in their houses or the flooded district.

- At 3 pm, the County Defence Commission meets in Devecser, followed by a residential hearing with the participation of the county director of disaster management.

- Sanitary tents are set up by the government in Devecser and Kolontár in order to ensure that the participants in the rescuing operations in direct contact with the material may immediately be washed, while they are still wearing the protective garments.

- The Kolontár fish pond is drained in the hope of finding the three missing persons, but the bodies are not found.

- The three-part dam designed to stop further leakage from the damaged basin is constructed. A new reservoir is built to store the collected sludge and debris.

- The National Directorate of Disaster Management entrust experts from Károly Róbert College, Gyöngyös to carry out aerial damage assessment of the areas flooded with red mud as a result of the breaking of the dam of the Ajka caustic waste reservoir.

- The National Bureau of Investigation initially stated they the original investigation into the suspected crime of reckless endangerment due to professional negligence resulting in manslaughter was reclassified as endangerment due to professional activities resulting in a lethal mass disaster.

- The Army constructs a temporary bridge to replace the bridge destroyed at Kolontár. The maintenance of the replacement bridge will be continually secured.

- More gypsum is deployed in order to uphold protection and to mitigate alkalinity at Kolontár village, followed by Devecser and Somlóvásárhely, the Marcal, and the bridge of the public road connecting the settlement of Szergény and Vinár.

- Fidesz MEP János Áder proposes the establishment of an EU disaster fund at the plenary session of the European Parliament in Brussels.

8 October 2010

- Gypsum is spread from the air at Marcal. This water is further diluted with water from the Rába and the Moson branch of the Danube, only entering the Danube at this stage. Further water quality problems and adverse health effects are not expected.

- After cleaning the residential areas, mitigation starts in the peripheral areas of the towns flooded by red mud.

- At 6 am on 8 October, a pH value of 8.8 is registered at the Petőfi Bridge section of the River Rába, and a pH value of 8.34 is registered at the Széchenyi Bridge section of the Moson branch of the Danube. Measured pH levels reach 8.5 at the point where the Marcal meets the Rába, and approx. pH 8 on the Danube. Along the Marcal, pH below 9.0 is reported at several measuring points. No further fish death is observed on the impacted river sections. The water management agency continually measures water pH values at the Budapest Danube section, but so far there is no indication of increase. Thus it is not likely that the contamination would reach the capital.

- Eighty police officers constantly maintain safety in the disaster-stricken area and emergency ambulance teams continue the search for missing people.

- A mentésben 400 ember és több száz munkagép vesz részt.

9 October 2010

- The evacuation of residents from Kolontár, in a state of emergency, is ordered impacting a total of 715 people, as The dam of Basin 10 of the Ajka reservoir weakened further during the night.

12 October 2010

- The construction of the third protective barrier is constructed at Kolontár to keep the resident safe. In Devecser, the location of new residential block is identified, to be constructed for those who used to live in the areas flooded with red mud flooded.

13 October 2010

- The number of deaths in the disaster reaches nine, as on of the injured dies in the Ajka hospital. The evacuation order is lifted after the construction of the new barrier in Kolontár safeguards the security of the residents of Devecser.

15 October 2010

- The first of the residents evacuated can move back to Kolontár.

2.2. Further risks

2.2.1. Another dam break

In the analysis of further risks, the question of the causes of the dam break need to be answered. Equally, an answer needs to be given to the question of why it has led to so severe consequences, and whether it might be repeated in the future. As shown in the previous chapter, it was the dimensions of the material spilled that resulted in a real flood in the case of the Kolontár disaster. Similar dam breaks have never happened in the field of alumina production. This at least partially explains that the expected impact was underestimated in the disaster management plan. Furthermore, the fact that the risk of a potential further dam break could not be estimated with significant precision in the days following the disaster can also be accounted for by the unprecedented nature of the accident. For this reason, the construction of a system of barriers was begun between Basin 10 and the flooded communities, the function of which has still not been entirely clarified. According to explanations given afterwards, what the experts were concerned about was not the fear that further quantities of sludge would leave Basin 10. The probability of such a turn of events was not significant for there was only the solid phase that is, a mass of limited mobility left within the reservoir. Instead, they were concerned that the wall shared by Basin 10 and Basin 9 would break. As the letter was equally filled to the brim with liquid, the fact that the spilled sludge was not there anymore meant that the wall of was left without support from the direction of Basin 10. At the same time, the barrier construction works continued even after a significant reduction of water levels in Basin 9, thus reducing the risk of the dam breaking.

2.2.2. Resuming production without a change of technology

The examination of the causes of deaths, health injuries and other consequences made it clear that the dimension of the disaster was not due to the dam break but rather to too much water being present in the escaping red mud flood. A significantly lesser quantity of water would have resulted in much more limited damage as far as both human lives and damages are concerned. Arguably, the effects and impact would have been smaller by several orders of magnitude and

it is likely that no loss of life would have occurred if the flood wave had been only half as high. At first sight it is not easy to understand how the authorities could have permitted production to be resumed with the same wet disposal technology especially with regard to the fact that according to the first declarations, the plant had only a limited capacity for disposal, barely enough for a few weeks or one or two months at most. With hindsight, the primary reason for that seems to be related to the intention to avoid the plant getting into an untenable situation and losing its markets. Thus environmental and environmental security considerations have played a limited part in the decision making process. At the same time it is a fact that simultaneously with resuming production, the company started to take preliminary steps to a shift to the dry depositing technology.

2.3. The health and environmental impacts of the disaster

2.3.1. The chemical background of the disaster

Alumina (technically: pure aluminium oxide), is almost exclusively produced from bauxite worldwide. Bauxite mined in Hungary (excluding the moisture absorbed) contains approx. 50% of aluminium oxide (Al_2O_3) mostly in the form boehmite, and approx 20% of iron oxide (Fe_2O_3). Further basic constituents include SiO_2 and oxides of other metals, such as titanium ores. The colour red is due to the iron (III) oxide content. In order to produce alumina from bauxite, the first step should be to separate hydrated aluminium oxide (boehmite) from the other components. This process of extraction is secured by relatively concentrated NaOH (caustic soda). Boehmite (AlO(OH)) is chemically soluble in the alkali while iron (III) oxide is not. As a first approximation, the other components of bauxite do not interact with alkali (except clay minerals).

The "dissolution" of boehmite in NaOH is not actually a process of physical dissolution, but a chemical reaction: water-soluble sodium aluminate is formed as an effect of the high temperature (240°C) and high OH^- concentration.

After the alkaline extraction, the solution (i.e. the solution of the sodium aluminate compound) is separated by sedimentation form the essentially insoluble bauxite residue (red mud). The solution is cooled, thereby becoming highly saturated in aluminium hydroxide, then the bulk of the aluminium hydroxide is crystallised. The aluminium hydroxide (hydrated alumina) is removed by calcination, thereby producing alumina. And as the extraction is performed with a relatively highly concentrated alkaline solution, the alkaline content of the solution phase accompanying the red mud upon separating the residual bauxite is equally high.By means of a multi-step counter-current water ablution process (7 steps at Ajka), the alkaline concentration of the accompanying solution is reduced to approx. 1/40 of the original value (typically, less than 0.5% NaOH level).

The solution phase accompanying the washed red mud has is alkaline, with pH values in the range 12 to 13, thus it is a fairly strong base.

Today, the red mud is not used anywhere in Hungary. As it contains little aluminium oxide (15-19%), its iron content is higher than that of bauxite, therefore, in principle, it could be used in iron production. Even though the manufacturing process is available in theory, it

is nevertheless not used. The reason is that it is still significantly more expensive and energy intensive than producing iron from mined ores. Thus it is dumped as non useful waste in reservoirs, and stored there until "better days" come.

Red mud is not classified as hazardous waste in Hungary, even though it clearly is hazardous due to its alkalinity. The water generated in the course of the sedimentation of red mud in the wet disposal process used at Ajka is mostly put to technological use. The utilization of useful ingredients by the manufacturer or operator is required by law in any case. As the bauxite residue (red mud) is not as yet the raw material of any other process, whatever is done to it appears as no more than "wasted" costs for the aluminium industry. Therefore it remains in the reservoirs. The reservoirs are typically recultivated, that is, covered with a surface organic material, such as sewage sludge, and an attempt is made to grow plants on top.

2.3.2. Environmental and health effects of the disaster

a) Exposure to a highly alkaline solution causes severe, potentially fatal injuries. Strong alkali dissolves the layer of fatty suet protecting the skin, and loosens the epidermis. This way, the internal tissues become unprotected. The dissolution of the oily substance secreted by the sebaceous gland is identical with the process traditionally used for making soap. Boiled in alkali (to speed up the process), the fat (glyceryl ester formed with palmitine, stearine and oleic acid) hydrolyzes and glycerol and soap are produced. The soap produced also "helps" to dissolve the fatty substances left over.

b) Strong alkalinity causes severe damage to tissues. As a result of high pH, proteins are denatured (including enzymes) and various cell membranes are destroyed (cell membrane, mitochondria, chloroplasts, etc.) thus the damaged cell tissues die.

c) Red mud contains traces of toxic metals. Certain metals such as mercury, cadmium and lead are highly toxic because they are deposited in the body connected to proteins and change the structure and functioning of vital proteins before long. The largest part of toxic metals are heavy metals, (with a density higher than 5g/cm^3), not because they are "heavy", but because their atomic structure enables them to make strong bonds with certain protein molecules. There is a debate about whether red mud from Ajka contains toxic metals at dangerous concentrations. According to measurements conducted by the Chemical Research Institute of the Hungarian Academy of Sciences, samples of red mud taken in the region of Kolontár and Devecser have concentration levels lower, sometimes significantly lower than sewage sludge limit values for cadmium, chromium, mercury, nickel, lead and zinc (http://mta.hu/mta_hirei). We have no reason to contest these test results. However, we have to think of what reason the researchers had to compare the composition of red mud to be found in the homes and gardens, and when inhaled, the lungs of the residents, to limit values of sewage sludge. Normally, the average citizen does not encounter sewage sludge. We do not tread in it, not even in rubber boots, we do not sweep it from the corner of our rooms, neither do we use it to water garden vegetables or inhale its dust. Thus the point of reference is mistaken. From the point of view of human health, concentration is not the real issue. What is, however

is whether living organisms (plants, animals, humans) are exposed to these heavy metals, considered toxic. In this regard, test results published by MTA (relating to solutions in water and ammonium acetate of 4,5 ph value) fail to provide sufficient answers.

d) Red mud entering rivers and the soil has a highly alkaline ph level that needs to be neutralised or at least mitigated. Acidic substances are suitable for this goal. In practice, acidic acid and sulphuric acid was used. For neutralization or mitigation purposes, gypsum ($CaSO_4$) was also used, spread in the contaminated area. Gypsum was poured in the Torna creek and the Marcal river in the emergency circumstances. Caustic soda and acidic acid react to form sodium acetate. This substance hydrolyzes in an alkaline manner, but it is much less alkaline than the original sodium hydroxide was. Gypsum is suitable for neutralising because $CaSO_4$ though, it is a salt dissolving badly in water, still enters Ca^{2+} ions in the system. In the presence of such a high OH^- ion concentration, based on the - the products of solubility - the $Ca(OH)^2$ dissolves even worse than the gypsum does. Thus, part of OH^- ions , responsible for alkalinity react with Ca^{2+}-ions to form a precipitation, and this decreases the alkalinity.

e) What happens to the spilled red mud once it dries up? The dry dustlike substance can be carried by the wind, and be inhaled by organisms. When inhaled, the red mud causes the same damage as it does to the skin, only more severe, since the breathing surface of the lung is far more delicate and vulnerable. This is why the residents moving back into the area were forced to wear dust filter masks as well as the participants in the rescue operation. The dried dust is a potential alkali since NaOH present in the original solution phase is contained in small crystalline form, thus the inhaled dust immediately creates a strong alkali reacting with the water content of the lungs. In order to reduce the formation of dust in the contaminated area, calcium chloride powder was originally planned to be scattered, as it has an absorbent quality, extracting moisture from the air to prevent the spilled red mud from drying out. The $CaCl_2$ is hygroscopic, i.e. absorbs humidity, thus a solid crystalline material gradually liquidifies (i.e. is transformed into a concentrated solution). Moreover, this salt is hydrolyzed in slightly acidic manner, neutralizing the lye to a limited extent.

Summary

- The accident took place at 12:25 pm on 04. 10. 2010. The red mud spill following the dam break reached the municipalities of Devecser, Kolontár, Somlóvásárhely, Somlójenő, Tüskevár, Apácatorna and Kisberzseny. The red mud contaminated the valleys of the Torna creek and the Marcal river, almost reaching the river Rába. Through the Torna, Marcal, Rába and the Moson branch of the Danube, the alkaline slurry entered the Danube, causing destruction in all the affected waters. Along the Torna and the impacted section of Marcal, practically all aquatic life was destroyed.

- The disaster left 10 people dead and almost 150 slightly or severely injured, including local residents and the participants in the rescue operations.

- The spilt mud and alkaline slurry polluted about 1,000 acres of land. The amount of the emitted pollutants was about 0.9–1 million cubic meters.

- The fact that the devastation wrought by the dam break significantly exceeded the expected impact as specified in the disaster management plan can be accounted for in physical terms by the exceedingly large water content of the slurry stored in Basin X, and from a chemical perspective by the alkalinity of the spilt liquid, which approached pH 13. The relatively high concentration of metals (arsenic, mercury, etc.) in the pollutant mix has also presented further health and environmental problems.

Recommendations

- Based on the experience of the Kolontár accident and the inundation models derived from it, the disaster management plans for facilities with high environmental risk should be urgently and thoroughly revised.

- Differentiated limit values for metals and other toxic substances need to be established with respect to soils contaminated through industrial activity (mining, ore processing, chemical industry, galvanic industry, leather manufacturing etc) and accidents. These limit values shall also be adapted to later land use. Breaking with current practice, these requirements should ensure that it is not only sewage sludge related limit values that are used as benchmarks when assessing environmental health risks or fulfilling recovery objectives.

- When the occurrence of an accident proves that a given technology is hazardous, general regulation should be adopted to ensure that no permission is granted to resume the industrial activity unless the technology used is significantly modified in a way that effectively reduces the environmental risks entailed.

Alkaline slurry among the houses —is soil replacement the solution?

3. Damage control

3.1. Actions by the authorities

As indicated above, the competent county offices of the Central Agricultural Office immediately declared a ban on hunting and fishing on the day of the disaster (at 16 o'clock in the afternoon). The sales and use of contaminated food and feed products was prohibited through official action by the Chief Veterinary Officer. In the wake of the disaster, Secretary of State for the Environment Zoltán Illés suspended production at MAL Co. Ltd. with immediate effect, simultaneously directing the company to restore the reservoir in the area of Ajka.

Based on the decision of the Defence Committee, the construction of four stone barriers between the red mud reservoirs and the village of Kolontár was started so that they could slow down sludge spill and reduce its destructive power in the case of a potential further breach of the reservoir dam. The fourth barrier was built on the territory of the municipality itself.

On 5 October, the first response of the government to the disaster was to issue a government decree declaring a state of emergency and defining a range of organizational, financial and communications tasks related to damage control.

"Acting upon the authority defined by Article 35, section (1), point i) of the Constitution, and based on Article 149, section (3) of Act CV of 2004 on National Defence and the Hungarian Defence Forces, the Government issues the following Decree:

1. § (1) The Government declares a state of emergency according to Article 2, section (2), point f) of Act XXXVII of 1996 on Civil Protection in the administrative area of Győr-Moson-Sopron, Veszprém and Vas counties.

(2) In the area impacted by the state of emergency, the measures stipulated by Article 159. (1) - (3), Article 165, Article 168, Article 169, Article 173 (1) - (2), (3) a)-c), (4), Article 186 and Article 195 of Act CV of 2004 on National Defence and the Hungarian Defence Forces (hereinafter referred to as NDA) shall be applied.

(3) On the basis of Article 8, point b of Act LXXIV of 1999 on the Management and Organisation of Disaster Protection and the Prevention of Major Accidents Involving Hazardous Substances, the Hungarian Defence and Police Forces may be called in to assist with the elimination of the state of emergency.

2. § (1) The Minister for Rural Development shall perform ministerial duties relating to the rectification of environmental damage according to relevant regulations. The Defence Working Committee shall function within the Ministry for Rural Development. The Minister for Rural Development shall direct the activities of the Working Committee.

(2) Governmental communication activities related to the elimination of threat in relation to the state of emergency referred to in the present Decree shall be coordinated by the Minister Of Public Administrative And Justice .

(3) Government shall provide funding for reasonable defence-related expenses occurring after 12.30 pm on 4 October 2010 from the general reserve of the budget or otherwise for the participants in the activities of protection.

3. § The present Decree enters into force at 3 pm on 6 October 2010."

A few days after the disaster, the Hungarian Financial Supervisory Authority learned from several sources that a number of disaster victims with mortgage loans in the red mud disaster stricken communities received a formal notice from their credit institution. For the majority of mortgage contracts, the contract is immediately terminated by the bank if the mortgaged property is destroyed. The Authority drew the attention of the banks to points IV. a) and b) of the Code of Conduct, which clearly define the procedures to be applied to handling payment difficulties. The institutions subscribing to the Code had undertaken to develop bridging solutions for these cases, and to notify customers through a letter or infor-

mation brochure. As terminating the contracts of clients having lost the loan collateral in the disaster would have disastrous consequences on these debtors, the Authority took the firm position that developing bridging solutions is the only solution sufficiently taking into account the multifaceted aspects of the present case. The Authority sent an executive circular to the financial institutions concerned, specifying the behaviour expected. The Financial Supervisory Authority set up a dedicated legal aid customer service operating during opening hours to address mortgage problems related to the red mud disaster.

On 11 October, the police took the CEO of MAL Co. Ltd. under custody and initiated pre-trial detention. The company's assets were seized. The same day, National Emergency Director General György Bakondi was appointed Government Emergency Commissioner. Parliament adopted an amendment to the NDA to the effect that the operation of business enitities may in the future be brought under the supervision of the state through a Decree, with the Minister or the Government Commissioner acting on behalf of the state.

The Governmental proposal was voted for by the majority of parties in Parliament, with the parliamentary group of LMP abstaining from the vote. The ecological party did not object to placing MAL Co. Ltd. under the state supervision, but warned that the proposed amendment was too vague as the scope in which it would enable placing companies under state supervision was too broad and not sufficiently clearly defined. Furthermore, it was less accurate in its provisions on the conditions and duration of maintaining supervision than would be required by the rule of law.

The Emergency Commissioner was granted the following competences: a right to overview the financial condition of the business entity, to endorse and countersign financial obligations the business entity would take on and to take decisions on matters within the competence of the entity's main decision making body with a view to directly eliminate the conditions that have lead to the adoption of the extraordinary measures or to mitigate their consequences. The Hungarian State shall notify, in writing, with immediate notice, the entity's senior officials and members of the Supervisory Board regarding decisions taken on matters within the competence of the entity's main decision making body. This right of decision making does not otherwise affect the competences of the highest decision making body of the entity. The Hungarian State owes the business entity or its owner compensation amounting to the value of the damage in effect incurred by decisions of the Commissioner in its competence for the period when a decree is in force that the Constitutional Court would later annul.

On 12 October, the National Public Health and Medical Officer Service (ÁNTSZ) published its findings concluding that drinking water quality is suitable and access to drinking water is secure in the area flooded with red mud. In the preceding week, the public health authority carried out a detailed analysis of 68 drinking water samples taken from 8 settlements of the area impacted. The samples included seven samples taken from drilled wells. The values did not deviate from the usual indicators of water quality, indicating appropriate water quality. Based on the results, Disaster Management added that the drinking water bases were not acutely impaired from any direction by the disaster. The National Public Health and Medical

Officer Service and the Central Transdanubian Environmental, Nature conservation and Water Management Inspectorate jointly performed air quality tests in Kolontár and Devecser. Based on data obtained by common standardised measurement methodologies, the concentration of airborne fine articulates did not exceed limit values between 7 to 10 October, i.e. the period for which airborne fine articulates were an increasing problem due to drying of the red sludge. Nevertheless, based on the test results the bodies communicated that wearing FFP2D dust masks was deemed secure and generally recommended. Eight air pollution measurement points were established, in the municipalities of Ajka, Devecser, Kolontár, Tüskevár and Somlóvásárhely, among others. According to measures by the National Public Health and Medical Officer Service, dust concentration in the air only exceeded the limit values in the disaster impacted area (in proximity of the dam break). In this area, wearing a dust mask was made compulsory for participants in the rescue operations.

Minister for Rural Development Alexander Fazekas announced on 5 November in Kolontár that Csaba Szabó was commissioned to oversee tasks of coordination and consultation related to restoration activities and the exchange of real estate plots in the region flooded by the red mud. The mandate of the Ministry Commissioner ran from 5 November 2010 to 5 May 2011. Csaba Szabó coordinates activities and acts on behalf of the Ministry in all areas of competence of the Ministry of Rural Development, consults with producers in the area on exchanging real estate plots or participation in the cultivation of energy crops. His tasks also include keeping contact with local governments and businesses, as well as to ensure accuracy in damage assessments. At the same time, works to plant the material dudarit into the soil was begun under the supervision of the Central Agricultural Office to neutralize alkalinity on the 150 hectare site that was covered by a thin layer (1-2 cm) of red mud.

3.2. Anomalies of central communication

The first days and weeks following the disaster were characterized locally and the national level by a lack of information and a multitude of false information simultaneously. The situation was made worse by the fact that the relevant administrative authorities (environment, health) communicated with delay and in a manner constantly aiming to shift off responsibility. The "mouth gag" of authorities can be directly associated with legislation adopted following the change of government under which the members of staff of the authorities can be made redundant without either justification or substantial compensation. Layoffs (the professional justification of which was regularly questioned by the press) did indeed start in August and September, thus professionals employed by the state would have had to make statements in an atmosphere characterised by apprehension, exposed to the risk of job loss, when they found themselves dealing with an environmental and environmental health disaster of extraordinary complexity, without precedent in Hungary.

As Greenpeace pointed out: "In the first weeks, the quality of the information provided was below classification. Concerning spilled toxic substances, the National Public Health and Medical Officer Service concluded on the second day after the event that the concentration of all potentially hazardous materials was below the risk limit - referring to measurements carried

out in 1987! The Hungarian Academy of Sciences reached essentially the same conclusion on the third day. Similarly, the National Public Health and Medical Officer Service confirmed this one week after the accident, based on recent measurements. Meanwhile, the lungs, skin, and mucous membrane of thousands of people in the zone were exposed to contact with an unknown mixture of toxic substances. In order to avoid suffering serious damage to health, they should have been provided accurate and honest information and adequate protective gear. They received neither.

Greenpeace was the first to inform the public of the results of effective measurements on the fourth day of the disaster. A high concentration in arsenic was measured, about 25 times the authorised limit for groundwater in the drainage ditches. The two other noxious heavy metals they tested, mercury and chromium were also significantly over the limit."

The official communication channel of the Ministry of the Interior, i.e. the website vorosiszap.bm.hu went online on 5 October. However, it was only on 8 October, viz. four days after the dam broke that the first summary appeared on the site including the most important (but by no means exhaustive) health related information concerning the contamination, crucial both for the local population and for those taking part in the damage rectification efforts (http://vorosiszap.bm.hu/?p=50).

In the most critical period, the regionally competent environmental authority provided no significant information relevant to the general public at all. Even at the time the present report is being compiled, i.e. February 2011, the website of the Inspectorate (kdtktvf.zoldhatosag.hu) contains nothing more on the disaster than the authorizations and decisions concerning the functioning of Mal Co. Ltd.

Following the accident, a series of reports appeared in the media on the health effects of red mud, indicating that the contaminant is potentially radioactive. Nevertheless, ANTSZ failed to provide comprehensive information about the actual impacts and risks earlier than 25 October, that is, three weeks after the accident (http://www.antsz.hu/portal/down/kulso/kozegeszsegugy/iszaptarolo_szakadt_at/lakossagi_tajekoztato_20101025.pdf).

In its decision dated 5 November, the government declared that it was Mal Co. Ltd. that caused the disaster. In an official communication, the legal representative of the company responded that "The concept of the government stipulating the identity of the party which caused the damage in any case is shocking by any means, as well as unprecedented from a legal point of view. Furthermore, the government's taking sides regarding the issue of liability would be utterly unacceptable, given the fact that final expert advice was not even given on the causes of the disaster themselves. It is up to the judicial bodies, and ultimately to the court to declare a decision on both the issue of harm and that of liability, and that only following an appropriate and fair procedure exploring the causes of the event."

In addition, it was a striking deficiency of communication that the residents of the area affected by the accident did not have any substantive knowledge of the potential risks of the dams breaking, of the consequences of exposure to red mud, or of the actions capable of reducing the effects of the disaster, even though there is a strong tradition of providing preliminary information in areas characterised by industrial activities with high environmental risk (for example, the Paks Nuclear Power Plant) in Hungary. This lack of information significantly contributed to the severity of the damage wrought on human lives, health and finances.

3.3. The communication of MAL Co. Ltd.

"The red mud is not dangerous." "It can be hosed off by a strong water current." "They say I should feel responsible, but I do not." These quotes are taken from the first communication of Zoltán Bakonyi, the director of Ajka Alumina Plant (a subsidiary of MAL Co. Ltd.), voiced with a delay of one day after the disaster. By this time, three villages had been flooded, three people were left dead and more than a dozen were treated in different hospitals, mostly for injuries of alkaline burn, similar to ordinary skinburn.

The company executive explained that it was the water layer from the top of the reservoir, containing sodium hydroxide that had flooded the area, taking with itself sludge and soil from the agricultural areas on its way. The water in the sludge reservoir is an inherent feature of the wet disposal technology, while the alkaline liquid can actually irritate the skin if it comes into contact with it. According to Mr. Bakonyi's words, about 97 to 98 percent of the sludge that had originally been stored in the reservoir remained in place even after the dam broke, and it was not to be expected that the clay-like substance, condensed in large blocks of material would move further (based on this account—as well as on the experience of subsequent on-site inspections—the construction of hastily erected protective emergency barriers between the reservoir and Kolontár was largely unjustified). Mr. Bakonyi argued that the disaster was caused directly by the fact that recent heavy rains have rendered the claylike soil so sodden below the external wall of the reservoir built 25 years previously that it could not withstand the pressure of water (this claim has not been confirmed in tests carried out since, though it has not been refuted either).

On the same day, MAL issued a corporate statement regarding the disaster. "Many people learned from the media that a natural disaster took place on 4 October 2010 at 12:10 pm when the dam of red mud reservoir basin 10 of the Ajka alumina plant owned by MAL Co. Ltd. broke, an event without precedent in the history of the Bayer alumina production process. The management expresses the deepest regrets to all residents who have been personally impacted by this disaster, and expresses condolences to the families who experienced the worst human tragedy, the loss of a family member." The suggestion that what happened was in fact a natural disaster have not been confirmed by the investigations so far. Rather, it seems to be the case that human errors, omissions, bad decisions and technological reasons together have led to the accident.

The following statement acknowledging responsibility was only issued on Thursday, 7 October, that is, three days after the accident took place. Subsequently, however, the company made constant efforts to spread out and relativise this responsibility. "In the 1997 privatization contract, the state imposed that a number of environmental investments be carried out by the company purchasing the plant with the sludge reservoir. One of the requirements was to build watertight slurry walls which would seal off the reservoirs below the ground, going down 10 to 18 meters vertically. These watertight slurry walls would reach down to the first impermeable layer, in a way that no release of harmful substances may take place. However, the resulting quasi-artificial underground pools thus created below the reservoirs also obstructed the path of large amounts of rainfall to flow off or leak away. The authorities and institutions of the state that ordered the construction of the slurry wall thus likely failed to consider the fact that the

large amounts of precipitation getting and filtering through here would change the behaviour of the subsoil, in particular the soil solidity. Thus on the basis of known prior expertise, the responsibility is shared: a reservoir began to be constructed in the mid-80s, upon order by the Hungarian Aluminum Industry Trust, owned by the Hungarian state. The reservoir design and construction was also implemented by state-owned firms. The building permits as well as the 1990 use permit were also issued by public authorities. When the company was privatized in 1997, the purchaser was justified to believe in good faith that there was nothing wrong with the reservoir since the constructing party, the seller and the company formerly operating the reservoirs each had all the required licenses. In addition, in the contract dossier amounting to nearly 100 pages including annexes, the buyer was nowhere informed that Basin 10 or the subsoil below the reservoirs would present any special features (e.g. different soil structure, etc) that needed to be addressed on their own. Construction of the slurry walls was required and the company did indeed construct them as there was a statutory obligation to do so.

Consequently, the company purchased the reservoir in good faith, though the reservoir had hidden faults in all certainty, as shown by the recent events. In addition, the competent public authorities constantly monitored the operation of the reservoirs and found it satisfactory in all cases."

On October 10, the company considered it timely to express once more its sympathy to the victims' relatives. "The Management and all employees of MAL Co. Ltd. were all deeply shaken by the disaster that occurred. We wish once more to express our deepest regret to all victims, the injured and the impacted and their families. The outmost efforts are made to rectify the damage. We work closely with all bodies involved in order restore normal conditions in the region as soon as possible."

On this day, the company issued a further notice denying that it had been aware of the Winkler soil study. As far as we know, this was the only document of expertise which drew attention to the risks imposed by the geo-morphological characteristics of the reservoir area prior to the accident.

"As reported by the press, physicist dr. Gusztáv Winkler (a senior lecturer at the Budapest University of Technology) conducted environmental studies in the region of Mosonmagyaróvár and Ajka at the end of the 1980s, i.e. at around the time when the foundations of reservoir 10 of the alumina plant were laid. The study states that soil of the region mostly consists of the floodplain meadow of Torna creek, an area with a flooded, swampy, meadow-like character without water outlets, enclosing a block of clay right at the northern wall of the reservoir. When saturated by precipitation or groundwater, this soil will move, but in a way that the different blocks of soil with dissimilar composition and structure are likely to show displacements to varying degrees. These displacements of several centimetres might be probing for the wall of the reservoir. The expert behind the study argues that this assumption is supported by the fact that the dam broke on Monday at the meeting point of two kinds of soil, and not only at the corner as shown by aerial photographs, but in another section of the wall as well. The block of clay was likely home to a phenomenon reducing the rate of friction which could have contributed to the disaster. According to the studies conducted by MAL Co. Ltd., its staff was not aware of the findings of the study. The management stated that they had no knowledge of negative circumstances regarding the design phase or subsequent construction. The

representatives of MAL Co. Ltd. which had purchased the shares of the Ajka alumina plant added that the privatization documents or the published tender did not include this kind of information, thus they received no warning or information about the existing risk factors. The company also denied allegations in the media suggesting that it had contacted senior lecturer Gusztáv Winkler concerning the research. Since then, the company had consulted Gusztáv Winkler with respect to the document. The investigation by MAL Co. Ltd. also addressed the issue of who abused the company name when approaching the senior lecturer in search of the construction design."

A summary of the results of the Winkler study is currently available on the Internet (http://www.pannonpalatinus.hu/up/pdf/185.pdf). The study itself, however, is not available in its entirety.

Concerning the environmental and health effects of the red mud spill, MAL Co. Ltd. only repeated the communication of the Hungarian Academy of Sciences (referred to in detail below).

3.4. Communication steps by LMP and social organizations

3.4.1. LMP

As early as in its communication dated 5 October, LMP formulated the cornerstones that have since been definitive for damage control, clarifying issues of liability and identify of the transgressors. Thus, several factors need to be mentioned and investigated among the causes of the accident, including the activities of authorities in a state of steady decline due to inadequate capacities, misconceptions regarding their duties and continued exposure to political pressures, the flaws in the design, implementation and monitoring of the privatization of the aluminium industry, as well as the deficiencies in the Hungarian regulations regarding reparations for environmental damage. In a press conference on 6 October in Kolontár, Benedek Jávor, the LMP-delegated chairman of the Sustainable Development Committee of the Hungarian Parliament demanded that the Government disclose the privatization contracts of the company involved in the accident which had previously been treated as confidential material.

Four days later, the ecological party defined the steps to be taken to reduce the risk of similar disasters (some of which have since been clearly recognizable in the measures taken by government in response to the disaster).

LMP's Twelve-Point Action Plan (10 October 2010):
"To stop further damage resulting from the catastrophic red mud spill, to rectify its consequences and to prevent future disasters of a similar nature, LMP has developed a twelve-point action plan including short, mid, and long term measures. LMP deems it important that the government acts according to this plan, in permanent consultation with the governmental and non-governmental organizations.

1. strengthening the dams and preventing future dam breaks;

2. the collection, safe disposal and neutralization of the red mud;

3. continuous monitoring and measurement of the concentration of heavy metals, arsenic, mercury, fluorine, PCBs and other contaminants potentially contained in the spilled sludge, the contaminated sites and the surrounding water deposits with regard to allegations that hazardous waste other than red mud might have been deposited in the damaged cassettes;

4. immediate structural engineering and stability testing of other similar establishments, especially the red mud reservoirs located in Mosonmagyaróvár, Almásfüzitő, Neszmély and the investigation of whether waste other than red mud had been deposited in these reservoirs;

5. the revision of the disaster management plans of all domestic hazardous industrial plants, mines, and landfills with a view to checking that they correspond to the actual conditions and that they are based on realistic models of the events that could occur in case of an accident;

6. strengthening the entire system of environmental and construction authorities, increasing the frequency and depth of the inspection by authorities;

7. arevision of the classification and treatment of red mud due to its high pH level, clearly defining it as a hazardous substance and ensuring it is treated as such in the permission procedures without regard to EU regulations that have been defined for substances produced through a different technological process and have lower pH levels;

8. developing the liability insurance system for hazardous industrial plants with mandatory and sufficiently high insurance rates, as in fact defined as a task for legislators by Hungarian environmental law fifteen years ago;

9. a revision of the system of issuing building permits and inspections, with regular mandatory comprehensive inspection of hazardous sites;

10. initiating an EU security fund, financed from the payments of hazardous sites and designed to provide financial coverage in the case of damage that cannot be rectified from other sources;

11. initiating the development of a European directive designed to set up compulsory liability insurance policies;

12. deploying an EU investigative committee with a wide mandate along the lines of those granted to the task force investigating the Baia Mare accident ten years previously, entrusted to draw conclusions and formulate recommendations.

LMP is convinced that measures in line with these twelve points are crucial both for the remediation effort and for preventing accidents in the future."

The European Green Party (EGP) unanimously passed an emergency resolution at its Council Meeting on 10-11 October, supporting the demands formulated by LMP concerning the ecological disaster caused the dam break in the region of Ajka. The EGP referred to the event as clearly one of the most severe ecological disasters of the past decades. Over 300 delegates from 55 countries called on the Hungarian state to ensure that the upper layer of the soil covered with red mud is replaced as soon as possible, thus preventing the toxic dust containing heavy metals and other hazardous components from spreading in the area. In addition, they also joined LMP in urging the authorities to examine the condition of similar alumina reservoirs and to enforce that appropriate disaster management plans be implemented, to be financed by the owners. Representing the fourth largest group in the EP, the European Greens also requested the Hungarian Government to comply with the demand of LMP to make public the privatisation contract of MAL Co. Ltd.

On 12 October, Benedek Jávor submitted six questions to competent government officials:

1. Had Mal Co. Ltd. in fact implemented the HUF 3 Billion environmental investment included in the privatisation contract for the alumina company, which it acquired for a grossly undercut price (HUF 10 Million) during the late '90s? What were the millions of Euros spent on, that Mal Co. Ltd. received as environmental investment subsidies, apparently still unaccounted for in Brussels?

2. Why is Hungarian red mud far more alkaline than would be considered normal in other countries, and why is there no regulation for neutralizing sludge prior to depositing it?

3. How could the Central Transdanubian Inspectorate for Environmental Issues, Nature Conservation and Water Management issue a permit for normal waste disposal when red mud has a pH of 13, and is therefore unquestionably a hazardous substance?

4. How could Mal Co. Ltd. neglect to inform the public or the authorities regarding the issues that have, as unanimously established by local residents, plant employees and a WWF report with photographic evidence, been present for weeks, indeed for months? Why is there no appropriate construction inspection to encompass architectural and structural engineering tests as well as environmental ones?

5. How could the plant's disaster management plan reckon with a 300 thousand cubic meter red mud spill, when spillage thus far amounts to 600 to 700 thousand cubic meters, and in all due probability will approach 1 million cubic meters, with a significant additional quantity still contained in the reservoir? Who ratified the obviously unrealistic disaster management plan?

6. How could government neglect its duty to ensure an appropriate environmental responsibility insurance system, as prescribed by the Environmental Law of 1995, for some 15 years?

Government has not provided reassuring answers to these questions since.

In its October 14th statement, ecopolitical party LMP declared that relocating the evacuated population to the red mud contaminated settlements of Kolontár and Devecser is premature, as official Greenpeace test results report excessive airborne dust contamination in the area, posing a long term health risk. LMP called on competent authorities to exercise far greater caution when resettling the residents, who have already had more than their share of suffering. The statement also makes it clear that there is none of the agencies involved in the disaster fulfilled their duties appropriately. Neither the business corporation nor the competent authorities had taken appropriate measures to prevent the reservoir rupture and the ensuing ecological and property damage. Authoritative legislation had been overdue since 1995, and neglecting its development is a responsibility of the government.

On October 20th, president of Sustainable Development Commission Benedek Jávor, member of LMP, informed representatives of the EU Parliament's Green Group about the disaster via a video conference. He made it clear to members of the Green Group participating an the meeting preceding the Tuesday evening EP session with the Ajka disaster on its agenda that this was the single greatest ecological disaster in Hungarian history, both in terms of human casualties and injuries, and the magnitude of environmental contamination. Immediate and longer term environmental damage was due primarily to the mud's extreme alkalinity, as well as its high concentrations of heavy metals. Jávor also called attention to the deficiencies of both Hungarian and EU regulations that contributed to the event. Under EU regulations, red mud is not classified a hazardous substance, without regard to its alkalinity and heavy metal content. However, due to the alkalinity of the technical process, red mud definitely meets the criteria for hazardous substances in Hungary. In practice, though, Hungarian authorities apply lax regulatory limits, and treat red mud as practically non-hazardous waste.

On October 29th, the party submitted a complex set of legislations to prevent future disasters in light of the Kolontár accident. According to LMP, the most urgent measure is a re-evaluation of hazardous and industrial waste containment, as there is no definitive up-to-date information available on such potential health and environment hazards. Left unchecked, potential sources of contamination may cause immense damage, and the financing of compensation and damages may fall on public funds. LMP wishes Parliament to call on the government to prepare an inventory of the country's hazardous and industrial waste dumps, the substances deposited there, and an estimate for their environmental impact, including alternatives for their elimination and a calculation for expenses.

The recommendation includes a re-evaluation of the recently downsized National Environmental Damage Prevention Programme, an immediate allocation of public funds for rehabilitation costs, and a warranty for the disaster prevention expenses of privately owned hazardous entities. The government ordnance for subterranean water protection needs to be modified, as does the government resolution regarding government responsibility for the rehabilitation of neglected environmental damage.

The ecopolitical party drafted a new legislative proposal for defining environmentally hazardous entities, their annual official inspection, and an independent investigation – conducted by an expert appointed by the environmental authority, not the investigated establishment – of impact, via a modification of the Act on the Environment (Ktv.). Rules of environmental rehabilitation warranties and environmental insurance for third party compensation would also be modified in the Act on the Environment. LMP also moves for modifying the Criminal Code (BTK) to ensure that neglect of supervision duties can be penalized. A category of "endangering through official procedure" would be included in the BTK.

3.4.2. Clean Air Action Group, Greenpeace and other NGO's

On day 2 of the disaster, Clean Air Action Group recapped how on numerous occasions, they had called government attention to the unresolved issues surrounding red mud containment, and had recommended specific legal measures, which had gone without response.

"It is with grave misgivings and deep compassion for the affected citizens that Clean Air Action Group took notice of the flooding of seven Transdanubian settlements by a highly toxic red mud spill. The NGO had called government attention to the issue years ago, demanding immediate action. In 2003, they gave the following statement:

The greatest volume of hazardous waste in Hungary is the so-called red mud, the by-product of aluminum oxide production, which is estimated to total some 30 million tonnes. The problem is twofold. Firstly, the waste poses a massive environmental hazard. Secondly, the production of aluminum oxide and aluminum hydroxide continues to this day, albeit on a smaller scale. Each tonne of aluminum oxide produces 2 tonnes of hazardous waste.

There is a professional consensus to the effect that red mud poses environmental problems:

- active dump areas appropriate valuable agricultural land,
- wind carries dry red mud dust clouds to remote settlements (10–15 km),
- the mud's liquid alkali content seeps into the soil, endangering local vegetation and drinking water supplies.

During privatization, proprietors agreed to warrant environmental costs of ten thousand million Forints, but despite this fact there has been no mention of any such responsibility, though by law it is public information.

Our EU membership requires rigorous action in this field. We suggest the initiation of an international campaign for the elimination and environmentally sound reutilization of red mud reservoirs, requesting support from EU countries and other developed nations. Government should draft a programme to this end. This would ensure thousands of long term jobs.

As undertaken during privatisation, environmental remediation and recultivation must commence. This does not entail any short term income for the state budget, but it waives state responsibility for several ten thousand million forints' worth of environmental remediation expenses.

Clean Air Action Group had repeatedly submitted its recommendation to several government representatives, but has not received meaningful replies.

Red mud reservoirs pose a threat to drinking water catchments in several locations. The situation is especially worrying at the MOTIM reservoir in Mosonmagyaróvár, where red mud is contained right above the water catchment—a place restricted even for communal waste disposal. An expert from Clean Air Action Group had filed suit at the prosecutor's office, and received the following response: 'Due investigation was given to all the processes and decisions concerning MOTIM Co. and its legal predecessors. It is hereby declared the decisions are sound and comply with the laws then in force. Accordingly, no action from the prosecutor's office was necessary.' It is not so much the prosecutor's office that was responsible for the erronous reply and for the failure to take action as the competent environmental authority, which—according to reports—was put under considerable political pressure and did in fact misinform the prosecutor's office.

Clean Air Action Group had also repeatedly called attention to the issue of limited responsibility—likewise to no avail. The immense environmental, health and property damage is usually suffered by the injured parties, and compensated by taxpayers, as the companies responsible for the damage are unable to cover damages. To this end, Clean Air Action Group encourages the obligation of companies conducting hazardous activities to take out insurance, as well as for their allocating a fund for full compensation for possible damages.

Clean Air Action Group also demands that the government immediately publish the relevant privatisation contracts, to clarify who and to what degree bears responsibility for the disastrous situation.

This event and its cost in human lives, serious injuries, immense material damage and ecological devastation all underscore that government must adopt a far more responsible attitude toward environmental organizations, their experts and their warnings.

Assessment of environmental damage and impact must begin immediately, and results must be made public. Remediation must also commence without delay, before the contamination spreads any further."

On October 7th, major Hungarian environmental organizations made a joint statement regarding the disaster.

"Environmental organizations' statement regarding the red mud disaster

October 7th, 2010

The undersigned environmental NGOs consider the preservation of public health, healing the injured, remedying damage and preventing further damage to be of topmost priority in the red mud contaminated settlements. We call on the general public, NGO's, corporations and institutions to join forces with government bodies to aid these operations. We also extend our sympathy and solidarity to those affected.

However, this disaster plainly calls for further action.

It is necessary to conduct a far more detailed national survey of potential environmental

threats, as well as expediting the remediation of existing damage. Though the process had initiated after the system change, it has since slowed to a near halt. However, as this present case proves, nature is less indulgent. At the present rate of remediation, we are risking further disaster and loss of life, and compensating damages costs us far more money than remediation would.

It must be avoided that innocent victims and taxpayers bear the costs of damage, instead these should be fully compensated by the injurious party. To this end, companies conducting hazardous activities should be required by law to take out insurance for all possible damages, as well as to allocate funds for full compensation. A further option is for a state tax on relevant activities to ensure funds for possible damage management.

State subsidising of heavily polluting activities and exploitation of non-renewable fuel must be stopped. One form of subsidization is when the injurious party is not held financially responsible for environmental damage caused. It would seem an efficient measure to raise the currently moderate mining annuity.

Expanding and improving environmental and health care vocational training is essential. A majority of the population is currently incapable of protecting their environment or health, and is uninformed of what to do in case of an environmental disaster.

Affected settlements and companies everywhere must compose disaster management plans, which they must be capable of carrying out. Competent authorities must supervise this rigorously!

Furthermore, injurious parties must be penalized in a strict and exemplary manner.

Environmental NGOs have voiced these suggestions in the past. We are hopeful it will no longer be necessary in future, when government implements the measures listed above."

In their joint letter of October 12th, Clean Air Action Group and Greenpeace asked the Minister of Interior the reason why, more than a week after the accident, there was still no clear information available regarding the composition of the mud spilled, or of the particulate air contamination.

"For instance, it seems incomprehensible that even though tests are reported by the press to be conducted on a daily basis, it is still not known exactly what kinds of toxic materials are inhaled by and absorbed through the skin of the workers on site and local residents. How can it be possible that the National Public Health and Medical Officer Service issues a reassuring statement on the basis of tests conducted at the Ajka Alumina Plant in 1987? As long as no comprehensive public data are made available about the exact nature, concentration and territorial dispersion on the polluting materials, the appropriate level of protection and of the proper protective wear cannot be determined for the people staying in the contaminated area.

The NGOs are committed to the view that residents must be informed continuously, coherently and in detail, and presently we are quite far from that. Deficient information endangers people's most precious treasure, their health. All the local people and rescue workers are rightly concerned about it in the swirling red clouds of dust.

That is why it is important to test the chemical composition of the contamination at a sufficient number of locations, with regard to the oxidation state of the metals involved since, for

example, chrome (III) is not particularly toxic, chrome (VI) represents a serious health hazard. In terms of neutralisation, composition is particularly important for while alkali absorbs toxic metals, they could get off the environment under the effect of acid causing a long-term problem.

On the day following the accident, the Disaster Management very properly drew up strict regulations, preparing for the worst: 'For the protection of the health of all those, who take part within the endangered area in the rescue and cleaning operation of the grounds and the properties, shall wear Wellington boots, closed clothing, acid and alkali-proof protective gloves and safety goggles in case of the risk of spillage.' According to information reported by the press, several firemen and disaster management employees suffered injuries and possibly health damage due to insufficient preparation. Because the composition of the toxic materials is still unknown, it cannot be concluded for certain that they had received the proper types of safety masks.

Greenpeace and the **Clean Air Action Group** suggested in addition that the enrichment of toxic materials in the system of rescue workers and local residents should be equally checked. Dry red mud getting into the air is a health risk if inhaled or if it gets into contact with the eyes or skin. Measures must therefore be taken in order to ensure the protection of the residents of the region as well, as wind can carry the toxic dust away, even 10-15 kilometres far. Red mud must be cleared away the fields as soon as possible to prevent the wind spreading it around the neighbouring villages.

Not only the people but animals in the region inhale the dust which may contain toxic metals. Therefore, measures must be taken to protect animals from disease, and, furthermore, to prevent the production of food out of these animals as it could be a health hazard for people who might consume it."

On October 15, Greenpeace protested against the hastily issued permission which allowed residents to return:

"Greenpeace, the international environmental organisation protests against the return of the residents and the re-opening of the Ajka Alumina Plant of MAL Co. Ltd. The exact causes of last week's red mud disaster are still not clear, but, in spite of the fact, the government decided to let the production restart.

Greenpeace regards the permission on the return of the residents of Kolontár as an utterly irresponsible decision. Up to the present, there is no reassuring data published by anybody which would prove the safety of staying in Kolontár in the long term, and nobody provided exact information about the short-term and long-term health effects of the high concentration of fine dust particulates in the air.

- Wearing dust masks and local damage limitation can only be a solution for a short-term stay. But the presence of dry red mud in the form of dust or otherwise is a threat to the health of local residents. Do decision makers seriously think that the people of Kolontár have to wear dust masks from now on in 24/7? – asked Zsolt Szegfalvi, the Director of Greenpeace Hungary.

According to the information of Greenpeace, the technology applied by MAL Co. Ltd. in its Ajka Alumina Plant does not meet today's requirements. The red mud made during the production here is highly alkaline. This fact only increases the risks if another accident takes place.

- How can it be possible that the German red mud is less harmful than the Hungarian one? In our opinion, we deserve the same safety levels as enjoyed by citizens of Western Europe have, Mr Szegfalvi added.

As a result of a political decision the operation of MAL Co. Ltd. was placed under the control of the Hungarian state and the restart of the production was permitted by state authorities. However, the opinion of an independent international committee of experts is required as presently the operator and the licensor are in a hierarchical relationship which does not guarantee proper safety.

Greenpeace Hungary asks the government to suspend re-opening the plant until the circumstances of the disaster are elucidated and environmental and health hazards are significantly reduced."

The statement of Csalán Environmental and Conservation Association (Csalán Egyesület) drew attention to a number of fundamental legal and environmental issues:

"Csalán Environmental and Conservation Association is seriously concerned about the events of the red mud disaster which flooded Kolontár, Devecser and five other villages of Veszprém county and expresses deep compassion for the citizens of the affected region whose life were destroyed overnight by the poisoning.

The association finds it outrageous that fate of people is turned to the worst due to careless and irresponsible industrial activities in our immediate environment. This raises the question who could set limits to the hazards of industrial activities and what is the point in the various laws and regulations considered as strict if such ecological disasters can destroy the lives of thousands? Who will pay for the damages caused by irresponsible behaviour? In fact, is it possible at all to compensate for the destruction of people's homes? Do residents living near the reservoir have the right to know the nature of the risks in their environment and what to do in case of a disaster?

We all know the answers to these questions. We have the right to know what exactly the continuation of industrial activities in our environment entails even if the state authorities have an obligation to monitor them and ensure all precaution is taken to prevent such disasters in the future. And yes, the residents of the red mud affected municipalities have the right to accurate information about the composition of the red mud flooding their homes and gardens so that the proper precautions be made even in these degrading circumstances."

3.5. Assessment of the disaster management

Some of the most important and most urgent disaster management tasks were conducted carefully and on time by the government.

These included:

- The suspension of the production at MAL Co. Ltd;
- The evacuation of the residents and the organisation of their supply;
- The maintenance of public order and public security in the affected area;
- The protection of the drinking water reserve;
- The organisation of environmental and public health monitoring;
- The localisation of risks threatening surface waters;

At the same time, a number of unnecessary or ill-advised steps have also been made besides the above examples:

- The construction of highly expensive temporary dams between the damaged reservoir and the flooded villages was controversial. (Several experts have expressed that there was no risk of another sludge flood which affecting the nearby villages). Nevertheless, this can be explained by the intention to prevent another possible disaster;
- The neutralisation of the alkaline spillage by gypsum and sulphuric acid delivered form faraway parts of the country. (Less harmful materials could have also been used including less industrial contamination and these could have come from regions closer to the damaged area);
- The relocation of residents was started too early;
- The removal of slightly contaminated soil in areas where harrowing and neutralisation could have been the appropriate solution.

Furthermore, some clearly wrong decisions have equally been made:

- First of all, there have been severe shortcomings in the information provided for local people and the public. Both the data provided in relation to the disaster and later the crucially important information on public health issues (dust contamination, etc.) were made available with delay, partially or not at all;

- The remediation of agricultural fields was started with delay and without a clear strategy;

- The distribution of the aid collected from public contributions has not been started yet (until February 2011);

- Local residents reported to have observed abuse in the distribution of material goods offered by individual donors or companies;

- The compensation for damages to real estate started in ways that were unjust and contrary to the promises originally made. However, the claims raised were redressed later on;

- The transportation of contaminated soil and the spilled red mud was organised on public roads, although sufficient railway capacity was available in the contaminated area.

Summary

- Following this unprecedented accident the authorities responded with the expected rapidity and decisiveness, but not always efficiently in the defence of human health, the environment and material assets impacted by the disaster or at risk. One reason for the fact that intervention was not efficient enough was lack of information (local residents and participants in the rescue operations were not informed as to the composition and pH value of the red mud, the biological effect of the slurry, the list of materials to be used in restoration and whether they were available). The defective communication structure was a further reason (crucial information on environmental health issues was published with a delay of several days, with significant initial inaccuracies). As a result, for several days the people impacted were on multiple occasions forced to make decisions potentially influencing the rest of their lives based on conflicting information (e.g. "the red mud is not harmful" vs. "the red mud is toxic and/or radioactive").

- The deficiencies of governmental communication characterising the first days after the accident were primarily mitigated by non-governmental organisations (Greenpeace, Clean Air Working Group, etc.), as they were the sources of communication regarding measurement data and useful health advice.

- The activity of the authorities in such extreme cases should be characterised exclusively by professional objectivity and based on firm legal foundations in order to preserve the trust of the public. This was however contradicted by the temporary arrest of the CEO of MAL Co. Ltd., which later turned out to be untenable; the "assurance" given by the Prime Minister on the issue the detention; the act of placing the company under state control and the allocation of liability for the accident to MAL Co. Ltd. (too early, without genuine investigations).

- On the 6th day after the accident, LMP drew up a comprehensive package for the government on the disaster management measures. The proposals did not fail to consider ecological concerns, and have since been substantiated as relevant and accurate. On the next day, The European Green Party declared support for LMP's claims. LMP raised the issues that have been at the focus of investigations ever since (e.g. the privatisation of the aluminium industry, the responsibility of the authorities regarding permission for alkaline sludge disposal, technological shortcomings of the reservoirs dam detected previously and the unsuitability of the disaster management plan). On 29 October, the party presented a proposal for legislation which could significantly reduce the chances of and the risks posed by similar disasters, however, the proposal was not supported.

Recommendations

- The official communication for major environmental disasters should be organised, including creating the legal background, clarifying responsibilities, communication channels and deadlines. When disaster strikes, it is especially important to provide adequate information to the residents in line with regulations such as the Aarhus Convention, the Act on Data Protection, the Act on the Environment, the Act on Freedom of Electronic Information etc.;

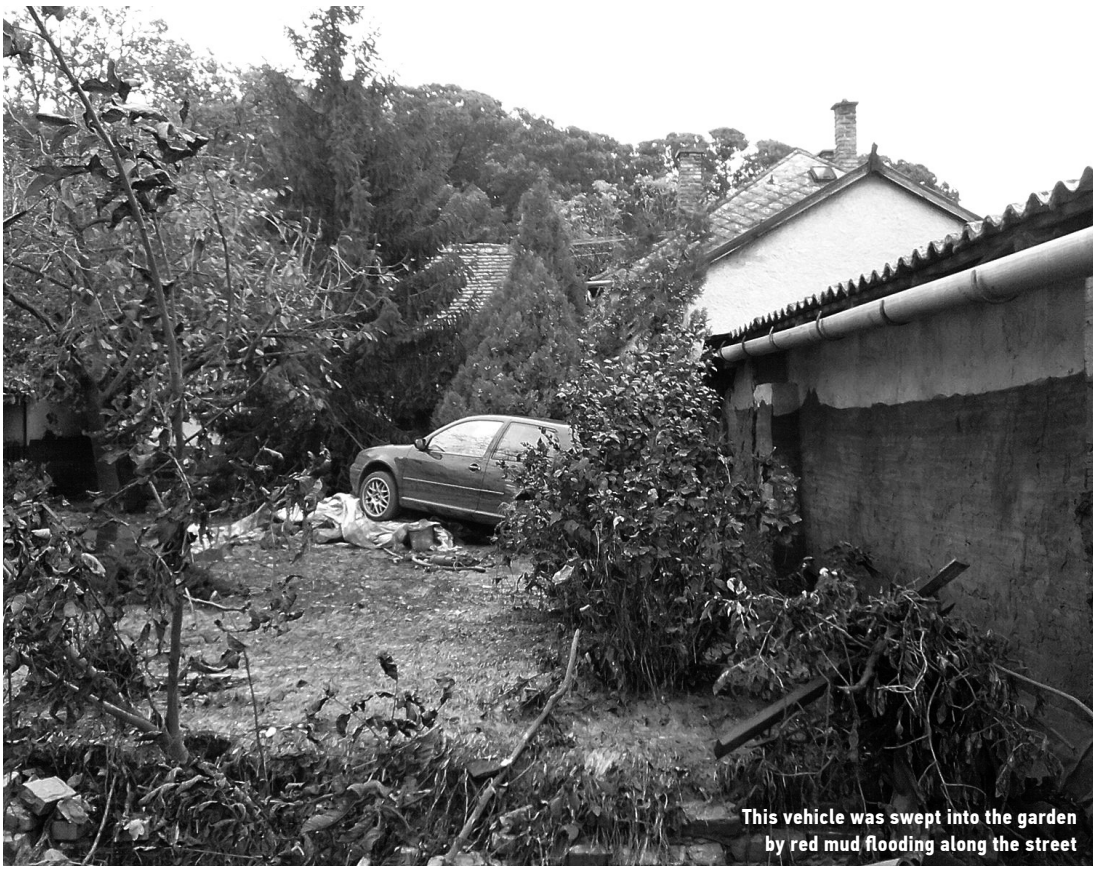
- All governments should adhere to rule of law standards even at times of environmental disaster. The problems encountered should be tackled within this framework;

- There is need for statutory authorities to implement a yearly compulsory audit of environmentally high-risk facilities, including substantive testing, with the participation of experts independent from the authority;

- In the procedure of issuing environmental permits, environmental impact assessment studies need to be prepared by experts working independently from the issuer of the permit;

- An EU-wide security fund needs to be set up, financed form the contribution of hazardous plants for damages that cannot otherwise be covered;

- There is need for an EU Directive on compulsory environmental liability insurance policies.



This vehicle was swept into the garden by red mud flooding along the street

4. Contamination reports

4.1. Initial reports based on earlier tests

A range of conflicting data and statements had been aired following the red mud disaster, pertaining to the constitution of the sludge, its toxicity and environmental impact. Immediately after the disaster, information was published on the official website of the National Directorate General for Disaster Management at the Ministry of the Interior about the red mud spill.

RED MUD

A by-product of alumina production. The material is thick like sour cream, strongly alkaline, thus has a caustic effect on the skin. The mud contains heavy metals, including lead, is mildly radioactive, and inhaling the dust may cause lung cancer.

A by-product of alumina production (the first phase of the of aluminium production), red mud has severe adverse health effects, thus it is classified as a category 2 hazardous substance. It is highly alkaline and contains large quantities of toxic metals including lead. Due to its alkalinity, red mud produces a caustic effect on the skin, and should be washed off immediately with plenty of water in order to neutralize it. The substance is radioactive, but because of its low activity, the direct risk of radiation is negligible. However, the wind may carry radioactive materials from areas nearby, so inhaling the substance may even cause lung cancer. On average, producing one ton of aluminium results in three tons of highly alkaline red mud produced. *(Source: Directorate for Disaster Management)*

According to the communication, [the] "mud contains heavy metals, including lead, is mildly radioactive, and inhaling the dust may cause lung cancer". This information was replaced on October 5th with data supplied by the National Public Health and Medical Officer Service (ÁNTSZ) (4.1.2). Later tests disproved the claims of high lead concentration and hazardous radioactivity. Lead and radioactivity warnings were therefore misleading.

4.1.1. Statements of MAL. Co. Ltd.

MAL. Co. Ltd. CEO and stakeholder Zoltán Bakonyi stated the day after the disaster, that the sludge was harmless, despite abundant news reports of countless alkaline burn injuries. When asked why several people suffered burns, he could not give an adequate reply. It was due to unfounded and misleading allegations that many affected local residents refused to believe that the red mud contained no other toxic materials.[1] During initial forum discussions, the residents referred to Kolontár as a dead village, and many declared they are afraid to return to their dwellings for fear of health risks. Continual uncertainty among residents has been due partly to initial information provided by Disaster Management and its later modification by the Public Health Service.

During the first days of the disaster, MAL. Co. Ltd. management denied responsibility, claiming that "sometimes, despite the most rigorous control measures, such disasters will happen", and also stressing that heavy rainfall contributed to what they called a natural disaster. Company management insisted they had adhered to all regulations to the letter, and opined that their claim was bolstered by the fact that official inspections also found the maintenance of the sludge containment in perfect order.

4.1.2. Initial reports and statements of the National Public Health and Medical Officer Service (ÁNTSZ)

Immediately after the spill, speculations arose about the toxic materials the sludge may contain. For a long time it wasn't clear whether it was actually red mud or the alkaline water covering the sludge, that flooded the area. According to company management and a number of experts, the latter was the case, while other experts allege that alkaline water containing actual red mud had caused the disaster.

On October 5th, the day after the disaster, ÁNTSZ published a document determining that the red mud is very low in toxic content,[2] including toxic metals. According to their published table, the sludge had a pH level of 11.8. The data seems reassuring, but the document makes it evidently clear that **it is reproducing the 1987 measurements made by the National**

pH	11,8

Table 1: Data from the ÁNTSZ document „What should we know about red mud?", published October 5th, 2010[3]

Furthermore, this document published by ÁNTSZ states that the red mud's *"composition is determined by properties of the bauxite mined, and the discharged, added and residual materials from its treatment"*. According to the document, the sludge awaiting containment contained 10-30% dry matter and had a pH level of approximately 12-13, which contradicts the pH 11.8 featured in the table. **In fact, pH levels of approximately 13 had been measured, exceeding both values specified, and far exceeding the pH 11.8 referred to in the ÁNTSZ table. According to the Hungarian Academy of Sciences (MTA) publication, the material leaking from the storage pool had a pH level varying from 11 to 14.**[4]

The ecotoxicity data published by ÁNTSZ are incomprehensible, lacking any specification of what the table's data actually pertains to (% toxicity), nor is there indication of the sample preparation/solution method used, as well as the lack of a solvent control for the DMSO extract. Nitric acid solution doesn't yield an all-around metal content assessment for the sludge, e.g. arsenic has lower nitric solubility, therefore these values are only partially indicative of the sludge's composition. However, following the disaster, the table's publication caused a communicational disturbance.

[3] http://www.antsz.hu/portal/down/kulso/kozegeszsegugy/iszaptarolo_szakadt_at/Mit_kell_tudni_a_vorosiszaprol_20101005.pdf

[4] http://www.katasztrofavedelem.hu/index2.php?pageid=lakossag_kolontar_vorosiszap2

4.1.3. Initial MTA statements and results —in light of the Greenpeace investigation

According to a release by the Hungarian Academy of Sciences (MTA) of October 7th 2010, the sludge contained no toxic metal.[5] On the third day of the disaster, chief secretary of the Academy Tamás Németh stated that apart from its alkalinity, the spilled sludge has no chemical content exceeding the toxicity limit.[6] In contrast to the reassuring statements from MTA and the data published by ÁNTSZ, considerable media interest was generated by a result published by Greenpeace on October 8th.[7] Greenpeace didn't quote results from tests of years past, but analyzed fresh samples taken from a rainwater ditch in Kolontár on the 2nd day of the disaster. **According to Greenpeace results, ditchwater from Kolontár yielded an arsenic concentration of 0.25 mg/l, which is 25 times that of the maximum contaminant level for tap water or groundwater, and 2.5 times that permissible for industrial sewage sludge. Furthermore, the 40.8 mg/kg result measured in dry samples exceeds by far the permissible 15 mg/kg level for soil,[8] which ÁNTSZ had referred to only 3 days earlier.** ÁNTSZ results pertained to acidic solutions, which yield diminutive arsenic concentrations. Test results for mercury content showed 0.76 mg/kg, exceeding the 0.5 mg/kg limit, and for chrome, a result of 191 mg/kg also exceeds the 75 mg/kg limit. Only the concentration of arsenic was in excess of maximum sewage sludge contaminant levels. When neutralized or diluted, arsenic compounds are precipitated as pH decreases, therefore the arsenic concentrations that living organisms contract will gradually diminish in the natural environment.

The secretary of MTA questioned the credibility of the Greenpeace results,[9] claiming they are referring to two different matters. *"Greenpeace is referring to red mud, the consistency of which is well known, while the Academy refers to those samples taken from the liquid phase of the alkaline spillage"*. Greenpeace results are not representative, as there may have been other pollutants present in the ditches of Kolontár, and they are not representative of the entire area. The reason Greenpeace compared its results with drinking water is that for surface water, there are no definitive maximum contaminant levels, and in the case of arsenic and chrome, the limits for drinking water are the same as for surface water. Pollutants will eventually dilute and disperse, the actual concentrations are therefore established after dilution sets in. Additionally, in theory nobody would drink the contaminated water, or till the contaminated land. As there are no maximum contaminant levels set for red mud contaminants in living waters, all comparison is difficult.

According to the MTA statement, *"the red mud contains no soluble heavy metals in excess of maximum contaminant levels"*. It was later revealed that the MTA had based its statement on

test results from 2003, and even then there had in fact been no tests for arsenic or mercury concentrations. Regardless, the MTA statement long served as a basis for challenging the results of Greenpeace tests. **Later on however, MTA removed its October 7th statement was removed from their website**[10] Later tests conducted by MTA after the disaster—although using different methods[11]—had by and large similar results as Greenpeace tests, though a larger sample size obviously led to greater variance.

Table 2: Metal content in red mud concomitant liquid (µg/l)

After the reservoir burst, Greenpeace conducted the following investigations:

2010.10.05. Sampling was directed to assess the content of the material spilled on the streets of Kolontár during the disaster. Tests were made both on more solid muddy material and the liquid flowing in the rainwater ditch.

2010.10.22. Samples were collected from drilled wells in Devecser and Kolontár, which had been washed over by the sludge. The object of the test was to determine the severity of the contamination of these wells, and publishing the result to call attention to the urgency of well

[10] The deleted website: http://mta.hu/cikkek/a-vorosiszap-szennyezes-hatasai-125707

[11] Distilled water and ammonium-acetate

[12] 28/2004. (XII. 25.) KvVM regulation for maximum water contaminant levels; ch.32 Metal production http://net.jogtar.hu/jr/gen/hjegy_doc.cgi?docid=A0400028.KVV

decontamination. Samples from the Torna stream were used to determine the quality of its water quality 3 weeks after the contamination. Samples were also taken in Kolontár, from the remaining red mud, as well as plaster and dudarit, to test the materials used to neutralize the sludge for contamination.

2010.11.11. Tap water samples were taken in Kolontár and Ajka to test for contamination. Additionally, red mud was sampled from Basin X, and hydrochloric acid used for neutralizing was taken from a feed pipe to Basin X/a. to determine what further water pollutants may come in contact with the water system from these sources. A further sample was taken at a measuring well connected to the catchment basin so that the old reservoirs are also beneath it in terms of fluid mechanics, in order to establish whether the entire drinking water supply might be polluted.

2010.11.02–12. Analysis of dust gathered by the organization's own dust collector device, in order to test the size of airborne particles and their contents, as well as to record dust concentration data.

2011.01.26. Sampling of leachate discharge pipe, the sewer above and below the pipe, and below the acidifying station. In order to establish what is being discharged into the sewer, and what detectable change the acidification process brings. Also to determine what materials flow directly into the Torna stream, this inflow's comparison to maximum contaminant levels, and an assessment of short and long term impact.

According to Greenpeace's test results, the red mud concomitant water phase contained high levels of the metals arsenic, nickel and lead several times higher than maximum contaminant levels for soil and drinking water, as ordained by regulations 6/2009. (IV. 14.) KvVM-EüM-FVM joint regulation and 201/2001. (X. 25.) government decree, as well as the groundwater intervention levels specified in the now defunct 10/2000.(VI.2.) KöM-EüM-FVM-KHVM **joint regulation. Established and defunct limits were exceeded, in the case of chrome, mercury and nickel. Only arsenic levels were in excess of maximum sewage sludge contamination levels.**

4.3. Water testing

4.3.1. Results from MTA (KFKI, MAFI, TAKI) tests

The Government Coordination Commission and the Interior Ministry's National Directorate General for Disaster Management requested the chairman of MTA to form a committee of experts to aid the disaster management effort.[13] The expert committee was set up on the second day of the disaster,[14] led by János Szépvölgyi, director of the Material and Environmental Chemistry Institute at the Chemical Research Centre of MTA (The Hungarian Academy of Sciences). On the same day, the group travelled to the scene of the disaster. MTA associates have since taken and analyzed a large number of samples.

The results of MTA tests were published in a report.[15] The research facilities investigated the following criteria:

- alkalinity (pH)
- physical constitution, with special regard to components posing a potential health and environmental hazard
- estimates for the dispersion of these components.

They concluded that *"based on the analysis of samples taken from various locations, the alkalinity of the material spilled from the reservoir varies between pH 11-14. This indicates that the red mud is environmentally hazardous."* The evaluation of the red mud's constitution determined that *"based on our data, the spilled sludge is a heterogeneous material, its constitution varies from place to place within specific margins."* There is of course no maximum contaminant level specified for red mud, so the MTA compared its results with contaminant limits set for sewage sludge.[16] Besides the MTA and other official results, the tables below also shows results from Greenpeace tests, specifying other valid limit levels besides the ones specified by the MTA. Levels exceeding the permissible limits are highlighted in bold.

Table 3: Red mud metal content (mg/kg) – Source: MTA[17]

Dry red mud has therefore been tested both by MTA and Greenpeace to contain levels of arsenic, chrome, mercury and nickel all far in excess of the levels limited by joint regulation 6/2009. (IV. 14.) KvVM-EüM-FVM[18] as Maximum Contaminant Levels for the soil. Several MTA samples tested lead concentration at approximately double the maximum soil contaminant level, and some samples contained cadmium concentrations slightly over the maximum level. The since defunct joint regulation 10/2000.(VI.2.) KöM-EüM-FVM-KHVM soil intervention level was only exceeded by arsenic concentrations in nearly every sample. These concentration levels were diminished with soil dispersion. Maximum sewage sludge contaminant levels were also only exceeded by arsenic concentrations. In comparison to the earlier regulation 10/2000, the successive regulation 6/2009 omitted the so-called action (C) levels that vary according to an area's sensitivity. We are specifying these intervention levels for comparison**.**

[17] http://mta.hu/data/HIREK/iszap/AKI_eredmenyek_osszefoglalasa.doc?wa=emun1021h

Samples	Solutions' metal content (µg/l)					
	As	Cd	Cr	Hg	Ni	Pb
MTA KK AKI 2010.10.05. distilled water	k.h.a	k.h.a	k.h.a	k.h.a	**190**	**60**
Maximum Contaminant Levels for sewage sludge[19]	**100**	**200**	**500**	**50**	**500**	**500**
Maximum Contaminant Levels for drinking water	**10**	**5**	**50**	**1**	**20**	**10**
Maximum Contaminant Levels (B) for groundwater	**10**	**5**	**50**	**1**	**20**	**10**

Table 4: Red mud solutions and their metal content (µg/l) – Source: MTA[20]

Tests for distilled water soluble metal content in the red mud was carried out by MTA AKI. Concentrations of nickel and lead were several times higher than the maximum contaminant levels for groundwater allowed in joint regulation 6/2009. (IV. 14.) KvVM-EüM-FVM, and fro drinking water in government regulation 201/2001. (X. 25.), also several times more than the minimal risk levels for groundwater, and chrome, mercury and nickel concentrations occasionally in excess of intervention levels specified in the defunct joint regulation 10/2000.(VI.2.) KöM-EüM-FVM-KHVM.

Environmentally diffused red mud and sludge concomitant water pollution is difficult to measure against any limit values, given how the material mixes and disperses in the soil, rainwater and living waters, thereby diminishing in concentration. Industrial sewage sludge contaminant limits are thus hardly applicable, since they are for application under well-known and controlled circumstances. The solubility of toxic metals alters as alkalinity changes. While arsenic is more likely to enter an aqueous phase in an alkaline environment, other toxic metals are only mobilized in acidic media.

4.3.2. Test results from University of Pannonia

Water chemical testing was also carried out by a team of experts from the University of Pannonia (UP). During the first phase of the disaster, neutralizing the lye dispersed with the red mud spill was top priority, in order to save surface and subterranean waters. In cooperation with the County Occupational Safety Commission, UP associates poured plaster, and subsequently liquid fertilizer and dolomite nitrate into the polluted living waters, primarily the Torna stream and the river Marcal. In the wake of these interventions, water chemical levels are now approaching normal.

Samples tested by UP associates indicated no mobilization (water solubility) of heavy metals in alkaline solutions. Some samples contained concentrations of cadmium, copper and

[19] regulation 28/2004. (XII. 25.) KvVM on maximum contaminant levels for water pollutants and applicable rules; ch. 32.Metal production http://net.jogtar.hu/jr/gen/hjegy_doc.cgi?docid=A0400028.KVV

[20] http://mta.hu/data/HIREK/iszap/AKI_eredmenyek_osszefoglalasa.doc?wa=emun1021h

arsenic in excess of permitted levels, but this was not brought in direct connection with the spill, considered a local contamination instead.

Experts recommend an investigation of the basin and mud of the Torna stream and the river Marcal, to assess the effect of de-alkalizing plaster on the river sediments.

4.4. Air/dust test results

Since over 1000 hectares of land were covered by the spilled red mud, the prospect of large quantities of red mud dust polluting the air became an immediate concern. The dust itself is alkaline, and contains some of the toxic elements of the sludge. Coming in contact with water inside the human body (mucous membranes, respiratory tracts, eyes), it may cause a burning, painful sensation. In time, the carbon dioxide occurring in the air will neutralize the alkali, the risk therefore diminishes in the long term.

Speculation arose about the effects of air-diffused dust following the disaster. In an open letter dated October 12th, Greenpeace and Clean Air Action Group petitioned clarification of data and increased protection for the population[21] to Minister of Interior Sándor Pintér. The NGO's highlighted the *"need for continual, coherent and concise public information, something we are presently far from attaining"*. Residents and rescue workers were handed out various types of dust mask, but residents wore these only sporadically and this was probably due to insufficient notification. Experts reported from the site that the trees and buildings in the area are covered in red dust, and that dust is regularly kicked up by rescue vehicles on dry days. In the aftermath of the disaster, frequent rains contributed to a decrease in dust emission, and alkaline surface dust was washed away or diluted by rainwater. Clean Air Action Group asked the Ministry of Agriculture and Regional Development repeatedly for information on the level of contamination, the concentrations of toxic pollutants, but the requested information didn't arrive until November.

During the first days, authorities only gave notice of PM10 (airborne particulate) concentration in the air, stating that it is within, or only in slight excess of, the maximum PM10 contaminant level. For several weeks, authorities neglected to clarify the possible presence of toxic, carcinogenic airborne substances. Maximum contaminant levels for carcinogenic airborne substances are specified in Appendix 1 of joint regulation 14/2001 (V.9.) KöM-EüM-FVM,[22] including chrome, arsenic and cadmium. If in fact the dust still contains some alkali, it causes a burning, painful sensation when contacting human mucous membranes, respiratory tracts and eyes. Greenpeace and Clean Air Action Group declared it misleading[23]

---

[21] Greenpeace and Clean Air Action Group petitions Minister of Interior Sándor Pintér for clarification of data and increased protection for the population http://levego.hu/hirek/2010/10/az_adatok_tisztazasat_es_az_emberek_fokozott_vedelmet_keri_a_greenpeace_es_a_levego_mu

[22] joint regulation 14/2001 (V.9.) KöM-EüM-FVM http://www.kvvm.hu/cimg/documents/14_2001_K_M_E_M_FVM.doc

[23] Red mud: only thorough testing will lead to good decisions; October 15th, 2010. http://levego.hu/hirek/2010/10/vorosiszap_csak_alapos_meresek_utan_hozhatok_jo_dontesek

to compare the local air quality data with general airborne particulate contamination levels, while permissible limits for carcinogenic substances found in red mud are one thousand to ten thousand times lower than those for airborne particulates.

Results for testing the dust pollution's constituents were published by Greenpeace on October 13th, 2010.[24] According to the Greenpeace report, ***"the presence of fine grain PM10 dust is extremely high, and anyone in the area exposed without adequate protective equipment faces serious health hazards".*** **This statement proved to be a mild overstatement, considering that though high PM10 concentrations are a health hazard, this is the same concentration level as Budapest's air contains in nearly 80 days of each year, and in fact most of the country's large towns had 30-60 days with pollution levels in excess of limits, in the year 2010.** The report[25] also called attention to the importance of wearing dust masks: *"in the areas affected by dust pollution, it is advised to wear minimum FFP3 (also known as P3) particulate filter (or ideally, combined filter) equipped masks that have separate exhalation valves. Filters should be replaced every four hours, or in accordance to respiratory irritation and/or heavy breathing".* A later in-depth Greenpeace report however, stated[26] that ***"based on a week long sampling, airborne fine dust contaminant levels were within permissible limits".***

It was only weeks after the disaster that authorities gave public notification of toxic metal levels in airborne dust around the affected area. **According to data published weeks after the disaster,[27] though the total quantity of airborne particulates (PM10) exceeded minimal risk levels, the concentration of individual carcinogenic substances in the air did not exceed annual minimal risk levels.**

As to the question of the health risk posed by alkaline dust, no appropriate and professionally founded statements were published. According to the Greenpeace report, *"when inhaled, the alkali irritates the mucous membranes and causes intense burning, and extensive exposure may lead o serious respiratory injury."* An expert from the ÁNTSZ stated, ***"wearing the so-called ftp 2-3 protective dust mask, air pollution is no worse than in heavily dust-polluted Budapest".***[28] The expert reassured the general population, saying *„this dust is not as dangerous as we first thought, after all this wasn't a chemical plant meltdown".*

Experts from University of Pannonia modelled the gradual dehydration and dispersion of the red mud affected surface and its impact. Modelling experiments showed that inhalable airborne dust constitutes nearly one-thousandth of the red mud's total mass, which is a high ratio compared to breathable dust yields of other flowing substances and natural soils.

When mobilized, red mud releases a reddish, smoke-like emission which shows copious visible fine grain dust content. Airborne dust grain size distribution ranges from fine to large. The large particles may be deposited inside the respiratory system, developing a strongly alkaline fluid. This dust-developed alkaline solution is a serious health hazard, especially in case of massively inhaled red mud. The fine particles enter the alveolar sacs, resulting in yet more severe alkaline poisoning. Those entering the secured area around Kolontár and Devecser were required to wear protective clothing. Dust pollution in the Devecser area was not critical. A mobile air pollution testing station was set up in the Castle Park of Devecser, so that should airborne dust levels increase, immediate notification may be sent to Disaster Management authorities.

4.5. WHO and EU reports

4.5.1. WHO red mud report

The World Health Organization (WHO) Regional Office for Europe deployed an international delegation to Hungary between the 12th and 16th of October, to support Hungarian government in combating mid- to long term health consequences of the red sludge disaster.[29] By November 17th, the report containing the statements and suggestions of WHO had been translated to Hungarian,[30] WHO experts submitted their suggestions to the Ministry of National Resources, the Ministry of Interior's National Directorate General for Disaster Management, representatives of the Government Coordination Commission and the National Institute of Environmental Health.

The report stated that deaths and injuries were caused primarily by the red sludge's highly alkaline pH level causing chemical burns on exposed skin and eyes.[31]

The WHO alerted Hungarian authorities that red sludge cleanup and rescue operations should be manned by trained emergency crews. The report also calls for a surveillance system and its maintenance in order to ensure that rescue workers are supplied with appropriate protective gear and clothing, and that workers really use the protective equipment.

The international report highlights that the area is of special health and environmental concern; its soil and air must be monitored continuously, as well as the health of relocated residents and rescue crews.[32] Importance of air testing and especially airborne particulate concentration was also emphasized. The report calls for the investigation of all significant increases in air pollution, and the eradication of causes thereof. In order to detect and prevent further pollution, and environmental pollution on a longer term, tests of air quality and the chemical constitution of soil and water must continue in the future. WHO experts suggested further testing points to be set up in affected settlement centres and near affected real estate. The WHO stated that an

[29] WHO red mud report, Nov.17th 2010 http://www.greenfo.hu/hirek/hirek_item.php?hir=25994/

[30] http://www.greenfo.hu/upload/WHO%20v%F6r%F6siszap%20jelent%E9s.doc

[31] WHO report on red mud disaster; 2010. 11. 18. http://www.mixonline.hu/Cikk.aspx?id=44847

[32] Sludge hazard: WHO report, November 16th 2010. http://www.stop.hu/articles/article.php?id=776244

urgent analysis of the remaining sludge still in the reservoir is of crucial importance, as well as a study of the geohydrologic stratification beneath the reservoirs. They also suggest investigations of the relocated red sludge and the reservoir used for storing contaminated soil.

Further suggestions include *"an investigation of possible mid to long term health effects of contacting locally produced food and water possibly contaminated by direct contact with red sludge"*. WHO experts stress that though drinking water quality remained stable in the disaster's aftermath, the general population must be cautioned that wells should be used for irrigation only, and water from private wells should only be imbibed after appropriate testing.

They also suggested the setting up of a local *"regular screening network for general health, reports and investigation of unexpected symptoms, with special attention to sensitive demographic groups"*. Residents must be appropriately notified of the programme. **A suggestion was made to develop the analytic capacity and equipment of ÁNTSZ to enable better reaction in similar future events.**

Evaluating the remediation, the WHO report states that contamination of the river Danube was successfully averted. A suggestion was made to drain the surface water from red sludge reservoirs in order to decrease pressure as well as to enable further dehydration of the red sludge.

A suggestion was made for assessing the environmental risk factor of similar facilities along the river Danube. The report proposes an investigation of various industrial facilities and landfills for their resistance to extreme weather conditions, and updating emergency plans with the participation of all parties concerned.

4.5.2. EU experts' red sludge report

On October 7th, the government of Hungary asked for help from the European Commission Monitoring and Information Centre (MIC), requesting the deployment of a group of experts to Hungary. The group of experts in minimising and countering environmental damage arrived from France, Belgium, Sweden, Austria and Germany to the scene of the disaster on October 11th, appointed to make suggestions for the effective management of damage caused by the red sludge.

Following an investigation in Kolontár, Devecser and the ruptured reservoir, the EU experts compiled a report by October 17th[33] and submitted it to the chief director of National Directorate General for Disaster Management. The EU experts had previously conferred with experts of the MTA, and received all test results from Hungarian authorities, as well as consulting with experts making tests on location.[34]

The EU experts, much like the WHO experts, called attention to the importance of further tests and investigation, which are indispensable for long term action. The report states that drinking water quality is safe for human consumption. The EU experts called Hungarian authorities' attention to ensure by all means that the water leaking out of the reservoirs should not come in contact with living waters.

[34] EU experts' preliminary report (statement); October 17th 2010 http://vorosiszap.bm.hu/?p=661

4.6. Information on the presence of further pollutants

According to MAL. Co. Ltd.'s environmental permit, valid until February 2011,[35] the company is licensed to conduct the following activities at its Ajka facility (8400 Ajka-Gyártelep, 598 hrsz.) to the following capacities:

- Aluminium oxide production 300.000 tonnes/year
- Gallium production 5.5 tonnes/year
- Zeolite production 30.000 tonnes/year
- Aluminium alloy 21.000 tonnes/year
- Aluminium slag processing 3.500 tonnes/year

From an environmental point of view, the production of gallium is of greatest risk, because the process involves the use of highly toxic mercury. According to the permit:

- *During aluminium oxide production, pollutants are removed from the alkaline residue after cooling, sedimentation and applying centrifugal force. The alkaline residue is used to produce Na-Ga-amalgam, in mercury cathode electrolytic cells.*
- *During the amalgam separation process, hot water is applied to produce a Na-gallate solution. The solution is evaporated, filtered, and cemented to yield raw Ga. The raw metal is heat treated, acidified, crystallized and electrorefined to yield high purity metal.*
- *The alkali exiting the cells is settled, its mercury content removed and united with the mercury regained from amalgam separation. The alkali is reintegrated into the aluminium oxide production cycle.*

Gallium production started at the Ajka plant in 1959. The gallium works are located on the Eastern edge of the t-1 aluminium oxide plant. According to the license, *"Air pollutants released during gallium processing in the manufacture of the refined product are emitted into the environment without purification"*. Following the 2010 accident, the preliminary study for the new permit[36] also states that 100% of the mercury emissions are due to gallium production, totalling around 0,004 kg/h. Earlier studies have noted the T-1 plant area's gallium works emitting Hg pollutant, *"while PAH contamination was found by industrial rail track no. VII. The necessary*

[35] CENTRAL TRANSDANUBIAN FOR ENVIRONMENTAL ISSUES, NATURE CONSERVATION AND WATER MANAGEMENT Subject: MAL. Co. Ltd. environmental permit http://kdtktvf.zoldhatosag.hu/upload/File/10897-05-2(1).doc

[36] MAL. Co. Ltd. Ajka Plant (8401 Ajka-Gyártelep, Hrsz. 598.) Environmental Permit – Full Environmental Review; November 2010; Székesfehérvár http://kdtktvf.zoldhatosag.hu/upload/File/I_kotet_Tanulmany.pdf

remediation was performed in the year 2000, removing 7.2 m^3 and 9.0 m^3 of soil contaminated with mercury and PAH, respectively".

The technology reprocesses the mercury both from amalgam separation and alkali sedimentation. According to the study, *"purified mercury is held in the mercury container, then fed back into the electrolytic cells. Fresh mercury making up for the amount lost in technology is also fed into the mercury container. Alkali separated during mercury purification is added to the sedimented alkali exiting the electrolytic cells, and are reused in aluminium oxide production*". These words make it obviously clear that there is a constant loss of mercury, and that reprocessed alkali are also contaminated with mercury. **Mercury emission is included in the plant's environmental permit, but it's also possible that some of the mercury used finds its way into the red sludge.**

ÁNTSZ published a document entitled, **"What should we know about red sludge?"** which makes no mention of possible mercury content. The test results produced by Greenpeace after the disaster found 0.76 mg/kg mercury dry mass concentrations in a Kolontár ditch, while associates of the Geological Institute of Hungary (MÁFI) analyzed 10 sludge samples in the Kolontár and Devecser area, also on October 6th 2010, and found mercury concentrations of 0.61-2.83 mg/kg.[37] **These levels exceed the maximum mercury limits of 0.5 mg/kg for soil, but are under the 10 mg/kg limit set for sewage sludge.**

4.7. Evaluating the test results

4.7.1. Pollution of the area's land and water

Conflicting statements, and especially that of environmental state secretary Zoltán Illés stating that unless the pollutant can be caught in the river Marcal but reaches the river Rába, "then we'd all better kneel and pray!",[38] filled local residents with considerable angst. Visiting the site, the state secretary alluded to the possible carcinogenicity of inhaled red sludge dust. On top of that, on the second day of the disaster, Zoltán Illés also declared that "the next difficult task is collecting and disposing the mildly radioactive contamination". Subsequently, all experts refuted that radioactivity emanating from the red sludge might pose even the slightest hazard to human health. Despite this fact, local residents were mostly worried about radioactive pollution during the first few days of the disaster.

Illés Zoltán stated that[39] *"the areas affected are unsuitable for any useful agricultural activity, and will bear no plants fit for human or animal consumption for fifteen or even twenty years, and we should thereby experiment with chemicals or bacteria that might neutralize the highly alkaline, mildly radioactive red sludge*". In reaction to the first statement, local residents declared that after the sludge is cleared, soil must be replaced up to a meter in depth, for fear of the area becoming

[37] A summary of tests related to the Ajka red mud spill conducted on October 12th 2010 http://www.geol.hu/index.php?option=com_content&view=article&id=72:voeroesiszap-mta-vizsgalatok&catid=30:spektrumkoenyvtar

[39] www.greenfo.hu/hirek/hirek_item.php

uninhabitable for up to 30-40 years.[40] In comparison, test results both foreign and domestic prove that even cash crops may be grown on neutralized red sludge, or soil containing such sludge, on the condition that toxic pollutants are within minimal soil risk levels.

Later, on November 24th, ministerial director **Csaba Szabó** stated[41] that the red sludge had covered 1017 hectares of topsoil, and caused contamination below the level anticipated. Even in the very first days of the disaster, MTA chief secretary Tamás Németh stated that topsoil replacement or special use are possibilities for the nearly 800 hectares of sludge contaminated land.[42] According to the MTA, once the alkalinity is neutralized, *"the area will remain unsuitable for farming, not even after the contamination is removed. These areas will be exempted from farming and may be used instead for energy crop production or possibly forestry."* **Subsequently, in light of new test results from MTA following the disaster, he stressed that toxic metal contamination levels are within maximum limits for sewage sludge.**

ÁNTSZ issued a statement declaring the area's water potable, based on 120 tests. Greenpeace found no pollutants in the drinking water catchment, though one Devecser well was found to contain 4200 micrograms of arsenic per litre, as opposed to the permissible 10.[43] Local provider Transdanubian Regional Waterworks gains regional drinking water from deep karst basins. Drinking water contamination risk is thereby minimal, though drilled wells are prone to contamination.

Tests conducted since the disaster have shown arsenic concentrations in the Torna stream, the river Marcal and inland waters exceeding groundwater and drinking water risk levels, often significantly. **Red sludge contained chrome, lead and nickel contaminants exceeding now defunct intervention levels, as well as maximum contaminant levels for groundwater and drinking water.**

Dry red sludge arsenic concentrations tested by both MTA and Greenpeace were found to significantly exceed maximum contaminant levels for soil and sewage sludge. According to tests, these extreme arsenic levels are only present in wells, which after due notification are hopefully only used for irrigation. According to available test results, the contamination has stopped spreading, the drinking water catchment is unaffected; no red sludge pollution is present in drinking waters. Further effects of high arsenic concentrations however may present further problems.

4.7.2. Alkalinity

Several days were to pass before it was determined that the main hazard posed by red sludge is its alkalinity.[44] The media featured many conflicting statements regarding alkalinity and its risks. Initial reports stated that hosing off the red sludge constitutes sufficient protection, are partly correct, as washing is the most effective way to combat alkali, however, due to the extent of the contamination, hosing was inadequate protection in cases where skin had become exposed to the alkaline liquid at length.

According to the ÁNTSZ publication brought out on the second day of the disaster, the sludge awaiting containment was pH 12-13, and an attached chart cited the sludge pH at 11.8, which is lower than the actually tested pH 13.[45]

Media repeatedly stated that the Ajka red sludge is not significantly alkaline. Following the disaster, Clean Air Action Group's call for international aid was met with puzzled responses whereby the pH 13 was considered an error, in light of far lower results. For example, the Aluminium Association of the USA opined that after 5-7 "washes", the sludge couldn't possibly be so alkaline. In an interview on Hungarian news portal Index, chemical engineer and aluminium oxide technician György Bánvölgyi stated[46] that pH 12.8 is a maximum contaminant level for red sludge in developed countries. For example, red sludge in the VAW Stade-plant is pH 12.1.[47] However, after the disaster, most published test results reported a maximal pH level of 13. This pH value was, however, measured in diluted concomitant liquid following the heavy rainfall. With a 700.000-900.000 m^3 spill, dilution takes considerable time to set in. **It therefore appears that the Ajka red sludge and the concomitant reddish liquid was more alkaline than average.**

4.7.3. Air pollution

Authorities were slow to clarify the possible presence of toxic, carcinogenic substances in red sludge related air pollution. In case it contains alkali, dust may burn and irritate mucous membranes, respiratory tracts, and eyes.

Environmental organizations deemed it misleading to compare the local air quality data with general airborne particulate contamination levels, while permissible limits for carcinogenic substances found in red sludge are one thousand to ten thousand times lower than those for airborne particulates. Local PM10 air pollution exceeded health limits repeatedly, but the pollution arrived partly from abroad, and affected the entire country. Several weeks after the disaster, disaster management authorities published its detailed test results for dust pollution. According to detailed analysis, these rigorous limit values were not exceeded by PM10 concentrations containing red sludge particles. However, no information was published regarding alkalinity of the dust pollution. Despite the lack of appropriate notification and conflicting information, authorities recommended dust masks to be worn to avoid alkaline risk.

---

[44] Several experts made similar statements on the second day of the disaster: **Olga Kálmán and György Bánvölgyi converse, Egyenes beszéd, 2010.10.05**. http://www.youtube.com/watch?v=XUPkndMtSSA

[45] The pH scale is logarythmic, thereby a pH 9 is tenfold the alkalinity of a pH 8

[46] http://index.hu/belfold/2010/10/13/vorosiszap-ph/

[47] www.aos-stade.de

4.7.4. Confusing the population

Uncertainty and fear on part of residents was consequential from an extended absence of reassuring or relevant information regarding the extent and effects of the contamination. Statements and information regarding the contamination and its effects were often contradictory to one another:

- On October 4-5th, Ministry of Interior's National Directorate General for Disaster Management website declared the *"sludge contains heavy metals, including lead, and is mildly radioactive, inhaling the dust may cause lung cancer"*. This notification was pulled from the website on October 5th, but had been quoted in domestic and international media.

- On October 5th, ÁNTSZ stated there is a low concentration of toxic contaminants in the sludge. A chart was provided demonstrating that toxic metal concentrations were lower than maximum soil contaminant levels.

- On October 7th, the MTA declared the sludge contains no toxic metals, or heavy metals soluble from the sludge to excess of minimal risk levels. The academy later pulled the statement from their website.

- On October 8th, Greenpeace published results from tests conducted October 6th, showing arsenic concentrations two magnitudes in excess of those published by ÁNTSZ. Test samples from a Kolontár ditch contained arsenic and other toxic metals significantly exceeding soil, groundwater and drinking water limits.

- In the days after October 8th, MTA challenged Greenpeace test results, but this was clearly based on results from 2003, and MTA had in fact neglected to test arsenic and mercury concentrations. Meanwhile, samples had been taken on October 5th by MTA AKI and October 6th by MÁFI.

- On October 13th, MTA published its results from tests after the disaster.[48] The data largely matched earlier results published by Greenpeace, and in some cases found even higher concentrations. However, MTA compared its results with maximum sewage sludge contaminant levels, which limits were not exceeded, or only slightly.

Residents continue to face confusion due primarily to misleading and inaccurate information provided by the authorities.

[48] http://mta.hu/mta_hirei/tajekoztato-a-kolontari-vorosiszap-tarozo-kornyezeteben-vegzett-vizsgalatokrol-125761/

4.7.5. Water pollution during the emergency

Environmental organizations were informed by the media[49] of alkaline, heavy metal contaminated water being drained from the ruptured Basin X and the neighbouring reservoirs, into the Torna stream, following acidification. **Environmental organizations and representatives of green party Lehet Más a Politika (LMP) observed on site that 3 pipes were feeding red liquid into the plant's water drain, the water was subsequently acidified before reaching the Torna stream. Environmentalists had documented this in November-December 2010 and late January, 2011.** During this time, EU experts called on Hungarian authorities to prevent the water leaking out of the reservoirs from contacting living water by any means.

In November 2010, Clean Air Action Group turned to the Central Transdanubian Inspectorate for Environmental issues, Nature Conservation and Water Management, referring to Act 2004 XXIX. 141-143.§ to request the investigation of the contamination reported in the cited news article, as per regulation 27/2005. (XII. 6.) KvVM, and prevent further ecological damage. In their reply on January 2011, the Inspectorate stated they are monitoring all emissions and there is no cause to fear further contamination. They also stated that *"the incident caused by the rupture of Basin X entailed a fine for activities ruled out by the environmental permit, and an additional waste mismanagement trial is currently underway".*

Authorities reported that due to the rupture of Basin X, the leachates previously deposited therein, as well as alkaline water preventively drained from reservoir IX, will be fed into the flow beside the reservoir, and following acidification into the Torna stream. According to Greenpeace results published February 8th, 2011, samples of the drainage fed into the plant's drain contained 1.300 µg/l arsenic, and 3.950 µg/l molybdenum,[50] both significantly exceeding the maximum sewage sludge contaminant level.[51] In reaction to Greenpeace results, Disaster Management replied on February 9th that nothing is being drained from Basin X/a, the alkaline water is being recovered. The drain pipes in question drained water from reservoir IX, as well as the leachates of other reservoirs that were formerly drained into Basin X. Disaster Management also declared that water fed into the Torna stream complied to regulations, but opted to lower pollution even further in the future. Several residents however informed NGO's and representatives of LMP, alleging that pollutants from Basin X/a had been fed into the Torna stream.

[51] regulation 28/2004. (XII. 25.) KvVM on maximum contaminant levels for water pollutants and applicable rules; ch. 32.Metal production http://net.jogtar.hu/jr/gen/hjegy_doc.cgi?docid=A0400028.KVV

Summary

In light of known pollution data, it is understood that the loss of life and injuries were caused not only by the flooding but by the alkalinity of the liquid flowing with the red sludge. Besides high alkalinity, certain heavy metals may mildly contaminate soil, groundwater and water. There is no information to determine whether the plaster and acid used to treat the spillage has led to further ecological damage.

Red sludge contained contaminations of chrome, mercury, lead and nickel that several times exceeded maximum levels for soil and drinking water, and occasionally exceeded now defunct intervention levels. Arsenic concentrations for dry red sludge tested by MTA and Greenpeace showed contamination in excess of soil and sewage sludge levels. According to tests by Greenpeace, arsenic concentration in samples of Kolontár ditch water measured 0.25 mg/l, which is 25 times the amount permissible in drinking water or groundwater, and 2.5 times the plant's maximum sewage sludge contamination level. High arsenic concentration mostly affected drilled wells. According to existing test results, the contamination has not spread further, and the drinking water catchment is unaffected. High arsenic concentration may cause further problems in the long term.

Besides arsenic, red sludge also contained a significantly high concentration of mercury. This is due to gallium production processes, a known fact and documented in the plant's environmental permit. Regardless, the mercury content of red sludge was not mentioned in the ÁNTSZ publication "What should we know about red sludge".

During the first days of the disaster, authorities cited test results several decades old to back up claims that red sludge poses no serious health or environmental hazard. During the first week of rescue operations, residents received no factual notification of possible radioactive contamination, or the health risks of airborne dust contamination. Affected residents were not informed of long term environmental impact or farming related consequences until February, 2011. Authorities communicated conflicting and often unfounded allegations throughout the entire remediation process.

The very first MTA results clarified what for years had been unclear for environmental authorities: that "analysis of samples taken at various locations indicate the substance spilled from the reservoir has a pH level that varies between 11-14. Therefore the red sludge classifies as an environmentally hazardous substance."

That results diverge from earlier years' can be partly due to the fact that the aluminium oxide plant had in recent years switched from domestic bauxite to Bosnian and Montenegrin bauxite sources.[52] The imported bauxite may differ slightly from domestic bauxite. However, this does not explain high arsenic concentrations, given that bauxite is not characterized by high arsenic content. Another possible explanation for divergent results is the fact that red sludge was spilled over a considerable area, and therefore is sure to be of heterogeneous constitution.

[52] http://index.hu/ gazdasag/magyar/2010/10/07/kik_allnak_az_iszapkatasztrofa_mogott/

Recommendations

- In order to investigate long term environmental and health impact, and to lower risk —as advised by WHO and EU expert groups—extensive, continuous and prolonged monitoring is necessary.

- Further testing must clarify the reason for the red sludge's unusually high arsenic content.

- The population must be provided scientifically verified information about the contaminated soil's future use for food and crop production.

- Legislation must be passed declaring maximum contamination levels for soil, groundwater, and surface waters, in accordance with various soil and water utilization forms. Presently there are only standards that are guidelines of a non-binding nature, and the ambivalence of relevant comparison levels leads to uncertainty in government communication as well as rescue operations.

"Thanks for the pollution"

5. Legislation

5.1. Overview of legislation in Europe and Hungary

5.1.1. The adoption and implementation of legislation in the light of the environmental licenses of MAL Ltd.

The legal foundation for MAL Co. Ltd. to engage in the activities it took over and was licensed to carry out according to the privatization contract – such as the production of alumina and gallium, as well as red mud waste disposal – was the environmental operating license no. 30.010-120/98. and its continued modifications. According to the terms of the license, the company was authorised to performing the operations referred to above until 31 December 2005. The present legal analysis concerns the treatment and disposal of red mud as a manufacturing waste product, thus the other manufacturing activities are not analyzed.

The relevant legislation in force at the time when the license was issued concerned, firstly, the classification of the waste, secondly, on the basis of that classification, the regulation of the landfill as a built structure, and thirdly, performing the activity concerned.

a) The classification of red mud as waste

The issue of when and how the classification of red mud as a waste (product) was regulated is important with respect to the activity under examination. According to Government Decree no. 102/1996 on hazardous waste substances and their treatment, in force until 31/12/2001, all waste shall be classified hazardous that is characterised by qualities defined as hazardous by the decree, such as caustic, corrosive, mutagenic, irritant and oxidising. For the sake of accuracy, Annex 2 of the decree contains a list of hazardous wastes, specifying that red mud is a grade 2 hazardous waste, under the code number V31608.

It is an important rule that the Authority issues the license for waste management based on the documentation and declaration submitted by the applicant focusing on the issue, that is, on the waste classification carried out by the applicant.

Starting with 01. 01. 2002, equally applied to ongoing proceedings, hazardous waste-related activities are regulated by Government decree 98/2001. According to the Decree, in a similar vein as under the regulation referred to above, materials shall be considered hazardous waste if they are either designated as such by a separate piece of legislation, or, in case they are not included in the list, if they have some particular hazardous characteristic. **Authorising hazardous waste-related activities including depositing hazardous waste require meeting more stringent criteria and the participation of more dedicated bodies with obligations of regular inspections than activities regarding non-hazardous waste. Furthermore, hazardous waste may only be deposited in hazardous waste disposal sites. The licensed activities must be reviewed every 3 years, including deliberations regarding modifications where appropriate, e.g. based on the requirement of using the best available technology in the field of waste management.**

The specifications of the Government decree are partially compatible with Directive 91/689/EEC. This Directive was replaced by Directive 2008/98/EC on Waste, in effect from 12. 12. 2010., which tightened or clarified the specifications of the earlier Directive on a number of accounts. According to the Directive, Member States may declare waste classified as hazardous in the EU list of hazardous waste as non hazardous, pr the other way round, provided the proper procedure is followed. However, the Directive states the general prohibition that:

(Article 7.4) The reclassification of hazardous waste as non-hazardous waste may not be achieved by diluting or mixing the waste with the aim of lowering the initial concentrations of hazardous substances to a level below the thresholds for defining waste as hazardous.

Article 34 of the Directive expressly obliges Member States to ensure that hazardous waste-related activities are subject to regular inspections:

(Article 34.1) Establishments or undertakings which carry out waste treatment operations, establishments or undertakings which collect or transport waste on a professional basis, brokers and dealers, and establishments or undertakings which produce hazardous waste shall be subject to appropriate periodic inspections by the competent authorities.

Member States are obliged to comply with EU Directive until 12. 12. 2010. This did not happen in Hungarian law.

MAL Co. Ltd. was granted permission to deposit red mud in reservoir 10 in 2004, through a modification applied to the operating license described above. By this time, however, it was Directive 16/2001. of the Ministry of the Environment, based on Government decree 98/2001, that was in force. This Directive contains the list of wastes that has been in force ever since. Unlike the earlier definition cited above, the new list, has a dedicated indication for red mud (among others), with an asterisk indicating hazardous waste:

01 03 07* other waste containing hazardous substances extracted through physical or chemical processing of metalliferous minerals

01 03 09 red mud from alumina production, different from 01 03 07

The directive containing the waste list complies with the Commission Decisions 2000/532/EC, 2001/118/EC and 2001/119/EC.

According to the definition of the waste list quoted above, however, the red mud resulting form alumina production, can in fact be hazardous as, depending on the technology used to extract the mineral raw materials and on the treatment the residue was subjected to, the waste to be treated may contain hazardous substances in concentrations which amount to having hazardous characteristics according to both Decision 2000/532/EC and Directive 16/2001 of the Ministry of the Environment.

However, the classification of the waste is not only a compulsory requirement at a given static moment, i.e. at the time of licensing, but it an act to be repeated periodically, since the waste disposed and its properties change depending on its chemical constituents and the method of treatment. It is not assumed that this autonomy is abused by applicants; nevertheless, it would be justified to require the Authority to carry out regular, independent testing on the question of whether the waste designated in the license is actually the same as the waste treated, and further to determine whether the current state and properties of the waste designated in the license meet the hazardous characteristics as a result of depositing and the passage of time. Furthermore, there is need for creating the appropriate legal environment in compliance with the regulations set forth in Directive 2008/98/EC, along with the implementation of the Directive into national law.

b) Environmental regulations governing waste disposal

- The construction of reservoir basin 10 for red mud disposal was finished in 2001, and the company was granted permission for disposing waste in 2004. The regulation to be applied was regulation 22/2001. (X. 10.) KöM on the rules and particular conditions on waste disposal and the closing down and post monitoring of waste disposal sites, in force from 2001. 10. 18. until 2006. 04. 12. Concerning the existing disposal areas, the ministry regulation called for mandatory supervision base on which a decision can be made whether the dump site conforms to the new regulations or can be modified conforming to regulations, and if not, than a decision has to be made to close it down. According to the regulation, all of the existing waste disposal facilities need to initiate inspection until 1 January 2003 at the inspectorate, and have to comply with the new regulations until 1 September 2009. Interestingly and unfortunately, this regulation does not cover the case at hand.

The objective of the regulation is compliance with DIRECTIVE 1999/31/EC and the implementation of EU legislation in Hungarian law. The directive formulates the list of waste disposal facilities excluded from its scope, e.g. for the reason that they fall under the scope of other regulations or because the disposed waste is not or hazardous or only to a limited extent. Such exceptions relevant for our case include the following as per Article 3:

ARTICLE 3, Section 2. Without prejudice to existing Community legislation, the following shall be excluded from the scope of this Directive:

- the deposit of unpolluted soil or of non-hazardous inert waste resulting from prospecting and extraction, treatment, and storage of mineral resources as well as from the operation of quarries.

Based on the provision quoted from the directive, red sludge is not excluded from the Scope of the directive, thus falls into its scope, —it is neither unpolluted soil or inert waste.

However, the regulation 22/2001. KöM. does not govern facilities under its scope in line with the definition of the directive. According to the regulation:

Article 1, Section (2): A, the following shall be excluded from the scope of this regulation:

d) the deposit of unpolluted materials or of non-hazardous inert waste resulting from prospecting and extraction, treatment, and storage of mineral resources as well as from the production technology related to mining operations.

Since in the given case, red mud was classified by the authority as non hazardous waste, and as waste resulting from the extraction of mineral raw materials, it does not fall under the scope of the regulation.

Regulation 22/2001. KöM does not comply with the provisions of the European directive regarding waste—more accurately, mining waste—not falling under its scope, and thus the regulations mistakenly failed to govern red mud landfills for disposal of red mud classified as non hazardous.

The same exclusion is contained within regulation 20/2006. KvVM. that has entered into force since then. A legitimate explanation is that these kinds of waste should be managed and regulated separately based on the EU directive on the treatment and disposal of mining waste adopted later on. This separate regulatory area was taken over by Hungarian law in 2008 according to the regulation to be analysed later on.

c) Regulation on landfills as built structures:

Directive 1999/31/EK and its appendices contain detailed provisions on the placements, technical criteria, environmental security and regular inspection of similar facilities. Due to a faulty implementation of the directive, the disposal of mining waste classified as non hazardous in international law and on the design of the built structure was not covered by special rules, only by the general construction rules.

The landfill as a built structure fell under the scope of regulation 12/1986. ÉVM in procedures that started before 1 January 1998, whereas they fell under the scope of regulation 46/1997. KTM in procedures that started after. The construction of basin 10 was granted permission in 1993, and its construction was finished in 2001. In the context of the legislation in force at the time of both the permission granting and the takeover, the two regulations above each use the rule of general scope. Thus every activity of construction and every built structure fall under the scope of the regulations except for the ones specifically specified within it. **The exceptions do not include waste disposal sites and facilities, and thus, they fall under the scope of construction permits according to the general rules, and the responsible authority is the general construction authority. Because the construction permit had to be assessed with the participation of the environmental inspectorate until November 2005. Following this state, the participation of the inspectorate is not required in the case of activities linked to environmental or integrated environmental permit as these permits specify the conditions falling under their scope, making duplication unjustified.**

Besides the procedure of permission, the construction authority keeps its important role concerning inspection obligation. At the time when the structure is first put to use, the authority inspects whether the structure was built according to the terms of the permit and whether it otherwise conform to the function intended. After this, the authority checks for stability and the obligation for proper maintenance. This post inspection obligation is defined by 47.§ (2) of the Act LXXVIII. of 1997 on the Built Environment. Under the legislation referred to, the authority must act and although for the restructuring and refurbishing the built structure if in its present state it poses any risk.

d) The fulfilment of the obligation for proper maintenance and, as well as the revision, restructuring, refurbishing, restoration or deconstruction of the built structure if its condition poses any risk to life or health, public security or that of material assets.

In the case at hand, the construction authority under obligation to monitor the condition of basin X would have had an important role to play. Construction authorities mistakenly took the position that did not have competence. This circumstance is clearly an anomaly of public administration, that will be eliminated by a modification of construction law since passed. Nevertheless, the obligation for post inspection will only be effective if it is carried out regularly by the authority. In any case, it is justified to make the act more precise, and to make it mandatory to regularly check buildings causing potential risk.

5.1.2. The problem of the hazardous character of red mud waste

Investigating the permissions, it can be declared that MAL CO. Ltd. had permission for the following substances under EWC classification.

01 03 09 red mud (700.000 tons / year)

06 05 03 sewage sludge (sludge generated during the neutralization of caustic soda content)

10 01 01 slags from power plants

10 01 02 coal fly ash

06 01 01* Sulphuric acid and sulphurous acid

06 01 06* hydrochloric acid

11 01 06* acids not specified otherwise

06 02 04* sodium and potassium hydroxide

11 01 07* bases used for pickling

11 01 09* sludges and filter cakes containing hazardous substances

11 01 10 sludges and filter cakes different from the 11 01 09*

On 30 March 2010, the inspectorate modified point 9.01 of the Permit under case no. 7613/2010-es, registry no. 29357/2010. Thus metallic oxides (EWC code 06 03 16) different from 06 03 15* came to be included in the scope.

This statement is important on two scores. Firstly, because **pH value of red mud exceeded 11.5 at the time of the accident, clearly making it hazardous under the EU directive.** Otherwise the hazardous and non hazardous substance enumerated, altogether that the company constantly receive permission for (with modifications) could have played a part in the severity of the accident. Thus it should be investigated how much this practice, considering the technology, influenced the material and/or the red mud deposited in the reservoir.

In addition, it has to be investigated if the reservoir basin only contained the material as per the permission. The documentation and the permission keep referring to the red mud as non hazardous substance. **Though Hungarian regulations treated red mud as hazardous material before 1 January 2002, later it could be classified non hazardous depending on the technology used. Here, the omission of the legislation can be identified.** Material that is classified as hazardous by the Act XLIII. on Waste Management of 2000 ("all waste shall be classified hazardous that is characterised by one ore more qualities defined in Annex 2, or contains such substances or components, posing a risk to health or the environment due to its origin, composition or concentration.") The appendix referred to classifies irritating and caustic materials (categories H4 and H8 respectively) based on this definition. Alkaline substances above pH value 9 also belong here.

Classifying red mud as non hazardous was initiated by the licensee in 2003. At this point, the inspectorate could have used the opportunity to classify the substance in the deposit as hazardous. However, due to the fact that the classification procedure was prolonged, a change in the law took place. As a consequence of the modification in force from 4 December 2003, the obligation on classification of the waste was transferred on its owner ("ART. 4, section 1: the obligation on classification of the waste in terms of its hazardousness is borne by its producer, and if the latter could not be located, by the proprietor of the waste with notice being taken of the provisions of separate legislation.")

However, the permit prescribes the waste proprietor to keep up to date registry documentation on the waste and send a summary of it yearly to the authority (quarterly in the case of hazardous waste). It also specifies that the authority should be notified of any serious change concerning the waste. The fact of becoming hazardous is clearly a significant change. The omission on the part of the licensee is obvious – due to failing to fulfil the obligation to maintain constant registry documentation and/or the obligation to report changes.

5.2. The licenses of MAL Co. Ltd. in the context of the Mining Directive, IPPC and BAT regulations and Seveso II

The activities of the company fall under the scope of government regulation 193/2001 on the use of the environment, which came into force on 30. 10. 2001. According to the interim provisions of the decree, facilities existing when it comes into force have to be obliged to be subjected to total revision by the authority with a deadline of 1 January 2004. Based on this obligation, the existing facilities must obtain an integrated environmental permit to carry out

these activities. The termination of the original license and the obligation of inspection made the company request an integrated environmental permit which it in fact received.

The concluding provisions of the decree say it "includes regulation compatible with Regulation 96/61/EC (IPPC)". The Regulation referred to specifies a separate reference to landfills indicated in points 5.1 and 5.4 in terms of the rules of their technological compliance:

Without prejudice to the provisions of this directive, the technological requirements concerning landfills falling under the scope of points 5.1 and 5.4 of Appendix I. shall be defined by the council; acting on the basis of the recommendation of the council, according to the procedure defined in the Contract.

The quoted Council regulation is Regulation 2003/33/EC, containing detailed regulation on the technical and compliance parameters of all kinds of landfills, as well as the obligation to provide regular and independent tests on the waste accepted, and the procedure of classification. The government decree on the integrated environmental permit does not contain this reference. On the other hand, the Council Regulation itself was adopted in Hungarian law, in the form of regulation 20/2006 KvVM cited above, which, however, due to the characteristic rules on entering into force does not cover the red mud disposal facility under investigation. For a specific situation developed to the effect that the landfill granted permission based on a Government Decree and provided operating permit on the basis of interim rules was not covered by an important regulatory item, the Council regulation. Yearly independent testing of the wast continuously deposited in the landfill could have shown that the west concerned has hazardous features owing to its treatment, its disposal or external conditions, and consequently its classification is not valid.

The practice of the inspection by the inspectorate raises further questions as well. That is, the indicative data provided in the permit regarding the pH value of the solidified waste material indicate that specimen 530/01 had pH value of 11,8, whereas that of 531/01 was 11,3. Though the data were merely indicative, the Inspectorate nevertheless clearly learned that based on its pH value, the red mud should have been classified hazardous already at the time of granting the permit. Based on the data, the significant difference or conflict between the tested data and the contents of the documentation should have been clarified by the inspectorate before granting the permit itself.

In the course of carrying out IPPC inspections, the authority has the right to check in terms of any of the data or aspects featured in the permit. True, this is not an obligation. only an opportunity. But it is beyond a doubt that the authority would have had to clarify the contradiction it learned from the indicative data.

Furthermore, the role of the concerned district mining directorate also needs to be investigated regarding the concerns raised by the treatment of the red mud waste. For the scope of ministry regulation 14/2008. (IV.3.) GKM on the treatment of mining waste, as per Par. 1. (1) is as follows: "the scope of the regulation covers the treatment of the prospecting, extraction, processing and storage of mineral raw materials (hereinafter: mining waste)". It is exactly the processing of a mineral raw material (bauxite) that is processed by an alkaline treatment by MAL Co. Ltd. (at its Ajka site), red mud being the waste product of this process.

Protection against risks related to the reservoir

Owing to the damage of reservoir basin X was to be explained by, beyond the fault of the facility, the deficiencies of the preventative system of protection.

Act LXXIV. of 1999. on the direction and organisation of the protection against disasters and against accidents related to hazardous substances, entering into force on 01.01. 2001., specifies the rules for the protection against serious accidents together with rules for the protection against serious disasters and emergencies owing to other reasons. ON the one hand, the act declares, that protection and damage control are tasks of the sates, and defines which authorities shall take part in it. On the other hand, according to the rules of special obligations, it provides for protective and preventive measures described in section 4 for so-called dangerous plants and facilities.

Their scope is defined depending on the hazardous materials over threshold values used in them. Section four of the act describes separate obligations of protection, but these do not need to be fulfilled for the period of the law entering into force until 12 January 2006 in the case of landfills, among others (ART. 4.(3)e.) This exception is explained by the fact that damage control measures for the exceptions specified are regulated by further, separate regulation, with the two ministerial regulations cited above prescribing the drafting of a damage control plan for the landfills.

The Act serves compliance with Directive 96/82/EK (SEVESO II). The rules of the Directive were equally did not cover landfills among others until 31. 12. 2003. This EU legislation has been modified under the impact of the events of 2000, a year especially full of industrial disasters. Directive 96/82/EC was modified by directive 2003/105/EC on several counts. The modifications resulted in précising the landfills excluded from its scope, and extended the directive on certain tailing ponds and dams:

g) waste land-fill sites, with the exception of operational tailings disposal facilities, including tailing ponds or dams, containing dangerous substances as defined in Annex I, in particular when used in connection with the chemical and thermal processing of minerals.

The modification of the exception was adopted by Hungarian law with entry into force by 12. January 2006.

(3) The scope of section 4 of the Act excludes:
e) waste land-fill sites, with the exception of facilities for the processing of tailings and slurry resulting from the extraction of mineral raw materials (including tailing ponds or dams), with the presence of high quantities of hazardous materials reaching determined thresholds, in particular when used in connection with the chemical and thermal processing of waste materials.

The extension of the Directive and the Act onto other facilities such as landfills described by the above-mentioned criteria affects the obligations falling on other facilities as well. The Directive systematically adheres to the principle that existing facilities coming to fall under its scope after the modification shall have to comply with its provisions over a short period.

Hungarian law deals with the modification of Directive 2003/105/EC not among the provisions of the Act but within a separate regulation. Due to the extended scope of the Act, Government decree 18/2006 contains detailed rules compatible with the directive for existing facilities that will come under the scope of disaster protection regulations owing to the extension of the scope.

Special rules governing mining wastes

The deficiency, referred to above, of ministerial regulation on landfills, i.e. the rules governing non hazardous mining waste is rectified by regulation 14/2008 GKM, in force since 11. 04. 2008. The scope of the regulation covers all hazardous and non hazardous waste the are directly related to the extraction or processing of the raw material, and does not fall under the scope of any other waste management regulation. The provisions of the regulation are rather strict. Only waste products with limit of hazard levels might be excluded from its jurisdiction, e.g. inert non polluted soil, and these only under special circumstances.

Defining the hazard level of waste is very important. It is used in the widest sense and does not link it to being part of or registered in a list or inventory.

"Hazardous waste: waste characterised by one or more attributes specified in Appendix 2 of the Act on Waste Management, or containing such substances or components, that poses a risk to health or the environment due to its origin, composition, concentration."

According to the rules defined by the regulation. the permission granting authority is the mining directorate. The process combines the requirement of the best available technology (IPPC) taken from the integrated environmental use procedure, the requirements of the protection against serious industrial accidents (Seveso II), the rules of liability for environmental damage and financial security deposit, the participation of the public (Aarhus). Altogether, it is an integrated piece of legislation with a sophisticated perspective.

It is an important regulatory item that the waste management facility also belongs under the authority of the mining directorate in terms of being a special kind of built structure. The deficiency referred to above that is that pos inspection on the part of the permission granting authorities is not a characteristic of Hungarian law is rectified by this regulation. It expects the operator to carry out regular monitoring activities at least yearly, in terms of the condition of both the built structure and the waste. The results of the monitoring activity are revaluated by the authority which may decide to initiate supervision by independent experts. Over and beyond yearly inspection, the operator is obliged to supervise all such facilities every five years. Furthermore, it is a noteworthy provision of the regulation is not of a static, but rather a flexible reactive character: thus the authority can modify the permit of the functioning facility not only upon request, but in its own competence of arbitration, if that is justified by the results of the monitoring report, or if the best available technology, as registered by the EU, has changed.

Directive 2006/21/EC on the management of waste from extractive industries equally provides for existing facilities:

"(36) The operation of waste facilities existing at the moment of transposition of this Directive should be regulated in order to take the necessary measures, within a specified period of time, for their adaptation to the requirements of this Directive."

Hungarian regulation features this requirement against the provisions on entry into force, and prescribes for operators to comply with technological and other requirements concerning operating landfills as formulated within the Directive by 01.05. 2010. Unfortunately, though it is described in eloquent terms, the financial security deposit still is an exception to the deadline, for the deposit only needs to be presented by may 2014.

The disaster investigated has in fact illustrated the point that even if domestic law complies with the directive on mining waste management, the rules of financial security deposit should be presented by operators over a much shorter period. It would be by all means justified to expect operators to present the appropriate financial security deposit by the general 2010 deadline.

The directive on the management of waste from extractive industries was duly and properly adopted by Hungarian law and it has entered into force. Nevertheless, the question still remains why did its practical implementation fail in the case presently investigated as well.

The rules of liability for environmental damage caused by the operation of and injuries occurring to the reservoir basin X.

Act LIII of 1995 on the protection of the environment, as the general legislation relevant to the present activity has included the obligation since it entered into force on 19. 12. 1995 that the rules for providing a security deposit and dedicated reserve as well as liability insurance shall be regulated by a government decree within the process of environmental licensing.

Similarly, **the act declares as a general rule of liability that the licensee has a special liability to damage caused through the use of the environment that can be limited or warded off only under strict circumstances. The modification of the law in 2007 declared special liability rules for the owners and private managers of the entities causing harm. The general rules however are not sufficient to provide for the satisfactory and available financial coverage and for this reason failing to create the government decree referred to has been a very serious omission on the part of legislators.** In terms of certain sectors, and focusing on areas raised in relation to the present issue, managing certain kinds of waste, granting permission for landfills and mining activities are all covered by regulations which include the obligation of providing security deposits.

- The Act on Mining declares providing a security deposit optional until 1 January 2008, and mandatory after that date.

• Regulation on landfills requires proof to be provided of the existence of security deposit since 13 December 2007.

Nevertheless, there is no appropriate detailed regulation on the dimensions of the deposit, and a formal exigency of having the deposit provides no guarantee for the costs of eliminating environmental damage wrought.

The relevant basic EU legislation is Directive 2004/35/EC on environmental liability and the prevention and elimination of environmental damage. The fundamental idea of the directive is to make the polluter pays principle mandatory in the field of environmental damages.

The directive was adopted by Hungarian law, on the one hand by a modification of the act on the environment, and on the other hand, by issuing a specific government decree. Applying the polluter pays principle had already been mandatory before adopting the Directive, due to the general and special rules mentioned above, though with the deficiency concerning financial deposits. Equally, the general obligation of preventing environmental damage dates back to the time the law was adopted. The more precise rules, adopted with the implementation of the directive, have been in force since 30 April 2007, under articles 102/A-B. These provisions on the user of the environment concern measures to be taken in order to prevent harm, to reduce the threat of damage and the obligation to report damage immediately, and on the other hand the monitoring and steps to be taken by the authorities. The provisions reflecting the directive are contained in articles 102/A-B of the Act and Government Decree 90/2007. It is an important fact that based on the text of the Act, the authority may request information on environmental use and damage at all times, but the business entity is under obligation to notify the inspectorate immediately of the threat of the damage or the damage occurred, even when it has not in fact been asked to do so, on the basis of the Government Decree.

The provisions of the Directive on mandatory financial security deposits were formally taken over by Hungarian legislation, when it called for providing proof of the deposit in regulations governing activities in the scope of environmental use defined in the Directive (waste management, activities based on the of hazardous materials and goods and mining activities linked to an integrated environmental permit).

Hungarian legislation, the Act and the Government Decree referred to above comply with the Directive regarding the prevention and exposure of the threat of damage and damage control. However, actual financial liability for the damage which is one of the cornerstones of the directive has not been properly implemented in the required scope. It is an obvious deficiency of Hungarian legislation that it lacks the framework regulations that would make it a mandatory prerequisite for granting permission to and for operating all activities with a threat of environmental damage to have a cost assessment made with the participation of an independent expert, based on which the authority would be under obligation to demand proof of the appropriate financial guarantee from the parties engaged in activities of environmental use.

5.3. The Role of Authorities

The severity of the red mud catastrophe in Ajka owes to factors such as

- the dam break as a rapidly occurring phenomenon, as well as the enormous amount of matter spilled, both of which are extremely hazardous factors even by themselves,
- the caustic effect of the spilled matter, as well as its irritating nature, both of which proved to be hazardous to humans and the environment alike,
- the extraordinary amount of means (both material and financial) required for damage control,
- the feasibility of damage control, given the nature and extensiveness of damages (rectification of the environmental impact – disaster recovery).

Due to the above, we are investigating the role of authorities concerning the red mud catastrophe in Ajka not in general, but rather as being grouped around the main factors accounting for the severity of the catastrophe.

5.3.1. The dam break

The Mal Co. Ltd. Site at Ajka was granted its integrated environmental permit ("Integrated Environmental Permit" or "Permit") by order No. 12785/2006. of the Transdanubian Environmental Protection, Nature Conservation and Water Affairs Inspectorate (KDKTVF or "Inspectorate"), requests towards the relevant authorities were also supplied by the Inspectorate. Environmental aspects of the activities have been supervised by this body ever since.

The permission-granting order of the Inspectorate is largely based on the integrated environmental permission requesting documentation submitted by MAL Rt. Site at Ajka ("Documentation"). These documents (i.e. the Permit and the Documentation) enlist the factors that may risk the environment of the activity (noise sources, possibilities of air and groundwater pollution, etc.). Contaminations in the surrounding control wells (fluoride, cyanide, etc.) were thoroughly tested between 1990 and 2000 and vertical blocking walls were built around the reservoirs. "The environmental effects of red mud reservoirs primarily occur in the form of atmospheric emissions and alkaline contamination of the groundwater." (page 144, chapter 4.6.2. paragraph 2.). Of course, the effects of noise, air pollution, propagation of dust were also investigated, the latter tested also concerning the reservoirs.

Nevertheless, neither the Documentation or the Permit identifies dam break as a risk factor.

The properties of dams are specified in the Documentation, it refers to expert opinions in soil mechanics (4.4.2.), but the latter were used only for surveying hazards to groundwater.

All this is anomalous since rupture is an inherent risk factor of dams. Although **the Documentation refers to the reduction of hydraulic pressure as desirable (p. 104 in sec-**

tion 4.3.4.), nevertheless, the possible consequences of hydraulic pressure are not further elaborated. The role of wind in propagating dust is taken into account, whereas the wave generating effects of wind on the 2-acre water surface are not. Although in Point 16.05. of the Permit, the relevant authorities set forth the preparation of an annual status survey concerning the red mud reservoirs, which has to include data on their sinking, still the possible degradation of the reservoirs as constructions, etc. is not considered otherwise.

Neglecting the risk of dam break is rather surprising given that the operators had direct experiences of such events. According to the Documentation (6.1., p. 160), a dam break occurred during the construction of Reservoir 10 on November 3, 1991, resulting in 43,200 m^3 of alkaline (pH = 10-11) slag water escaping into the environment, thus polluting the rivers Marcal and Rába through the Torna stream to a traceable extent.

Government decree No. 193/2001. (X. 19.) was applied upon the granting of the Permit, and it sets forth the identification of sources of pollution, as well as of "solutions for the disposal of non-recoverable waste in a manner excluding environmental pollution or damage" (appendix 3, point k)). Anyways, an enormous reservoir, designated to retaining thousands of tons of mud, towering 21 to 25 meters above ground level (Documentation, table 4.3.4.b., page 101), is a danger to its environment, however thick a dam it is girdled with.

In case of concerns, the Inspectorate has to contact the authorities in accordance with appendix 4, chapters 1. and 2. of Government decree No. 193/2001. (X. 19.). A special expert building authority has to be consulted, still there is no expert opinion concerning the dam mentioned in the resolution. **The Notary of Ajka specifies only that disposal of hazardous waste on the abandoned landfills is forbidden.**

In summary, neither Mal Co. Ltd. requesting the Permit, nor the Inspectorate granting the Permit (or the relevant building authority) took into account the inherent risk of breaking of dams as a source of notable hazard to the environment, which is an elementary fault.

5.3.2. Caustic effect and irritating nature of the spilled material

Both the Documentation and the Permit refers continuously and systematically to red mud as non-hazardous matter. Although the Hungarian legislation prior to January 1, 2002 treated red mud exclusively as hazardous waste, later on qualifying it as non-hazardous waste became possible depending on the technology applied.

As we noted above, the legislative amendment effective of December 4, 2003 transfers the obligation of waste qualification on the owner of the waste ("4. § (1) Qualification of the waste – concerning the hazardous nature thereof – is bound to be performed by the producer of the waste, or, if the former is not identifiable, by the owner thereof, in accordance with separate legislation."), after that, the Inspectorate only "acknowledged" the qualification of the owner. However, since the qualification is based on laboratory analysis, it shall be assumed that at the time of requesting the Permit, the pH-rate of the red mud did not exceed the limit of qualification for hazardous waste.

However, point 9.03. of the Permit obliges the owner to continuously keep up-to-date records on the waste, and present its summary to the authorities annually (or, in the case of

hazardous waste, quarterly). In accordance with point 4.01., important changes have to be reported to the authorities within 15 days, and the waste's becoming hazardous is positively an important change. **Omissions by the Licensee are unequivocal, either for the omission of the obligation of continuous record-keeping and/or for the omission of the obligation of reporting important changes.**

In the course of investigating the anomalies in the management of red mud waste, repeated note must be made of the liability of the District Mining Inspectorate. Their argument, stating that their authority is effective if a permission has been requested (letter No. MAL-171/2010. by the Government Commissioner to Soledad Blanco, page 6), is simply incorrect. According to 5.§ (1) of Law No. XLVIII of 1993 on mining, which provides the legislative framework for the decree, the mining inspectorate allows the management of waste arising in the course of mining activities (point h), and is otherwise introduced authority with procedural obligations not only in the case of permitted activities, but also if they detect the carrying-out of unauthorised activities.

It cannot be assumed that the competent District Mining Inspectorate was not aware of the activities of Mal Co. Ltd. at Ajka, given the latter's history going back to approx. 60 years, as well as its national ecopolitical importance, not to mention the mining permissions granted for its activities by the District Mining Inspectorate.

5.3.3. The extraordinary amount of material and financial means required for damage control

Besides measures taken for the prevention of identified risks, the management of damages needs to be arranged as well. Damage control has financial conditions. These financial conditions are to be provided by the law sections recording the obligations and possibilities of assurance provision and insurance underwriting, namely by 101. § (5) of Law No. LIII of 1995 on environmental protection, and by 47. § (1) of Law No. XLIII of 2000 on waste management. These regulations are void since there exists no sufficient decree for their enforcement. Due to this, application of these law sections is voluntary, and therefore, predictable and secure financial conditions for damage control cannot be provided. The all-time governments are liable for the omission of decreeing (and thereby, for omitting the enforcement of Article 8 (2) of Directive No. 2004/35/EC in the international law).

5.3.4. Other significant anomalies in the operation of the environmental protection system (incentives for prevention and the means of damage control)

According to point 11. of the Permit, the Licensee is obliged to employ a commissioner for environmental protection and to make him available for contact to inspectors of the Inspectorate at any time. It is not known whether the company met this obligation or not. The self-assessment plan or the contents of worklogs (which, by the way, are to be cleared at the end of each calendar year and kept for 5 years) are not known either.

Point 12. of the Permit disposes of the obligation of the Licensee to report the following towards the Inspectorate:

- operational status other than designated (in case of malfunction)
- in case of non-permitted emissions resulting from the activity
- in any and all cases that may result in threatening or contamination of surface water or ground water, of air or soil, and requires/may require acute intervention.

At the same time, in all these cases, the assigned authorities to be informed are (point 13.):

- the Inspectorate,
- Veszprém county Directorate for Disaster Management (in case of fire and disaster),
- Veszprém county Institute of the National Public Health and Medical Officer Service (upon occurrence of accident and operational status that threatens human health)

No legal references are made, the Directorate for Disaster Management is not listed under point 18. as an expert authority.

That is, neither the District Mining Inspectorate or any other state organ is listed among the authorities.

Records—obligations of reporting

The Permit disposes of obligations of continuous reporting, the completion of which is due within 8 days of the end of the actual fiscal quarter in concern of hazardous matter, and on March 1 of the year following the actual fiscal year in concern of non-hazardous matter.

Within the framework of reporting, the Permit disposes of the Licensee's obligation of data supply towards the Inspectorate with a deadline and data content as per appendix 1. Reporting frequency for each report type is treated in the appendix in a resolution in accordance with effective regulations – this obligation has been met by the company.

Appendix 3 specifies emissions limit values in concern of cleaned industrial water released into the Torna stream. This value in concern of the pH rate is set between 6 and 9.5, which contradicts point 9.02. of the Permit, wherein the same value is between 8.0 and 8.5 pH. The textual amendment emphasizes the necessity of measuring the volume and pH rate of the cleaned industrial water prior to its release into the Torna stream.

However, it is expressly set forth in the Permit that the weaker limit value set in appendix 3 is to be applied in concern of waste water emissions, i.e. a pH rate of 9.5 is also considered acceptable. The justification for this remains unknown as well.

It is set forth that an overall report on the supervisions conducted and the observations made

during the operation of the landfill (red mud reservoir basins) is to be submitted by the Licensee to the Inspectorate annually (prior to April 30 of the year following the actual fiscal year).

This report is to include the following:

- Site description of the landfill along with data thereon
- Status description of the landfill
- Data on the sinking of the levels of the landfill
- Results of ground water analyses

Based on the available documents, such continuous reporting has been concluded only partially.

In case of emergency occurring at the Site, the measures set forth in the water quality damage control plan are to be taken. Therefore, the damage control plan shall be considered part of the Permit.

Point 18. refers to altogether two provisions made by expert authorities:

- Provision by Veszprém county Institute of the National Public Health and Medical Officer Service: "The activities must not generate hazardous impact on human health in employees and the surrounding residential area."
- Provisions by the Notary of the City of Ajka: "Landfills for hazardous waste must not be established on the area of abandoned slurry reservoirs. The abandoned slurry reservoirs must be continuously recultivated and strengthened."

The two provisions by the expert authorities are rather evasive. In addition, the one by the Notary is intriguing since all through the Permit, provisions were made in concern of non-hazardous "slurry" reservoirs, while at this point hazardous landfills are mentioned.

The justification in the Permit is as follows:

With reference to point 9.08, in concern of the collection of waste produced on-site the provisions are justified by 5§ of Government decree No. 213/2001 (XI.14.) on the conditions of conducting activities relating to municipal waste, as well as by 5§ (3) of Government decree No. 98/2001. (VI.15.) on the conditions of conducting activities relating to hazardous waste. Further reference is made to points (29 b), 14§ (1), (2), and 51 §(1) of Law No. XLIII of 2000 on waste management, as well as to Government decree No. 164/2003. (X.18.) on record-keeping and data supply obligations in relation to waste.

In the section justifying the commitment made by the Notary of Ajka as expert authority, reference is made to appendix 4 of Government decree No. 193/2001. (X.19.), through which to Municipal decree No. 11/2001. (VII.02.), i.e. reference is made to paragraphs 28§ (20) and (21) of the regulatory plan and local building regulations of the City of Ajka.

In the section concerned with ground water protection: "During the activities, self-contained technologies are utilized, during the operation of which raw materials, end- and by-products may not contaminate the soil directly. Contamination may occur only in case of malfunction 'emergency,' as well as during the transport, loading, or storage of accessory and raw materials. Red mud is transmitted to the storage basins through a closed piping system, therefore, besides the environmental impact of the basins, the red mud may cause soil contamination only in case of a failure in the transmission piping system."

Point 22. of the Permit, and the later references made to the monitoring results and to 6§ (1) b) and c) of the law on environmental protection in the justification section imply that the basin that met the accident is in order. Moreover, the passage stating that "besides Basin 10/a, a new reservoir is to be erected in the area on the northern side of Basins 9 and 10" can be interpreted as proving the security of the technology. References are made to investigations conducted in 2003 as vertical enclosures (curtains) were built to protect the Kolontár area against contamination.

"Due to the construction of the vertical enclosures the state of the red mud reservoirs' environment saw significant improvement." (Note that posterior evaluations partly associate the construction of the curtains with the soaking of the soil under the dam base, and thereby indirectly, with the dam break.)

In the light of the above it can be stated that even within the framework of the integrated environmental permit it is possible to miss the evaluation of important risk factors (possibility of dam break), and moreover, clarification of obvious contradictions (pH rate of 11.8 along with qualification as non-hazardous), and such shortcomings cannot be remedied by the monitoring options of the authorities.

Changing the monitoring options of the authorities to obligations would upset the system, in which the licensee—and not the authority—executes risk identification and is responsible in case of realization of the risks.

However, the system—also in its current form—is deficient. Obligation of self-assessment may be introduced to the licensee along with collateral cost bearing and liabilities, nevertheless it remains a void commitment until (financial) liability of the licensee is not warranted. If financial liability of the licensee remains voluntary for the lack of regulation, then neither damage prevention or even damage control is motivated by economic interests.

Legislative ruling of the financial conditions of the licensee's liability may be the sole resolution. Deposit of a security motivates for damage prevention (supplying real input data upon the licensing application, complying with the provisions set out in the permit to avoid immediate financial liability, and for the subsequent narrowing of liabilities), provides latitude in damage control for both the licensee and the state, which is at times forced to act on behalf of the former, the insurance covers the damages made to third parties and the environment.

5.4. Charges filed following the tragedy

5.4.1. Official and political charges

The Veszprém Police Department initiated investigation in concern of the accident the day after it took place, which was on October 4. Three days later the presumptive criminal action was requalified in the procedure as endangerment due to professional activities resulting in a lethal mass disaster (the first suspicion was reckless endangerment due to professional negligence resulting in manslaughter), and the case was taken over by the National Bureau of Investigation. According to police communications, currently investigation of the already confiscated documents, interrogation of witnesses, and involvement of experts are in progress. Associates of the National Bureau of Investigation are in close collaboration with the Veszprém Police Department and the joint authorities, as well as with the municipalities concerned and those participating in damage control operations. In the first days of the investigation, which chiefly consists of analyses of documents and auditions of witnesses, the police took the general manager of Mal Co. Ltd. into custody and initiated his pre-trial detention. The issue got political overtones as the detention was announced by the prime minister prior to actual police action. Zoltán Bakonyi, who was released uneventfully a few days later, was suspected of environmental damaging and public endangerment resulting in multiple fatalities in connection with the mud disaster. The general manager of Mal Co. Ltd. was accused of the signing of the company's disaster management plan, which according to the authorities was deficient as it did not provide an action plan for management of accidents like the one that occurred, moreover, of not having established appropriate ramparts and signalling alarm systems. According to the primary suspicion of the police, the mud disaster occurred exactly due to the fact that the management of Mal Co. Ltd., besides not having an elaborate action plan, has not made sure of the adequate state of the dam. At the same time, a paper signed and stamped by the competent executive of the regional Transdanubian environmental protection and water affairs expert authority proves that the expert authority found everything appropriate nine days before the disaster.

5.4.2. Charges by NGO's

As pointed out above, the Clean Air Working Group submitted a warning letter to the government already in 2003, asserting that the some 30 million tons of red mud accumulated in the course of decades poses unpredictable risk. According to the commitment made by the organization, the issue is twofold. On the one hand, the accumulated waste matter is an environmental risk factor. On the other hand, production of alumina and aluminium hydroxide—although in a lesser amount—is still continued to this day, and the production of each ton of alumina result in the production of 2 tons of hazardous waste. The reservoirs take away valuable land area from agriculture, plus the wind carries the dry red mud to distant residential areas in the form of dust clouds. Dilute alkali content of the mud is leaking into the soil, which endangers the vegetation as well as the area's drinking water supply. According to the Clean Air Working Group, upon privatization the new owners agreed in contract to manage the environmental damages that add up to 10 billion HUF, nevertheless, no information has been issued thereon so far in spite of that

such information qualified by the effective laws as being of public interest. The organization in 2003 advocated the initiation of a comprehensive international campaign for the elimination and development of the red mud reservoir areas, suggesting that Hungary ask for contributions by the EU and other developed countries to an environmentally non-destructive way of development of such matter, as well as to the neutralization thereof. The Clean Air Working Group solicited this suggestion to a number of government members and government officials several times, still no substantive response has been given.

Likewise, an expert at the Clean Air Working Group filed a complaint to the Prosecution Service in 2006 due to the red mud reservoir areas' endangering drinking water bases at several locations. The situation at the Mosonmagyaróvár reservoir of MOTIM is especially distressing as in this case, the red mud is disposed over the water base—which is a place where also the disposal of the city's communal waste is forbidden, exactly in order to protect the water base. However, no investigation was initiated by the Prosecution Service, since their audit confirmed that the measures taken by MOTIM complied with the effective regulations of the law. According to the Clean Air Working Group, it is not the Prosecution Service that is primarily responsible for the lack of taking action, but rather the competent environmental protection inspectorate, which—reportedly—misinformed the Prosecution Service under heavy political pressure.

Since inappropriate official monitoring may have contributed to the red mud disaster in Ajka, the Debrecen-based Society of Conservationists of Eastern Hungary filed a criminal complaint to the Chief Prosecution Service against an unknown perpetrator or unknown perpetrators in the subject of the suspicion of reckless endangerment due to professional activities resulting in a lethal mass disaster after the accident in Kolontár. The legal position of the non-governmental organization is that the competent environmental protection authority did not comply with the applicable provisions of the government decree on ground water protection, as well as of the recommendation on determining the minimum requirements for environmental monitoring executed in member states during the on-site investigation carried out on September 23, 2010 on the basis of the decree on the environmental impact monitoring and the integrated environmental licensing procedures. Laws for environmental protection set forth rigorous on-site monitoring of activities to be carried out by the environmental protection authorities exactly to allow for the avoidance of such ecological disasters.

5.5. Liability assessment

5.5.1. Liabilities of the authorities

The above legal analysis points out that all domestic authorities that were involved in the licensing and monitoring of the red mud reservoir that met with the accident committed errors.

- The Transdanubian Environmental Protection, Nature Conservation and Water Affairs Inspectorate acknowledged the qualification of the disposed matter as non-hazardous waste, thereby substantially easing the requirements concerning the disposal and the monitoring thereof.

- The same environmental protection inspectorate accepted as part of the Permit the unrealistic disaster management plan by Mal Co. Ltd., which allowed for the maximum spillage of 300.000 m^3 of matter in case of disaster, whereas in reality, the volume of escaped matter was approximately three times larger. The signing of this disaster management plan is listed among the charges against Zoltán Bakonyi, general manager of Mal Co. Ltd., yet the possibility of the liability of the authority in connection with that was not raised.

- The Inspectorate failed to involve the competent District Mining Inspectorate in the licensing procedure.

- Although the Notary of Ajka prohibited the disposal of hazardous waste at the landfill, nevertheless no action was taken against de facto disposal of hazardous waste in the area.

- Although from 2008 on, licensing of the disposal of waste from mining is within the scope of authority of the mining inspectorate, the competent District Mining Inspectorate did not check the technical appropriateness of the structure used for disposal, and did not enforce the application of the best available technology in concern of the disposal (i.e. switching to dry technologies).

- ENone of the authorities involved paid substantial consideration to the risk of dam break.

- Upon the conclusion of the contract of privatization, provisions of BAT and IPPC should have been considered. In Mosonmagyaróvár, the so-called dry storage has been applied since the mid-80s, which is far more secure. Mal Co. Ltd. has only been recently obliged to do so by the permit issued by the authority after the disaster.

5.5.2. Liabilities of MAL

Liability of the company operating the landfill is graspable in that in the course of applying for the integrated environmental permit, they qualified the disposed matter as non-hazardous despite the fact that qualification criteria for hazardous waste subsisted unequivocally based on the alkalinity. Besides that, the company is partially liable for the belated and partial observation of the provisions on environmental protection set forth in the contract of privatization. Non-occurrence of the switch (or, of the preparation thereof) to dry disposal technology – even as late as submitting application for the integrated environmental permit – is once again the company's partial liability.

5.5.3. The consequences of decisions made in the course of damage control (impact of gypsum and hydrochloric acid)

The aim of the damage reducing measures taken in the days following the dam break was the mitigation of the spatial extension and the severity of environmental damages. Decisions concerning such measures were made in an emergency situation, without lengthy pondering. Bearing all this mind, deployment of gypsum and hydrochloric acid was (also) justifiable in the given situation, at the same time however, damage alleviation could have been executed in a more watchful manner, with lesser environmental risk. The materials deployed are by-products of industrial activities, the exact composition or incidental contamination thereof is not known. Groups of experts from WHO and the EU advocated the monitoring of long-term environmental impact of these materials within the polluted natural waters.

5.6. Room for improvement in the regulatory environment

5.6.1. An assessment of the implementation and enforcement of EU regulations

Our analysis showed that in connection with the adoption of EU regulations on environmental protection, which are applicable to the case, the following have not occurred:

- establishment of the appropriate regulatory environment for the rules of Directive No. 2008/98/EC on landfills, adoption of the directive to the national provisions,

- compliance with Directive No. 1999/31/EC (in regard of the hazardousness of waste produced in the course of mineral raw material extraction, as well as of the technical configuration and environmental security of the reservoirs),

- appropriate adoption in concern of Resolution No. 2003/33/EC, which contains detailed specifications on the technical and aptitude parameters of all types of landfill facilities, as well as on the obligation of regular independent monitoring and the qualification procedure of the waste received (since this is not applied by Hungarian legislation to some of the facilities concerned, such as to Reservoir 10 in Ajka),

- establishment of harmony with Directive No. 2006/21/EC on the management of waste from mining (in regard of deposit of a security),
- complete adoption of Directive No. 2004/35/EC (on environmental liability, prevention and remedying of environmental damage): provisions of the directive concerning compulsorily required financial security have only been adopted pro forma by the Hungarian legislation, actual financial liability for damages is not appropriately and comprehensively regulated.

5.6.2. Required regulatory changes

The Hungarian law is completely lacking the legal framework that would require a cost estimation prepared with the involvement of an independent expert as licensing and operational feature of all activities threatening with environmental damages, on the basis of which the authority would be obliged to require a certificate of adequate financial warranty from the user of the environment. It is also necessary to define the exact financial conditions of the licensee's liability. On the one hand, deposit of a security motivates for damage prevention, on the other hand it assists both the licensee and the state, which is at times forced to act on behalf of the former, in damage control, and thirdly, the insurance covers the damages made to third parties and the environment.

The collective introduction of a joint insurance fund (that would be filled up by the payments made by the companies concerned) and a compulsory liability insurance is desirable for the above aims.

Preliminary supervision and regular official monitoring of the waste during operation is inevitably necessary (also as regulatory requirement) in the case of waste disposal activities to determine whether the waste product set out in the permit is identical to the waste that is actually handled, as well as to determine whether the current state and the properties of the waste product set out in the permit complies with the hazard characteristics given the effects of unloading and passage of time.

The establishment of the appropriate regulatory environment for the rules of Directive No. 2008/98/EC on landfills, and the adoption of the directive to the national provisions is just as well indispensable.

It seems expedient that in the future, the impact assessment documentation required for the licensing should be prepared by experts independent of the licensee and appointed by the authorities (in this concern, the LMP (Politics Can be Different) prepared a legislative recommendation in November 2010). Certain environmental uses require regular independent supervision in order to filter out hazardous situations resulting from these activities.

Summary

All Hungarian authorities with a role in licensing and monitoring the accident-stricken red mud reservoir had committed errors.

- **The Central Transdanubian Environmental, Nature Protection and Water Management Inspectorate had endorsed the classification of the deposited material as non-hazardous waste, thus significantly relaxing requirements on disposal and subsequent monitoring.**

- **The environmental authorities endorsed the unsubstantiated disaster management plan handed in by MAL Co. Ltd.**

- **The Inspectorate failed to engage the competent District Mining Inspectorate in the licensing process.**

- **The notary of Ajka had prohibited the depositing of hazardous waste in the reservoir, but failed to take steps when hazardous waste was in fact deposited in the area.**

- **Although the licensing of mining waste deposits has been the competence of the Mine Supervision since 2008, the competent District Mining Inspectorate did not check the structure of the disposal site for technological compliance, and failed to enforce use of the best available technology with regard to disposal (conversion to dry technology).**

- **None of the authorities substantially considered the risk of a dam break.**

- **When the privatisation contract was concluded, IPPC and BAT requirements were not taken into consideration. Neither was compliance with these requirements subsequently enforced in an exhaustive manner by either the environmental or the construction authorities.**

Regarding the occurrence and the severity of accident, a decisive factor was the Hungarian authorities' failure to treat the red mud deposited together with the slurry as hazardous waste in the course of the licensing and inspection process, even though the alkalinity of the material in the reservoir that was later damaged would have justified this. Licensing hazardous waste disposal entails imposing stricter standards and the participation of more authorities than is required for treating non-hazardous waste. A more thorough procedure might have shed light the technological risks of the landfill and the deficiencies of the emergency plan.

The company acting as the landfill operator bears liability for classifying the deposited material as non-hazardous at the time of applying for the integrated environmental permit, even though the alkalinity levels clearly met the criteria for hazardous waste. The company also bears partial liability in failing to meet the environmental requirements specified in

the privatisation contract fully and on time. Similarly, the company bears partial liability for failing to ensure the transition (or the preparation for the transition) to a dry depositing technology, at the latest, by the time of requesting the integrated environmental permit.

Furthermore, the occurrence of the accident can be linked to regulatory anomalies owing to the fact there had been deficiencies in adopting and properly implementing EU legislation.

The relevant Hungarian legislation only partially matches "Directive 2008/98/EC on waste requirements". Though it should have entered into force by 12.12.2010, the Directive was not fully implemented in Hungary. An important fact concerning the issue of the responsibility of authorities is that the waste treatment plant belongs to the competence of the Mine Supervision under Hungarian legislation. The directive cited imposes an obligation of regular monitoring on the operator, to be carried out at least annually with regard to both the condition of the built structure and of the waste, but this obligation was not fulfilled in practice.

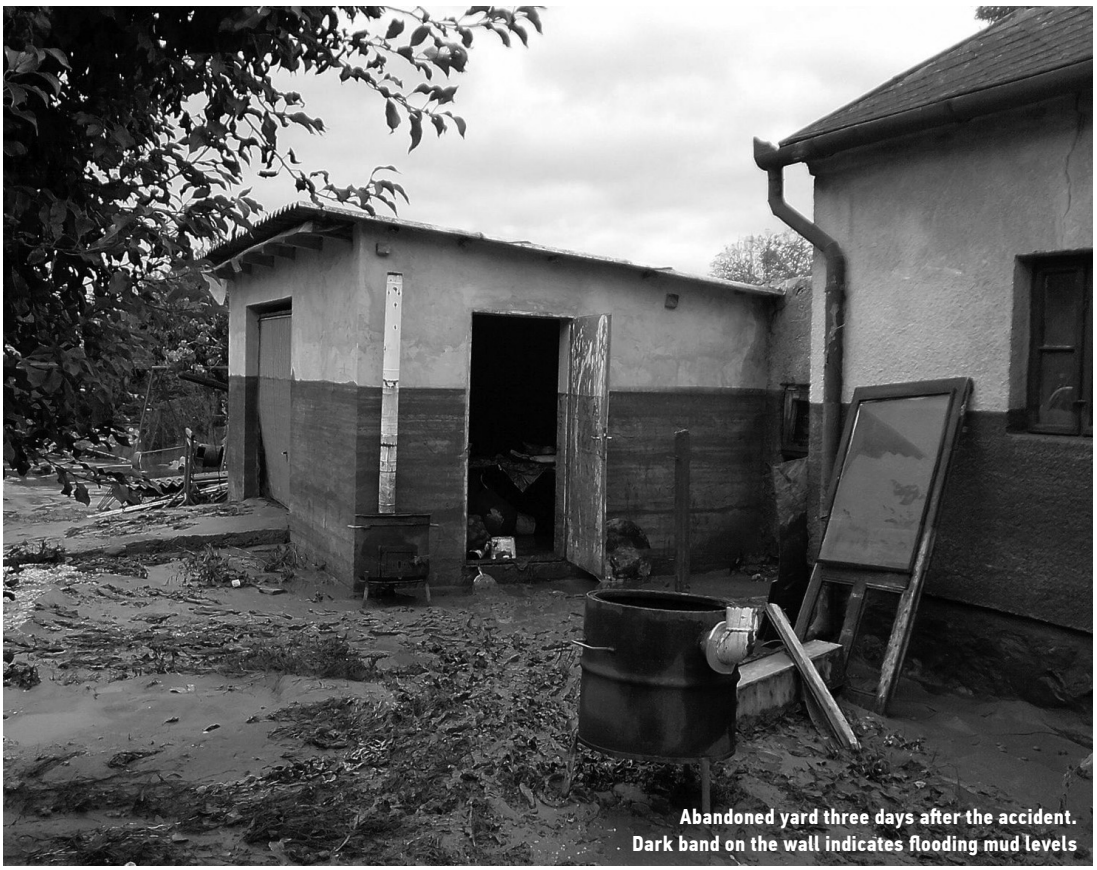
According to the Act on the Environment, the permit-holder (along with the owners and managers of legal entities which cause harm) has increased responsibility for damages incurred through use of the environment, a responsibility which may only be limited, or transferred under very strict conditions. However, these general rules apparently come short of providing for adequate and available financial means needed to cover for the damage incurred. According to the Act adopted in 1995, the rules governing the obligation to provide a security deposit and to establish dedicated reserve funds in the course of the environmental licensing process and the rules on liability insurance policies shall be laid down in a government decree. This objective has only been formally met so far.

The documents available demonstrate that authorities in charge of granting permits and inspection have not at all reckoned with the possibility of dam break.

On the whole, the EU legislation examined in the present analysis, provided it is adopted and implemented in line with the intent of the legislator, seems suitable for the prevention of similar accidents and for managing the consequences thereof. At the same time, there is a need to adopt uniform classification criteria for hazardous waste, unified EU-wide regulation governing security deposits and liability insurance (at least for reasons concerning competition law), and a common EU environmental emergency fund set up to cover environmental damage that can not be remedied otherwise.

Recommendations

The suggested measures conclusive of the legal analysis are included in point 5.6.2. of the chapter.



Abandoned yard three days after the accident.
Dark band on the wall indicates flooding mud levels

6. International comparison

6.1. Alumina production in other parts of the world

The basic raw material of aluminium production, i.e. alumina is produced out of bauxite. Bauxite is one of the (not very common) components of the earth's crust. It is produced by surface mining which means the mineral can be produced after stripping off the upper surface of the earth's crust. The world's bauxite reserve is estimated at 55 to 75 billion tons.[1] The world's three top bauxite producer countries are Australia, China and Brazil. In 2003, Hungary was ranked as 16th largest bauxite producer in the world.[2]

[1] BAUXITE AND ALUMINA http://minerals.usgs.gov/minerals/pubs/commodity/bauxite/mcs-2011-bauxi.pdf

[2] Bauxit, http://hu.wikipedia.org/wiki/Bauxit

The country's annual bauxite production was estimated at about half a million tons in 2005.[3] However, this value dropped by half since then as today only MAL Co. Ltd. produce bauxite in Hungary, altogether 240,000 tons in 2009.[4]

Country	Annual production (million tons)
1) Australia	65,2
2) China	40
3) Brazil	28,2
4) India	16
5) Guinea	15,6
6) Jamaica	7,8
7) Russia	5,8
8) Kazakhstan	5,1
9) Suriname	4
10) Venezuela	2,5
Altogether	199

Table 1: The world's bauxite production in 2009[5]

At least half of the industrial bauxite consists of aluminium oxyhydrates and minerals (gibbsite, boehmite, diaspore) along with a significant level of iron oxides (hematite, goethite), and silicic acid and titanium minerals as well. The two main types of bauxite is the karst bauxite which is formed on carbonate rocks and the so-called lateritic bauxite which is formed on alumonisilicate rocks. Lateritic bauxites can be found in tropical or subtropical areas.

Composition	Karst bauxite	Laterite bauxite
Al_2O_3	48–60	54–61
SiO_2	3–7	1–6
Fe_2O_3	15–23	2–10
TiO_2	2–3	2–4
CaO	1–3	0–4
Heating loss, mostly H_2O	10–14	20–28

Table 2: The composition of karst and lateritic bauxites (% on waterless base) Source: Wikipedia[6]

[5] BAUXITE AND ALUMINA http://minerals.usgs.gov/minerals/pubs/commodity/bauxite/mcs-2011-bauxi.pdf

[6] http://hu.wikipedia.org/wiki/Bauxit

Through the Bayer process (which is commonly used all over the world now) aluminium oxyhydrates are dissolved from bauxite ore at a relatively high temperature along with a sodium hydroxide (NaOH) solution. During the decomposition process, gibbsite bauxites are normally heated up to 140°C, while boehmite bauxites, which can be found in Hungary, are processed at a temperature of 240°C. After separation of ferruginous residue (red mud) by filtering, pure gibbsite is precipitated when the liquid is cooled, and then seeded with fine-grained aluminium hydroxide. The water content of aluminium hydroxide is removed by a thermal treatment process at about 1100°C (the so-called calcination). The clean (in a technological sense) aluminium oxide is called alumina. In case of bauxites processed in Hungary, the production of each ton of alumina results in about 1,2-1,3 tons of (solid) bauxite residue (red mud).

Finally, in the so-called Hall-Heroult process cryolite (Na_3AlF_6) is added to the alumina to decrease its melting point, then aluminium is made out of this molten substance by electrolysis. This technology results in a 99 to 99.7% clean aluminium.

It is worth to mention that in Ajka Alumina Plant alumina production for metallurgical purposes added up to about 98% of the whole production in 1990, with the rest consisting of were non-metallurgic (special) products. As a result of intense development in non-metallurgic products (and due to the closure of the Hungarian aluminium furnaces) Ajka Alumina Plant has not produced alumina for metallurgical purposes since 2006.

6.2. Red mud storage methods

6.2.1. Red mud storage worldwide

Due to Bayer technology, red mud is produced practically everywhere in aluminium production. However, presently this by-product cannot be processed or recycled in an economic and efficient way. Therefore, red mud has been stored in different ways for about 120 years,[7] and in most countries only the concomitant solution, mainly alkali, is reused. The composition of bauxite and therefore of red mud depends on the source of the bauxite. Table 2 shows the composition of bauxite normally used in Ajka Alumina Plant, while Table 3 comprises the composition of red mud.

[7] Biggest Ever Red Mud Disaster in the World, Source: Index, 5 October 2010. http://index.hu/tudomany/kornyezet/2010/10/05/nem_volt_meg_a_vilagon_ekkora_vorosiszap-katasztrofa/

Composition	Characteristic percentage
Al_2O_3	15–19 %
Fe_2O_3	33–40 %
SiO_2	10–15 %
TiO_2	4–6 %
CaO	3–9 %
MgO	0,3–1,0 %
Na_2O_{fixed}	7–11 %
V_2O_5	0,2–0,4 %
P_2O_5	0,5–1,0 %
CO_2	2–3 %
SO_3	0.8–1.5 %
F	0.1–0.15 %
C	0.15–0.20 %
Heating loss	~ 9 %

Table 3: The characteristic composition of red mud[8]

The big alumina producer countries evidently have large red mud reservoirs. Utilisation and exploitation of red mud made all over the world adds up only to a few thousandths. There is no red mud utilisation or processing in Hungary, too. There are red mud storages in the country next to the closed down Mosonmagyaróvár Alumina Plant and near the Almásfüzitő Alumina Plant (also closed down) and by the still working Ajka Alumina Plant. (At the Mosonmagyaróvár Alumina Plant the so-called dry red mud storing was in use.)

The biggest challenge for every alumina producer is the proper red mud storage. Some countries, such as France, Greece and Japan, still dispose washed red mud slurry into the sea, saying that alkali contents of red slurry is neutralised by certain components of seawater. This solution is not allowed by EU laws, however, France has gained a permission for sea disposal until 2015. According to data provided by Red Mud Project[9] today only 7 out of the world's 84 alumina plants dispose red mud into the sea. The dissolved alkali (that is, in this case sodium hydroxide and sodium aluminate) contents of red mud is normally reduced by washing in every alumina plant. During this process, the concentration of dissolved sodium hydroxide and sodium aluminate is reduced to the thirtieth or fortieth part, to the fraction of the original value by "clean water" through a multi-stage counter-current washing procedure. The washed red mud can be treated by different filtering methods. Filtering by vacuum filters is the most common procedure. Through this process, the quantity of concomitant fluid of the bauxite residue (red mud) can be reduced to a great extent and, on the other hand, it equals to a washing of 2 or 3 stages.

[8] György Bánvölgyi: Failure of the embankment of a red mud pond in Hungary: The most serious accident of the Bayer process http://icsoba.org/images/Newsletter2011.pdf

[9] Red Mud> Disposal http://www.redmud.org/Disposal.html

Mainland storing technology depends on environmental conditions to some extent. Previously, only pumped diluted red mud was pumped out and it was left to thicken and dry by itself, however, without proper protection towards the subsoil, it could easily result in the contamination of the environment, particularly of the ground water. That is why reservoirs with double, membrane polymer and clay isolation are widespread, as this way toxic materials cannot leak out to the environment. During the thickening process, the alkaline fluid, which accumulates on the surface as a "surplus", is normally driven back to the alumina plant. Dry red mud storing which poses less environmental risk, is also becoming more and more common. The main principle of dry red mud storing technology is the dehydration of the red mud. There are two common methods to do this: one is thickening in special washing facilities and the other is filtration. For example, several Australian companies[10] reduce alkalinity of red mud down to pH 9 by a relatively new process using seawater. In the three alumina plants of the United States (in Texas and Louisiana)[11] they use more modern but expensive technology. It is a widespread drying method in the US to settle red mud and remove water from the surface continuously. According to experts, in the United States an industrial disaster similar to the one happened in Hungary cannot occur even in case of a breach in the dam, as the dry material could flow out. In the US, they also wash the red mud through several times in order to remove alkaline. In the Sherwin Alumina Plant in Gregory, Texas 80 percent of the red mud disposed to the reservoir is solid. According to American experts, red mud must be damp but not mud-like. If it was too dry, it could easily give off dust, so they spray it with water if necessary. The embankments of the reservoirs are checked at least two times a year and extreme weather conditions are also taken into consideration at planning. These reservoirs, for instance, could even stand up to Hurricane Katrina in 2005. Besides the USA, dry storing is also widespread in some Australian and Brazilian alumina plants.

In China, about 10 percent of the red mud is reused (however, it is not clear whether the so-called brown sludge derived from pyrogene technology is included here as well) they produce bricks out of it. In Japan, bauxite is enriched before the Bayer process in order to reduce the quantity of red mud produced at the end. In Greece, red mud was disposed into the sea until 2006, however, since then filtration through high pressure filters and dry storing technology have been introduced gradually.

6.2.2. Developments at MAL Co. Ltd. after the accident

MAL Co. Ltd. will introduce dry technology, which is prescribed in its new licence, in two stages. (Source: I_kotet_Tanulmany_pdf pages 40-42)

In the first stage, they add power plant gypsum to the 55% filtered red mud formed on the existing drum filters, counting 20-30% to wet material. The solid material contents of the mixture increases up to 60% which makes it transportable by lorries and spreadable at the storing place. By the effect of gypsum and natural drying it is expected to reach the required solidity of dry sludge in 2 or 3 weeks. This stage was put into operation at the end of February 2011.

---

[10] Queensland Alumina Limited, Rio Tinto Alcan Gove alumina plant and Yarwun plant

[11] Safe sludge disposal is much more expensive; 11 October 2010; http://index.hu/kulfold/2010/10/11/az_amerikai_timfoldgyartokat_nem_ijesztene_meg_egy_gatszakadas/

In the second stage, red mud formed on the drum filters with 55s% solid density ratio would be filtered by newly set pressure filter thus a sludge with 65-70s% solid density ratio is made. This dry sludge can be transported by lorries and can be spread at the storing place and does not need further drying to become easily handled. They plan to add (a reduced quantity of) 17 % power plant gypsum to this sludge until studies cannot prove that a further reduction of gypsum ratio is possible, or even a technology without using gypsum can be realised. The planned deadline for putting this technology (which is regarded as final) into operation is 1 November 2011

The applied gypsum technology—as far as we know—has never been used before. The application of gypsum also changes the chemical structure of red mud, during the neutralisation process sodium sulphate is formed. However, there is an element of risk in the technology—as with any new invention.

Switching to the new dry technology cost HUF 500 million, while safety investments such as building embankments, clearing out canal belts, closing down the damaged Basin X, building water systems, neutralisation facilities and roads cost further HUF 1.5 billion.[12] According to the new licence the change of technology must be completed by the end of the test operation, during the test period fluid sludge will be disposed into Basin X/a. According to the licence[13] fluid red mud can be disposed into Basin X/a until 30 April 2011. Until 31 October 2011 dehydrated sludge with solid density ratio of 60% will be disposed, then, as of 1 November 2011 only the disposal of dehydrated sludge with solid density of 60-70% will be possible.

Filtered and gypsum treated red mud will be transported to the appointed Basin X,[14] mainly on an internal route by lorries, the new technology will increase delivery traffic by 4 or 5 lorries per hour. After switching to the dry red mud storing technology, the licence is valid for alumina production of 300.000 tons/year.

6.3. Red mud utilisation worldwide

According to some experts, the problem of the red mud produced continuously in enormous quantities all over the world can be solved the most reassuringly in the long term by the utilisation of red mud. Due to its metal contents, red mud can be regarded as secondary raw material. It contains iron in the biggest quantity. According to the Hungarian Academy of Sciences (MTA) the estimated the iron content[15] of about 50 million tons of red mud stored

---

in Hungary (out of which 15 million tons is moisture content) is 15 to 18 million tons. Besides this, red mud contains vanadium, gallium, titanium and other rare earth metals[16] as well.

Practically, extraction of all the metals is possible in terms of technology, however, it is very expensive thus not profitable[17] in most cases. Utilisation of red mud with the present technology could only become profitable with much higher raw material rates and cheaper energy prices. In some countries bricks and other building materials are made out of the red mud without the extraction of any metals. As a trial, red mud is used in agriculture to improve the quality of soil.

Dr Katalin Gruiz, Reader of Budapest University Technology and Economics (BME) and Delegate of Hungary in the Committee for Risk Assessment of ECHA (European Chemicals Agency) compiled a list of the possible red mud utilisation opportunities:[18]

1. Utilisation in the construction industry as a building material

- Cement production
- Aggregate production
- Brick, block brick, building element production
- Geopolymers: aluminium silicate based geopolymers to replace cement: Si-O-Al-O-Si-O- structure

2. Usage in the chemical industry

- Catalysts (TiO_2 and Fe_2O_3 content, and for the large specific surface)
- Absorbents
- Ceramics
- Coating
- Plastics
- Pigment production

3. Environment technology

- Treatment of sewage and other waters
- Treatment of acidic mine waters
- Treatment of polluted soil
- Treatment of acidic smoke gases and end gases:
  SO_2 absorption in alkaline red mud for neutralisation purposes,
  CO_2 eabsorption in alkaline red mud: to neutralise carbonisation and improve solidity

[16] **Rare earth metals in red mud (g/ton)** Berilium (5–18), Gallium (36–43), Nióbium (35–77), Molibdén (19–32), Szelén (11), Vanádium (490–730), Raterfordium (80–100), Thorium (45–50), Urán (32), Cirkon (340–540) (forrás: Kiss János: Ércteleptan. Tankönyvkiadó, Budapest, 1982.)

[17] Utilization of Red Mud for Soil Conditioner Manufacturing; 2010.10.25. http://www.kisalfold.hu/embargo/vorosiszap-hasznositas_talajjavito_eloallitasara/2185312/

[18] Red Mud Utilization http://www.mokkka.hu/drupal/node/7686

4. Usage in agriculture

- General soil supplement
- pH normalisation of soil
- Improve phosphorus content, phosphorus holdback
- To treat soil contamination

5. Metal industry, metal production

- Metal extraction from red mud
- Steel production
- Extraction of micro components

György Bánvölgyi and Tran Minh Huan summarised the most important red mud utilisation opportunities in 2009:[19]

- To improve acidic soil;
- Absorb heavy metals in soil;
- Keep nutrients such as phosphorus in agricultural soil;
- ceramics (tiles and floor tiles) production;
- brick production;
- road building; particularly the coarse fraction of red mud
- component in cement industry;
- additive material in iron metallurgy;
- filling material in tyre and plastics industry;
- pigment in paint production;
- absorption of CO_2 and SO_2 content of smoke gases
- raw material for absorbent and catalyst production
- raw material for chemicals to treat water and sewage water

Redmud.org made a compilation of the biggest red mud utilisation projects in the world.[20] According to 2004 estimations in China 10 % of the produced red mud was utilised for metal extraction or for brick production, although in this number the so-called brown sludge produced by plants using pyrogen technology might have been included. In Australia, there have been attempts to utilise red mud in the construction industry since the 80s. Alcoa's plant in Kwinana, West-Australia produces bricks from red mud and residential buildings have already been built out of these bricks. However, the usage of these materials for houses have triggered fierce debates as according to the Health Ministry the radiation of bricks made out of red mud exceeds the acceptable level for residential buildings.[21] Red mud is also utilised as a secondary raw material in Japan, it is mainly used in the cement industry as an additive.

[20] Red Mud>Industrial Uses, http://www.redmud.org/Industrial_Uses.html

[21] Australian Fluoridation News Jan-Feb 2002 Edition, http://www.fluoridationfacts.com/ausfnews/marapr02/pollution_in_western.htm

There have been several attempts for red mud utilisation in Hungary too. György Dobos and Lajos Bartha invented the Dobos-Bartha process which aimed at the complex utilisation of red mud (iron extraction and cement production out of the remains). The process had reached the stage of half operational implementation by the early 70s, but after the oil price explosion it has not proved to be profitable. Ferenc Puskás conducted cultivation tests in Hungary and in India in the 80s and 90s on different plants and vegetables on artificial soil containing 50 % to 80 % red mud. Klára Bálint Egyedné and András Terpó have also done cultivation tests at the University of Horticulture. The Pannon University and the Agricultural College of Nyíregyháza have also studied the selection of plants able to grow on recultivated red mud surface. There are several Hungarian inventions for red mud utilisation. For example, Béla Venesz from Mosonmagyaróvár has invented eleven types of soil improving agents containing red mud and took out a patent on them.[22]

6.4. Similar major industrial accidents

There has never been a similar accident to the present catastrophe in the world. Wet red mud reservoirs usually damage the environment with a leakage towards the subsoil. We collected a few major Hungarian and international embankment accidents which caused water and soil contamination. Accidents of water reservoir dams which are more and less unknown for the Hungarian public have been compiled by tailings.info website: http://www.tailings.info/accidents.htm.

6.4.1. Disasters worldwide

The Buffalo Creek Flood: a Sludge Disaster

The sludge disaster known as the Buffalo Creek Flood can be compared the most to the Ajka red mud disaster in several respects. In February 1972 in Pittstone, North-Virginia of the United States the dam of a grey sludge reservoir of a mining company broke through due to the heavy rainfall for several days.[23] Similarly to the Ajka disaster here the sludge reservoir of a coal mine was built on a stream, the Buffalo Creek. It is interesting that the dams had been checked and claimed proper few days before the disaster just like in Ajka, although local residents discovered several cracks on the dam walls and warned the mine owners.

During the disaster 500.000 cubic meters (half a billion litres) grey sludge water rushed into 16 mining villages. The 4 to 6 meters high flood killed 125 people, seven people disap-

[22] http://www.origo.hu/itthon/20101007-nemzetkozi-jelentesek-nyilvantartottak-a-veszelyes-helyek-kozott-a-vorosiszap-tarozot.html

[23] The people responsible got away with a sludge spill 30 times tougher than the one in Ajka 06 October 2010 http://www.origo.hu/nagyvilag/20101006-buffalo-creeki-katasztrofa-egy-1972es-amerikai-iszapolmes-tanulsagai.html

peared, 502 houses were destroyed and further 943 houses were damaged. Property damage was estimated at USD 50 million. However, the company blamed everything on the weather, the heavy rains, several investigating committee claimed that the company had not met several safety and environmental regulations. Despite the facts the company has not been called to account for the disaster.

Dioxin poisoning in Seveso

On July 10, 1976 in Seveso, Italy, a chemical industrial accident happened in the factory of Icmesa, the affiliate company of Switzerland's Hoffmann-La Roche. 2 kilograms of dioxin (tetrachlorine-dibenzo-paradioxin—TCDD), one of the most dangerous industrial by-product leaked off the air.

193 people suffered serious damages and another 447 people had minor injuries due to the accidents, many faced long-term health problems. In the aftermath the frequency of genetic disorders increased which raised the developmental abnormalities ratio among newborn babies, and the number of spontaneous abortions grew by 20 percent. 600 people were evacuated after the poisoning which affected 37.000 people and polluted more than 2.500 hectares of land and vegetation, in addition 80.000 animals had to be slaughtered. After the contamination, soil change needed on a vast area. The management of the plant received 2.5 to 5-years prison sentence.[24]

The EU principles on the prevention of serious accidents related to dangerous chemicals was named after the Seveso accident.

A tragedy in Bhopal

On December 3, 1984 in Bhopal, India forty tons of methyl-isocyanate gas leaked out of the Union Carbide pesticide plant resulting in the world's worst industrial disaster. The leakage caused the immediate death of about 8.000 people and further 20.000 people died in a few years. About half a million people were affected by the pollution and more than 120.000 have suffered permanent damage. According to a study published in 2010[25] a significant level of contamination can be measured in the region of Bhopal even now. Most of the local women have no regular period as pesticides cause hormone related diseases.

Those who responsible for the chemical disaster were only prosecuted in 2010, twenty-five years after the disaster. Seven Indian employees of the Union Carbide were sentenced for two years in prison, however, the then CEO of the company, the American Warren Anderson is still at liberty and lives a luxury lifestyle in the USA.

Oil disaster in the Gulf of Mexico

In April 2010, during the most serious ever industrial disaster in the history of the United States the British Petrol's Deepwater Horizon oil rig first exploded, then sank into the sea. They could not stop the oil spill for more than two months, thus an estimated 4.9 million barrels that is 780 million litres of crude oil gushed into the water of the Gulf of Mexico. The oil caused lasting damages to the marine habitats and to the coastal wildlife, however, the major part of the spill evaporated or dissolved. The moorland of the coast has been revitalised after a few months and less animals were killed than environmentalists feared.[26] Apart from this, the economical damages are significant. Previously, 90 percent of the fish consumption of the States had been caught in the Gulf of Mexico. Today oyster beds became extinct or on the verge of extinction, in addition, there is still a huge quantity of spilled crude oil on the sea-bed which can damage the whole food chain.

The accident of Prestige crude oil tanker

On November 14, 2002, the Bahamas-registered but Greek-owned Prestige tanker sprang a leak in a storm 50 kilometres far from the coast of Galicia, Spain.[27] The ship carried 77.000 tons of crude oil out of which 38.000 tons spilled into the sea. The spillage caused a vast ecological disaster, the oil covered the coasts of North of Spain and South of France 2.400 kilometres long. On the coast which was highly precious in terms of nature reserve, the carcasses of more than 35.000 birds and thousands of sea otters were washed ashore, and even more sank into the ocean. According to the subsequent surveys on the northern coast of Spain practically every marine habitat, even the migratory birds have been killed, despite the efforts of masses of volunteers who tried to clean the oil-covered animals. The damage was estimated at about EUR 1 billion, the soar of the unemployment rate only made things worse since 60 percent of the local people made their living by fishing.

6.4.2. Disasters in Hungary

It is hard to compare the 2010 red mud flood around Kolontár with the environmental pollution caused by Metallochemia plant near Nagytétény over a period of decades. According to the MTA Research Institute for Soil Science and Agricultural Chemistry it is difficult in an analytical sense as they were very different types (and happened with different chemicals). However, negligent industrial activity resulted in an extreme contamination of the environment in both cases

---

[26] The extent of the red mud damage is not clear; 21. October 2010
http://ozonenetwork.hu/ozonenetwork/20101021-olajkatasztrofa-bp-kar-mexikoiobol-meg-nem-vilagos-mekkora-kart.html

[27] Spain: Tanker sinks; 20 November 2002
http://www.greenfo.hu/hirek/print_hirek_item.php?hir=2882&PHPSESSID=07ea8d058e7aaac679bc2b438101ef38

Basic differences between the two contamination cases:

	Nagytétény (Metallochemia)	Ajka - Kolontár (MAL Co. Ltd.)
Duration of contamination	Continuous environmental load (lasting several decades)	Instantaneous
Different thickness of (contaminated) soil	10 cm –> 1 m	3–5 cm
Partial differences in the nature of land use	Industrial and residential areas	Agricultural and residential areas
Geographical extent of the affected areas	20 ha polluting source (factory plant) size of land affected approx. ten times higher –> 600.000 – 800.000 m^3 soil	3500 ha –> 10 cm 3.500.000 m^3 soil 3 cm 1.050.000 m^3 soil
Different heavy metal pollution profile	Main pollutants: Pb, Zn, Cu, Ni, Cd	Main pollutants: As, Hg
Mercury (Hg)	11–32 mg/kg	1–17 mg/kg
Chromium (Cr)	52–670 mg/kg	14–134 mg/kg
Nickel (Ni)	44–50 mg/kg	7–67 mg/kg
Arsenic (As)	86 mg/kg	6–54 mg/kg

Soil has been replaced in about a thousand of private gardens in Nagytétény between 2004 and 2009. The region had been polluted by the Metallochemia factory for a century with different heavy metals—directly through the soil, the subsoil water and the smokestacks. Because of the slag products 800.000 cubic metres of field—80 hectares—has been spoiled and have to be replaced. A minor part of the material was used for the building of M6 motorway, and a waste hill was built out of the rest. As a first step, they piled up a hill of 300×300 metres basic area and insulated it with foil and felt. A layer of pebbles and arable land came on the top of that, and finally landscaping. The hill was equipped with an electric monitoring system of wire netting, too.

The 800.000 cubic metres land which was carried away from the residential area of Nagytétény had to be replaced. This was followed by the restoration of the vegetation of the gardens. The whole compensation project cost HUF 12 billion.

After the Ajka accident highly alkaline, caustic industrial waste spread out on about a 14-35 km^2 area. If an average 3 cm thick red mud spread out on a 35 km^2 area that means about 1 million m^3 soil. It could be the real contamination, however, there is no available technology for replacing soil in a thickness of 3 cm. If the upper 10 cm of the soil will be replaced that means 3.5 million m^3 soil has to be carried away and brought back.

At the Nagytétény contamination the main polluting heavy metals were: lead (Pb), zinc (Zn), brass (Cu), nickel (Ni), cadmium (Cd). Pb 65-1320 , Cd 1-26, Cu 121-1500, Zn 693-2828, Hg 11-32, Cr 52-670, Ni 44-50, Sn 340 and As showed 86 mg/kg ratio at some places in the upper layers of soil. Except of Ni these mean enormous enrichments compared to the normal or even to the acceptable values.

In the region of Kolontár arsenic (As) and mercury (Hg) were the most significant polluters. According to the studies As 6-54, Cr 14-134, Hg 1-17, Ni 7-67 and Pb 18-110 mg/kg toxic content of elements was found in the upper layer of soil contaminated with red mud.

To sum up, a smaller level of contamination was found in the Kolontár region compared to the one in Nagytétény (about 50-75%) (which is not surprising due to their different characters), however, the geographic area of the contamination is much larger.

The occurrence of heavy metals in a soil layer 0-10 cm deep around Nagytétény with cc. HNO_3 solution:

(Source: MTA TAKI, "Studies on the Environmental Effects of the Red Mud Spillage in the Kolontár Region in 2010" Professional Report, 2011)

Comment: There are no suitable limit values related to the concentration of pollution in red mud or the in the sediment contaminated by red mud and in the contacting surface waters. To apply these values to the soil or the drinking water would be too strict and unprofessional.

CHINOIN cypermetrine contamination in Nagytétény

On May 26, 1998 at Chinoin's premises in Nagytétény during drawing off a *8 m^3 reactor 120 litres of CHINMIX 5EC spilled on the floor due to the failure.*[28] Chinmix 5 contains fluid beta-cypermethrine in a quantity of 5 g/l. This synthetic pyretroid insecticide is particularly dangerous to fish, thus is not allowed to use within 200 metres of the coast of surface waters.[29]

After the spillage, the workers washed the spilled insecticide down with water, but the workshop's 1.4 m^3 safety pool could not receive it so they pumped it out to the gutter in front of the workshop. They placed it on record but failed to inform the authorities. Next morning fishermen reported mass destruction of fish, the investigation started only after that in Chinoin. Pyretroid leaked into the Danube had caused a HUF 85 million damage and left Ercsi without drinking water for two days. It was fortunate that it did not cause bigger drinking water contamination as the pollution had not reached the water reserve of Budapest. The pollution could not reach the waters down in the river as cypermethrine dissolves relatively rapidly, its half-life is 27 hours.

The accident at Baia Mare and the cyanide contamination of the river Tisza

In January 2000, a cyanide pollution took place in Baia Mare, Romania, during the reexploitation of mine dumps. During the process cyanide technology was used to extract the remaining noble metals (gold, silver). This activity requires plenty of water, the washing waters with cyanide content get back to the system after settling. The embankment of the settling pond broke in a 30 metres section because of the high pressure and 100.000 to 120.000 m^3 sewage water highly polluted with heavy metals and cyanide got to the streams Zazar and Lápos and from there through the Szamos to the river Tisza causing a significant contamination on the Hungarian section of the river too. Since the main contractor had no plans for disaster management at all, efforts made to stop the spreading of the pollution were limited and inefficient. Although, there have been subsequent attempts to reduce the poisoning with the addition of sodium-hypochlorite but this then proved to be ineffective.

About a month after the first pollution a second significant contamination happened in Romania during the heavy metal and non-ferrous metal production and preparation for metallurgy. The embankment of the company's cleaning plant suddenly broke through due to the rapid melting of snow in March 2000, and about 20.000 m^3 sludge polluted with heavy metals spilled into the valley under the reservoir. Due to the continuous rainfall, this sludge was washed into the stream Novac from where the pollution reached the river Tisza through the river Visó. The pollution at this time reached the section of the Tisza above the river Szamos which was intact at the time of the cyanide pollution. On the evidence of the investigations

---

[28] Dr. Ernő Fleit: A Hungarian Example of Industrial Accidents: Cypermethrin pollution at the CHINOIN plant in Nagytétény in 1998, Department of Sanitary and Environmental Engineering, BME
http://www.epito.bme.hu/vcst/oktatas/feltoltesek/BMEEOVKASH2/chinoin_2006_harom.ppt

[29] In the band not further than 1000m from the coast of lake Balaton

it can be stated that the polluted sludge contained lead, brass and zinc, mainly in a state of bonded to floating materials.[30]

Contamination by the waste incinerator of Dorog

On July 30, 2004 from the premises of a dangerous waste incinerator managed by Onyx Magyarország Kft toxic materials leaked off the gutters. According to local green organisations[31] dioxin and PCB contamination leaked into a canal which was connected to the stream Kenyérmezei and from there to the Danube. The polluting company reported the accident to the authorities with significant delay, then did not let the staff of the authorities immediately to the premises of the plant. In addition, the employees of the incinerator held back crucial information and the authorities were not fully aware of what kind of pollution is to be defended. The Committee of Defence of Esztergom passed a resolution with a significant delay on its meeting on August 5, 2004 about the prohibition of drinking water in Esztergom, Esztergom-Kertváros and Tokodaltáró thus residents could have drunk polluted water for several days.[32]

Onyx Magyarország Kft claimed that the applied closed technology excluded that the materials with PCB content leak out into the factory's precipitation channel system. The polluting material could only leak into the rainwater if someone poured a pail of PCB waste into the canal system with a provocative intent. So Onyx reported an unknown offender to the police. The environmental protection authority conducted investigations in the surface waters, but the tests did not prove toxic PCB and dioxin in the stream Kenyérmezei and in the Danube at Tát.[33]

An accredited laboratory Bálint Analitika took samples on July 28 out of the canal of the Dorog incinerator connecting to the stream Kenyérmezei and found dioxin and PCB compounds. The ratio of PCB compounds 400 times, the dioxins 100 times exceeded the limit.[34]

6.5. Environmental hazards, proposals of civil and green organisations in other countries

Alumina production in Brazil

Brazil is the third biggest bauxite producer of the world. There are several alumina plants in the Amazon region. These plants are permanently criticised by natives and civil organisations as their activity leads to deforestation, even if Alcoa Juruti's[35] plant proudly claims that it reforests its production areas. The related establishments such as aluminium refineries, ports and railway networks cause further environmental damage.

Many have been outraged by the fact that while the Norwegian government is the biggest sponsor of the Amazon Fund set up to protect the Amazon region, a Norwegian company has started to produce alumina and aluminium on the protectable lands and wants to provide electricity needed for aluminium production by a new giant hydroelectric power plant. Norway's Norsk Hydro ASA, the world's third biggest aluminium producer has recently bought up Brazil's Vale do Rio Doce company.[36] Local communities and civil organisations fear that the new development would lead to deforestation, contamination of the environment and relocation of the native people, that is endangers the life and health of the residents of the region.

Fears of red mud in Australia

According to civil organisations the alumina plant of Alcoa Pinjarra caused fluoride contamination which resulted in health problems.[37] On December 19, 2001 the daily West Australian called the region of Alcoa "cancer street" because of the numerous illnesses. The Pinjarra plant is one of the largest plants in the world with a production of 3.2 tons alumina a year. According to the leading toxicologist of the Ministry of Health the Pinjarra polluted the region with carcinogenic arsenic and polycyclic aromatic hydrocarbons. In 2001, more than 500 complaints were filed by residents because of the pollution of the plants in six months. The investigations revealed that the plant emitted 390 kilograms of fluoride a year into the air. Alcoa later acknowledged that contaminated water was leaking to the subsoil in its three West-Australian alumina plants.

In Australia they tried to utilise red mud mostly in the construction industry. Alcoa's plant in Kwinana, West-Australia started to produce bricks out of red mud, and residential building were built out of them.[38] The project was halted by the Australian Ministry of Health as

according to the tests, the building materials made out of red mud had a radiation level above the limits. The red mud contained radioactive thorium and uranium.

6.6. Compensation after industrial disasters all over the world

After the majority of the disasters restoration is made from public money as most countries lack the regulations which could guarantee that the polluter must have reserves for compensation, or which could force the compensation. Normally, only the fact of criminal offence is stated after the disasters. However, the European Union 2009 recommendation on environmental responsibility prescribes that the responsibility involves not only the clean-up of the spilled dangerous materials but the indirect damages caused to the flora and fauna, the land and water reserves and other areas, but in practice, as there is no mandatory funds for compensation, the companies cannot bear the costs of the damages.

Compensation after the cyanide disaster at the river Tisza

Hungarian rivers needed over 3 years until they could partially recover following the cyanide contamination from the settling pond of the waste dumps in Baia Mare. As a result of the cyanide pollution Hungary submitted a HUF 29.3 Billion claim against Romania, which included the damage to wildlife and the related rehabilitation costs. The Romanian state however transferred responsibility for the natural disaster to Aurul. The Hungarian State filed a lawsuit for the damage against Aurul in 2001 as it had failed to respond to the offer for out-of-court settlement. With reference to its own inspection, the Australian company refused to take responsibility for the disaster stating that the dam brake was brought about by circumstances outside their scope. In 2006, the Metropolitan Court stated in the interlocutory judgement that responsibility rested with Transgold, successor to Aurul. Later on, Transgold went into liquidation—it was bought by Romaltyn Mining, a corporation established by a British and a Kazakh company for approximately four million Euros. Since then the British company has resigned from the joint venture and the company became the property of Russia's gold producer Polyus Gold. *"This company is investing tens of millions of Euros to process gold and silver accumulated in a sludge storage in the proximity of Baia Mare as a result of extraction in the past decades, but this must comply with the requirements of the European Union (which states that cyanide content of the water in the sedimentation basin shall not exceed ten milligrams per litre.) The company had to make a 35 million Euro environmental investment by the end of 2010".*[39]

The lawsuit has not yet been closed, however, there is an increasing chance that, even in case of winning the suit, there won't be anybody left to recover the claim from.

[39] Cyanide spill in the river Tisza happened 11 years ago http://tiszakecske.blog.hu/2011/02/01/11_eve_omlott_cian_a_tiszaba

Sludge disaster in Buffalo Creek

When the dam of the Buffalo Creek coal slurry impoundment dam burst in 1972, the owner, Pittstone Mining Corporation didn't recognise its responsibility and blamed the days of heavy rainfall for the disaster.[40] Many review panels announced that the company had failed to comply with a number of provisions, yet it wasn't convicted: neither have they had to pay any penalty nor have the owners or the operators been held accountable.

The fact that the members of the West-Virginia committee investigating the case were all interested in coal mining or worked for authorities or government departments who would have been responsible for preventing the incident casts doubts on the objectivity of the investigation. In contrast, no representatives of the miners were placed in the committee. A committee set up by the victims stated that Pittstone is responsible for the tragedy, and that the authorities had defended the interests of mining companies and not of the people.[41]

After the disaster 750 homes were promised to be built but only 17 display houses and 90 flats were constructed, added to that latter were pulled up on a former waste-heap. The governor promised 10 recovery projects but only a fragment of them were completed. The damage was eliminated by the technical corps of the US Army instead of the company from 3,7 million Dollar worth of public founds. Total material damage was estimated at 50 million Dollars.[42] The West Virginia government filed a $ 100 million lawsuit against Pittston, but eventually compromised with the governor in compensation amounting to one million dollars. Victims of the disaster have initiated a number of suits against the company. The biggest joinder of 600 Parties claimed 64 million Dollars, but eventually received 13.5 million in an out-of-court settlement, which meant 13 thousand dollars per person after deducting the costs of litigation.

Compensation after the BP Deepwater Horizon accident

The oil contamination caused by an explosion on British Petrol oil platform named Deepwater Horizon was followed by compensation procedures and sues for damages. The US government promised to impose strict punishment on BP having been responsible for the pollution. BP immediately set up a 20 billion dollar compensation fund, which compensated for example local fishermen, although many American papers claim many have been waiting for their payment for over months. BP was estimated to have spent approximately 8 million Dollars on salvage since the oil platform explosion by the end of 2010.

In late 2010 the U.S. government sued BP for the oil disaster.[43] According to a law accepted in 1990, polluting water with oil might involve a 1100-dollar compensation per barrel, but it

[42] Disaster on Buffalo Creek, http://www.wvgazette.com/static/series/buffalocreek/commission.html

[43] American government sues BP for the oil disaster, 15 December 2010 http://www.origo.hu/nagyvilag/20101215-beperelte-az-amerikai-kormany-a-bpt-az-olajkatasztrofa-miatt.html

may multiply to 4300 Dollar per barrel if BP is condemned for culpable negligence or deliberateness.[44] Thus, the company might be required to pay a total of 5 billion-dollar compensation.

Summary

The Bayer process is globally the most widespread method of producing Aluminium. In practical terms, this technology leads to the formation of red mud wherever it is used. Currently, no economically viable and efficient solutions are available for the recovery of this material. It is most often deposited (dumping it in the sea or in reservoirs surrounded by dams).

Attempts have been made to find ways of recovering it: red mud is used both as a raw material or an additive e.g. in manufacturing bricks, road construction and soil improvement. Furthermore, the technology for extracting metals is feasible, but it is too costly).

In an international context, the trend is shifting away from wet disposal technologies towards dry disposal, which poses less risk. (The latter method was used in Mosonmagyaróvár until production was shut down there.) The alkalinity of the deposited slurry is typically lower internationally than it is in Hungary. On the other hand, the dry technology about to be introduced in Ajka, a technology which involves blending in power plant gypsum, has not yet been implemented at an industrial level anywhere.

The red mud disaster in Ajka is unparalleled in both its volume and its character. Nevertheless, at least part of the lessons learned from similar industrial accidents remain valid:

- The costs of remediation eventually are to be paid by the state, with the companies responsible for the accidents almost always backing out of the process to a greater or smaller extent,
- Compensation for damages only takes place in the long run, with both the range of individuals eventually receiving compensation and its extent much more limited than was originally promised,
- Personal and institutional responsibility is most rarely identified,
- The impact of environmental damage typically lasts longer than was originally estimated.

[44] Oil disaster: BP may be forced to pay USD 5 BN in penalties; 15 September 2010, http://www.hirextra.hu/2010/09/15/olajkatasztrofa-otmilliard-dollaros-karteritesre-kotelezhetik-a-bp-t/

Recommendations

In order to reduce the risk of similar incidents and to be able to manage the resulting damage, a common EU environmental emergency fund should be established, to be financed from payments by companies responsible for the risks.

Setting up such a fund and specifying the required level of financing calls for a review of similar industrial accidents and the subsequent compensation procedures. (As a typical example, the BP oil disaster in the Mexican Gulf required establishing a USD 20 Million compensation fund. This was made possible by the company's financial resources, however, as indicated above, the general rule is that there are no funds available to cover for damage and compensation.)

In the field of regulation and supervision, the factors enforcing the application of safer solutions posing less environmental risk should be strengthened.

Excavator levelling the broken dam wall.
This is the gap where the flood burst through.

7. Long-term effects, further necessary measures

7.1. Future of impacted areas

Following the rupture of the dam, the spilled sludge and the alkaline slurry contaminated an area of about 1000 hectares. The affected landmass, however, was even larger, as autumn floodings went on to spread out the slurry on lands not impacted in the October accident. According to data from the Central Agricultural Office (MgSzH), approximately 1000 hectares (based on March 2011 data, nearly 1300 hectares) of arable land was contaminated. According to the first surveys, 600 hectares will need soil replacement and mandatory special (limited) land use methods. The red mud cover can be considered 5-10 cm deep on average (min. 3 cm–max. 45 cm). The affected cultures included 300 ha of grassland, approx. 310 ha of prepared arable land, 30 ha alfalfa, 150 ha corn, 15 ha millet. In Vas county, the contaminated water stepping out of the Marcal riverbed flooded agricultural areas of significant size in the section bordered by Nemeskocs and route no. 8.

For the benefit of an accurate assessment of the damage, The Central Agricultural Office created an orthophoto map demonstrating the span of the red mud contamination. Besides this, in order to perform radioanalitical and heavy metal examinations, the institution took samples of grapes, carrots, lettuce and sunflower. These, however, are only suitable for assessing immediate and short-term impacts, providing little base for estimating long-term consequences.

One way of regenerating the arable lands and grasslands utilized as pastures is to neutralize the contaminants with dudarit and leave the clean-up of sludge residues up to biological processes. This is only conceivable where the red mud cover is thinner. In areas covered by thicker (greater than 5-10 centimetres) sludge layers, the only solution is to remove the red mud, though this results in damage to part of the topsoil and in turn, the degradation of the soil, as well. This is a sensitive loss on lands covered with less than average quality alluvial soil.

The pace of cleaning up the agricultural lands is slow. By the time of releasing the report, the sludge removal had only been completed on 50 hectares between Kolontár and Devecser while a 25 hectare area was treated and tilled in with dudarit.

Thus far, there is no reliable information available on what can be produced in the affected areas following the damage control. The production of food and feed crops definitely runs into obstacles, in part due to judicial, in part to market factors (a typical example is that in the wine region of Somló mountain, considered historic, wine tourism practically came to a halt to the news of the disaster, although the sludge did not physically reach the wine producing areas). It has been suggested that the production of energy crops could be the solution, but this solution equally raised expert concern since the toxic metals absorbed by the crops might be released into the atmosphere during the incineration of the biomass.

A further source of problems is the affectedness of hobby gardens and farmsteads in the vicinity of Devecser, Kolontár, Somlóvásárhely, Somlójenő, Tüskevár, Apácatorna and Kisberzseny. This is where soils and groundwater testing, as well as a continuous monitoring would be the most urgent, since without the ability to produce garden vegetables, the traditional lifestyle and livelihood of dwellers in these settlements are also at risk. **Besides rapidly carrying out investigations, the most important task would be to properly inform the residents and to organise a service providing consultation and advice. Agricultural work in the gardens starts as early as March, but without sufficient information, the residents will not be able to decide whether they should be concerned by the vegetables they have grown themselves, and to know what restrictions or security measures shall govern their traditional activities of production.** The production lost to a lack of information and legitimate precaution may lead to serious social and nutritional problems at the local level.

The third critical issue is the question of polluted riverbeds and riparian areas in the valleys of Torna Creek and Marcal River. Secondary damage control (removing the sludge deposited onto the banks) has already started in these areas. Nevertheless, the work advances illogically (dredging was begun at the mid section of the Marcal, entailing the risk of recontamination in the lower river section while carrying out the clean-up of the upper section later on).

7.2. Long-term health hazards

Hungarian experts, as well as the healthcare work group of WHO and the EU visiting Kolontár agreed that two significant sources of risks emerged following the accident. The health damaging effect of pollutants (arsenic and mercury above all) that have gotten into the soil and groundwater, must be taken into consideration. Arsenic can develop its toxicity mainly by appearing in dug wells and entering the food chain. Red mud escaped into the environment and deposited on the surface is a similarly important problem. The material truly acting sludge-like at the time of the accident, once dry, dusts off and can be carried by winds over a distance of several dozen kilometres. The dust of the red mud is alkaline itself, too, besides containing toxic elements as well (thus it is controversial that air pollution caused by red mud is compared to the general threshold for airborne dust, although only a fraction of the allowed dust concentration is permissible for carcinogenic materials under the legislation). Rough particulate matter of the alkaline dust has a caustic effect in the human organism when getting in contact with fluids. The fine particulates getting inside of the pulmonary alveoli also have a caustic effect and damage the thin tissues responsible for breathing. Experts state that no safe limit values can be set for the alkaline dust laden with toxic metals (safe limit values meaning such a load, under which the organism exposed to the harming effect does not suffer damage in any way).

Among the harmful health effects, one should also mention the psychological shock caused by the disaster, as well as the posttraumatic effects due to the fact that livelihoods have been put at peril.

7.3. Long-term environmental impacts

As noted above, most environmental problems may occur due to the toxic metals (arsenic, mercury, chromium, lead, nickel) gotten into the soil and waters, as well as due to the alkalinity of the slurry. **It is to be expected, that on the most severely damaged lands in the vicinity of the reservoir, no agricultural activity will be possible in the future; here afforestation may be the only method of utilization** (along with the same problems we have already mentioned in relation to the energy crops).

It should be noted at the same time that it is really difficult to determine the long-term environmental risks, since no similar accident has happened anywhere in the world. Based on data found in specialized literature, alkalinity of the red mud dust will diminish with time, due to exposure to the carbon dioxide content of the air. However, there is no reliable information available in what way the red mud spilled, still present in significant proportions in the environment will affect the natural flora and fauna of the region.

That is why **it is necessary to accurately measure the chemical composition of the contaminants at a sufficient number of locations,** specifying the oxidation stage of the metals, since for example while chromium(III) is not really toxic, chromium(VI) represents a serious health hazard. From the perspective of mitigation, the composition of the substances

is especially important, because whereas lye binds toxic metals, it can release them into the environment when exposed to acids, causing problems in the long run.

7.3.1. Long-term effects to the soil

Predicting prolonged effects is hindered by the fact that pollution caused by the red mud and its slurry escaped into the environment cannot be referenced to specific threshold data, since the contamination gradually mixes, dilutes in the soil. Solubility of toxic metals also varies with the change in alkalinity. While arsenic enters the aqueous phase more readily in an alkaline medium, multiple toxic metals are only mobilized in acidic media.

Greenpeace forecasts that in the long run, at least three other elements from the red mud spill in the Ajka region besides arsenic may pose prolonged environmental and health problems. The antimony, nickel and cadmium content of the contamination may be equally problematic to humans, animals and the environment – although from these only the concentration of the arsenic is considered to be at critical level. Located in Vienna, the Austrian Environment Agency (UBA) led research immediately following the accident detected 40 mg/kg value for the antimony that is classified as "potentially carcinogenic", three times the permitted limit in soils. The allergenic nickel count was 270 mg/kg, also a ratio above the threshold allowable in soils. The 7 mg/kg cadmium concentration could be below the threshold, but in the case of soils already laden with cadmium, for example due to using artificial fertilizers, it may still represent a concern. Cadmium is harmful to the reproductive and nervous systems.

It is important to note in regard to alkalinity and toxic metals that **according to the research done thus far, nowhere did the contamination penetrate deeper than 10 centimetres into the soils.** This relatively favourable circumstance for damage control can be explained with the structure of the red mud, especially its pore clogging characteristics.

7.3.2. Long-term effects to waters

To the surface water flows the alkaline slurry caused mainly short-term grievous environmental damage. The damaging effects of the slurry spread onto the floodplain and the sludge deposited in the riverbed have to be taken into consideration in multi-year perspective, too. Gypsum used to neutralize contaminants decreases the pH, promotes the deposition of the suspended red mud particles and bonds toxins to itself. Because of this (as well as due to the power plant gypsum potentially being further contaminated), the red mud mixed with gypsum, in some places of 50-70 cm thickness, has to be dredged from the beds of the Torna Creek, the Marcal River and to a smaller extent the Rába River.

A relatively small amount of acids used for neutralization got into rivers; this amount was diluted in the meantime and "went adrift", it does not take any further intervention.

Groundwater and drilled wells have to be tested on a continuous basis mainly for toxic metals and to detect water alkalinity. It can be expected that for the next few years or decades drilled wells of the region will only be suitable for irrigation, that is, even their use as drinking water for animals will be too risky.

7.4. Long-term effects of the measures taken

Detailed evaluation of administrative measures aimed for handling the mitigation of damages and of the consequences in the days following the accident, has not been done yet. **Experts generally agree that it has been beneficial to use acids and gypsum for neutralization, in order to protect the wildlife of more distant water bodies (Rába, Danube).** It occurred, at the same time, that larger amounts of these materials were also stored at locations closer to the site of the accident, this way the relief work could have been solved with less environmental pollution attributed to transportation.

During the time that has elapsed since the accident, the justifiability of the dam system construction began in the first days has not been proven. Many experts voiced doubts as to the necessity of the multi billion Forint investment. Furthermore, the decision to transport red mud and the contaminated soil from the relieved areas to the Ajka waste disposal site on public roads even though rail transportation capacity was also available can also be contested. This has resulted in damages done to residential buildings alongside the roads, to the roads themselves, and a significant dust and sound pollution accompanied by exhaust emissions, all of which would not have happened, had the railroad been used.

Following the disaster, the Central Agricultural Office prohibited the consumption of locally produced vegetables and fruits. Back then, this measure may have been justifiable for safety reasons and for lack of more detailed information. At the same time, the prohibitions on part the fodder crops, as well as local meat, milk and egg production need to be revised on a regular basis according to the results of the continuous measurements and examinations and they ought to be relaxed when necessary.

7.5. Official evaluations (by the authorities, the EU and the WHO)

The Hungarian authorities (the National Public Health and Medical Officer Service, the Central Agricultural Office, the Environmental Protection Inspectorate, Disaster Management) considered the efforts done to protect the population and the environment successful in their statements, despite the substantiated criticism on the part of NGOs. This event also supported the argument that in similar catastrophes the direct damage control, the damage relief and the settling of compensation cases are all fostered by continuous control by society, as well as the intensive dialogue among governmental and municipal authorities and NGOs.

The WHO team of experts evaluated damage control as effective mainly in terms of the mitigation of the longer term environmental impacts and preventing the spread of pollution to more distant water flows. The team of experts made noteworthy suggestions towards lowering the long-term environmental risks of the red mud reservoir. In addition, WHO recommended urgently carrying out an examination of the constituents of the sludge left in the reservoir and for assessing future risks, the organization considered it especially advisable to analyse the geohydrologic layer structure underneath the reservoir(s).

Similar to the WHO-experts, the EU-experts drew attention to the need for further measurements and analyses, indispensable for carrying out long-term measures. In their report they stated that drinking water quality is excellent, safe for human consumption. EU Experts called on Hungarian authorities to do everything in their power to prevent the contaminated alkaline water still seeping out of the reservoirs in large quantities from getting into the fresh waters.

7.6. Further necessary measures

7.6.1. Biomonitoring of the population

As the WHO reports also pointed out, **monitoring the health status of residents moving back into the area, as well as of those participating in the relief work will need to be continued in the future.** The organization recommended the assessment of possible mid- and long-term health effects as well, that might arise from direct contact with the sludge, from the potential contamination of locally produced food items and the drinking water. WHO found it necessary to create the local infrastructure for the targeted and regular screening of general health status, for reporting unexpected symptoms and their check-up, with special attention to the most sensitive groups of the population (in the meanwhile the government carried this out by establishing a screening and data collecting station). They suggested that the analytical capacity and the technical background of ÁNTSZ be improved, so that in similar situations it can react more effectively.

It makes analysis related to volatile dust particulates more difficult that there is no benchmark to compare the measured values to. There are only yearly and workplace related (8-hour) limit values—measurements typically approximate one thousandth of the latter value. Meanwhile, weekly patient turnover data is being collected from the family doctors of the region (in 19 districts). In comparison with the data from two weeks prior to the accident, an increase was experienced mostly in the frequency of complaints related to the respiratory system and the eye and mucous tissue, as well as a significant surge in the number of bronchitis cases.

7.6.2. Further necessary monitoring: water, dust, soil, groundwater

Within the air pollution measurements, emphasis should be placed on measuring volatile dust concentration and each more significant increase in pollution level has to be assessed, while the cause of the increase shall be eliminated. Further on, it is necessary to continuously measure the chemical composition of the soil, the groundwater, the wells and the surface waters. Test points need to be created in the centre of each built-up area and near the properties destroyed by the sludge spill. (It is worth noting here, that one of the two mobile air pollution measuring stations operating in Derecske was taken from Miskolc, thus significantly reducing the measuring capacity in a city with one of the worst air quality levels in the country.)

The ecotoxicological analysis of the spilled red mud has to be carried out by all means. Data available from previous times was collected when aluminium oxide was still exclusively produced in Hungary from domestic bauxite of known composition. The composition of the

present, partly imported raw material is however unknown. All what is clear is that half of the bauxite processed at Ajka is of domestic origin, the other half coming from Bosnia.

In the damaged agricultural areas there would be a need for a more detailed heavy metal analysis: to reveal in part the ecotoxicological, in part the biological effects of the contamination (presumably, the alkaline liquid destroyed a large portion of the organisms living in the soil).

An analysis conducted at the request of Benedek Jávor, the chair of the green committee in Parliament by the MTA TAKI Ecotoxicological Research Group in January 2011 repeatedly indicated high mercury and arsenic content. In addition it proved, thet concentration data merely with reference to individual contaminants are not sufficiently informative. **Ecotoxicological tests conducted with the indicator species (Daphnia magna) have demonstrated that the complex pollution has an impact on living organisms (as measured by the mortality rate) which is significantly higher than originally expected.**[1] Water analysis seems to constitute a task that is even more complex, among other things because besides the aforementioned toxic metals, the effect of the acids and gypsum used for neutralization, as well as the organic micro contaminants of the sedimentation need to be assessed (and in spring, as the ground thaws out, further contaminants can be expected to leach in). On top of all, the flood gushing through the built-in areas carried away huge amounts of pollutants of unknown composition (the contents of toilets and septic tanks, plant protection products, paints, used oil, etc.), thus the emergence of compounds of these can also be expected.

7.7. Risks of the continued operation

The continued operation of the Ajka plant and the red mud reservoirs also carries environmental risks. **The factory switches over to the dry deposition technology as of the beginning of March, nevertheless for a longer interim period they will mix gypsum to the deposited sludge in order to condense it. This solution has not yet been used anywhere; its environmental impacts are unknown.** The plan is to deposit the sludge cakes in Basin 10, but until its refill reaches the proper level, the dam shared by Basins 9 and 10 will not be supported from the Basin 10 side, which may result in its rupture. In Basins 9 and 10/A there is a certain amount of diluted slurry at present, too, and contaminated liquid seeps through the dams into the environment. The slurry wall surrounding the dams makes it harder for the leachate to get into the groundwater, at the same time it might contribute to a waterlogged condition in the footing of the dams some other parts, too. Gallium extraction remains to be associated with significant mercury contamination.

However, the main risk is represented by the fact that as long as the licensing and inspection practices of the authorities concerned do not change (we pointed out their faults in great detail above), **there is no institutional guarantee that technical or technological shortcomings potentially leading to further accidents will be revealed in time and the**

[1] How come there is mercury in the Torna creek?
http://lehetmas.hu/sajtokozlemenyek/11325/hogy-kerul-higany-a-torna-patakba/

necessary precautionary steps can be taken. As we have seen, in the reopening of the factory and during its operation, concerns related to keeping the market share and saving jobs had priority over environmental considerations, and it is not unlikely that this remains the case in the future as well.

Vegetation damaged in the spill needs to be replaced as well

8. Conclusion

The Kolontár red mud disaster was the greatest environmental crisis ever of the Central and Eastern European region. It was an accident that in terms of the presence of large amounts of accumulated contaminants often without a clearly identifiable owner, deficient regulations and insufficient control on the part of the authorities and civil society, could easily happen again in any of the countries of the region. This justified the preparation of an exhaustive report that would retrace the recent history of the company involved in the accident, MAL Co. Ltd. and the Hungarian aluminium industry, the process of privatization, the reasons for the accumulation of waste products like slurry and tailings, the technologies widely used for their treatment, would introduce the legal context, the practice of the authorities and all relevant factors which might help to understand events, draw the conclusions and identify the steps that can reduce the occurrence of similar accidents in the future.

The Baia Mare cyanide pollution in 2000 was the only environmental disaster of comparable dimensions in the region. At that time, it was the EU that provided assistance in collecting accurate information, clarifying the consequences, in damage control and the revision of regulations. That incident has exerted a strong influence on the development of European

environmental law, not in the least owing to the work done be the Baia Mare Task Force and the detailed and thorough documentation they prepared. Since the present case and objectives are of a similar nature, we thought it wise to follow the example set by the Task Force in preparing our study. Thus we set out to present how the differences in the legislation of Member States and the EU, the difficulties of applying the relevant regulations, and deficiencies in the legal framework and the work of authorities can lead to the similar accidents and what tasks the legislators should derive from the lessons of the recent disaster.

We think that most of the added value of the present report owes to the high level of uncertainty observed in the public opinion and at the political level regarding the disaster. Thus, there is need for a comprehensive study that will give an accurate image of the causes and extent of the pollution, the consequences to be reckoned with, and the legal, institutional, technological and financial conditions required to be met for damage limitation and prevention. As the manuscript of our report is being finalised, six months after the disaster, it is clear that neither the causes nor the environmental and health effects or the liability issues have been presented to the wider public in a lucid manner. No reliable information is available on establishments posing similar environmental risk; nobody knows if prevention and the remediation of damages should be the task of the state or the owners, and it is not clear which authorities should be inspecting slurry and tailings reservoirs. It is furthermore not widely known what existing technology should be used for neutralising industrial hazardous waste or its utilisation. These dilemmas are clearly explained by the study we aimed to prepare with investigative thoroughness, with references made to the relevant documents and with contributions by experts.

The most important finding of the report is that—though relevant Hungarian regulation in force still differs significantly from EU legislation—this accident would not have happened in this form and with such a severe impact, had all the authorities involved as well as the company adhered to existing regulations and carried out the tasks derived from the latter in the course of authorising and monitoring the reservoir at Ajka. The factors leading to the gravest results (excessive water content and alkalinity of the slurry in the reservoir, the sinking of the dam of the reservoir) can be traced back to omissions and faults in interpreting and applying the law which could, without a doubt, have been prevented. At the same time, politics also contributed to preparing the disaster by failing to include environmental guarantees in the privatization contracts, sabotaging the decision taken one and a half decades ago to work out policies of environmental liability insurance and by tolerating lax behaviour on the part of the authorities.

We put priority on elucidating the European dimensions of the case. We have presented how EU legislation deals with structures like red mud reservoirs, whether Hungarian environmental, construction and mining regulations comply in this respect with European rules (where is further need for legal harmonization) to what extent is the European legal framework suitable for managing environmental risk of such an order of magnitude, and where the law needs to be changed (both domestically and in the EU) to prevent disasters like the one in Kolontár and to alleviate efficient remediation should they nevertheless occur. We concluded that the Community acquis contains, for the most part, the provisions necessary for prevention, while the EU should exercise firmer behaviour regarding the implementation of the regulations concerned, as well as in controlling the proper management of the institutional

framework overseeing and enforcing regulations. Finally, the regulatory and financial background (including financial resources) for the rectification of the damage wrought should be established at the European level in the nearest future.

The report was edited by LMP's Sustainable Development Cabinet. Experts from Hungarian scientific institutions and NGOs who played a definitive part in investigating the accident (e.g. Greenpeace, Clean Air Action Group) as well as scholars of environmental law contributed to writing individual chapters. We organised two specialised conferences for initiating dialog among conflicting points of view and to find the consensus hoped for. We conducted several field trips at the disaster site, talked to the representatives of the residents of the affected areas, to the staff of national parks, officials of disaster management and the authorities concerned. All of this contributed to the preparation of a detailed document complete with quotations and references, verified several times scientifically, that experts, researchers, students and interested laymen can use as a reliable work of reference in the future both in Hungary and in other Member States. Finally, the report wishes to provide opportunities for decision makers to derive legislative and other tasks from the lessons of the disaster.

after hearing the Opinion of the Advocate General at the sitting on 16 December 2010,

gives the following

Judgment

1 These references for a preliminary ruling concern the interpretation of Article 9 of Council Directive 96/61/EC of 24 September 1996 concerning integrated pollution prevention and control (OJ 1996 L 257, p. 26), in its original version and as codified by Directive 2008/1/EC of the European Parliament and of the Council of 15 January 2008 concerning integrated pollution prevention and control (OJ 2008 L 24, p. 8; 'the IPPC Directive'), and of the provisions that are relevant, in light of the circumstances of the disputes in the main proceedings, of Directive 2001/81/EC of the European Parliament and of the Council of 23 October 2001 on national emission ceilings for certain atmospheric pollutants (OJ 2001 L 309, p. 22; 'the NEC Directive').

2 The references have been made in proceedings brought, as regards Case C-165/09, by the foundations Stichting Natuur en Milieu ('Natuur en Milieu') and Stichting Greenpeace Nederland ('Greenpeace') and by four natural persons against the College van Gedeputeerde Staten van Groningen (Provincial Executive of the Province of Groningen) concerning a decision by which the latter granted the company RWE Eemshaven Holding BV, formerly RWE Power AG ('RWE'), a permit for the construction and operation of a power station in the province of Groningen and, as regards Cases C-166/09 and C-167/09, by the foundations Natuur en Milieu, Stichting Zuid-Hollandse Milieufederatie ('Milieufederatie') and Greenpeace and the association Vereniging van Verontruste Burgers van Voorne (Association of Concerned Citizens of Voorne; 'the VVBV') against the College van Gedeputeerde Staten van Zuid-Holland (Provincial Executive of the Province of South Holland) concerning the decisions by which that authority granted the companies Electrabel Nederland N.V. ('Electrabel') and E.On Benelux N.V. ('E.On') respectively permits for the construction and operation of two power stations in the province of South Holland.

Legal context

European Union legislation

The IPPC Directive

3 As the IPPC Directive has codified and replaced Directive 96/61, the provisions of the latter will be set out below in their consolidated version, which does not result in their substantive alteration.

4 Recitals 3 and 9 in the preamble to the IPPC Directive state:

‘(3) The Fifth Environmental Action Programme … accorded priority to integrated pollution control as an important part of the move towards a more sustainable balance between human activity and socioeconomic development, on the one hand, and the resources and regenerative capacity of nature, on the other.

(9) The objective of an integrated approach to pollution control is to prevent emissions into air, water or soil wherever this is practicable, taking into account waste management, and, where it is not, to minimise them in order to achieve a high level of protection for the environment as a whole.’

5 Article 2(7) of the IPPC Directive defines ‘environmental quality standard’ as ‘the set of requirements which must be fulfilled at a given time by a given environment or particular part thereof, as set out in Community legislation’.

6 As stated in Article 2(12), ‘“best available techniques” means the most effective and advanced stage in the development of activities and their methods of operation which indicate the practical suitability of particular techniques for providing in principle the basis for emission limit values designed to prevent and, where that is not practicable, generally to reduce emissions and the impact on the environment as a whole’.

7 Article 4 of the IPPC Directive provides:

‘Member States shall take the necessary measures to ensure that no new installation is operated without a permit issued in accordance with this Directive …’

8 Article 9 of the IPPC Directive provides:

‘1. Member States shall ensure that the permit includes all measures necessary for compliance with the requirements of Articles 3 and 10 for the granting of permits in order to achieve a high level of protection for the environment as a whole by means of protection of the air, water and land.

…

3. The permit shall include emission limit values for polluting substances, in particular those listed in Annex III, likely to be emitted from the installation concerned in significant quantities, having regard to their nature and their potential to transfer pollution from one medium to another (water, air and land). If necessary, the permit shall include appropriate requirements ensuring protection of the soil and ground water and measures concerning the management of waste generated by the installation. Where appropriate, limit values may be supplemented or replaced by equivalent parameters or technical measures.

…

4. Without prejudice to Article 10, the emission limit values and the equivalent parameters and technical measures referred to in paragraph 3 shall be based on the best available techniques, without prescribing the use of any technique or specific technology, but taking into account the technical characteristics of the installation concerned, its geographical location and the local environmental conditions. In all circumstances, the conditions of the permit shall contain provisions on the minimisation of long-distance or transboundary pollution and ensure a high level of protection for the environment as a whole.

…

7. The permit may contain such other specific conditions for the purposes of this Directive as the Member State or competent authority may think fit.

8. Without prejudice to the obligation to implement a permit procedure pursuant to this Directive, Member States may prescribe certain requirements for certain categories of installations in general binding rules instead of including them in individual permit conditions, provided that an integrated approach and an equivalent high level of environmental protection as a whole are ensured.'

9 Article 10 of the IPPC Directive is worded as follows:

'Where an environmental quality standard requires stricter conditions than those achievable by the use of the best available techniques, additional measures shall in particular be required in the permit, without prejudice to other measures which might be taken to comply with environmental quality standards.'

10 Article 19(2) of the IPPC Directive provides:

'In the absence of Community emission limit values defined pursuant to this Directive, the relevant emission limit values contained in the Directives listed in Annex II and in other Community legislation shall be applied as minimum emission limit values pursuant to this Directive for the installations listed in Annex I.'

11 Annex II to the IPPC Directive lists the following directives:

'1. Council Directive 87/217/EEC of 19 March 1987 on the prevention and reduction of environmental pollution by asbestos.

2. Council Directive 82/176/EEC of 22 March 1982 on limit values and quality objectives for mercury discharges by the chlor-alkali electrolysis industry.

3. Council Directive 83/513/EEC of 26 September 1983 on limit values and quality objectives for cadmium discharges.

4. Council Directive 84/156/EEC of 8 March 1984 on limit values and quality objectives for mercury discharges by sectors other than the chlor-alkali electrolysis industry.

5. Council Directive 84/491/EEC of 9 October 1984 on limit values and quality objectives for discharges of hexachlorocyclohexane.

6. Council Directive 86/280/EEC of 12 June 1986 on limit values and quality objectives for discharges of certain dangerous substances included in List I of the Annex to Directive 76/464/EEC.

7. Directive 2000/76/EC of the European Parliament and of the Council of 4 December 2000 on the incineration of waste.

8. Council Directive 92/112/EEC of 15 December 1992 on procedures for harmonising the programmes for the reduction and eventual elimination of pollution caused by waste from the titanium dioxide industry.

9. Directive 2001/80/EC of the European Parliament and of the Council of 23 October 2001 on the

limitation of emissions of certain pollutants into the air from large combustion plants.

10. Directive 2006/11/EC of the European Parliament and of the Council of 15 February 2006 on pollution caused by certain dangerous substances discharged into the aquatic environment of the Community.

11. Directive 2006/12/EC of the European Parliament and of the Council of 5 April 2006 on waste.

12. Council Directive 75/439/EEC of 16 June 1975 on the disposal of waste oils.

13. Council Directive 91/689/EEC of 12 December 1991 on hazardous waste.

14. Council Directive 1999/31/EC of 26 April 1999 on the landfill of waste.'

The NEC Directive

12 Recitals 11 and 12 in the preamble to the NEC Directive state:

'(11) A set of national ceilings for each Member State for emissions of sulphur dioxide, nitrogen oxides, volatile organic compounds and ammonia is a cost-effective way of meeting interim environmental objectives. Such emission ceilings will allow the Community and the Member States flexibility in determining how to comply with them.

(12) Member States should be responsible for implementing measures to comply with national emission ceilings. It will be necessary to evaluate progress towards compliance with the emission ceilings. National programmes for the reduction of emissions should therefore be drawn up and reported on to the Commission and should include information on the measures adopted or envisaged to comply with the emission ceilings.'

13 Recital 19 in the preamble to the NEC Directive states as follows:

'The provisions of this Directive should apply without prejudice to the Community legislation regulating emissions of those pollutants from specific sources and to the provisions of [Directive 96/61] in relation to emission limit values and use of best available techniques.'

14 The aim of the NEC Directive, according to Article 1, is to limit emissions of acidifying and eutrophying pollutants and ozone precursors in order to improve the protection of the environment and human health against risks of adverse effects from acidification, soil eutrophication and ground-level ozone.

15 Article 4 of the NEC Directive, which is headed 'National emission ceilings', provides:

'1. By the year 2010 at the latest, Member States shall limit their annual national emissions of the pollutants sulphur dioxide (SO_2), nitrogen oxides (NO_x), volatile organic compounds (VOC) and ammonia (NH_3) to amounts not greater than the emission ceilings laid down in Annex I, taking into account any modifications made by Community measures adopted following the reports referred to in Article 9.

2. Member States shall ensure that the emission ceilings laid down in Annex I are not exceeded in any year after 2010.'

16 Article 6 of the NEC Directive states:

‘1. Member States shall, by 1 October 2002 at the latest, draw up programmes for the progressive reduction of national emissions of the pollutants referred to in Article 4 with the aim of complying at least with the national emission ceilings laid down in Annex I by 2010 at the latest.

2. The national programmes shall include information on adopted and envisaged policies and measures and quantified estimates of the effect of these policies and measures on emissions of the pollutants in 2010. Anticipated significant changes in the geographical distribution of national emissions shall be indicated.

3. Member States shall update and revise the national programmes as necessary by 1 October 2006.

4. Member States shall make available to the public and to appropriate organisations such as environmental organisations the programmes drawn up in accordance with paragraphs 1, 2 and 3. Information made available to the public and to organisations under this paragraph shall be clear, comprehensible and easily accessible.’

17 Article 7(1) and (2) of the NEC Directive is worded as follows:

‘1. Member States shall prepare and annually update national emission inventories and emission projections for 2010 for the pollutants referred to in Article 4.

2. Member States shall establish their emission inventories and projections using the methodologies specified in Annex III.’

18 Article 8(1) and (2) of the NEC Directive provides:

‘1. Member States shall each year, by 31 December at the latest, report their national emission inventories and their emission projections for 2010 established in accordance with Article 7 to the Commission and the European Environment Agency. They shall report their final emission inventories for the previous year but one and their provisional emission inventories for the previous year. Emission projections shall include information to enable a quantitative understanding of the key socioeconomic assumptions used in their preparation.

2. Member States shall, by 31 December 2002 at the latest, inform the Commission of the programmes drawn up in accordance with Article 6(1) and (2).

Member States shall, by 31 December 2006 at the latest, inform the Commission of the updated programmes drawn up in accordance with Article 6(3).’

19 Annex I to the NEC Directive lays down for the Kingdom of the Netherlands an emission ceiling of 50 kilotonnes of SO_2 and 260 kilotonnes of NO_x to be attained by 2010 at the latest.

National legislation

20 Directive 96/61 and the IPPC Directive have been transposed into domestic law by amending certain provisions of the Law on Environmental Management (Wet Milieubeheer; ‘the WMB’). Under Article 8.1(1)(b) of the WMB, it is prohibited, without a permit granted for that purpose, to modify an installation covered by Directive 96/61, and subsequently by the IPPC Directive, or to convert its

operation.

21 In particular, Article 8.10 of the WMB provides that a permit for the construction and operation of such an installation may be refused only in the interests of environmental protection. Article 8.10(2)(a) specifies in this regard that a permit is to be refused in any event if it cannot be ensured by its grant that the best available techniques will be applied in the installation in question.

22 As provided by Article 8.11(2) of the WMB, a permit may be granted subject to restrictions where the interests of environmental protection so require.

23 The Netherlands authorities have taken a number of steps and adopted several measures in order to implement and transpose the NEC Directive.

24 In accordance with Article 8(2) of that directive, in December 2002 the State Secretary for Housing, Spatial Planning and the Environment (Staatssecretaris van Volkshuisvesting, Ruimtelijke Ordening en Milieubeheer) drew up and notified to the Commission the report on the national programme relating to emission ceilings concerning acidification and large-scale air pollution ('Rapportage emissieplafonds verzuring en grootschalige luchtverontreiniging 2002'). In 2003, he drew up the implementing memorandum relating to the emission ceilings concerning acidification and large-scale air pollution ('Uitvoeringsnotitie emissieplafonds verzuring en grootschalige luchtverontreiniging 2003 Erop of eronder'), which sets out the measures envisaged and divides up the national emission ceilings on a sectoral basis.

25 On 6 July 2005 the Law of 16 June 2005 amending the Law on Air Pollution (implementation of the EC directive on national emission ceilings) (Wet van 16 juni 2005 tot wijziging van de Wet inzake de luchtverontreiniging (uitvoering EG-richtlijn nationale emissieplafonds)) and the Decree to implement the EC directive on national emission ceilings (Besluit uitvoering EG-richtlijn nationale emissieplafonds) entered into force.

26 In accordance with Article 8(2) of the NEC Directive, the national environmental-policy programme was revised and updated in 2006. For that purpose, the Minister for Housing, Spatial Planning and the Environment (Minister van Volkshuisvesting, Ruimtelijke Ordening en Milieubeheer; 'the Minister') adopted a report on the emission ceilings concerning acidification and large-scale air pollution ('Uitvoeringsnotitie emissieplafonds verzuring en grootschalige luchtverontreiniging 2006'), which included a set of legal requirements, tax measures and binding agreements that was envisaged in order to comply by 31 December 2010 at the latest with the emission ceilings laid down for the Kingdom of the Netherlands.

27 On 28 June 2007 the Minister, acting upon the implementing memorandum relating to the emission ceilings concerning acidification and large-scale air pollution that had been drawn up by the State Secretary for Housing, Spatial Planning and the Environment, set the sectoral SO_2 emission ceiling for the energy sector at a total of 13.5 kilotonnes per year, without taking account of the bringing into operation of new power stations. A binding and enforceable memorandum of understanding on SO_2 was concluded on 26 June 2008 between the national authorities concerned, the provincial authorities (including those of South Holland and Groningen) and all the electricity companies, so that it would be obligatory for all the signatories to comply with this emission limit in the energy sector over a period extending until 31 December 2019.

28 In the context of the national emission ceiling for NO_x, on the other hand, the Netherlands authorities set up an emissions trading scheme, on the basis of a target of 55 kilotonnes of NO_x emissions in 2010

for their large industrial installations.

The main actions and the questions referred for a preliminary ruling

29 In Case C-165/09, by decision of 11 December 2007 the College van Gedeputeerde Staten van Groningen granted RWE a permit for the construction and operation of a power station fuelled by pulverised coal and biomass at Eemshaven, an industrial site in Eemsmond.

30 The total annual emissions from this installation, from its entry into operation envisaged in 2012 at the earliest, should amount to 1 454 tonnes of SO_2, which constitute roughly 2.9% of the national emission ceiling for this pollutant.

31 Natuur en Milieu, Greenpeace, Mr and Mrs Meijer, Mr Zwaag and Mr Pals brought an action challenging that decision before the Raad van State (Council of State).

32 In Case C-166/09, the College van Gedeputeerde Staten van Zuid-Holland granted a permit on 11 March 2008 for Electrabel's proposed construction and operation of a power station fuelled by pulverised coal and biomass on Missouriweg, Rotterdam.

33 This power station, which will not be brought into operation before 2013, should generate annual emissions amounting to 580 tonnes of SO_2 and 730 tonnes of NO_x, that is to say, 1.2% and 0.3% respectively of the national emission ceilings laid down for SO_2 and NO_x.

34 Natuur en Milieu, Milieufederatie, Greenpeace and the VVBV challenged the decision granting this permit before the Raad van State.

35 In Case C-167/09, by decision of 26 October 2007 the College van Gedeputeerde Staten van Zuid-Holland granted E.On a partial revision permit authorising a new installation, on Coloradoweg in the industrial area of Rotterdam, for the production of electricity by burning mainly coal.

36 The total annual emissions envisaged once the installation has been brought into operation, in 2012 at the earliest, should amount to 923 tonnes of SO_2 and 1 535 tonnes of NO_x, which respectively amount to 1.8% and 0.6% of the national emission ceilings for SO_2 and NO_x.

37 Natuur en Milieu, Milieufederatie, Greenpeace and the VVBV brought an action challenging that decision granting a permit before the Raad van State.

38 In those three actions, the applicants submitted in essence that, given the fact that the emission ceilings laid down for the Kingdom of the Netherlands by the NEC Directive would not be complied with at the end of 2010, the competent authorities should not have granted the permits or should, at least, have granted them subject to stricter conditions.

39 In its orders for reference, the Raad van State endorsed the proposition that, when the permits were granted, the policy and measures adopted were not sufficient to enable the Kingdom of the Netherlands to achieve by the end of 2010 the objective referred to in Article 4 of the NEC Directive.

40 Indeed, as was apparent in particular from the report drawn up by the Minister on the emission ceilings concerning acidification and large-scale air pollution, from the report drawn up by AEA Energy & Environment in 2008 on the evaluation of national plans submitted under the NEC Directive and from 'Environmental Balance 2008' ('Milieubalans 2008') adopted by the Planbureau voor de

Leefomgeving (Netherlands Environmental Assessment Agency), the national emission ceilings for SO_2 and NO_x would, according to the estimates, probably be exceeded in the Netherlands in 2010 without a change in policy.

41 Thus, in each of the main actions, the Raad van State was prompted to ponder over certain aspects of European Union law, in identical terms subject to the following provisos:

– in Case C-165/09, only the emission ceiling for SO_2 laid down by the NEC Directive is at issue, whereas Cases C-166/09 and C-167/09 also relate to the emission ceiling for NO_x that is referred to by that directive;

– given the time at which the facts in the main proceedings occurred, the first question referred for a preliminary ruling in Cases C-165/09 and C-167/09 relates to the interpretation of Article 9 of Directive 96/61, whilst in Case C-166/09 the first question refers to the same provision, the wording of which is unchanged, as codified by the IPPC Directive.

42 In those circumstances, the Raad van State decided to stay the proceedings and, in each of the three cases before it, to refer the following questions to the Court for a preliminary ruling:

‘1. Does the obligation of interpretation in conformity with directives imply that the obligations under Directive [96/61] (now [the IPPC Directive]) [(Cases C-165/09 and C-167/09)] [or] [the IPPC Directive] [(Case C-166/09)], as transposed in the [WMB], can and must be interpreted as meaning that, in deciding on an application for an environmental permit, the national emission ceiling for SO_2 [(Case C-165/09)] [or] the national emission ceilings for SO_2 and NO_x [(Cases C-166/09 and C-167/09)] in [the NEC Directive] must be fully taken into account, in particular as regards the obligations under Article 9(4) of [the IPPC Directive]?

2. (a) Does the duty of a Member State to refrain from taking measures liable seriously to compromise the attainment of the result prescribed by a directive also apply during the period of 27 November 2002 to 31 December 2010 envisaged in Article 4(1) of the NEC Directive?

(b) Do positive obligations rest with the Member State concerned during the relevant period of 27 November 2002 to 31 December 2010, either in parallel with the aforementioned duty to refrain or in place thereof, if the national emission ceiling for SO_2 and/or NO_x in the NEC Directive is exceeded, or if there is a risk that it may be exceeded, at the end of that period?

(c) In answering Questions 2(a) and 2(b), is it significant that an application for an environmental permit for an installation which contributes to the national emission ceiling for SO_2 and/or NO_x in the NEC Directive being exceeded or the risk of its being exceeded indicates that the installation will become operational in the year 2011 at the earliest?

3. (a) Do the obligations referred to in Question 2 mean that, in the absence of guarantees that the installation for which an environmental permit has been sought will not contribute to the national emission ceiling for SO_2 and/or NO_x in the NEC Directive being exceeded or the risk of its being exceeded, the Member State must refuse the application for the environmental permit or attach further conditions or restrictions to it? In answering that

question, is the extent to which the installation contributes to the emission ceiling being exceeded or the risk of its being exceeded of significance?

(b) Or does it follow from the NEC Directive that, even where the national emission ceiling for SO_2 and/or NO_x is exceeded or risks being exceeded, a Member State has the discretion to bring about the result prescribed by the directive not by refusing the permit or by making it subject to further conditions or restrictions, but rather by adopting other measures such as other forms of compensation?

4. Where obligations as referred to in Questions 2 and 3 rest with a Member State, can an individual bring the issue of compliance with those obligations before a national court?

5. (a) Can an individual rely directly on Article 4 of the NEC Directive?

(b) If so, is it possible to do so from 27 November 2002 or only from 31 December 2010? Is it significant, when answering that question, that the application for an environmental permit indicates that the installation will become operational in the year 2011 at the earliest?

6. More particularly, if the grant of an environmental permit and/or other measures contribute to the national emission ceiling for SO_2 and/or NO_x in the NEC Directive being exceeded or the risk of its being exceeded, is an individual entitled, on the basis of Article 4 of that directive:

(a) to make a general claim that the Member State concerned should adopt a package of measures which, by 2010 at the latest, would limit the annual national emissions of SO_2 and NO_x to amounts not greater than the national emission ceilings in the NEC Directive, or, if that does not succeed, a package of measures which would limit the emissions to those amounts as soon as possible thereafter;

(b) to make concrete claims that the Member State concerned should adopt specific measures in respect of an individual installation – for example, by refusing a permit or attaching further conditions or restrictions to the permit – which, by the year 2010 at the latest, would contribute to the annual national emissions of SO_2 and NO_x being limited to amounts not greater than the national emission ceilings in the NEC Directive, or, if that does not succeed, specific measures which would contribute to the emissions being limited to those amounts as soon as possible thereafter?

(c) In answering Questions 6(a) and 6(b), is the extent to which the installation contributes to the emission ceiling being exceeded or the risk of its being exceeded of significance?'

43 By order of the President of the Court of 24 June 2009, Cases C-165/09 to C-167/09 were joined for the purposes of the written and oral procedure and the judgment.

Admissibility

44 RWE, Electrabel and E.On contest the admissibility of the references for a preliminary ruling.

45 In particular, those companies submit, first, that inasmuch as the questions referred relate to interpretation of the provisions of the NEC Directive, they bear no relation to the subject-matter of the

main actions, which concern grant of an environmental permit under the national rules which have transposed the IPPC Directive into domestic law, and second, that the questions referred are hypothetical as the national programmes adopted enable the Kingdom of the Netherlands not to exceed, as at 31 December 2010, the emission ceilings laid down for SO_2 and NO_x.

46 E.On further submits that the Raad van State could have decided the main actions on the basis of existing well-established case-law that leaves no doubt as to the correct application of the European Union law concerned.

47 It should be recalled that, in accordance with settled case-law, in proceedings under Article 267 TFEU, which are based on a clear separation of functions between the national courts and the Court of Justice, the national court alone has jurisdiction to find and assess the facts in the case before it and to interpret and apply national law. Similarly, it is solely for the national court, before which the dispute has been brought and which must assume responsibility for the forthcoming judicial decision, to determine, in the light of the particular circumstances of the case, both the need for and the relevance of the questions which it submits to the Court. Consequently, where the questions submitted concern the interpretation of European Union law, the Court is in principle bound to give a ruling (see Case C-145/03 *Keller* [2005] ECR I-2529, paragraph 33; Case C-119/05 *Lucchini* [2007] ECR I-6199, paragraph 43; and Case C-11/07 *Eckelkamp and Others* [2008] ECR I-6845, paragraphs 27 and 32).

48 The Court is not bound to give a ruling, in particular, where it is quite obvious that the interpretation of European Union law that is sought bears no relation to the actual facts of the main action or its purpose or where the problem is hypothetical (see, to this effect, Case C-379/98 *PreussenElektra* [2001] ECR I-2099, paragraph 39, and Case C-169/07 *Hartlauer* [2009] ECR I-1721, paragraph 25).

49 However, that is not the case in the present proceedings.

50 In the orders for reference, the Raad van State, first, is uncertain specifically as to whether the obligations flowing from the IPPC Directive, in particular from Article 9, require the competent national authorities to take account, when granting a permit under that directive ('environmental permit'), of the national SO_2 and NO_x ceilings laid down by the NEC Directive. Consequently, it cannot be maintained that the interpretation of the NEC Directive's provisions that is sought bears no relation to the subject-matter of the main proceedings.

51 Second, the Raad van State is unsure as to the scope of the obligations owed by the Member States under Article 4 of the NEC Directive and its other relevant provisions, in particular in situations where risks remain that Member States will not comply with the national SO_2 and NO_x ceilings laid down by that directive. Since the parties do not all agree upon the assessment of the technical information and scientific data which are referred to in this last respect by the Raad van State and such risks cannot be ruled out, it at any rate does not appear obvious that the questions referred are hypothetical in light of the decisions which the national court is called upon to make in the main actions.

52 Furthermore, as regards E.On's argument that the questions submitted in the present cases concern an interpretation of European Union law that follows fairly clearly from the Court's well-established case-law, it is to be remembered that Article 267 TFEU always allows a national court, if it considers it desirable, to refer questions of interpretation to the Court (see, to this effect, Joined Cases 28/62 to 30/62 *Da Costa and Others* [1963] ECR 31, 38; Case 283/81 *Cilfit and Others* [1982] ECR 3415, paragraph 15; and Case C-45/09 *Rosenbladt* [2010] ECR I-0000, paragraph 31).

53 Consequently, the references for a preliminary ruling must be considered admissible.

Substance

Preliminary remarks

54 In the orders for reference submitted to the Court, the Raad van State mentions both Directive 96/61 and the IPPC Directive, in light of the time material in the main proceedings.

55 However, inasmuch as the provisions of Article 9 of Directive 96/61 and of the IPPC Directive to which the first question relates have the same wording and must therefore be interpreted in the same way (see Case C-513/99 *Concordia Bus Finland* [2002] ECR I-7213, paragraph 91, and Case C-331/04 *ATI EAC e Viaggi di Maio and Others* [2005] ECR I-10109, paragraph 20), the Court can give a proper answer to the questions by referring only to the consolidated version of those provisions.

Question 1

56 By its first question, the Raad van State asks, in essence, whether Article 9(1), (3) and (4) of the IPPC Directive must be interpreted as meaning that, when granting an environmental permit for the construction and operation of an industrial installation, the competent national authorities are obliged to include among the conditions for grant of that permit the national emission ceilings for SO_2 and NO_x laid down by the NEC Directive.

57 It must be stated at the outset that, as all the Member States which have intervened in the present proceedings have also maintained, none of these paragraphs of Article 9 of the IPPC Directive refers, expressly or by implication, to those emission ceilings.

58 Article 9(1) of the IPPC Directive does not refer to the emission ceilings when it obliges Member States to ensure that the environmental permit includes all measures necessary for compliance with the requirements of Article 3 thereof. Article 3 in fact merely requires, first, that installations be operated in such a way that the appropriate preventive measures are adopted so that no significant pollution is caused, in particular through application of the best available techniques, and second, that waste production be avoided or limited in order to reduce the impact on the environment, that energy be used efficiently, and that the necessary measures be taken in order to prevent accidents or limit their consequences and also, upon definitive cessation of activities, in order to avoid any pollution risk and return the site of operation to a satisfactory state.

59 Nor does any reference result from Article 9(1) of the IPPC Directive, read in conjunction with Article 9(4), in so far as it requires the competent national authorities also to observe, where appropriate, the requirements of Article 10 for the granting of permits.

60 Article 10 of the IPPC Directive provides in particular that additional measures are to be required in the permit where ‘environmental quality standards’ require stricter conditions than those achievable by the use of the best available techniques.

61 It is apparent, however, from the wording of Article 2(7) of the IPPC Directive that those standards are rules laying down ‘requirements which must be fulfilled at a given time by a given environment or particular part thereof’ and are therefore linked to the qualitative characteristics of the elements protected.

62 As the Advocate General also has observed in point 63 of her Opinion, the national emission ceilings laid down by the NEC Directive do not involve such characteristics, since those ceilings refer to the total quantity of polluting substances that can be discharged into the atmosphere and not to specific qualitative requirements, relating to concentrations of polluting substances, that must be met at a given time by that particular medium.

63 Likewise, no reference to the emission ceilings in question results from Article 9(3) of the IPPC Directive. It is true that, under that provision, all environmental permits must include emission limit values for polluting substances, including SO_2 and NO_x, likely to be emitted from the installations concerned.

64 However, Article 19(2) of the IPPC Directive provides in this regard that, in the absence of Community emission limit values, it is the values contained 'in the Directives listed in Annex II and in other Community legislation' which are to be applied, as minimum emission limit values, for those installations.

65 The NEC Directive, first, is not among the directives listed in Annex II to the IPPC Directive. Second, inasmuch as it lays down national emission ceilings for pollutants discharged into the atmosphere by multiple unspecified sources and activities, the NEC Directive equally cannot be regarded as 'other Community legislation' containing emission limit values since the latter constitute, under Article 2 of the IPPC Directive, 'the mass, expressed in terms of certain specific parameters, concentration and/or level of an emission, which may not be exceeded during one or more periods of time … [that] normally apply at the point where the emissions leave the installation'.

66 Finally, Article 9(4) of the IPPC Directive contains no reference by implication to the ceilings mentioned in the NEC Directive. The first sentence of that provision merely states that the emission limit values must be based on application of the best available techniques, without prescribing the use of any technique or specific technology, but taking into account the technical characteristics of the installation concerned, its geographical location and the local environmental conditions.

67 Also, the obligation, laid down in the second sentence of Article 9(4) of the IPPC Directive, to see to it that the conditions of the permit contain provisions on the minimisation of long-distance or transboundary pollution and ensure a high level of protection for the environment as a whole, can be interpreted only in the context of the system established by the IPPC Directive itself and in particular of the rule, set out in the first sentence of Article 9(4), under which it is mandatory for the emission limit values to be based on the best available techniques.

68 It should, moreover, be added that the IPPC Directive, which was adopted on the basis of Article 175(1) EC in order to achieve the objectives and implement the principles of the European Union's environment policy which are referred to in Article 174 EC, does not envisage complete harmonisation. In this context, the Member States retain the power, in accordance with Article 9(7) and (8) of the directive, to prescribe other specific – possibly more stringent – permit conditions, and to prescribe certain requirements for certain categories of installations in general binding rules provided that an integrated approach and an equivalent high level of environmental protection as a whole are ensured.

69 That having been explained, it must next be stated that equally no provision of the NEC Directive imposes obligations on the competent national authorities to regard the national emission ceilings for SO_2 and NO_x, when granting an environmental permit, as a condition for the permit.

70 On the contrary, the European Union legislature expressly stated, in recital 19 in its preamble, that the

NEC Directive should apply 'without prejudice to [the provisions of the IPPC Directive] in relation to emission limit values and use of best available techniques', thereby indicating that the obligations owed by the Member States under the NEC Directive cannot directly affect those flowing, inter alia, from Article 9 of the IPPC Directive.

71 This interpretation is borne out, finally, by the different purpose and the general scheme of both of the directives in question.

72 The objective of the IPPC Directive, as set out in essence in Article 1 thereof, is to achieve integrated prevention and control of pollution by the implementation of measures designed to prevent or, where that is not practicable, to reduce emissions, from the activities referred to there, in the air, water and land in order to achieve a high level of protection of the environment taken as a whole. That integrated approach is realised by appropriate coordination of the procedure and authorisation conditions for industrial installations whose potential for pollution is significant (see to this effect, in respect of Directive 96/61, Case C-473/07 *Association nationale pour la protection des eaux et rivières and OABA* [2009] ECR I-319, paragraphs 25 and 26).

73 For this purpose, as the Commission stated in its Communication of 21 December 2007 to the Council, the European Parliament, the Economic and Social Committee and the Committee of the Regions – Towards an improved policy on industrial emissions (COM(2007) 843 final), the IPPC Directive establishes the principles for the permitting and control of large industrial installations based on an integrated approach and the application of best available techniques, which are the most effective techniques to achieve a high level of environmental protection, taking into account the costs and benefits.

74 On the other hand, the NEC Directive is intended, as follows from Articles 1 and 2 thereof, to limit emissions, produced by any source, of acidifying and eutrophying pollutants and ozone precursors in order to improve the protection of the environment and human health, with the long-term objective of not exceeding critical levels and loads.

75 Furthermore, as is clear from Article 4 of the NEC Directive and recitals 11 and 12 in its preamble, that directive is based on a purely programmatic approach under which the Member States enjoy wide flexibility as regards the choice of the policies and measures to be adopted or envisaged, within the framework of national programmes concerning all sources of pollution, in order progressively to achieve a structural reduction of emissions of inter alia SO_2 and NO_x to amounts not exceeding, at the end of 2010 at the latest, the emission ceilings laid down in Annex I to the directive. It follows that attainment of the objectives set by the directive cannot interfere directly in the procedures for grant of an environmental permit.

76 In light of all the foregoing considerations, the answer to the first question therefore is that Article 9(1), (3) and (4) of the IPPC Directive must be interpreted as meaning that, when granting an environmental permit for the construction and operation of an industrial installation, such as those at issue in the main actions, the Member States are not obliged to include among the conditions for grant of that permit the national emission ceilings for SO_2 and NO_x laid down by the NEC Directive, whilst they must comply with the obligation arising from the NEC Directive to adopt or envisage, within the framework of national programmes, appropriate and coherent policies and measures capable of reducing, as a whole, emissions of inter alia those pollutants to amounts not exceeding the ceilings laid down in Annex I to that directive by the end of 2010 at the latest.

Questions 2 and 3

77 By its second and third questions, which it is appropriate to examine together, the national court asks in essence, first, what obligations are owed by the Member States under the NEC Directive during the period between 27 November 2002, when the time-limit for its transposition expired, and 31 December 2010, the deadline after which the Member States must comply with the emission ceilings laid down by it. Second, the national court is uncertain whether, in light of those obligations, the competent national authorities might be obliged to refuse or to attach restrictions to the grant of an environmental permit, or to adopt specific compensatory measures, where the national emission ceilings for SO_2 and NO_x under the NEC Directive are exceeded or risk being exceeded.

Obligation to refrain from taking any measures liable seriously to compromise the attainment of the result prescribed by a directive

78 First of all, it is to be remembered that it is settled case-law that, during the period prescribed for transposition of a directive, the Member States to which it is addressed must refrain from taking any measures liable seriously to compromise the attainment of the result prescribed by that directive (Case C-129/96 *Inter-Environnement Wallonie* [1997] ECR I-7411, paragraph 45; Case C-14/02 *ATRAL* [2003] ECR I-4431, paragraph 58; and Joined Cases C-261/07 and C-299/07 *VTB-VAB and Galatea* [2009] ECR I-2949, paragraph 38). Such an obligation to refrain owed by all the national authorities (see Case C-212/04 *Adeneler and Others* [2006] ECR I-6057, paragraph 122 and the case-law cited) must be understood as referring to the adoption of any measure, general or specific, liable to produce such a compromising effect.

79 This obligation to refrain from taking measures is also owed by the Member States, by virtue of the application of Article 4(3) TEU in conjunction with the third paragraph of Article 288 TFEU, during a transitional period in which they are authorised to continue to apply their national systems, even though those systems do not comply with the directive in question (see Case C-316/04 *Stichting Zuid-Hollandse Milieufederatie* [2005] ECR I-9759, paragraph 42, and Case C-138/05 *Stichting Zuid-Hollandse Milieufederatie* [2006] ECR I-8339, paragraph 42).

80 It therefore follows that such an obligation is also to be complied with in the transitional period provided for in Article 4 of the NEC Directive, during which the Member States are authorised not to comply for the time being with the annual national emission quantities laid down in Annex I to that directive. It is for the national court to review whether this obligation has been complied with in the light of the provisions and measures whose legality it is called upon to examine (see, to this effect, *Inter-Environnement Wallonie*, paragraph 46).

81 Nevertheless, such a review must necessarily be conducted on the basis of an overall assessment, taking account of all the policies and measures adopted in the national territory concerned.

82 Having regard to the system established by the NEC Directive and, in particular, to the programmatic approach, as noted in paragraph 75 of the present judgment, for which it provides, attainment of the result prescribed by that directive can be seriously impeded by the Member States only by the adoption and implementation of a body of policies and measures which, given, in particular, their effects in practice and their duration in time, allow or give rise to a critical situation in light of the total quantity of emissions discharged into the atmosphere by all sources of pollution, such as necessarily to compromise compliance, at the end of 2010, with the ceilings laid down in Annex I to the directive (see, by analogy, *Inter-Environnement Wallonie*, paragraphs 47 and 49).

83 It follows that a simple specific measure relating to a single source of SO_2 and NO_x, consisting in the decision to grant an environmental permit for the construction and operation of an industrial installation,

does not appear liable, in itself, seriously to compromise the result prescribed by the NEC Directive, namely limiting emissions from those sources of pollution into the atmosphere to annual total amounts not exceeding the national ceilings in 2010 at the latest. This conclusion applies all the more where, in circumstances such as those in the main actions, the installation in question is not to be brought into operation until 2012 at the earliest.

Positive obligations owed by the Member States during the transitional period from 27 November 2002 to 31 December 2010

84 With regard to the question of whether and, if so, what positive obligations are owed by the Member States during the transitional period from 27 November 2002 to 31 December 2010, it should be recalled that, in accordance with settled case-law, the obligation of a Member State to take all the measures necessary to achieve the result prescribed by a directive is a binding obligation imposed by the third paragraph of Article 288 TFEU and by the directive itself (Case 152/84 *Marshall* [1986] ECR 723, paragraph 48; Case 72/95 *Kraaijeveld and Others* [1996] ECR I-5403, paragraph 55; and *Inter-Environnement Wallonie*, paragraph 40).

85 It follows from that obligation that, during the period prescribed for transposition, the Member States must take the measures necessary to ensure that the result prescribed by the directive is achieved at the end of that period (*Inter-Environnement Wallonie*, paragraph 44). The same is true as regards a transitional period, such as the period provided for in Article 4 of the NEC Directive.

86 It should be noted that the NEC Directive itself lays down certain positive obligations on the Member States during that period, concerning in particular the establishment of overall action strategies with the aim of progressively reducing annual emissions of the pollutants concerned, by the end of 2010 at the latest, to amounts not exceeding the ceilings laid down by Annex I to the directive.

87 More specifically, under Articles 6 and 8(2) of the NEC Directive, the Member States must draw up by 1 October 2002 at the latest, and then update and revise as necessary by 1 October 2006 at the latest, programmes for the progressive reduction of the emissions in question, which they are obliged to make available to the public and appropriate organisations by means of clear, comprehensible and easily accessible information, and to notify to the Commission within the time-limit prescribed. Articles 7(1) and (2) and 8(1) of the NEC Directive also oblige the Member States to prepare and annually update national inventories of those emissions and national emission projections for 2010. The final emission inventories for the previous year but one and the provisional emission inventories for the previous year, as well as the national emission projections for 2010, must be reported to the Commission and the European Environment Agency each year, by 31 December at the latest (see, to this effect, the judgment of 18 December 2008 in Case C-273/08 *Commission* v *Luxembourg*, not published in the ECR, paragraphs 2 and 11).

88 As regards the specific content of those national programmes, it must nevertheless be found that, as noted in paragraph 75 of the present judgment, the wide flexibility accorded to the Member States by the NEC Directive prevents limits from being placed upon them in the development of the programmes and their thus being obliged to adopt or to refrain from adopting specific measures or initiatives for reasons extraneous to assessments of a strategic nature which take account globally of the factual circumstances and the various competing public and private interests.

89 The imposition of any requirements to that effect would run counter to the intention of the European Union legislature, whose aim in particular is to allow the Member States to strike a certain balance between the various interests involved. Furthermore, that would result in excessive constraints being

placed on the Member States and would, accordingly, be contrary to the principle of proportionality, laid down in Article 5 TEU and expressly borne in mind in recital 13 in the preamble to the NEC Directive, which requires that the means deployed by a provision of European Union law be appropriate for attaining the legitimate objectives pursued by the legislation at issue and must not go beyond what is necessary to achieve them (see Joined Cases C-453/03, C-11/04, C-12/04 and C-194/04 *ABNA and Others* [2005] ECR I-10423, paragraph 68 and the case-law cited, and Case C-58/08 *Vodafone and Others* [2010] ECR I-0000, paragraph 51).

90 It accordingly follows that, during the transitional period from 27 November 2002 to 31 December 2010, the third paragraph of Article 288 TFEU and the NEC Directive itself do not require the Member States to refuse or to attach restrictions to the grant of an environmental permit such as those at issue in the main actions, or to adopt specific compensatory measures for each permit granted of that kind, even where the national emission ceilings for SO_2 and NO_x are exceeded or risk being exceeded.

91 In light of all the foregoing reasoning, the answer to the second and third questions is that during the transitional period from 27 November 2002 to 31 December 2010, provided for in Article 4 of the NEC Directive:

– Article 4(3) TEU, the third paragraph of Article 288 TFEU and the NEC Directive require the Member States to refrain from adopting any measures liable seriously to compromise the attainment of the result prescribed by that directive;

– adoption by the Member States of a specific measure relating to a single source of SO_2 and NO_x does not appear liable, in itself, seriously to compromise the attainment of the result prescribed by the NEC Directive. It is for the national court to review whether that is true of each of the decisions granting an environmental permit for the construction and operation of an industrial installation such as the permits at issue in the main actions;

– the third paragraph of Article 288 TFEU and Articles 6, 7(1) and (2) and 8(1) and (2) of the NEC Directive require the Member States, first, to draw up, to update and to revise as necessary programmes for the progressive reduction of national SO_2 and NO_x emissions, which they are obliged to make available to the public and appropriate organisations by means of clear, comprehensible and easily accessible information, and to notify to the Commission within the time-limit prescribed, and second, to prepare and annually update national inventories of those emissions and national emission projections for 2010, which they must report to the Commission and the European Environment Agency within the time-limit prescribed;

– the third paragraph of Article 288 TFEU and the NEC Directive itself do not require the Member States to refuse or to attach restrictions to the grant of an environmental permit for the construction and operation of an industrial installation such as the permits at issue in the main actions, or to adopt specific compensatory measures for each permit granted of that kind, even where the national emission ceilings for SO_2 and NO_x are exceeded or risk being exceeded.

Questions 4 to 6

92 By its fourth, fifth and sixth questions, which it is appropriate to examine together, the national court asks in essence whether and, if so, to what extent an individual can rely directly before the national courts upon the obligations imposed by Articles 4 and 6 of the NEC Directive.

93 It is to be recalled at the outset that it is settled case-law that, whenever provisions of a directive

appear, so far as their subject-matter is concerned, to be unconditional and sufficiently precise, they may be relied upon by individuals against the Member State where the latter has failed to implement the directive in domestic law by the end of the period prescribed or where it has failed to implement the directive correctly (see, inter alia, Joined Cases C-6/90 and C-9/90 *Francovich and Others* [1991] ECR I-5357, paragraph 11; Case C-62/00 *Marks & Spencer* [2002] ECR I-6325, paragraph 25; and Joined Cases C-397/01 to C-403/01 *Pfeiffer and Others* [2004] ECR I-8835, paragraph 103).

94 As the Court of Justice has pointed out on numerous occasions, it would be incompatible with the binding effect which the third paragraph of Article 288 TFEU ascribes to a directive to exclude, in principle, the possibility of the obligation imposed by a directive being relied on by persons concerned. That consideration applies particularly in respect of a directive whose objective is to control and reduce atmospheric pollution and which is designed, therefore, to protect public health (see Case C-237/07 *Janecek* [2008] ECR I-6221, paragraph 37).

95 It should nevertheless be noted in this regard that a provision of European Union law is unconditional where it sets forth an obligation which is not qualified by any condition, or subject, in its implementation or effects, to the taking of any measure either by the institutions of the European Union or by the Member States (see, inter alia, Case 28/67 *Molkerei-Zentrale Westfalen/Lippe* [1968] ECR 143 and Case C-236/92 *Comitato di coordinamento per la difesa della cava and Others* [1994] ECR I-483, paragraph 9).

96 It is clear that Article 4 of the NEC Directive does not display the characteristics set out above.

97 Viewed in its context, that article is purely programmatic in nature, in that it merely lays down an objective to be attained, leaving the Member States wide flexibility as to the means to be employed in order to reach that objective.

98 It follows that, since it does not lay down any unconditional and sufficiently precise obligation requiring the adoption of specific individual policies or measures intended to enable the result prescribed to be achieved, individuals cannot rely directly before a national court upon Article 4 of the NEC Directive to claim, before 31 December 2010, that the competent authorities should refuse, or attach restrictions when deciding to grant, an environmental permit such as those at issue in the main actions, or should adopt specific compensatory measures following the grant of such a permit.

99 On the other hand, Article 6 of the NEC Directive is unconditional and sufficiently precise in that it requires the Member States in unequivocal terms, first, under Article 6(1) and (3), to draw up national programmes for the progressive reduction of national emissions of inter alia SO_2 and NO_x in order to comply with the ceilings laid down in Annex I to the directive by the end of 2010 at the latest and, second, as provided in Article 6(4), to make those programmes available to the public and to appropriate organisations such as environmental organisations by means of clear, comprehensible and easily accessible information.

100 It follows that the natural and legal persons directly concerned must be able to require the competent authorities, if necessary by bringing the matter before the national courts, to observe and implement such rules of European Union law.

101 As to the content of the programmes that must be drawn up, it is true that, as follows from paragraph 88 of the present judgment, the Member States have wide flexibility in selecting the specific initiatives to be implemented, whilst it is also true that they are not obliged to adopt policies and measures to ensure that ceilings are not exceeded before the end of 2010.

102 It is apparent, however, from Article 6 of the NEC Directive and from the scheme of that directive, which seeks a progressive reduction of national emissions of the pollutants expressly referred to, that the Member States have the task, during the transitional period from 27 November 2002 to 31 December 2010, of adopting or envisaging appropriate and coherent policies and measures capable of reducing, as a whole, emissions of those pollutants so as to comply with the national ceilings laid down in Annex I to the directive.

103 Whilst the Member States thus have a discretion, Article 6 of the NEC Directive nevertheless involves limits on its exercise, which are capable of being relied upon before the national courts, relating to the appropriateness of the body of policies and measures adopted or envisaged within the framework of the respective national programmes to the objective of limiting, by the end of 2010 at the latest, emissions of the pollutants covered to amounts not exceeding the ceilings laid down for each Member State (see, to this effect, *Janecek*, paragraph 46).

104 In light of the foregoing considerations, the answer to the fourth, fifth and sixth questions therefore is as follows:

– Article 4 of the NEC Directive is not unconditional and sufficiently precise for individuals to be able to rely upon it before the national courts before 31 December 2010.

– Article 6 of the NEC Directive grants rights to individuals directly concerned which can be relied upon before the national courts in order to claim that, during the transitional period from 27 November 2002 to 31 December 2010, the Member States should adopt or envisage, within the framework of national programmes, appropriate and coherent policies and measures capable of reducing, as a whole, emissions of the pollutants covered so as to comply with the national ceilings laid down in Annex I to that directive by the end of 2010 at the latest, and should make the programmes drawn up for those purposes available to the public and appropriate organisations by means of clear, comprehensible and easily accessible information.

Costs

105 Since these proceedings are, for the parties to the main proceedings, a step in the action pending before the national court, the decision on costs is a matter for that court. Costs incurred in submitting observations to the Court, other than the costs of those parties, are not recoverable.

On those grounds, the Court (First Chamber) hereby rules:

1. **Article 9(1), (3) and (4) of Council Directive 96/61/EC of 24 September 1996 concerning integrated pollution prevention and control, in its original version and as codified by Directive 2008/1/EC of the European Parliament and of the Council of 15 January 2008 concerning integrated pollution prevention and control, must be interpreted as meaning that, when granting an environmental permit for the construction and operation of an industrial installation, such as those at issue in the main actions, the Member States are not obliged to include among the conditions for grant of that permit the national emission ceilings for SO_2 and NO_x laid down by Directive 2001/81/EC of the European Parliament and of the Council of 23 October 2001 on national emission ceilings for certain atmospheric pollutants, whilst they must comply with the obligation arising from Directive 2001/81 to adopt or envisage, within the framework of national programmes,**

appropriate and coherent policies and measures capable of reducing, as a whole, emissions of inter alia those pollutants to amounts not exceeding the ceilings laid down in Annex I to that directive by the end of 2010 at the latest.

2. During the transitional period from 27 November 2002 to 31 December 2010, provided for in Article 4 of Directive 2001/81:

– **Article 4(3) TEU, the third paragraph of Article 288 TFEU and Directive 2001/81 require the Member States to refrain from adopting any measures liable seriously to compromise the attainment of the result prescribed by that directive;**

– **adoption by the Member States of a specific measure relating to a single source of SO_2 and NO_x does not appear liable, in itself, seriously to compromise the attainment of the result prescribed by Directive 2001/81. It is for the national court to review whether that is true of each of the decisions granting an environmental permit for the construction and operation of an industrial installation such as the permits at issue in the main actions;**

– **the third paragraph of Article 288 TFEU and Articles 6, 7(1) and (2) and 8(1) and (2) of Directive 2001/81 require the Member States, first, to draw up, to update and to revise as necessary programmes for the progressive reduction of national SO_2 and NO_x emissions, which they are obliged to make available to the public and appropriate organisations by means of clear, comprehensible and easily accessible information, and to notify to the European Commission within the time-limit prescribed, and second, to prepare and annually update national inventories of those emissions and national emission projections for 2010, which they must report to the European Commission and the European Environment Agency within the time-limit prescribed;**

– **the third paragraph of Article 288 TFEU and Directive 2001/81 itself do not require the Member States to refuse or to attach restrictions to the grant of an environmental permit for the construction and operation of an industrial installation such as the permits at issue in the main actions, or to adopt specific compensatory measures for each permit granted of that kind, even where the national emission ceilings for SO_2 and NO_x are exceeded or risk being exceeded.**

3. Article 4 of Directive 2001/81 is not unconditional and sufficiently precise for individuals to be able to rely upon it before the national courts before 31 December 2010.

Article 6 of Directive 2001/81 grants rights to individuals directly concerned which can be relied upon before the national courts in order to claim that, during the transitional period from 27 November 2002 to 31 December 2010, the Member States should adopt or envisage, within the framework of national programmes, appropriate and coherent policies and measures capable of reducing, as a whole, emissions of the pollutants covered so as to comply with the national ceilings laid down in Annex I to that directive by the end of 2010 at the latest, and should make the programmes drawn up for those purposes available to the public and appropriate organisations by means of clear, comprehensible and easily accessible information.

JUDGMENT OF THE COURT (Second Chamber)

22 January 2009 (*)

(Pollution and nuisance – Directive 96/61/EC – Annex I – Subheading 6.6(a) – Intensive rearing of poultry – Definition – Meaning of 'poultry' – Maximum number of animals per installation)

In Case C-473/07,

REFERENCE for a preliminary ruling under Article 234 EC from the Conseil d'État (France), made by decision of 7 May 2007, received at the Court on 25 October 2007, in the proceedings

Association nationale pour la protection des eaux et rivières-TOS,

Association OABA

v

Ministère de l'Écologie, du Développement et de l'Aménagement durables,

intervening party:

Association France Nature Environnement,

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, K. Schiemann, J. Makarczyk, P. Kūris (Rapporteur), and C. Toader, Judges,

Advocate General: P. Mengozzi,

Registrar: R. Şereş, Administrator,

having regard to the written procedure and further to the hearing on 18 September 2008,

after considering the observations submitted on behalf of:

– Association nationale pour la protection des eaux et rivières-TOS, by P. Jeanson, Vice-President of the Association,

– France Nature Environnement, by R. Léost, Vice-President of the association,

– the French Government, by G. de Bergues and A.-L. During, acting as Agents,

– the Greek Government, by V. Kontolaimos and S. Papaioannou, acting as Agents,

– the Commission of the European Communities, by A. Alcover San Pedro and J.-B. Laignelot, acting as Agents,

after hearing the Opinion of the Advocate General at the sitting on 6 November 2008,

gives the following

Judgment

1 This reference for a preliminary ruling concerns the interpretation of subheading 6.6(a) of Annex I to Council Directive 96/61/EC of 24 September 1996 concerning integrated pollution prevention and control (OJ 1996 L 257, p. 26), as amended by Regulation (EC) No 1882/2003 of the European Parliament and of the Council of 29 September 2003 (OJ 2003 L 284, p. 1; 'Directive 96/61').

2 The reference was made by the Conseil d'État (Council of State) in the course of proceedings brought by the Association nationale pour la protection des eaux et rivières-TOS (National Association for the Protection of Waters and Rivers) and the OABA association seeking, on grounds of misuse of powers, annulment of Decree No 2005-989 of 10 August 2005 amending the nomenclature of classified installations (JORF, 13 August 2005, Text 52).

Legal context

Community legislation

3 Article 1 of Directive 96/61 provides:

'The purpose of this Directive is to achieve integrated prevention and control of pollution arising from the activities listed in Annex I. It lays down measures designed to prevent or, where that is not practicable, to reduce emissions in the air, water and land from the abovementioned activities, including measures concerning waste, in order to achieve a high level of protection of the environment taken as a whole, without prejudice to [Council] Directive 85/337/EEC [of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment] and other relevant Community provisions.'

4 Article 2 of Directive 96/61 provides:

'For the purposes of this Directive:

...

(3) "installation" shall mean a stationary technical unit where one or more activities listed in Annex I are carried out …

(4) "existing installation" shall mean an installation in operation or, in accordance with legislation existing before the date on which this Directive is brought into effect, an installation authorised or in the view of the competent authority the subject of a full request for authorisation, provided that that installation is put into operation no later than one year after the date on which this Directive is brought into effect;

...

(9) "permit" shall mean that part or the whole of a written decision (or several such decisions) granting authorisation to operate all or part of an installation, subject to certain conditions which guarantee that the installation complies with the requirements of this Directive. …

…’

5 Article 4 of Directive 96/61 states:

‘Member States shall take the necessary measures to ensure that no new installation is operated without a permit issued in accordance with this Directive …’

6 Article 9 of Directive 96/61, entitled ‘Conditions of the permit’, states:

‘1. Member States shall ensure that the permit includes all measures necessary for compliance with the requirements of Articles 3 and 10 for the granting of permits in order to achieve a high level of protection for the environment as a whole by means of protection of the air, water and land.

2. In the case of a new installation or a substantial change where Article 4 of Directive 85/337/EEC applies, any relevant information obtained or conclusion arrived at pursuant to Articles 5, 6 and 7 of that Directive shall be taken into consideration for the purposes of granting the permit.

3. The permit shall include emission limit values for pollutants, in particular, those listed in Annex III, likely to be emitted from the installation concerned in significant quantities, having regard to their nature and their potential to transfer pollution from one medium to another (water, air and land). If necessary, the permit shall include appropriate requirements ensuring protection of the soil and ground water and measures concerning the management of waste generated by the installation. Where appropriate, limit values may be supplemented or replaced by equivalent parameters or technical measures.

For installations under subheading 6.6 in Annex I, emission limit values laid down in accordance with this paragraph shall take into account practical considerations appropriate to these categories of installation.

4. Without prejudice to Article 10, the emission limit values and the equivalent parameters and technical measures referred to in paragraph 3 shall be based on the best available techniques, without prescribing the use of any technique or specific technology, but taking into account the technical characteristics of the installation concerned, its geographical location and the local environmental conditions. In all circumstances, the conditions of the permit shall contain provisions on the minimisation of long-distance or transboundary pollution and ensure a high level of protection for the environment as a whole.

…’

7 Article 16(2) of Directive 96/61 provides:

‘The Commission shall organise an exchange of information between Member States and the industries concerned on best available techniques, associated monitoring, and developments in them. Every three years the Commission shall publish the results of the exchanges of information.’

8 Annex I to Directive 96/61 lays down the categories of industrial activities referred to in Article 1. Subheading 2 of the introduction to Annex I states:

‘The threshold values given below generally refer to production capacities or outputs. …’

9 In subheading 6.6(a), that annex also mentions, as categories of industrial activities referred to in Article 1 of Directive 96/61:

‘Installations for the intensive rearing of poultry … with more than … 40 000 places for poultry’.

10 Annex III to Directive 96/61, entitled ‘Indicative list of the main polluting substances to be taken into account if they are relevant for fixing emission limit values’, sets out various air and water pollutants. It thus mentions, in relation to air, inter alia, oxides of nitrogen and other nitrogen compounds, and metals and their compounds. With regard to water, it mentions, inter alia, organophosphorus compounds, metals and their compounds, and substances which contribute to eutrophication (in particular, nitrates and phosphates).

National legislation

11 Annex I to Decree No 2005-989 amending the nomenclature of classified installations, contains, inter alia, the following table:

NUMBER	DESCRIPTION OF THE HEADING	A.D.S. (1)	R (2)
…			

2111	Poultry, game birds (rearing, sale, etc), excluding the specific activities referred to under other headings:
	
	1. More than 30 000 animal-equivalents……...
	
	From 5 000 to 30 000 animal-equivalents…….
	
	Note – Poultry and game birds are counted by using the following values expressed as animal-equivalents:
	
	quail = 0.125;
	
	pigeon, partridge = 0.25;
	
	cockerel = 0.75;
	
	small chicken = 0.85;
	
	hen, standard chicken, ‘quality label’ chicken, organic chicken, pullet, laying hen, breeder hen, pheasant, guinea fowl, mallard duck = 1;
	
	large chicken = 1.15;
	
	roasting duck, duck ready for force-feeding, breeder duck = 2;
	
	small turkey = 2.20;
	
	medium turkey, breeder turkey, goose = 3;
	
	large turkey = 3.50;
		A
		
		D
			3

	force-fed geese or duck = 7;

The dispute in the main proceedings and the question referred for a preliminary ruling

12 The Association nationale pour la protection des eaux et rivières-TOS and OABA claim, in support of their action before the Conseil d'État for annulment of all or part of Decree No 2005-989, that that decree does not comply with subheading 6.6(a) of Annex I to Directive 96/61. That decree, they argue, provides, under heading 2111 of the nomenclature of classified installations, for a threshold of 30 000 'animal-equivalents' beyond which the rearing of poultry and game cannot be carried out without first obtaining a permit to do so, establishing, inter alia, a conversion coefficient of 0.125 for quail, and 0.25 for partridge and pigeon. Thus, by applying those coefficients, a farm of more than 40 000 quails, partridges or pigeons would not exceed the threshold of 30 000 'animal-equivalents' and could be operated under the declaration system.

13 In the grounds of its decision, the Conseil d'État notes, with regard to subheading 6.6(a) of Annex I to Directive 96/61, that:

– installations for the intensive rearing of poultry with more than 40 000 places are subject to an authorisation requirement;

– that directive does not define the species to be regarded as 'poultry' for the purposes of that annex, whereas directives applicable to poultry under other legislation expressly lay down the species which fall within their scope, either by excluding quail, partridge and pigeon, or by including them.

14 The Conseil d'État accordingly decided to stay the proceedings and refer the following question to the Court of Justice for a preliminary ruling:

'Must subheading 6.6(a) of Annex I to Directive 96/61 …, which applies to installations for the intensive rearing of poultry with more than 40 000 places, be interpreted:

– (i) as including within its scope quails, partridges and pigeons; and if so,

– (ii) as authorising a mechanism for calculating authorisation thresholds on the basis of a system of "animal-equivalents", which gives weighting to the number of animals per place according to species so that account may be taken of the amount of nitrogen actually excreted by the various species?'

The question referred for a preliminary ruling

15 At the outset, it should be noted that it is clear from the provisions of Directive 96/61, and subheading 6.6(a) of Annex I thereto, that installations for the intensive rearing of poultry with more than 40 000 places are subject to a system of prior authorisation.

16 The scope of that provision is determined by three cumulative elements, namely that it must be ‘intensive’ rearing, that it must involve the rearing of poultry, and that the installations concerned must have more than 40 000 places.

17 It is, in addition, common ground that Directive 96/61 does not define the term ‘intensive rearing’, the term ‘poultry’ or the term ‘places’.

The first part of the question referred

18 In the first part of its question, the referring court asks whether the term ‘poultry’, used in subheading 6.6(a) of Annex I to Directive 96/61, includes quails, partridges and pigeons.

19 As a preliminary point, the French Government asserts, inter alia, that quails, partridges and pigeons cannot be reared intensively. Subheading 6.6(a) of Annex I to Directive 96/61, it argues, is not therefore intended to apply to those birds.

20 Such reasoning cannot be accepted.

21 The French Government has produced no scientific evidence to demonstrate that it is impossible to rear those birds intensively, and the mere fact that French quail or pigeon farms normally contain an average of 3 000 animals is not such as to establish that farms of more than 40 000 birds are not likely to exist.

22 In addition, it should be noted that the existence of intensive rearing of some of those birds is envisaged by French legislation, as is clear, in particular, from the actual provisions of the Ministerial Decree of 18 September 1985 establishing the equivalence coefficients for battery farming (JORF, 8 October 1985, p. 11683) which lays down, for a farmer, the minimum surface area for battery farming of 200 000 quails sold alive, or 120 000 quails sold dead.

23 Further, as regards the term ‘poultry’, which is not specifically defined by Directive 96/61, it should be borne in mind that the usual meaning of that word describes all those birds farmed for their eggs or their meat. Quails, partridges and pigeons are species of birds which may be farmed for the consumption of their eggs or their meat.

24 That interpretation can also be based on the general scheme and purpose of the directive (see, by analogy, Case C-72/95 *Kraaijeveld and Others* [1996] ECR I-5403, paragraph 38).

25 In that regard, it must be borne in mind that the purpose of Directive 96/61, as laid down in Article 1, is to achieve integrated prevention and control of pollution by putting in place measures designed to prevent or reduce the emissions, of the activities listed in Annex I, into the air, water and land in order to achieve a high level of protection of the environment.

26 As the Advocate General states in point 34 of his Opinion, that integrated approach is realised by appropriate coordination of the procedure and authorisation conditions for industrial installations whose potential for pollution is significant, making it possible to achieve the highest level of protection for the environment as a whole, which must in all cases include provisions minimising long-distance or transboundary pollution and ensure a high level of protection for the environment as a whole.

27 Since the purpose of Directive 96/61 has been broadly defined, it cannot be held that subheading 6.6(a) of Annex I could be interpreted in such a way as to exclude quail, partridge and pigeon.

28 The fact, relied upon by the French Government, that point 17(a) of Annex I to Directive 85/337, in the version of that annex resulting from Council Directive 97/11/EC of 3 March 1997 (OJ 1997 L 73, p. 5), refers to installations for intensive rearing of poultry containing more than 85 000 places for broiler chickens or more than 60 000 for hens cannot, moreover, affect the interpretation which must be given to subheading 6.6(a) of Annex I to Directive 96/61. The latter is specific legislation which, as is clear from its wording, covers poultry in the broader sense and lays down a threshold which is different to those provided for in point 17(a) of Annex I to Directive 85/337.

29 In addition, the French Government's argument which seeks to restrict the scope of subheading 6.6(a) of Annex I to Directive 96/61 to laying hens, meat chickens, turkey, duck and guinea fowl only, on the basis that such a restriction was imposed in the document on the best available techniques in intensive rearing of poultry and pigs (BREF), published by the Commission in the course of July 2003 (OJ 2003 C 170, p. 3) pursuant to Article 16(2) of Directive 96/61, must be rejected.

30 It must be pointed out, first, that the BREF document itself states that the interpretation of the term 'poultry' is specific to that document and, second, that such a document has no binding effect or interpretative value for Directive 96/61, as it is limited to providing an inventory of technical knowledge on the best available farming techniques.

31 Consequently, the fact that the BREF document in question does not concern quail, partridge or pigeon does not in any way mean that those three birds are not covered by the term 'poultry' appearing in subheading 6.6(a) of Annex I to Directive 96/61.

32 Lastly, it is necessary to reject the French Government's contention that the proposal for a Directive of the European Parliament and of the Council on industrial emissions (integrated pollution prevention and control), presented by the Commission on 21 December 2007 (COM(2007) 844 final) – designed to revise and to recast a number of Community instruments, including Directive 96/61, into a single legal document – lends support to a narrow interpretation of the term 'poultry' within the meaning of Directive 96/61.

33 A proposal for a directive, even if it does no more than reshape the legislation in force into consistent law, cannot serve as a basis for the interpretation of a directive in force.

34 In the light of those considerations, the answer to the first part of the question referred is that the term 'poultry' which appears in subheading 6.6(a) of Annex I to Directive 96/61 must be interpreted as including quails, partridges and pigeons.

The second part of the question referred

35 By its question, the referring court also wishes to establish whether subheading 6.6(a) of Annex I to Directive 96/61 precludes a Member State from establishing a system, known as 'animal-equivalents', which consists of establishing prior authorisation thresholds for installations for intensive rearing of poultry by weighting the number of animals per place according to species so that account may be taken of the amount of nitrogen actually excreted by the various birds.

36 The applicant associations in the main proceedings claim that the use of a system of 'animal-equivalents' is not prohibited, as long as the authorisation threshold remains at or below 40 000 birds physically present in the installation at any given moment.

37 The French Government contends that the French legislation provides that a permit is necessary for poultry or game bird farming of more than 30 000 'animal-equivalents', and sets a weighting coefficient

of 0.125 for quail and 0.25 for partridge and pigeon. Those coefficients were calculated in such a way as to reflect not only the amount of nitrogen excreted by the different species on the basis of data published by the Policy Committee on environmentally-friendly agricultural practices (Corpen), a body under the supervision of the Ministry of Agriculture and the Ministry of the Environment, but also all the other effects on the environment such as the amount of effluent produced in a year and the nuisance linked to noise and smell.

38 The Commission argues that, while the interpretation given by the French Government may appear justified, it is, in the current state of Community law, tantamount to an interpretation *contra legem*. According to the Commission, the expression 'more than … 40 000 places for poultry' contained in subheading 6.6(a) of Annex I to Directive 96/61 refers to a simultaneous production capacity of more than 40 000 game birds, and not to an authorisation threshold which depends on the pollution generated by each bird species.

39 In that regard, while it is not in dispute that the term 'place' is not defined by Directive 96/61, it should nevertheless be noted that subheading 2 of the introduction to Annex I to that directive states that '[t]he threshold values given below generally refer to production capacities or outputs'. Directive 96/61 does not therefore envisage, without at the same time excluding it, establishment of the authorisation threshold in accordance with a system of 'animal-equivalents'.

40 As the purpose of Directive 96/61 is the prevention and control of pollution arising from certain activities, including intensive rearing of poultry, the use of a method of 'animal-equivalents' should be permitted only if it is fully consistent with that objective. Use of that method must not, by contrast, have the effect of excluding from the system established by that directive installations set up under that method in relation to their total number of places.

41 In the present case, the link that might exist between the content of the French legislation and the taking into account of the level of nitrogen actually excreted by those birds has, moreover, not been proved by the French Government.

42 Suffice it to state that the information contained in the annexes to the circular of the ministère de l'Écologie, du Développement et de l'Aménagement durables (Ministry for Ecology, Sustainable Development and Planning) of 7 September 2007 on classified installations (farms, poultry) use of new references for waste material (Bulletin officiel, 30 October 2007, MEDAD 2007/20, Text 15, p. 1) shows that the level of nitrogen waste from a quail, a partridge or a pigeon in comparison with that of a standard chicken does not correspond to the weighting selected in Decree No 2005-989. The latter provides that a standard chicken is equivalent to eight quails, four partridges or four pigeons, even though the aforementioned information shows that excretions from a quail or a partridge contain a level of nitrogen equal to one half of that of a standard chicken, while a pigeon produces five times more. According to that same information, the level of phosphorous, copper and zinc in the waste of quails, partridges or pigeons is also greater than that contained in the waste of standard chickens.

43 At the hearing, with a view to justifying that lack of proportionality, the French Government asserted that other effects on the environment were taken into account, without, however, providing any scientific evidence establishing the nature and scale of those other effects on the environment.

44 In those circumstances, and as the Advocate General stated in point 54 of his Opinion, it appears that Decree No 2005-989 leads to intensive rearing installations consisting of 40 001 to 240 000 quails, or 40 001 to 120 000 partridges or pigeons, being exempted from the prior authorisation procedure laid down by Directive 96/61, notwithstanding the fact that those installations are liable to produce an

amount of nitrogen, phosphorous, copper and zinc greater than that produced by installations for the intensive rearing of 40 000 standard chickens.

45 Having regard to all of the foregoing, the reply to the second part of the question is that subheading 6.6(a) of Annex I to Directive 96/61 precludes national legislation, such as that at issue in the main proceedings, which calculates the thresholds for authorisation of installations for intensive rearing on the basis of a system of 'animal-equivalents' founded on a weighting of animals by places according to species so that account may be taken of the amount of nitrogen actually excreted by the various bird species.

Costs

46 Since these proceedings are, for the parties to the main proceedings, a step in the action pending before the national court, the decision on costs is a matter for that court. Costs incurred in submitting observations to the Court, other than the costs of those parties, are not recoverable.

On those grounds, the Court (Second Chamber) hereby rules:

1. **The term 'poultry', which appears in subheading 6.6(a) of Annex I to Council Directive 96/61/EC of 24 September 1996 concerning integrated pollution prevention and control, as amended by Regulation (EC) No 1882/2003 of the European Parliament and of the Council of 29 September 2003, must be interpreted as including quails, partridges and pigeons.**

2. **Subheading 6.6(a) of Annex I to Directive 96/61, as amended by Regulation No 1882/2003, precludes national legislation, such as that at issue in the main proceedings, which calculates the thresholds for authorisation of installations for intensive rearing on the basis of a system of 'animal-equivalents' founded on a weighting of animals by places according to species so that account may be taken of the amount of nitrogen actually excreted by the various bird species.**

Case C-237/07

Dieter Janecek

v

Freistaat Bayern

(Reference for a preliminary ruling from the Bundesverwaltungsgericht)

(Directive 96/62/EC – Ambient air quality assessment and management – Fixing of limit values – Entitlement of a third party, whose health has been impaired, to have an action plan drawn up)

Summary of the Judgment

1. *Environment – Ambient air quality assessment and management – Directive 96/62*

(Council Directive 96/62, as amended by Regulation No 1882/2003, Art. 7(3))

2. *Environment – Ambient air quality assessment and management – Directive 96/62*

(Council Directive 96/62, as amended by Regulation No 1882/2003, Art. 7(3))

1. Article 7(3) of Directive 96/62 on ambient air quality assessment and management, as amended by Regulation No 1882/2003, must be interpreted as meaning that, where there is a risk that the emission limit values in respect of particulate matter PM10 or alert thresholds may be exceeded, persons directly concerned must be in a position to require the competent national authorities to draw up an action plan, even though, under national law, those persons may have other courses of action available to them for requiring those authorities to take measures to combat atmospheric pollution.

(see para. 42, operative part 1)

2. In the application of Article 7(3) of Directive 96/62 on ambient air quality assessment and management, as amended by Regulation No 1882/2003, the Member States are obliged, subject to judicial review by the national courts, to take such measures – in the context of an action plan and in the short term – as are capable of reducing to a minimum the risk that the emission limit values in respect of particulate matter PM10 or alert thresholds may be exceeded and of ensuring a gradual return to a level below those values or thresholds, taking into account the factual circumstances and all opposing interests.

(see para. 47, operative part 2)

JUDGMENT OF THE COURT (Second Chamber)

25 July 2008 (*)

(Directive 96/62/EC – Ambient air quality assessment and management – Fixing of limit values

– Entitlement of a third party, whose health has been impaired, to have an action plan drawn up)

In Case C-237/07,

REFERENCE for a preliminary ruling under Article 234 EC from the Bundesverwaltungsgericht (Germany), made by decision of 29 March 2007, received at the Court on 14 May 2007, in the proceedings

Dieter Janecek

v

Freistaat Bayern,

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, L. Bay Larsen, K. Schiemann, J. Makarczyk and J.-C. Bonichot (Rapporteur), Judges,

Advocate General: J. Mazák,

Registrar: B. Fülop, Administrator,

having regard to the written procedure and further to the hearing on 5 June 2008,

after considering the observations submitted on behalf of:

– Mr Janecek, by R. Klinger, Rechtsanwalt,

– the Netherlands Government, by C. Wissels and M. De Grave, acting as Agents,

– the Austrian Government, by C. Pesendorfer, acting as Agent,

– the Commission of the European Communities, by F. Erlbacher, A. Alcover San Pedro and D. Recchia, acting as Agents,

having decided, after hearing the Advocate General, to proceed to judgment without an Opinion,

gives the following

Judgment

1 This reference for a preliminary ruling concerns the interpretation of Article 7(3) of Council Directive 96/62/EC of 27 September 1996 on ambient air quality assessment and management (OJ 1996 L 296, p. 55), as amended by Regulation (EC) No 1882/2003 of the European Parliament and of the Council of 29 September 2003 (OJ 2003 L 284, p. 1; 'Directive 96/62').

2 The reference has been made in the course of proceedings between Mr Janecek and the Freistaat Bayern concerning an application for an order requiring the Freistaat Bayern to draw up an air quality action plan in the Landshuter Allee district in Munich, where the applicant lives, the plan in question to include the measures to be taken in the short term to ensure compliance with the limit set by Community legislation in respect of ambient air emissions of particulate matter PM_{10}.

Legal context

Community legislation

3 According to the 12th recital in the preamble to Directive 96/62:

'… in order to protect the environment as a whole and human health, it is necessary that Member States take action when limit values are exceeded in order to comply with these values within the time fixed'.

4 Annex I to Directive 96/62 contains a list of atmospheric pollutants to be taken into consideration in the assessment and management of ambient air quality. Item 3 in that list refers to '[f]ine particulate matter such as soot (including $[PM]_{10}$)'.

5 Article 7 of Directive 96/62, headed 'Improvement of ambient air quality – General requirements', provides:

'1. Member States shall take the necessary measures to ensure compliance with the limit values.

…

3. Member States shall draw up action plans indicating the measures to be taken in the short term where there is a risk of the limit values and/or alert thresholds being exceeded, in order to reduce that risk and to limit the duration of such an occurrence. ...'

6 Article 8 of the directive, headed 'Measures applicable in zones where levels are higher than the limit value', provides:

'1. Member States shall draw up a list of zones and agglomerations in which the levels of one or more pollutants are higher than the limit value plus the margin of tolerance.

Where no margin of tolerance has been fixed for a specific pollutant, zones and agglomerations in which the level of that pollutant exceeds the limit value shall be treated in the same way as the zones and agglomerations referred to in the first subparagraph, and paragraphs 3, 4 and 5 shall apply to them.

2. Member States shall draw up a list of zones and agglomerations in which the levels of one or more pollutants are between the limit value and the limit value plus the margin of tolerance.

3. In the zones and agglomerations referred to in paragraph 1, Member States shall take measures to ensure that a plan or programme is prepared or implemented for attaining the limit value within the specific time-limit.

The said plan or programme, which must be made available to the public, shall incorporate at least the information listed in Annex IV.

4. In the zones and agglomerations referred to in paragraph 1, where the level of more than one pollutant is higher than the limit values, Member States shall provide an integrated plan covering all the pollutants concerned.

…'

7 Article 5(1) of Council Directive 1999/30/EC of 22 April 1999 relating to limit values for sulphur dioxide, nitrogen dioxide and oxides of nitrogen, particulate matter and lead in ambient air (OJ 1999 L 163, p. 41) provides:

'Member States shall take the measures necessary to ensure that concentrations of PM_{10} in

ambient air, as assessed in accordance with Article 7, do not exceed the limit values laid down in Section I of Annex III as from the dates specified therein.

The margins of tolerance laid down in Section I of Annex III shall apply in accordance with Article 8 of Directive 96/62/EC.'

8 Stage 1, section 1 of Annex III to Directive 1999/30 sets out, in a table, the limit values for particulate matter PM_{10}.

National legislation

9 Directive 96/62 was transposed into German law by the Gesetz zum Schutz vor schädlichen Umwelteinwirkungen durch Luftverunreinigungen, Geräusche, Erschütterungen und ähnliche Vorgänge (Federal Law on protection against the harmful effects of air pollution, noise, vibrations and other types of nuisance on the environment), as published on 26 September 2002 (BGBl I, p. 3830), as amended by the Law of 25 June 2005 (BGBl I, p. 1865; 'the Federal Law on combating pollution').

10 Paragraph 45 of the Federal Law on combating pollution, headed 'Improvement of air quality', provides:

'(1) The competent authorities shall take the measures necessary to comply with the emission values fixed pursuant to Paragraph 48a, in particular by means of the plans provided for under Paragraph 47.

…'

11 Paragraph 47 of that Law, headed 'Air quality plans, action plans, Land regulations', provides:

'(1) Where the limit values plus the statutory margins of tolerance defined by regulation pursuant to Paragraph 48a(1) are exceeded, the competent authorities shall draw up an air quality plan which determines the measures necessary for the permanent reduction of atmospheric pollutants and which complies with the requirements of the regulation.

(2) Where there is a risk of the emission limit values or alert thresholds defined by regulation pursuant to Paragraph 48a(1) being exceeded, the competent authority shall draw up an action plan laying down the measures to be taken in the short term which must be capable of reducing that risk or of limiting the duration of such an occurrence. Action plans may be incorporated in an air quality plan pursuant to subparagraph 1.

…'

12 The emission limit values referred to in Paragraph 47 of the Federal Law on combating pollution are fixed in the 22nd regulation for the implementation of that Law, which provides, in Paragraph 4(1):

'The average emission limit value over a 24-hour period in respect of PM_{10}, having regard to the protection of human health, is 50 µg/m³, which may be exceeded 35 times in a calendar year …'

The dispute in the main proceedings and the questions referred for a preliminary ruling

13 Mr Janecek lives on the Landshuter Allee on Munich's central ring road, approximately 900 metres north of an air quality measuring station.

14 Measurements taken at that station have shown that, in 2005 and 2006, the limit value fixed for

emissions of particulate matter PM_{10} was exceeded much more than 35 times, even though that is the maximum number of instances permitted under the Federal Law on combating pollution.

15 It is common ground that an air quality action plan exists in respect of the city of Munich, that action plan having been declared mandatory on 28 December 2004.

16 However, the applicant in the main proceedings brought an action before the Verwaltungsgericht (Administrative Court) Munich for an order requiring the Freistaat Bayern to draw up an air quality action plan in the Landshuter Allee district, so as to determine the measures to be taken in the short-term in order to ensure compliance with the maximum permitted number of instances – 35 per year – of the emission limit value for particulate matter PM_{10} being exceeded. The Verwaltungsgericht Munich dismissed that action as unfounded.

17 On appeal, the Verwaltungsgerichtshof (Higher Administrative Court) took a different view, holding that the residents concerned may require the competent authorities to draw up an action plan, but that they are not entitled to insist that it must include the particular measures that would guarantee compliance in the short-term with the emission limit values for particulate matter PM_{10}. According to the Verwaltungsgerichtshof, the national authorities are required only to ensure that such a plan pursues that objective to the extent to which it is possible and proportionate for it to do so. Consequently, it ordered the Freistaat Bayern to draw up an action plan complying with those requirements.

18 Mr Janecek and the Freistaat Bayern appealed to the Bundesverwaltungsgericht (Federal Administrative Court) against the judgment of the Verwaltungsgerichtshof. According to the Bundesverwaltungsgericht, the applicant in the main proceedings cannot rely on any entitlement to have an action plan drawn up pursuant to Paragraph 47(2) of the Federal Law on combating pollution. The Bundesverwaltungsgericht takes the view, moreover, that neither the spirit nor the letter of Article 7(3) of Directive 96/62 confers a personal right to have an action plan drawn up.

19 The referring court states that, even though the – albeit unlawful – failure to adopt an action plan does not, under national law, prejudice the rights of the applicant in the main proceedings, he is not without the means to ensure compliance with the legislation. Protection against the harmful effects of particulate matter PM_{10} should be secured by measures that are independent of such a plan, which the persons concerned are entitled to require the competent authorities to implement. Thus, effective protection is assured, under the same conditions as those that would result from the drawing-up of an action plan.

20 The Bundesverwaltungsgericht recognises, however, that there is a school of thought which draws different conclusions from the Community rules in question, namely that the third parties affected are entitled to have action plans drawn up, which appears to be confirmed by the judgment in Case C-59/89 *Commission* v *Germany* [1991] ECR I-2607.

21 In those circumstances, the Bundesverwaltungsgericht decided to stay the proceedings and to refer the following questions to the Court of Justice for a preliminary ruling:

‘(1) Is Article 7(3) of Council Directive 96/62… to be interpreted as meaning that a third party whose health is impaired is entitled to the preparation of an action plan even if, irrespective of any action plan, he is in a position to enforce his right to avoid any detriment to his health as a result of the emission limit value for particulate matter PM_{10} being exceeded, by bringing an action for intervention by the public authority?

(2) If so, is a third party who is affected by such concentrations of particulate matter PM_{10} as could be detrimental to health entitled to have an action plan drawn up laying down the measures to be taken in the short term to ensure strict compliance with the emission limit value for particulate matter PM_{10}?

(3) If the answer to Question 2 is in the negative, to what extent must the measures included in an action plan serve to reduce the risk of exceeding the limit value and to limit the duration of such an occurrence? Can an action plan be limited, on the principle of "one step at a time", to measures which, while not guaranteeing compliance with the limit value, nevertheless contribute in the short term to improvements in ambient air quality?'

The questions referred for a preliminary ruling

Observations submitted to the Court

22 The applicant in the main proceedings submits that, whenever the failure of national authorities to comply with the requirements of a directive designed to protect public health could endanger human health, the persons concerned must be in a position to rely on the mandatory rules included in that directive (see, as regards Council Directive 80/779/EEC of 15 July 1980 on air quality limit values and guide values for sulphur dioxide and suspended particulates (OJ 1980 L 229, p. 30), Case C-361/88 *Commission* v *Germany* [1991] ECR I-2567, paragraph 16; and, as regards Council Directive 75/440/EEC of 16 June 1975 concerning the quality required of surface water intended for the abstraction of drinking water in the Member States (OJ 1975 L 194, p. 26) and Council Directive 79/869/EEC of 9 October 1979 concerning the methods of measurement and frequencies of sampling and analysis of surface water intended for the abstraction of drinking water in the Member States (OJ 1979 L 271, p. 44), Case C-58/89 *Commission* v *Germany* [1991] ECR I-4983, paragraph 14).

23 Taking the view that Directive 96/62 is designed to protect human health, the applicant in the main proceedings maintains that Article 7(3) of that directive constitutes a mandatory rule which requires an action plan to be drawn up even where there is merely a risk that a limit value may be exceeded. The obligation to draw up such a plan in that situation, the existence of which is not disputed in the main proceedings, is therefore a rule upon which the applicant is in a position to rely, on the basis of the case-law referred to in the previous paragraph of the present judgment.

24 With regard to the content of the action plan, the applicant in the main proceedings submits that it must lay down all the appropriate measures to ensure that the period during which the limit values are exceeded is kept to a minimum. That follows, in particular, from the broad logic of Article 7(3) of Directive 96/62 – which states clearly that action plans must be drawn up where there is a mere risk of those values being exceeded – and Article 8(3) of the directive, according to which, where limit values have already been exceeded, the Member States must take measures to ensure that a plan or programme is prepared or implemented for attaining the limit value within the specific time-limit.

25 The Netherlands Government submits that Article 7(3) of Directive 96/62 does not confer on third parties a personal right to have an action plan drawn up. The Member States, it argues, have a wide discretion in respect of both the adoption of action plans and the determination of their content.

26 It follows, the Netherlands Government continues, from Article 7(3) that the Community legislature intended to leave to the Member States the power to put in place an action plan and to take the ancillary measures which they consider necessary and proportionate in order to attain the result envisaged.

27 Accordingly, it continues, Article 7(3) of Directive 96/62 does not impose any obligation on the Member States as to the result to be achieved. Their broad discretion allows the Member States to weigh up different interests and to adopt specific measures, taking account of compliance with limit values as well as of other interests and obligations, such as free movement within the European Union.

28 Thus, the Member States are required only to put in place action plans setting out the

measures to be taken in the short-term in order to reduce the risk of those values being exceeded or to limit the duration of such an occurrence.

29 The Austrian Government points out that the Court has held that the Community-law provisions which fix limit values for the protection of human health also confer on the persons concerned a legally enforceable right to compliance with those limit values (Case C-59/89 *Commission* v *Germany*).

30 However, the Austrian Government takes the view that, while Article 7(3) of Directive 96/62 may have direct effect, it does not follow from this that Article 7(3) establishes a personal right on the part of individuals to have action plans drawn up, since, in its view, that provision covers only the adoption of measures – in the context of national programmes – which are liable to help ensure compliance with limit values.

31 The Commission submits that it is apparent from the wording of Directive 96/62, in particular the combined provisions of Articles 7(3) and 2(5) and the 12th recital in the preamble to the directive, that the fixing of limit values in respect of particulate matter PM_{10} serves to protect human health. The Court has established in relation to similar provisions that, whenever the exceeding of limit values was capable of endangering human health, the persons concerned were in a position to rely on those rules in order to assert their rights (Case C-361/88 *Commission* v *Germany*, paragraph 16; Case C-59/89 *Commission* v *Germany*, paragraph 19; and Case C-58/89 *Commission* v *Germany*, paragraph 14).

32 According to the Commission, the principles identified in those judgments apply to the action plans provided for under Directive 96/62. The competent authority is therefore obliged to draw up such plans where the conditions laid down by that directive are satisfied. It follows that a third party who is affected by the limit values being exceeded is in a position to assert his right to the preparation of an action plan, which is required for the attainment of the objective relating to the limit values set by that directive.

33 With regard to the content of the action plans, the Commission's response is based on the terms of Article 7(3) of Directive 96/62, according to which those action plans must provide for measures 'to be taken in the short term ... in order to reduce [the risk of the limit values being exceeded] and to limit the duration of such an occurrence'. The Commission takes the view that the competent authority has a discretion to take the measures which it considers to be the most appropriate, provided that those measures are designed in the light of what is actually possible and legally proportionate, in such a way as to enable levels to drop back below the prescribed limit values within the shortest possible time.

The Court's findings

The preparation of action plans

34 By its first question, the Bundesverwaltungsgericht is asking whether an individual can require the competent national authorities to draw up an action plan in the case – referred to in Article 7(3) of Directive 96/62 – where there is a risk that the limit values or alert thresholds may be exceeded.

35 That provision places the Member States under a clear obligation to draw up action plans both where there is a risk of the limit values being exceeded and where there is a risk of the alert thresholds being exceeded. That interpretation, which follows from a straightforward reading of Article 7(3) of Directive 96/62, is, moreover, confirmed in the 12th recital in the preamble to the directive. What is laid down in relation to the limit values applies all the more with regard to the alert thresholds, in respect of which, moreover, Article 2 – which defines the various terms used in the directive – provides that 'immediate steps shall be taken by the Member States as laid down in this Directive'.

36 In addition, the Court has consistently held that individuals are entitled, as against public bodies,

to rely on the provisions of a directive which are unconditional and sufficiently precise (see, to that effect, Case 148/78 *Ratti* [1979] ECR 1629, paragraph 20). It is for the competent national authorities and courts to interpret national law, as far as possible, in a way that is compatible with the purpose of that directive (see, to that effect, Case C-106/89 *Marleasing* [1990] ECR I-4135, paragraph 8). Where such an interpretation is not possible, they must disapply the rules of national law which are incompatible with the directive concerned.

37 As the Court of Justice has noted on numerous occasions, it is incompatible with the binding effect which Article 249 EC ascribes to a directive to exclude, in principle, the possibility of the obligation imposed by that directive being relied on by persons concerned. That consideration applies particularly in respect of a directive which is intended to control and reduce atmospheric pollution and which is designed, therefore, to protect public health.

38 Thus, the Court has held that, whenever the failure to observe the measures required by the directives which relate to air quality and drinking water, and which are designed to protect public health, could endanger human health, the persons concerned must be in a position to rely on the mandatory rules included in those directives (see Case C-361/88 *Commission* v *Germany*; Case C-59/89 *Commission* v *Germany*; and Case C-58/89 *Commission* v *Germany*).

39 It follows from the foregoing that the natural or legal persons directly concerned by a risk that the limit values or alert thresholds may be exceeded must be in a position to require the competent authorities to draw up an action plan where such a risk exists, if necessary by bringing an action before the competent courts.

40 The fact that those persons may have other courses of action available to them – in particular, the power to require that the competent authorities lay down specific measures to reduce pollution, which, as indicated by the referring court, is provided for under German law – is irrelevant in that regard.

41 Directive 96/62 does not place any restrictions on the measures which may be adopted pursuant to other provisions of national law; moreover, it contains wording that is quite specific with regard to planning for the purposes, as stated in the 12th recital in the preamble to the directive, of protecting the environment ‘as a whole’, taking account of all the factors to be considered, such as, in particular, the requirements for the operation of industrial installations or travel.

42 The answer to the first question must therefore be that Article 7(3) of Directive 96/62 must be interpreted as meaning that, where there is a risk that the limit values or alert thresholds may be exceeded, persons directly concerned must be in a position to require the competent national authorities to draw up an action plan, even though, under national law, those persons may have other courses of action available to them for requiring those authorities to take measures to combat atmospheric pollution.

The content of action plans

43 By its second and third questions, the Bundesverwaltungsgericht is asking whether the competent national authorities are obliged to lay down measures which, in the short term, would ensure that the limit value is attained, or whether they can confine themselves to taking measures to ensure a reduction in instances of the limit value being exceeded or limits on their duration and which are, consequently, liable to make it possible for the situation to be improved gradually.

44 According to Article 7(3) of Directive 96/62, action plans must include the measures ‘to be taken in the short term where there is a risk of the limit values and/or alert thresholds being exceeded, in order to reduce that risk and to limit the duration of such an occurrence’. It follows from that very wording that the Member States are not obliged to take measures to ensure that those limit values and/or alert thresholds are never exceeded.

45 On the contrary, it is apparent from the broad logic of the directive – which seeks an integrated reduction of pollution – that it is for the Member States to take measures capable of reducing to a minimum the risk of the limit values and/or alert thresholds being exceeded and the duration of such an occurrence, taking into account all the material circumstances and opposing interests.

46 It must be noted in this regard that, while the Member States thus have a discretion, Article 7(3) of Directive 96/62 includes limits on the exercise of that discretion which may be relied upon before the national courts (see, to that effect, Case C-72/95 *Kraaijeveld and Others* [1996] ECR I-5403, paragraph 59), relating to the adequacy of the measures which must be included in the action plan with the aim of reducing the risk of the limit values and/or alert thresholds being exceeded and the duration of such an occurrence, taking into account the balance which must be maintained between that objective and the various opposing public and private interests.

47 Therefore, the answer to the second and third questions must be that the Member States are obliged, subject to judicial review by the national courts, only to take such measures – in the context of an action plan and in the short term – as are capable of reducing to a minimum the risk that the limit values or alert thresholds may be exceeded and of ensuring a gradual return to a level below those values or thresholds, taking into account the factual circumstances and all opposing interests.

Costs

48 Since these proceedings are, for the parties to the main proceedings, a step in the action pending before the national court, the decision on costs is a matter for that court. Costs incurred in submitting observations to the Court, other than the costs of those parties, are not recoverable.

On those grounds, the Court (Second Chamber) hereby rules:

1. **Article 7(3) of Council Directive 96/62/EC of 27 September 1996 on ambient air quality assessment and management, as amended by Regulation (EC) No 1882/2003 of the European Parliament and of the Council of 29 September 2003, must be interpreted as meaning that, where there is a risk that the limit values or alert thresholds may be exceeded, persons directly concerned must be in a position to require the competent national authorities to draw up an action plan, even though, under national law, those persons may have other courses of action available to them for requiring those authorities to take measures to combat atmospheric pollution.**

2. **The Member States are obliged, subject to judicial review by the national courts, only to take such measures – in the context of an action plan and in the short term – as are capable of reducing to a minimum the risk that the limit values or alert thresholds may be exceeded and of ensuring a gradual return to a level below those values or thresholds, taking into account the factual circumstances and all opposing interests.**
